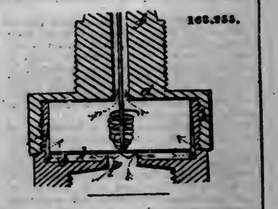
The stove-bottom A, having the downwardly-projecting rim *a* and dovetailed ribs B, and the leg C, in combination with the fastener D, arranged on the outside of the leg, and adapted to lock behind rim *a*, substantially as and for the purpose specified.

162,953

162,954.

162,954. RAILWAY-TIES. Henry Reese, Baltimore, Md. [Filed Apr. 2, 1875.]

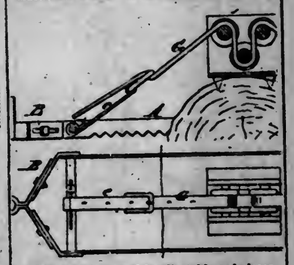


A T-iron railroad cross-tie provided near each end with oppositely-facing boat lugs O O', in combination with the U-shaped clamps D and wedges E, as and for the purpose specified.

162,955. GAS-REGULATORS. Isaac Rahn, Philadelphia, Pa. [Filed May 1, 1875.]

Brief.—Graduated slots in the wall of the chamber. Notched bearings upon the neck of the screw-orifice.

1. The combination of the graduated slots *o* with the movable disk *b*, arranged and constructed as described, or substantially the same, for the regulation of the flow of gas to burners.



2. The combination, in the regulator, of the disk *b*, inlet *p*, and bearings for the disk, arranged to maintain a gas-passage when the disk is at the limit of its lowest motion, substantially as set forth.

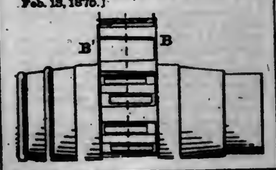
162,955.

162,956. ATTACHMENTS TO CROSSCUT-SAWS. Alex. H. Riley, Butler, Ga. [Filed Apr. 15, 1875.]

Brief.—For facilitating the operation of sawing logs into different lengths by gauge of crosscut-saws, two or more saws are suspended in a pulley-carrying frame, which can be spiked to the log. The saws are attached to laterally-adjustable end pieces by means of elastic and non-elastic straps.

The saws A secured to adjustable end pieces B, in combination with the spiked pulley-frame D and the elastic and non-elastic straps G *e*, substantially as shown and described.

162,957. ROCK-DRILL CHUCKS. George H. Reynolds, New York, and Walter Taft, Mineville, N. Y. [Filed Apr. 3, 1875.]



1. The grooved piston-rod A *a*, in combination with correspondingly-formed cheeks C D, and with means for firmly fixing the cheeks upon the rod and engaging in the groove therein, as and for the purpose specified.

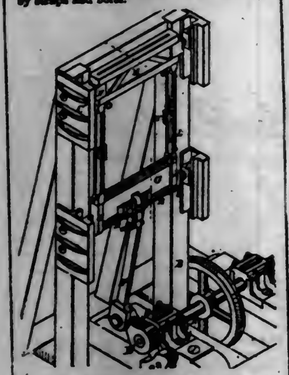
2. The inclined surface *a'* on one side of the groove *a* in the piston-rod A, and the corresponding inclined faces *c' d'* of the internal projections *c d* on the cheeks C D, combined and arranged to serve as herein specified.

3. In combination with cheeks C D, having a conical exterior surface, and with a hoop, E, for firmly fixing the same to the piston-rod A, the second hoop or band G, adapted to confine and release the drill-bit B, as herein specified.

4. The annular recess *n* in the cheeks C D, arranged as shown relatively to the second hoop G, in combination with the piston-rod A and drill B, and adapted to serve therewith, as and for the purposes herein specified.

162,958. HUBS FOR VEHICLE-WHEELS. L. Rodenhausen, Philadelphia, Pa. [Filed Feb. 13, 1875.]

1. The combination, with a wheel-hub, of two bands, B B', one having at its outer periphery horizontally-extending plates C, substantially as and for the purpose set forth.



2. The combination, with a wheel-hub, of two bands, B B', having at their outer peripheries horizontally-extending plates C and horizontally-extending ledges D, substantially as and for the purpose set forth.

3. The combination, with a wheel-hub, of two bands, B B', one band having at its inner periphery horizontally-extending plates E, substantially as and for the purpose set forth.

4. The combination, with a wheel-hub, of two bands, B B', the bands being provided at outer peripheries with horizontally-extending plates C and ledges D, and at inner peripheries with horizontally-extending plates E, substantially as and for the purpose set forth.

162,260. SAW-MILLS. Alexander Rodgers, Muskegon, Mich. [Filed Jan. 20, 1875.]

Brief.—The lower girt, including the needle-pin, is formed of a single piece of metal, instead of from several secured to each other by straps and bolts.

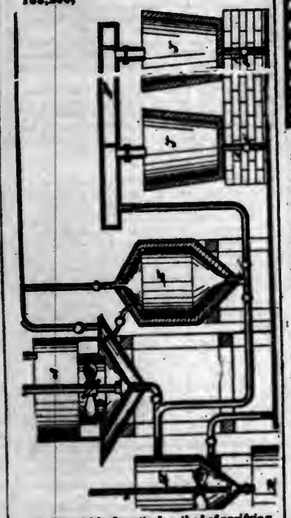
1. The girt G, provided with the needle-pin P forged from the same piece of metal as the girt, and forming a component part thereof, substantially as and for the purpose specified.

2. The rock-shaft H, provided with the slotted arm a, and arm b, with its wrist-pin b', above a, and jam-nut p, as and for the purpose specified.

3. The girt G, constructed as set forth, in combination with the rock-shafts H, pin n, and pitman F, substantially as shown and described.

4. The method of imparting an oscillatory movement to a saw-frame by means of independent rock-shafts acting upon the slide-blocks, as shown and described.

162,261. APPARATUS FOR DISSOLVING AND CRYSTALLISING. John B. Rich, New York, N. Y. [Filed Sept. 8, 1874.]



Brief.—The solution is agitated in the tank and heated by steam-jacket. The undissolved residue is run into H, when more water is added and agitation continued. The clear solution is run from A into the jacketed and closed tank B, from which, on the admission of steam, it is forced into the channel F, and thence into crystallising-tanks. The mother-liquor from these is run into channel L, together with the additional solution from residuum-tank H, then into the tank M, where the mixture is heated, and from which it is pumped back to A, and added to the new solution

1. In an apparatus for purifying and crystallising soluble solids, a dissolving-tank combined with an air-tight and jacketed receiver, substantially as and for the purpose described.

2. In an apparatus for purifying and crystallising soluble solids, the combination of a dissolving-tank with an air-tight and jacketed receiver, and a residuum-tank, substantially as and for the purpose described.

3. In an apparatus for purifying and crystallising soluble solids, an air-tight and jacketed tank, as and for the purpose shown and described.

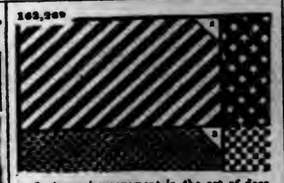
162,262.

4. The within-described method of purifying and crystallising soluble solids, consisting in dissolving the solid by heat and agitation, conveying such solution to an air-tight receiver, and thence to crystallising-tanks, the residuum being subjected to further agitation and solution, and, with the mother-water from the crystallising-tanks, heated and returned to the dissolving-tank, substantially as specified.

5. In an apparatus for purifying and crystallising soluble solids, the combination of a tank, constructed with steam-bottom, agitator, and annulus, with a residuum-tank, provided with an agitator, one or more air-tight jacketed tanks, and one or more crystallising-tanks, and all arranged, constructed, and combined as and for the purpose herein before shown and described.

162,263. HOSE-COUPLINGS. J. Ruppenthal, St. Louis, Mo. [Filed Mar. 26, 1875.]

Brief.—The necks of the coupling are formed with a swell, from which they taper in both directions, and are circularly fluted, so as to better hold the hose ends in which they are inserted. Outside the hose ends are two conical sleeves, one of which screws into the other, and clamps the hose against the tapering sides of the swell on the coupling-necks. The inner one of the sleeves is prevented from turning on the coupling-neck by a lug or feather formed thereon, which enters a notch formed in the flange of said sleeve.



1. The swelled and fluted neck A, in combination with the tapering sleeves D E, arranged to screw together, as and for the purpose set forth.

2. The swelled and fluted neck A, having lug *a'*, in combination with tapering sleeves D E, as and for the purpose set forth.

162,264. PROCESSES OF DECORATING TIN-PLATE. Albert Edwin Schmidt and Gustav Jacob M. Bodtruch, Hamburg, Germany, assignors to Hamburg American Sewing-Machine Company, same place. [Filed Aug. 6, 1875.]

162,264.

1. As an improvement in the art of decorating tin-plate, coating the surface with a varnish containing alkanna, and subjecting the coated plate to heat, the color of the plate being determined or varied by regulating the heat, substantially as herein set forth.

2. The improved process of decorating tin-plate, consisting in printing the pattern or figure thereon, coating the printed surface with a varnish containing alkanna, and subjecting the prepared plate to heat of a greater or less degree to produce the desired color of pattern or figure, substantially as herein specified.

162,265. FAUCETS. Peter Schofield, Philadelphia, Pa. [Filed Apr. 7, 1875.]

1. A faucet in which a sliding tube, B, containing a valve, is combined with a fixed tubular stem, the end of which forms the seat of the valve, and with devices by which the said tube may be moved to and fro on the stem, all substantially as and for the purpose set forth.

2. The sliding tube B and its valve, the fixed stem A, and a weighted handle having a hub, *h*, in combination with screw-threads, substantially as described, by which the said tube B may be moved to or fro by operating the handle, as set forth.

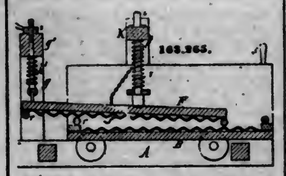
3. The combination of the hub *h* of the handle with a nut, *p*, for limiting the outward movement of the handle, in the manner specified.

162,266.

162,264.

162,266. TONGUE-SUPPORTS. L. Schumber, La Fayette, Ind. [Filed Apr. 3, 1875.]

Brief.—The tongue is held up by a spring.



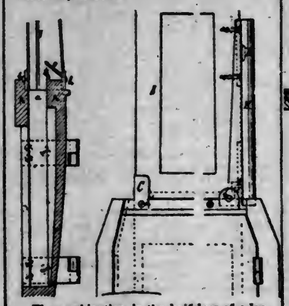
1. In a wagon, the combination of a sliding clip-plate, J, with a wagon-tongue and double-tree, substantially as set forth.

2. The combination of a sliding clip, J, double-tree E, spring-yoke K', and chains L, substantially as and for the purpose set forth.

3. The combination, with a vibrating tongue, H, and the spring-supported block *b*, of the set-screws *c*, substantially as set forth.

162,267. WASHING-MACHINES. P. Schweinhart, Buffalo, N. Y. [Filed Aug. 18, 1875.]

162,265.



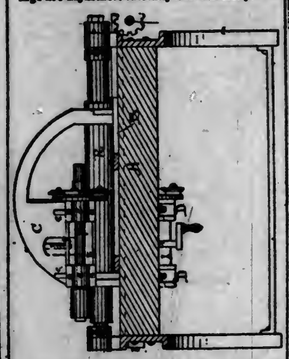
1. The combination, with the frame A, of the stationary rubbing-board F, pivoted at one end, and provided with spring-pressure bars *l*, and the reciprocating rubbing-board B, substantially as and for the purpose hereinbefore set forth.

2. The combination, with the movable rubbing-board B, of the stationary board F, hinged at one end to the cross-piece *g'*, and attached near the middle to the pivoted cross-head K, so that by turning the latter the free end of the board F is raised or lowered, substantially as and for the purpose hereinbefore set forth.

162,268. CARRIAGE-DOORS. G. Schaffner, Troy, N. Y. [Filed Mar. 31, 1875.]

Brief.—The door may be used with the window up or down.

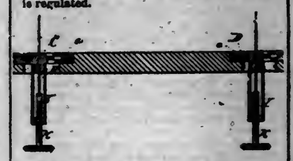
The combination, in the half-door of a landau, either in an open or closed carriage, of the panels A and A', the space *a*, the sash B, with its lower beveled edge *a*, and provided with the slide-button B and beveled grooved latch-piece *l*, the single sash-holder H, with its lipped groove *g* and catch *c*, hinged upon the top of the panels of the door at *h*, and the clasp or brace C, fixed upon the top of the half-door at *h'*, as and for the purpose described.



162,269. PAPER FANS. C. C. B. Schwartz, Philadelphia, Pa. [Filed Jan. 6, 1875.]

As a new article of manufacture, the paper fan herein shown and described, the same consisting of the circular fluted disk B, formed of a flattened truncated cone constructed of a quadrilateral piece of paper, crimped and united at its ends, in combination with the handle C, consisting of two strips, C', of pasteboard, secured to each other and to the disk, all as set forth.

162,270. MACHINES FOR MATCHING LUMBER. Geo. J. Shimer, Milton, Pa. [Filed Jan. 2, 1875.]

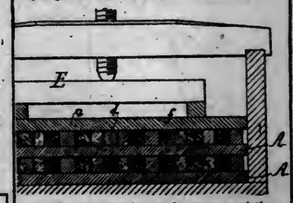


Brief.—For forming two narrow flooring-boards from one wide one that has been surfaced and grooved on both edges. Opposite grooves of suitable shape to form two tongues are cut along the top and bottom of a wide board, when the board is severed along the middle of said grooves, by means of two cutter-heads mounted on mandrels whose bearings are adjustable laterally and vertically.

The slide B, provided with an adjusting-screw, and constructed with the arch standard C, and pendent studs D D, provided with guide-cribs *c c* and *d d*, combined with sliding frames E I, combined with boxes *i i*, in which the cutter-head mandrels run, and whereby they are adjustable, as set forth.

162,271. NEEDLE-BOARDS FOR REGISTERING RAISE-NOTES AND OTHER PRINTS. James D. Smith, Washington, D. C. [Filed Feb. 12, 1875.]

Brief.—The needle passes through a longitudinally-adjustable socket, and rests upon a screw-rod, by which its height above the table is regulated.



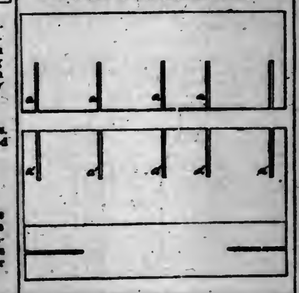
1. In combination with the needle-board and bearing-plate B, the needle-socket C and clamping-plate D, constructed and operating substantially as and for the purposes set forth.

2. In combination with the socket-plate C, having a hole through the same, the tube I and screw-rod K, whereby the needle may be adjusted vertically, substantially as and for the purposes described.

162,272. OMAR-PRESSES. Wm. P. Smith, Quakerstown, Pa. [Filed Mar. 3, 1875.]

Brief.—The bunches are laid upon a flat plate between hinged clamps, which are forced against the bunches by laterally-working wedges. The clamps are thrown back by springs when the wedges are withdrawn.

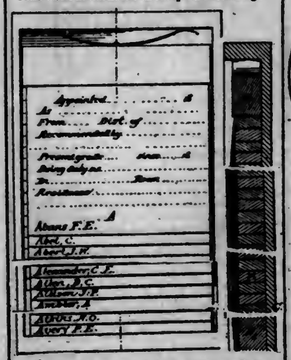
1. The combination of the tray, consisting of the board A, its permanent stripe, and hinged arms, with wedges *d*, and pressure-plate *f*.



2. The combination of the permanent stripe *a*, hinged arms *b*, springs *m*, and wedges *d* for operating on the hinged arms.

3. The bar D, with its wedges *d*, arranged in respect to, and combined with, the hinged arms *b* of the tray and its stripe, as set forth.

162,273. MINERAL PAINT. James L. Sneed and Jno. B. Kirtley, Frankfort, Ky. [Filed Oct. 13, 1874.]



A paint made from the rock herein described, the constituents of which are silica, alumina, protoxide of iron, lime, magnesia, potash, soda, phosphoric acid, sulphur, and carbonic acid, by pulverising the rock and mixing with oil and pigments, if required.

162,274. HOG-CATCHERS. John L. Stevens, Chicago, Ill. [Filed Sept. 26, 1873.]

162,275. INDEXES. Charles W. Seaton, Washington, D. C. [Filed Apr. 15, 1875.]

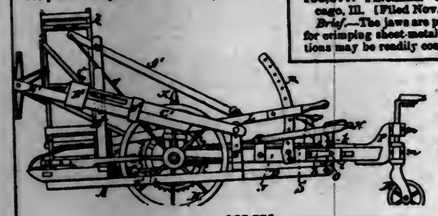
Brief.—Slips of paper are pasted to one side of rectangular blocks, and the blocks placed side by side in a trough, the slips of paper extending one beyond the other a distance equal to the thickness of block, and the name or head word is borne on the flap so extending.

1. An expansible index, consisting of slips A, of equal size, and attached blocks E, said blocks being arranged side by side and the slips folded down one upon another, substantially as set forth.

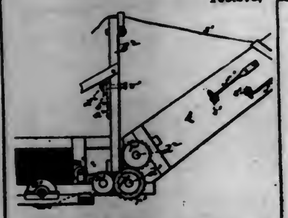
2. The combination of a series of blocks, E, with the attached slips A, box C, and spring-block B, substantially as described.

3. The combination, with a box, C, containing a section or division of the card-index, of the covering slip *c*, attached to said box, substantially as described.

162,276. MODES OF ATTACHING BUTTONS. Samuel W. Shorey, Boston, Mass. [Filed Nov. 2, 1874.]



The improved method of attaching buttons to shoes, garments, &c., described, the same consisting in the metallic loop or staple C connected with the button, and having its free ends united by solder, substantially as and for the purpose specified.



An egg-carrier provided with removably-folding trays divided into folding egg-receiving compartments, the trays and their compartments consisting of the series of sheets A A, having the notches *a a* sunken into one of their longitudinal edges, and of the series of sheets B B, having the notches *a' a'* sunken into one of their longitudinal edges, and also having the folding extensions *b' b'* projecting therefrom, each of said series being arranged together, substantially as shown and described.

162,273. HARVESTERS. Charles S. Stickle, and James D. Moore, Grinnell, and Wm. P. Parker, Tama, Iowa; said Moore assignor to said Stickle and Parker. [Filed Nov. 6, 1873.]

Brief.—The cut grain that falls upon the endless-belt platform is carried to the elevator, where it is carried between the two belts to the point of deposit.

162,275.

1. The combination, with the lever D N and connecting-bar G, of the pin *i*, spring *k*, and crank-shaft *h*, substantially as and for the purposes herein set forth.

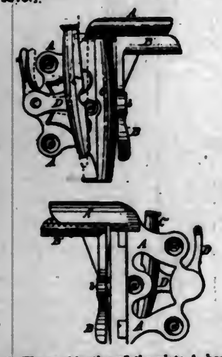
2. The combination, with the frame A with its standards B B, and the axle C with the wheels H H', of the lever L, rods *f f*, chains *e e*, levers I I, with cogged segments *b b*, and the slotted and cogged plates *d d* attached to the standards B B, all substantially as and for the purposes herein set forth.

3. The endless aprons F F, arranged as described in the elevator E, so as to be farther apart at the throat *g* than at the center A', and closer together at the center than at the outer end *f*, for the purposes herein set forth.

4. The rollers *c* supported in spring-bearings *f' f'* and operating in combination with the aprons F F, substantially as and for the purposes herein set forth.

5. The combination of the adjustable arm C', loops D' D', reel-bearer E', and set-screw *g'*, substantially as and for the purposes herein set forth.

162,276. DETACHABLE PLATES FOR GLASS-MOLDS. Gustavus Storm, Philadelphia, Pa. [Filed Feb. 12, 1875.]



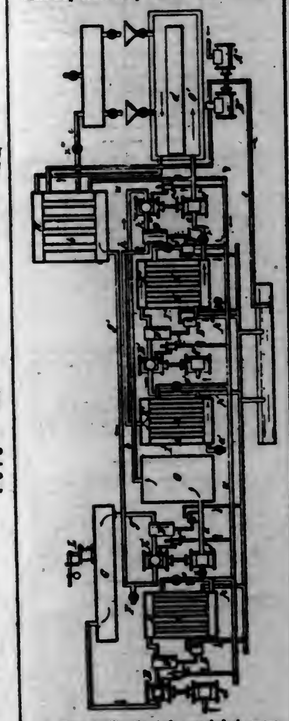
A detachable engraved plate for glass molds composed of two or more sections, *a*, adapted to a recess in the mold, all substantially as and for the purpose set forth.

162,277. FENCERS. Geo. H. Strong, Chicago, Ill. [Filed Nov. 23, 1874.]

Brief.—The jaws are provided with a swage for crimping sheet-metal pipe, so that the sections may be readily connected.

The pivoted jaws Q R, provided with the swage H N and gage P, substantially as and for the purpose set forth.

162,278. CORRUGED RIBS-HOLDERS AND WEFT-SOCKETS. J. H. Sunderman, Quincy, Ill., assignor of one-half his right to H. Moecker, same place. [Filed Jan. 30, 1875.]



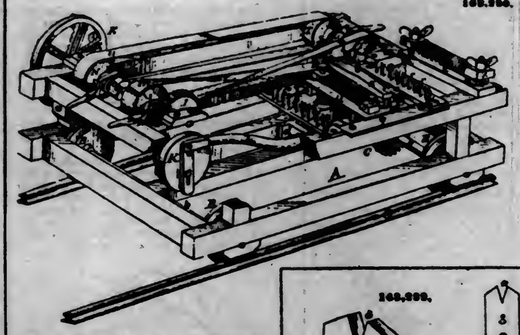
1. The combination of the plate A, having the socket-piece C and laterally-projecting arm A' rigidly secured thereto, with the angular lever D' D pivoted at *c*, and carrying the swinging socket-piece C', substantially as and for the purpose shown and specified.

2. The combination of the plate A, having the socket-piece C and laterally-projecting arm A' rigidly secured thereto, with the angular lever E B' pivoted at *b*, substantially as and for the purpose shown and specified.

3. The combination of the plate A, having the socket-piece C and laterally-projecting arm A' rigidly secured thereto, with the angular lever D' D carrying the socket-piece C', and with the angular lever B B', said levers pivoted, respectively, at *c* and *b*, substantially as and for the purpose shown and specified.

162,279. ICE-MACHINES. Augustus H. Tait, Jersey City, N. J. [Filed Oct. 21, 1874.]

Brief.—Cooled air is subjected to two consecutive and cumulative pressures, and allowed to expand in a closed chamber, whereby it is reduced in temperature to (say) zero. While at its greatest compression it is cooled by being passed through tubes jacketed with water. This air, at zero, is subjected to severer compressions and jacketings, and again allowed to expand (being at, say, 30° below zero) around pans containing water, which it freezes. It then passes backward through the apparatus, cooling the water, and repeating the circuit. Jet-pumps cool the air-pumps, while trap-boxes carry off the water.

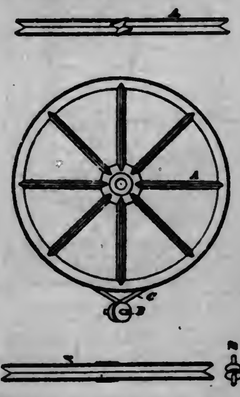


1. The combination of a cooled-air reservoir, O, air-pump B, condensed-air receiver H, expanding-air cylinder J, pump K, worked by expansion of air in J, pipes *g' g'*, and air-jacketed air chamber O, whereby cooled air is subjected to pressure, is condensed, reduced to lower temperature, and expanded, as and for the purpose specified.

2. The combination of condensed-air receiver H', having inlet *a'*, pump B', condensed-air receiver H'', air-expansion cylinder J', pump K', driven by J', and expanded-air chambers O and O', whereby the cooled air in O, which had been cooled by condensation and expansion, is further condensed and expanded, substantially as and for the purpose set forth.

162,280. MACHINES FOR FEATHERING CORDAGE, ROPE, &c. Theodore Tebow, Lexington, Ky. [Filed Mar. 6, 1875.]

Brief.—The cordage passes between the bars of the rubbers, and as the carriage moves along its track, the reciprocating rubber moves back and forth, sticking the cord; the devices of the first claim giving these motions, and permitting the operation of the movable rubber to be suspended when desired.



162,280.

1. The combination of the wheeled carriage A B, driving-shaft *i*, driven either immediately or by means of auxiliary shaft *j*, crank K, pitman L, reciprocating-rubber frame Q loose pulleys M N, clutches *o h*, direct- and cross-belts *m n*, pulley T T, shaft *i*, clutches *v s*, gear-wheels U V C, and detachable shaft-pulley D, for giving the direct and reversed motion to the carriage A B, the whole being arranged and operating substantially as and for the purpose specified.

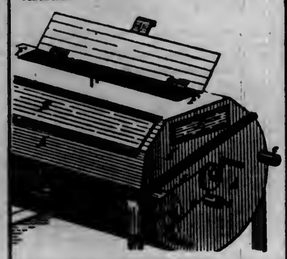
2. A rubber, either reciprocating or stationary, composed of a block or blocks provided with elastic cushions and wound with hair cordage, as and for the purpose described.

162,281. DEVICES FOR TRANSMITTING POWER. George J. Trobaugh, Baltimore, Md. [Filed Dec. 28, 1874.]

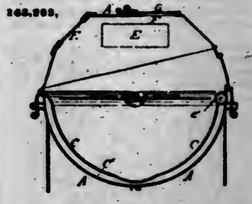
In combination with a grooved wheel or pulley adapted to revolve in a certain plane, a correspondingly-grooved pulley constructed to revolve in a plane inclined with reference to the plane aforesaid, the said pulleys being connected by a crossed belt of a circular or nearly circular cross-section, substantially as and for the purpose set forth.

162,282. AUGERS AND AUGER-BITS. Wm. Tucker, Fishdale, Mass. [Filed Nov. 21, 1874.]

Brief.—The auger is made stiffer than ordinarily, and adapted to cut its entire length into the wood without being withdrawn for the removal of chips, by having the twist extend entirely up to the holding end, which is made flat and of the same size as the twist or rod. The auger is provided with a counter-sink, and a V-shaped groove in the end of the shank, for direct application to a brace having a corresponding V-shaped projection.



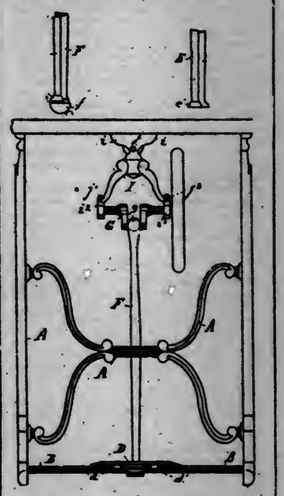
162,282.



An auger-bit or auger having a flat holding end, 3, which is of the same, or nearly the same, size as the metal of the twist or rod 1, and is constructed with a notch, 4, and counter-sink 5, or their equivalents, to adapt the same for the application of a brace, handle, or stock directly thereto, as herein specified, for the purpose set forth.

162,283. FEATHER-RENOVATORS. Uriah B. Waddle, Trenton, Mo., assignor of one-half his right to Stephen D. Saxby, same place. [Filed Mar. 13, 1875.]

Brief.—The steam is injected from the perforated pipe at the side into the falling feathers.



162,283.

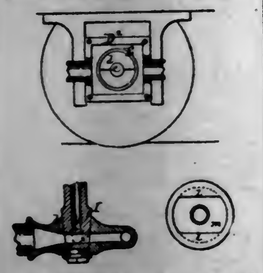
The combination of the steam-pipe *c*, having opening *c'*, arranged as specified, to blow the steam-jets transversely across the cylinder or case, C, with an agitator consisting of the fan-blades D', having beaters D'' affixed thereto, substantially as and for the purpose specified.

162,284. TREADLES. Simon W. Wardwell, Jr., St. Louis, Mo., assignor to himself and George W. Shaw, same place. [Filed June 23, 1874.]

Brief.—The connecting-rod is, for adjustment, composed of one piece inclosing another along its length, grasping at top the crank-pin, and working on a ball and socket below in the treadle. Crank and wheel hang by a tongue-and-groove joint to the periphery of a disk on the under side of the table.

1. The combination of connecting-bar C, sandal D, screw H, sandal-rod E, pitman parts E F, and crank-shaft G, all said parts being constructed as herein shown and described, as and for the purpose set forth.

2. The combination of the supporting-block J, hanger I, crank-shaft G, pitman parts E F, connecting-bar C, sandal D, and rod E, constructed to operate as herein shown and described, as and for the purpose set forth.



3. The pitman part E, having groove *e*, upper half-ball cavity *e'*, and lower half-ball bearing *e''*, to operate as and for the purpose set forth.

4. The pitman part F, having solid body, and terminating at its upper end with a cavity, *f'*, and its lower end with half-solid bearing *f*, to operate as and for the purpose set forth.

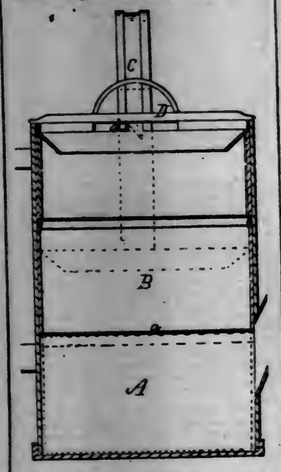
5. The combination of the grooved and solid pitman parts E F with upper and lower ball parts *e' f'* *e' f* and transverse openings *e' f'*, to operate as and for the purpose set forth.

162,266. DEVICES FOR LUBRICATING AND PREVENTING THE HEATING OF CAR-AXLE BOXES. Edmond A. Warren, Brooklyn, N. Y. [Filed Mar. 27, 1875.]

Brief.—The axle-boxes are connected by pipes, and by means of a pump water is forced through them, which serves to lubricate and prevent heating.

1. The combination, with the axle-boxes of a railroad car or cars, of pipes or tubes connected and communicating with the axle-boxes and with a pump, whereby water or other liquid may be forced to circulate through all the axle-boxes, as and for the purpose specified.

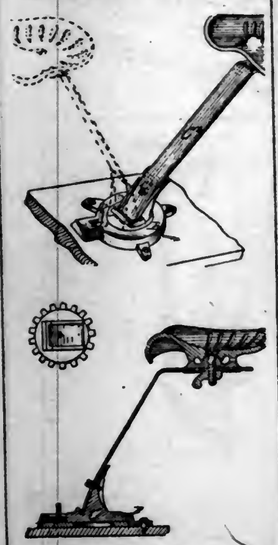
2. The combination, with the axle-boxes of a railroad car, and a tank and pump, of longitudinal tubes at the sides of the cars, and communicating with all the axle-boxes and a transverse tube, G, connecting the ends pipes or tubes, whereby a continuous supply of water from the tank may be forced through the axle-boxes, and conducted back to said tank for further use, as set forth.



3. The axle-boxes of a railroad-car having nozzles, in combination with tubes or pipes F connecting the axle-boxes, substantially as described.

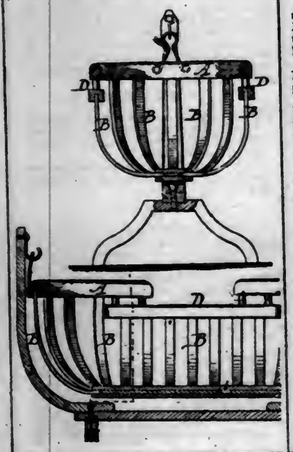
4. The axle-boxes, provided with nozzles substantially for their connection by means of the circulating-pipes F.

5. The combination of the axle-boxes D' or D², and their connecting pipes F G, the three-way cocks or valves I, and the pipes J attached to said valves, and provided with flexible connections and couplings, substantially as herein described.



162,282. COFFEE-POTS. Henry W. Watson, New York, N. Y. [Filed Jan. 27, 1875.]

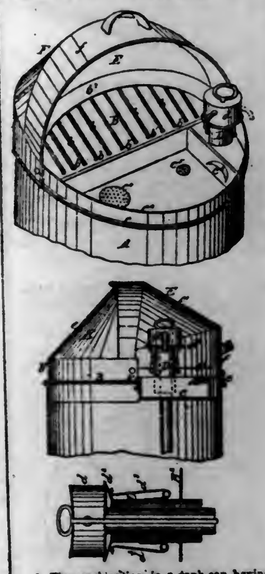
Brief.—To lift and adjust the retainer without removing the cover of the vessel.



The coffee-holder B, constructed with the projecting handle C and notch *a*, in combination with the coffee-pot A, having the inward projection *d* and notch or depression outside of its cover D, as and for the purpose herein specified.

162,287. HARVESTER-SEATS. O. Wheeler, Jr., and H. J. Case, Auburn, N. Y.; said Case assignor to said Wheeler, Jr. [Filed Apr. 1, 1875.]

The notched or toothed disk, forming the pivotal support for the seat-standard, in combination with the socket-plate B and the spring locking pin or bolt, substantially as and for the purpose set forth.



162,288. CRADLES. Francis O. Wireman, New York, N. Y. [Filed July 18, 1874.]

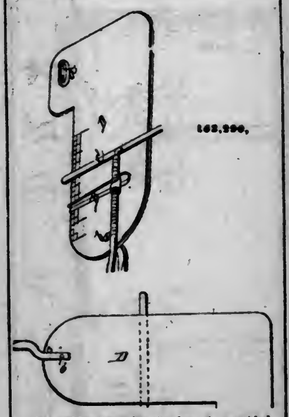
In a cradle-body, the combination of the independent end frames A, the vertical ribs B, the bottom C, and the straight bars or strips D, connected with the ends of the frames A by the bolts or pins *d*, and supported by the ribs B, as and for the purpose shown and described.

162,289. TANK-CANS FOR OILS. Henry H. Woloott, Syracuse, N. Y. [Filed Mar. 24, 1875.]

Brief.—The cover slides back above the fixed hood. When closed the entire top of the can is covered. Corrugations in the fixed dripping shelf carry the waste oils from the measures back into the tank. The pump is supported upon a fixed extension-shelf at the side. A removable tray, provided with drip apparatus, covers the rest of the top.

1. The combination, in a tank-can having a fixed hood, of a permanent dripping-shelf, B, provided with inclined corrugations or gutters *b*, and perforations *b'*, substantially as herein set forth.

2. The combination, with the dripping-shelf B, of the shelf-extension B² for the pump-support D, substantially as herein set forth.



3. The combination, with the dripping-shelf B, of a fixed hood, E, and the rim-guard *b'*, inclosing and forming a base boundary for the shelf, substantially as and for the purpose set forth.

4. The combination, with a removable sink, C, and a fixed dripping-shelf, B, of the extension B² for the pump-support, independent of the sink, and the shelf, as and for the purpose set forth.

5. The cover F, constructed with the tapering end and gore sections *f f' f'*, in combination with the fixed hood E, having the inclined back *e* and guard-rim *b'*, over and upon which the cover is hinged to be opened and closed without binding of the overlapping parts, as set forth.

6. The combination of the hinged cover F, fixed hood E, and the dripping shelf B, the latter being inclosed and rim bounded above the sink, and with the pump-support, to obtain a firm and compact superstructure for the can, as set forth.

162,290. SEWING-MACHINE TUCKERS. J. H. Cleveland, Buffalo, N. Y. [Filed Oct. 2, 1874.]

162,290.

In combination with the bow A, provided with the adjustable shoe B, and adjustable gage C, the graduated plate D, pivoted to the end of the bow A, and provided with slot *a* and stop *d*, all substantially as and for the purposes herein set forth.

REISSUES.

6,122. KNITTING-MACHINES. Dana Bickford, New York, N. Y. Patent No. 60,121, dated July 21, 1868. [Filed Apr. 5, 1875.]

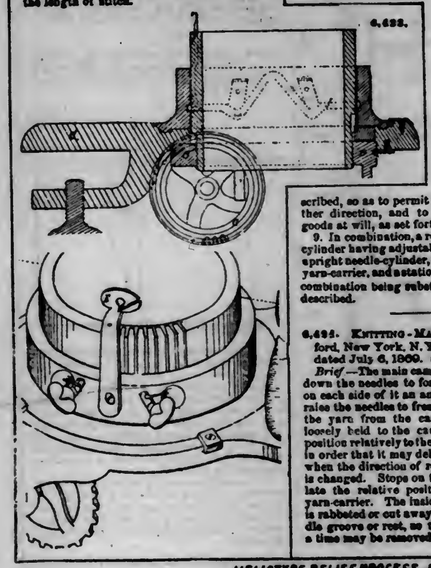
Brief.—The needle-cylinder does not revolve, but is adjustable vertically, to vary the length of stitch, by having a screw-thread on its lower end, engaging a ring-nut, held by projections to the lower side of the frame. The cams of the cam-cylinder directly engage the needle-butts, and are made precisely similar on each side of the elevating-cam, so that the machine may knit in either direction, and the draw-down cam-pieces are adjustable to vary the length of stitch.

1. In a rotary family knitting machine, having an adjustable needle-cylinder for lengthening and shortening the stitch, the cam-cylinder provided with the needle-guide or groove *i*, having two equal depressions, *a a*, for drawing down the needles to form the stitch, and one elevating-bead for forcing up the needles, the whole permitting the revolution of the cylinder in either direction.

2. In combination with a needle-cylinder and the cam-cylinder, provided with the needle elevating and depressing cam-groove, the two sides or cams K, for drawing down the needles to form the stitch, all arranged to permit the revolution of the machine in either direction.

3. A longitudinally-grooved needle-cylinder, in combination with a cam-cylinder having an endless cam-groove with two equal and similar bends, and two sliding cam-pieces, one for each bend, and each supported in side bearings or walls, so that proper adjustments may be made to tighten or loosen the stitches, and yet which will permit the revolution of the machine in either direction, to knit tubular or flat goods at will.

4. The combination of an upright needle-cylinder, the frame, and the cam-cylinder, as described, whereby the needle-cylinder may be readily removed without changing any other mechanism than the needles, and another similar cylinder, having more or less needle-grooves, be readily put in its place.

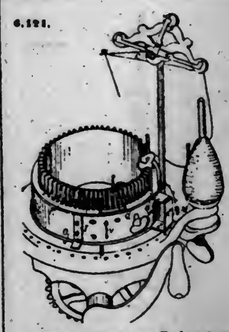


5. A needle-cylinder of a rotary reversible knitting-machine, constructed with a peripheral screw-thread or its equivalent, and combined with a piece engaging with such thread, whereby the cylinder may be raised or lowered to change the character of the fabric while the machine is in action.

6. The combination, with the needle-cylinder, of a ring-nut and detents or projections, adapted to raise or lower such cylinder, and to retain it in any desired position relatively to the cam-cylinder, substantially as and for the purpose described.

7. The combination, in the same machine, of devices, substantially such as described, for varying the cam-groove, with devices, substantially such as described, for raising or lowering the needle-cylinder.

8. A circular family knitting-machine composed of a stationary needle-cylinder and a rotary cam-cylinder whose cams are adapted to operate directly upon the heels of the needles, and are constructed substantially as described, so as to permit it to be rotated in either direction, and to knit tubular or flat goods at will, as set forth.



9. In combination, a reversible upright cam-cylinder having adjustable cams, a stationary upright needle-cylinder, a reversible open-eyed yarn-carrier, and a stationary thread-guide, the combination being substantially as shown and described.

6,122.

6,121. KNITTING-MACHINES. Dana Bickford, New York, N. Y. Patent No. 92,146, dated July 6, 1869. [Filed Apr. 12, 1875.]

Brief.—The main cam in this machine draws down the needles to form the stitch, and has on each side of it an automatic switch, which raise the needles to free the latch, and receive the yarn from the carrier, the latter being loosely held to the cam-cylinder, so that its position relatively to the cams may be changed, in order that it may deliver the yarn properly when the direction of rotation of the cylinder is changed. Stops on the cam-cylinder regulate the relative positions of the cams and yarn-carrier. The inside of the cam-cylinder is rabbeted or cut away widely above the needle groove or rest, so that several needles at a time may be removed.

6,121.

1. The draw-down cam Z of a rotary reversible family knitting-machine, substantially as described, combined with the guides Z', Z², all made and applied substantially as set forth.

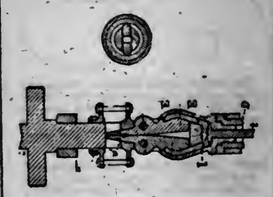
2. In combination with the needle-cylinder, the cam-cylinder, provided with the stitch-cam, the switches, and the guides Z', for bringing or keeping the needles in position as the machine reverses, to work properly to free the latch and form the stitch.

3. A rotary reversible cam-cylinder for a knitting-machine, provided with a stitch-cam, substantially such as described, and with automatic switches situated on opposite sides of such stitch-cam, whereby the needles first engaged by such switches are compelled to rise high enough to free the latch, as set forth.

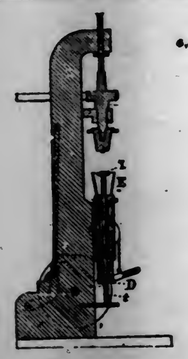
4. The combination, with the cam-cylinder, of a yarn carrier or guide, constructed substantially as shown and described, whereby it may be changed in position from one side to the other of the stitch-cam, substantially as and for the purpose set forth.

5. In combination with the cam, grooved substantially as described, and with the bed-plate, provided with a series of holes, the adjustable pins or stops, and a shifting yarn-guide, substantially as and for the purpose set forth.

6. A needle ring or plate, the tops of whose walls or ridges between the needle-grooves are rounded off, substantially as and for the purpose described.



7. The combination of the bed-plate, the cam-ring, the reversible yarn-carrier, the stitch-cam, and the automatic switches, the combination being substantially as described.



8. The combination, with a revolving cam, grooved substantially as described, of a thread-carrier, held by friction on the cam-plate or ring, so as to be carried by it, and yet permit the latter to continue its motions after the carrier is at rest, substantially as set forth.

9. Stops, or their equivalents, and projections on the cylinder, for determining the extent of traverse in either direction of the cam-cylinder or yarn-carrier of a rotating knitting-machine.

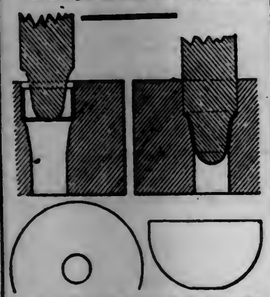
10. The continuously-grooved cylinder, having spacious rabbets F, two similar needle-elevating cams, and two automatic switches, substantially as and for the purpose set forth.

6,495. MACHINES FOR MOLDING POTTERY. Elizabeth Linton, Baltimore, Md., administratrix of Wm. Linton, deceased. Patent No. 31,304, dated Feb. 12, 1861; extended seven years. [Filed Apr. 26, 1875.]

6,496.

1. The combination of a core-mold or male former, having a punch point, with a matrix or female former, having a vertically-adjustable bottom, the said core-mold and matrix being adapted to be brought together, so as to form pottery articles within the space existing between the outer and inner surfaces of the said core-mold and matrix, and the newly-formed article to be lifted out from the matrix, substantially as herein specified.

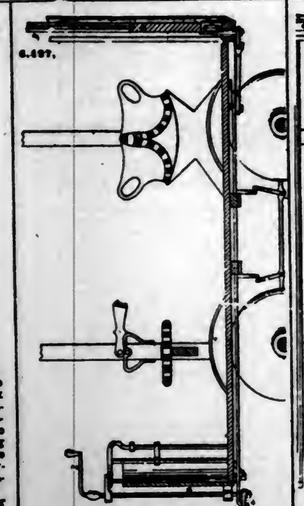
2. The combination of the matrix F, slider D, suitably supported and guided in its up-and-down movement, rod t, and disk I, substantially as and for the purposes specified.



3. The revolving core-mold, in combination with the stationary, yielding, or traversing lip-mold or top molder, operated by springs, or so as to hold the vessel formed in the mold when the core is removed, substantially as described.

4. The core-mold grooved out or provided with air-channels, substantially as and for the purpose specified.

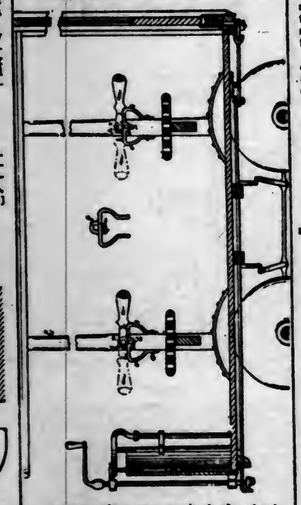
5. The punch-pointed core-mold, combined with the raising bottom I of the external mold or matrix E, substantially as herein set forth.



6. The method of forming flower-pots by drawing together a revolving and a stationary former or mold, simultaneously inclosing the clay in the space between the molds and punching out the bottom of the pot, substantially as herein specified.

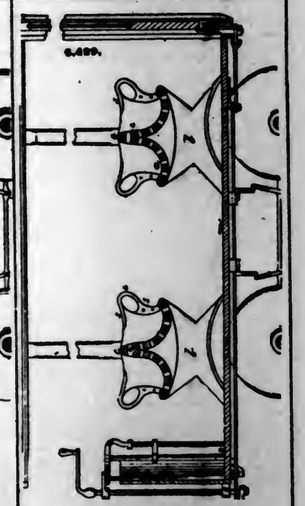
6,496. MANUFACTURE OF EYELETS. Edwd. Parker, Plymouth, assignor, by mesne assignments, to the American Ring Company, Waterbury, Conn. Patent No. 48,064, dated Aug. 23, 1864. [Filed Feb. 27, 1875.]

The method herein described of manufacturing eyelets by perforating the metallic blank with a hole that is smaller than the opening through the eyelet, and then stamping up the eyelet, substantially as specified.



6,497. STREET-CARS. John Stephenson, New York, N. Y. Patent No. 150,118, dated Sept. 15, 1874. [Filed Apr. 20, 1875.]

6,497.



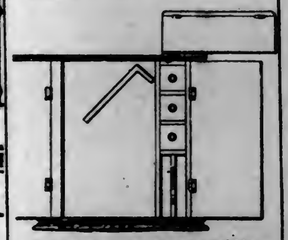
A rock-shaft, C, carrying at one end a crank-handle, *b*, at the front of the car, and at the other an arm or arms, *c*, in combination with a car end car-door, the arm or arms *c* being connected to the latter, substantially as and for the purposes set forth.

6,498. STREET-CARS. John Stephenson, New York, N. Y. Patent No. 150,118, dated Sept. 15, 1874. [Filed Apr. 20, 1875.]

A support for a turn-over back of a street-car seat, provided with a rest, *b*, for the arms of the passengers, and a grab-handle, *c*, to assist them in getting in and out of the car, substantially as set forth.

6,499. STREET-CARS. John Stephenson, New York, N. Y. Patent No. 150,118, dated Sept. 15, 1874. [Filed Apr. 20, 1875.]

6,499.



1. A frame end of a car-seat provided with a grab-handle, *a*, substantially as set forth.

2. A frame end of a car-seat provided with a grab-handle, *c*, in combination with a street-car having exit and entrance openings *m* at its sides for the passengers, substantially as set forth.

3. In combination with a street-car having exit and entrance openings *m* at its sides, a car-seat-frame end, *d*, provided with a grab-handle, *c*, the upper edge of both constituting a rest for an arm of the passenger sitting next to it, and the two adapted to prevent the passenger from falling out, substantially as set forth.

4. A frame end, *d d*, for a double car-seat, *a a*, said frame end being made in one piece, and provided with two grab-handles, *c c*, substantially as and for the purposes set forth.

6,500. SEWING-MACHINE TABLES. Francis B. Woltingw, Chicago, Ill. Patent No. 117,350, dated July 26, 1871. [Filed Mar. 11, 1875.]

1. A cabinet or table for sewing-machines, provided with a bed-plate for the machine, that is hinged at one end to the cabinet, substantially as described.

2. A cabinet or table for sewing-machines, having an opening through its top, a bed-plate for the machine, that is hinged at one end inside of the opening, and a cover to close over the said opening when the bed-plate is dropped down below the level of the table, substantially as shown.

3. The combination of a cabinet or table for sewing-machines with a writing-desk that is pivoted thereto at or near one end, so that the desk can be swung around out of the way while the machine is being used, substantially as set forth.

COMMISSIONER'S DECISIONS.

SMITH *vs.* EDSON.—*Interference.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the interference between the applications of Jonathan Smith and Horace M. Edson, for letters patent for an* "IMPROVED VULCANIZING APPARATUS."—*Decided May* 24, 1875.]

The uncontradicted testimony of an applicant, supported by that of a disinterested and credible witness, that he made drawings of his invention at a certain date held sufficient, although the drawings were not preserved, to prove the conception of the invention at that date.

Where an applicant was first to conceive an invention, to reduce it to a working drawing and model, and to make application for a patent upon it, held that he was the first inventor, his opponent not having reduced the invention to practice.

THACHER, *Commissioner:*

The subject-matter of this interference consists of certain improvements in a vulcanizing apparatus used by dentists for molding dental plates. The arrangement and operation of these devices are quite clearly set forth by the applicant, Smith, in his specification, as follows:

I arrange the mold-closing device so as to draw or press the molds up against the under side of the top of the vessel, while at the same time the external device that produces this movement of the mold-closing clamp bears down upon the top of the vessel, thus equalizing the pressure upon the said top or head and removing liability of its being strained or ruptured by pressure of the molds from the inside of the vessel.

This arrangement is claimed to be a great improvement on an invention for which Edson, the opposing applicant, received a patent in July, 1868. In said patent the mold-closing clamp or device bears on top of the mold and presses it against the bottom of the mold-containing vessel. This vessel being at the same time a boiler for generating steam, it is alleged that the bottom is liable to be forced out by the great pressure brought upon it.

From the testimony in behalf of Smith it appears that about the 1st of January, 1874, one J. R. B. Ransom was negotiating with Edson for the sale of his 1868 patent; that one day Edson and Ransom came to the office of Smith, who is a brass founder and machinist, bringing with them a crude vulcanizing apparatus constructed upon Edson's patent of 1868.

They wished to engage Smith to improve the construction of this machine, to examine Edson's patent, and to ascertain whether it interfered with any other patents for a similar invention. Smith desired Ransom to procure a copy of what was known as the "Robert's patent," which was done about the 4th or 5th of February, 1874, and Smith then decided that said patent would not interfere with the manufacture of Edson's device. During the same week Smith, in the presence of Edson and Ransom, suggested ways, and made sketches of plans, whereby Edson's patent could be evaded by other parties, unless the same could be covered by a reissue of the Edson patent, and they all then thought they could be. Smith then proceeded to reconstruct and improve the machine Edson had brought to him. Among the sketches just alluded to, made in the first week of February, was one (marked "C" on Smith's Exhibit No. 1) which is claimed to indicate, and does indicate quite clearly, the particular device now in controversy. Smith and Ransom both swear positively that this sketch "C" was made in the presence of Edson about the time above mentioned, and its merits discussed by him and them. April 7, 1874, Ransom bought Edson's patent, and later, as it appears from the same testimony, Ransom and Smith came to Washington for the purpose of reissuing the same, which they accomplished, but without attempting, it seems, to embody therein the improvement represented by the sketch "C."

Before the sale of the patent, Ransom alleges that Edson assured him he would do everything in his power to make the machine a success, and if at any time he should discover that improvements could be made thereon he would give to him (Ransom) the benefit of such improvements.

Edson filed his application for the device in dispute June 3, 1874. About the 1st of July Ransom learned of this, and shortly afterward called Edson to account for it, claiming that it belonged to him under the contract before mentioned, and calling his attention to the fact that Smith had described to them this improvement in the previous February. Ransom testifies that Edson stated in reply that he had not thought of this invention until after he had sold his patent to him, and not until a short time before Ransom came to Washington; that it was not included in the contract, and that he had no recollection of Smith's explaining this invention to them.

Palmer, an employé of Ransom, also testifies that on one occasion Edson told him that he did not think of the present invention until after he had made the contract with Ransom.

On the 28th of August, 1874, Smith filed his application for a patent, and on September 8th a model, which he had made about the same time his application was filed, and which was the first model he had ever made, or caused to be made, of this invention.

Edson's account of his invention of this device is as follows: "The first thought I had of this matter was in 1866, and I made sketches of the same, although at the time I did not consider these sketches perfect in detail; they were exhibited to Dr. Terry and explained at my office in Mount Vernon, Ohio; then in '68 I took out a patent for one of the inventions, for the reason that that invention could be applied to boilers then in use; this other invention, the one in controversy, could not be applied to boilers then in use, because the boilers were not large enough; I mean the boilers in *general* use—those manufactured by the Buffalo Dental Manufacturing Company. I next exhibited sketches or drawings of this invention in controversy to Dr. Terry in 1868, and declared my intention to him to apply for a patent as soon as I had disposed of the other invention or patent. Again, I exhibited it to Dr. Terry in 1869; at that time I had almost made up my mind to procure or apply for a patent on this invention, but, in discussing the matter further, it was concluded best not to do it, because it would make the patent then out worthless, or nearly so, or injure its sale; then, in January 1874, I exhibited the drawings or sketches to Dr. Terry at my office in Toledo."

Dr. Terry, who alleges that he has nothing to do with Edson's inventions, confirms the testimony of Edson in the most positive manner. He alleges that Edson, in 1866, showed him sketches which substantially represented both Edson's 1868 patent and the invention in controversy; that in March, 1869, Edson again showed him sketches of this invention, and that they then fully discussed its merits, and then again in January, 1874. He makes a sketch of substantially the disputed device, and swears that it, as well as the present drawings, are precisely the same, principle as the device explained to him by Edson in 1866, and that, from Edson's explanation and sketches to him in January, 1874, he could have easily directed the invention to be made.

Edson positively denies that Smith showed him a sketch of this invention in February, 1874, or in any other month, and also denies having admitted to either Ransom or Palmer that he did not think of this invention until after he had made the contract of sale with Ransom in 1874.

Charles H. Allen testifies that about the last day of March, 1874, he made a drawing (Edson's Exhibit No. 1) fully showing the invention in controversy in every particular under Edson's instructions; and that he made a model in accordance with that exhibit about six weeks thereafter. Allen is not cross-examined, and his testimony, if it does not establish the truth of Edson's allegation that he made no such statement to Ransom and Palmer in regard to his having first thought of the invention after April 7, as they allege, certainly renders nugatory the effect of any such admission.

It is clear that Edson was desirous of disposing of his patent of 1868 to good advantage before he brought forward his present invention. To this end he seems to have found it necessary to resort to dissimulation, if not something worse.

Unsupported, he would have overreached himself by his own sharp dealing; but the fact of his conception and reduction to a tangible form of this invention prior to the same by Smith is established by the testimony of the only disinterested witnesses in the case. There is not the slightest evidence of collusion between Terry and Edson; and the testimony of the former, although unsupported by the production of the sketches made contemporaneously with Edson's conception of the invention, yet is very clear and strong, and increases in strength upon cross-examination.

The description Terry gives of the condition to which Edson had reduced the invention in January, 1874, corresponding precisely with its present form, the declaration that he himself could have then easily directed its construction, his demonstrated ability to do so, as shown by his familiar acquaintance with and correct description of the various features in this class of devices, together with his clear narration of other circumstances by which he was enabled to fix the latter-named date, convinces me that Edson had developed this invention as early, at least, as January, 1874.

This is sufficient in showing that he had anticipated Smith in the conception of the invention, and the testimony of Allen and the records of this Office also show that he preceded Smith in reducing the invention to the form of a working drawing and model, and in filing his application for letters patent.

The decision of the Examiners-in-Chief is therefore reversed, and priority awarded to Edson.

JAMES AND WILLIAM HORLICK.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of James and William Horlick, for letters patent for an* "IMPROVED COMPOUND FOR THE FOOD OF INFANTS AND INVALIDS."—*Decided May* 3, 1875.]

Where a new ingredient is added to an existing composition of matter, and the composition is thereby materially changed in form and quality, it is patentable.

THACHER, *Commissioner:*

The applicants claim—

The concentrated extract for food, consisting of wheat-flour, malt-flour, wheat-bran, and bicarbonate of potash, substantially as herein set forth.

The claim was rejected on reference to the forfeited application of Henry Sturz, filed October 13, 1866.

The ingredients of Sturz's compound are wheat-flour, ground barley, malt, water, and bicarbonate of potassa. It is thus seen that the present applicants add an ingredient not found in Sturz's mixture, viz., wheat-bran.

Both Sturz and the applicants base their inventions on a formula given by Liebig, which is set forth as follows in Sturz's application:

"In a small saucepan, carefully mix, so as to avoid the formation of lumps, wheat-flour, one-half ounce; and cow's milk, five ounces. Bring this mixture to boil slowly and keep it boiling for three or four minutes, and then take the saucepan off the fire. While it is boiling, mix in another vessel, malt, one-half ounce, and water, two ounces, with thirty drops of a solution containing eleven per cent. of bicarbonate of potassa. Then add this mixture to the hot contents of the saucepan, stir it together, put on the lid, and let it remain quiet in a warm place at a temperature not exceeding 148° Fahrenheit. After the lapse of this time put the saucepan on the fire again till the contents begin to boil, and then pass them through a fine strainer. The milk will then have absorbed all the soluble nutritive parts of the flour and malt, leaving the insoluble and indigestible parts in the strainer, and the acid nature of the milk and the flour, which is highly injurious to the infant stomach, will have been destroyed by the carbonate of potassa."

The object of both Sturz and the applicants was to make this discovery of Professor Liebig available to the public by putting it in such shape that it would be marketable, and with such simple directions accompanying it as could be readily understood and followed by all classes of people.

A somewhat analogous case was that of George Thompson, (*Pennsylvania Salt Company* vs. *Gugenheim*, 3 Fish., 423,) who introduced caustic alkali into general use in the manufacture of soap by farmers and others throughout the country, by incasing the same in an anti-corrosive impervious fabric. Judge Grier said "caustic alkali was not a new substance, nor was it a new composition of matter, nor its manufacture a new art, yet the fact was clear that the patentee had made a very important improvement in the art, and one of great practical value."

So, by a change in the process as given by Liebig, Sturz was enabled to give the above compound to the public, put up in bottles, or in a solid mass; but the trouble with Sturz's compound was that when put in a fluid state it was apt to ferment, and was thus unsuitable for transportation. He also appears to have found it necessary to offer, with a certain number of his bottles of mixture, a small porcelain cup, so that purchasers would be enabled to measure the exact quantity of the sirup to be mixed with a proper quantity of milk.

The Horlicks, on the other hand, have put the article into dry granular form, with clear and simple directions for its use, thus in every respect improving its merchantable qualities. But more than this, the present applicants have added a new element, mentioned neither by Liebig nor Sturz. They claim that by the addition of wheat-bran a greatly improved article is produced.

They are supported in their claims by several physicians, who certify that Horlick's preparation is a superior food in every respect to that of Sturz, and is put in a much more convenient and concentrated form. I coincide with this opinion, and believe the applicants have made a new and substantial improvement in this prepared food.

The decision of the Board is reversed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF OHIO.

THE STILWELL AND BIERCE MANUFACTURING COMPANY *vs.* THE CINCINNATI GAS-LIGHT AND COKE COMPANY, THE ARMSTRONG HEATER MANUFACTURING COMPANY, JAMES A. ARMSTRONG, AND STEPHEN H. STARR.

[*In equity.—Before* SWING, *J.—Decided January*, 1875.]

The first claim in reissued patent for feed-water heater and filter, granted to E. R. Stilwell, August 24, 1869, which is for "filtering material F, between a series of shelves and outlet, substantially as described," held valid, notwithstanding the fact that filters had been used for freeing the feed-water for boilers from the matter held in mechanical suspension therein, and the further fact that heaters composed of a series of shelves had been used for a similar purpose to remove from the water the matter held in solution and a portion of that held in suspension.

Although the operation of neither the shelves nor the filter is affected by the union of the two in the same machine, a new result is produced, inasmuch as the water is passed into the boiler in a condition different from that which would have been produced by either of the devices separately.

The Stilwell patent is not invalidated by the earlier English patent of Wagner, since it is doubtful whether the Wagner device could be practically used with success.

There is no force in the objection that the Stilwell patent does not specify what filtering material is to be used. The patent permits the use of any suitable filtering material, and persons skilled in the art could at once use the invention without experiment or additional invention.

The mere making of a model of an invention, held not to constitute invention, as against a patent subsequently granted to another for the same thing.

The alleged anticipation of the Stilwell invention by James A. Armstrong discussed.

[*Wood* and *Boyd*, for complainant.
Fisher & Duncan and *John E. Hatch*, for defendants.]

SWING, *J.:*

This suit is brought for the infringement of letters patent granted to E. R. Stilwell, for improvements in feed-water heaters and filters, and vested, by assignment, in the complainants.

Three patents are claimed to have been infringed—the first, Reissue No. 2,160, dated January 23, 1869; the second, Reissue No. 3,618, dated August 24, 1869; the third, Letters Patent No. 93,244, dated August 3, 1869.

The respondents file separate and joint answers denying infringement, and that E. R. Stilwell was the original inventor, and setting up prior invention by James Armstrong and prior use by sundry persons named in said answers.

The invention in the first patent described relates to the means of supplying water to a "feed-water heater and filter," and of effecting the separation of foreign elements therefrom; the first claim of which is as follows:

The overflow-box C, the pipe B, arranged with reference to the vessel A, substantially as described, and for the purposes specified.

And this is the claim alleged to have been infringed by the respondents.

By reference to the specification and drawings of the patent it will be seen that the end of the induction-pipe B, through which the water flows, is so placed in the overflow-box C as to be completely immersed, whereby the steam is prevented from entering the pipe.

It is not claimed that the respondents have in fact any such overflow-box as complainants' in form; but it is contended that the upper plate of the respondents' heater is so constructed, and the end of the induction-pipe so arranged, as that the end is in fact immersed, thus accomplishing the same result by equivalent means. Upon this point there is a difference in the testimony of the witnesses for the complainants and respondents; but the model No. 4 in evidence, stipulated by complainants as correctly representing the machine of the respondents, shows very clearly that, by its relations to the upper plate of the respondents' machine, it cannot be immersed; the space between the discharge-orifice of the pipe and upturned sides of the plate is so great that by no possibility could the water rise, before overflowing the plate, so as to immerse in any degree the pipe.

It is suggested by counsel that the relations of the pipe to the plate may have been changed after the witnesses examined the machine. As to that we cannot speak; but it is stipulated that the model correctly represents the machine, and it shows no such relations as claimed.

The first patent is not, therefore, infringed by the respondents.

The invention of the second patent is set forth in its claims as follows:

1. Filtering material F, between a series of shelves, and outlet, substantially as described.
2. The arrangement of steam-inlet *n*, shelves *a a a*, constructed and arranged substantially as described.
3. Depositing-plates *a a a*, constructed and arranged substantially as described.
4. The arrangement of steam-pipes M and N with reference to the plates *a a a*, substantially as specified.
5. The combination of the vessel A, the plates *a a a*, the plate *d*, the steam-pipes M, N, and E, and water-pipes *f* and *r*, substantially as described.

Complainants allege that the first and second claims of this patent are infringed.

The first claim is for the arrangement of three elements—filtering material, a series of shelves, and an outlet—and this arrangement is of that character that the filtering material may occupy such position between the series of shelves and the outlet as that the water, after flowing over the several plates, will pass through the filtering material on its way to the outlet.

The second is for the arrangement of steam-inlet, shelves, filtering material, and outlet.

Each of the elements embraced in these claims are old and have in some way been in use in and connected with devices for heating, purifying, and separating water for steam boilers. The filtering material is found in the Covington, Greenfield, Brownell, and Seaward devices; the series of shelves in the Wagner, Hooton, and Burden devices, and the outlet and inlet in all the devices referred to. This is not, therefore, in either of the claims a combination or arrangement of any new element or new elements with old elements, neither is it a combination of old elements applied to a new purpose; but it is bringing together and combining and arranging in a single machine or device that which existed before in several, and each performing the same office in their new relations which they did in their old.

The series of shelves. In the new the water passes over the shelves in a thin sheet, is subject to the action of steam passing through the spaces between the shelves, and in this way, and by these means, the crystallizable atoms in the water will be deposited upon the shelves and the water will be considerably heated. In the old the water spreads in very thin films during its whole course on the heated partitions (shelves) and is kept constantly boiling; from this it results that all matters settling, whatever may be their nature, held in suspension or solution, are not only divided, but a portion of them are brought to adhere and incrust on the partitions (shelves,) where they gradually deposit, according to their density.

The filtering matter in the new is to deprive the water of its less soluble particles of matter, and in the old to free it from any sand, mud, or other foreign matters which may be mechanically intermixed therewith; and when brought together, as in complainants' device, it is difficult to see in what way the former or customary action of either is modified by their connection with the other.

It is not claimed that the relation of the filtering matter with the shelves causes them to perform any new office, or even to perform their customary office in any better or more effective manner; no increased crystallization, adhesion, or incrustation.

Neither can it be successfully shown that the filtering material, by its relation with the shelves, performs any new office; it is for freeing the water from matter mechanically intermixed with the water, (mechanically held in suspension,) and it is by no means clear from the evidence that its relation enables it to perform this office in a more effective manner.

If, then, the operation of neither is affected by the other, does their union, their action in the same device, produce a result not produced by some of them separately? By the series of the shelves the matter held in solution was crystallized, and adhered and incrusted to the plates, and a portion of that held in suspension was also deposited upon them; but a large portion of the matter held in suspension still remained in the water and, from the lack of the filtering material, passed into the boilers. By the filtering material a large portion of the matter held in mechanical suspension was taken up and separated from the water; but from the lack of the series of shelves the matter held in solution was not separated from the water, but passed into the boiler; but, by combining both in a single machine, both these objects are accomplished, and the water is passed into the boiler in a condition different from that in which it was in passing from either of the devices after their separate action upon it.

If this be so, a new result is produced by the union, a result not previously produced by either of the elements acting separately, which removes it from the doctrine of aggregation as laid down in the cases of *Hailes* vs. *Van Wormer*, (vol. 5 PATENT OFFICE GAZETTE, 91;)

Birdsell vs. *McDonald*, (vol. 6 PATENT OFFICE GAZETTE, 682.) Treating the invention, then, as a combination producing a new result, is it novel?

It is not contended that any of the devices relied upon by respondents as anticipating complainants' patent embraces all the elements, excepting that patented to Wagner. This, the respondents say, is a complete anticipation of the invention, and their expert witness, who seems to be a very intelligent man, says: "I find the invention claimed in said English patent, (Wagner's,) when compared with the inventions claimed in the complainants' patents Nos. 2 and 3, to be identical in principle and operation."

And the expert witness Millward says: "I am of the opinion clearly that the said English patent (Wagner's) cannot be justly said to embrace or contain the invention set forth in the first claim of the letters patent No. 2, for the reason that it does not embody filtering material between "a series of heating-shelves and its outlet, the filtering material being located in the outlet-pipe itself; that its capacity is insufficient to perform the functions of Stilwell's filtering material, and that it is not designed to perform them."

In speaking of the third and fourth claims of the third patent, he says: "There is in the Wagner patent no upward filter at all, and no mud-well, from which mud can be drawn off while the heater is in operation." Again, "I do not find in this English patent a mud-well below a series of shelves and below an upward-filtering chamber; and, as I regard the construction and arrangement as essential to the invention specified in the fourth claim of said patent, and as it is so set forth in that claim, I am of the opinion that the English patent of Wagner does not contain or describe the invention specified in said fourth claim."

Thus we have two men, well versed in mechanical and chemical science, presenting to the court, under oath, statements diametrically opposed to each other in regard to the principle and operation of the two devices.

Strictly construed, it is very certain that the Wagner patent does not anticipate complainants' invention as described in the first and second claims of the second patent. Construed broadly, however, it may not be so clear that it does not anticipate it. It has the series of shelves operating in substantially the same way for the accomplishing of the same purpose; it has filtering material between the series of shelves and the outlet, and there is what may be called a mud-well; but it seems clear from the testimony that, from the incapacity of the filtering-chamber, and the kind of filtering material described in the patent, the Wagner device would not accomplish the results as efficiently as complainants'.

The superior utility of complainants' device over that of Wagner's is clearly shown by the evidence in the case, and is sufficient, in the opinion of the court, as against the Wagner device, to establish its novelty; for it is doubtful whether Wagner's could be practically successfully used. Our better opinion, therefore, is that the patent, either strictly or broadly construed, is not anticipated by the Wagner patent.

It is said, however, that as no kind of filtering material is mentioned, and no function is mentioned except filtering, if it appears that some kinds of filtering material will not work, the patent is void.

By the act of Congress an inventor is to describe his invention and the manner, and process of making, constructing, and using the same, in such full, clear, and exact terms as to enable any person skilled in the art to make, construct, and use the same.

This specification or description is addressed to persons acquainted with the character and nature of the business to which the invention relates, and it is only necessary that it should be so definite or full as to enable persons of competent skill and knowledge to construct, produce, or use the thing described without invention or addition of their own, and without repeated experiments. The description in the patent is not any and all filtering material, but is, any suitable filtering material. Suitable for what? For performing the function or office assigned to it, to wit: The separation of the solid matter from the hot water. This could hardly be said to embrace filtering material which would not perform the office or function assigned to it.

The persons acquainted with the business in which this invention was to be used were familiar with the various kinds of filtering material suitable for this purpose, and would at once use it and put it into operation without invention, addition, or experiment.

The patent is not, therefore, for that reason void.

Passing from the second to the third patent, the third and fourth claims of which it is alleged respondents infringe, the third claim in this patent is—

The filtering-chamber D, constructed and arranged substantially as described.

Without entering into an extended review of the evidence upon this claim, but examining it in connection with the specification and drawings, and with the other claims, and in the light of the state of the art at the time of the invention, I do not think it can receive that broad construction necessary to embrace the filtering-chamber of the respondents; and, receiving a strict construction, respondents do not infringe this claim.

The fourth claim is—

The mud-well G', arranged below a filtering-chamber, in combination with the shelves and inlets, substantially as described.

A broad construction of this claim would embrace the defendants mud-well. But can this claim, from the state of the art and a fair interpretation, receive such construction?

Mr. Millward says: "Mud-wells, as employed in steam-boilers and other apparatuses, have long been known as appliances for the collection and discharge of mud, and not simply for the collection only." Mr. Stilwell was familiar with the state of the art at the time he prepared his specifications, and, from the specification, it is very clear that he had no idea that he was claiming as his invention anything but the particular mud-well which he described in his specifications and drawings. The claim is the mud-well G', and the mud-well G' is described in the specifications and drawings as below the strainer G, and as of a funnel shape and form. Could complainant have entertained the idea that he could remove the entire mud-well, shown in his drawings and described in his specifications below the strainer G, and substitute in the place of the strainer G a plate at the terminus of shell A, and claim the space between the filtering-chamber D, and such plate as the mud-well of

his invention as described in his patent? I think not. Nor do I think that the specification, drawings, and claim, when fairly construed together, will bear any such construction; but his invention was *the* mud well which he so particularly and minutely describes, and as such is not embraced in the defendants' device.

The only remaining question in the case is whether the subject of the first and second claims of the second patent is the invention of E. R. Stilwell or of the defendant, James Armstrong?

The defendants claim the device as used by them was the invention of James Armstrong; that it was invented by him and put into public practical use in the latter part of the year 1845 or 1846; and have introduced in evidence a model which they claim represents the device which was so constructed and so used, and which was made, they say, by James Armstrong, in 1857, a period before complainant claims to have invented his device.

As bearing upon the date of the existence of the model and the construction of the device and its public use, the depositions of eighteen witnesses were taken by the parties, twelve by the respondents and six by the complainants. Of the respondents' witnesses, six testify in relation to the model and eight in relation to the device. The six witnesses of the complainant all were examined in relation to the alleged construction and use of the device.

As to the model—

James Armstrong testifies that he made it in 1857, and that it represented the machine he made and used in 1845 and 1846.

William Armstrong testifies that he saw the model in 1857.

Ruby E. Lucas testifies that she saw the model in 1860, under peculiar circumstances, and placed upon it the initials of herself and friend, which she finds upon it now.

John G. Sherwood testifies that he saw it in the spring of 1862.

Olin Armstrong testifies that he saw the model in 1861 or 1862.

Irwin R. Harris, that he saw it in 1863.

This testimony would seem to establish the existence of the model at a period as early as 1857.

The testimony offered by the respondents to establish the existence and public use of the device is as follows:

James Armstrong testifies to the construction and use of the device in the latter part of 1845 or fore part of 1846.

William H. Armstrong testifies to the use of the device about the same time: he also gives a general description of it.

Robert A. Gettings testifies that he helped make the device; that he furnished the plank; and gives a general description of it, but does not remember all its parts; testifies to the use of it.

George A. Mead testifies to the use of a long box, from five to eight feet long, with an upright at one end; saw Armstrong repairing it; with a pipe at one end.

William Cuykendall testifies that he went to look at Armstrong's mill and saw there a wooden heater in a rough state. This was before he put steam in his mill, which was in 1847.

F. W. Owings testifies that he drew a load of straw to the mill, which was put into a box which was used for filtering or clearing water. The box was square one way and long the other, with a spout on one end of it resembling the model of 1857.

David Trucell testifies that he heard William Armstrong speak of a heater that he was going to have put in the mill; didn't say whether it was wooden or no; but didn't know that it was ever put in.

James S. McCarrell testifies that in 1867 William Armstrong told him his brother had a similar machine in successful operation several years before that at his saw-mill, made of wood; heated the water and removed the mud before it went into the boiler.

Stephen R. Harris testifies that he saw the model in 1869, and James Armstrong then told him that it represented a heater and filterer he had made many years before that in a steam-mill in Huron county; that it was of wood; worked well in practice.

The testimony offered by the complainants to disprove the existence and public use of the device as claimed by the respondents is, first, the deposition of John Collins, who testifies that he assisted in putting up the works, setting the engine, and fixing the machinery for starting the grist-mill; that the heater used there was of sheet-copper, and used five months up to the time he left, and there was nothing of the kind described by Armstrong used while he was there.

Seymour N. Sage, who testifies that he commenced working for Armstrong, Long & Gettings, in the New Haven Mills, in the fall of 1845, and worked there till the first day of December, 1846; that he helped get out the timber and put up the saw-mill frame late in the winter or early in the spring of 1846, and helped put in a steam-engine, a tub-shaped iron heater, used from the time it was put up until he left, in December; that they never used the device described by Armstrong in that or any mill. John and William Armstrong were the owners while he was there.

Corydon Curtiss testifies that he was frequently at the mill from 1846 to 1847; saw Seymour Sage there; saw cast-iron heater, but did not see wooden one; thinks if one had been used would have seen it; cast-iron heater used as long as he recollected the mill, and don't recollect of ever seeing any other heater used in the mill.

Russell Curtiss testifies that he lived near the mill from 1845 to 1847; was acquainted with Seymour N. Sage, who sometimes ran the engine and sawed in steam-mill about eight months; taught Sage how to run the saw-mill; recollects something they called a heater; thinks it was made of iron; it was removed, thinks in March, 1847, and thinks he put the heater in the wagon, and thinks he would have seen the wooden heater if it had been there.

David Turcell testifies that he worked in Armstrong's mill in January, 1846; that he worked there about eight weeks; an iron heater was used while he was there; no other was used; don't think Seymour N. Sage worked there while he was there; quit before he came; heard Armstrong speak of getting another heater; didn't say whether it was to be wooden one or not, and don't know whether he ever put it in.

Asher Taylor testifies that he owned an interest in the mill during the time that Finch owned an interest in it. "I bought after he did, and sold before he did." Thinks he purchased in May, 1846, and sold last of August or in the fall, but not certain whether 1846 or 1845; an iron heater used while he was there, and no other that he remembers while he owned the mill; if there had been a wooden one would have likely recollected it.

George W. Benard testifies that he is a machinist; lived within three-fourths of a mile of the mill; worked in it while owned by William Armstrong and Finch, and when Mr. Sage was there; began the latter part of April or May and worked till July; about a year after worked for Taylor; tore out fore-bay and engine timbers; supposed the heater made of cast-iron; no other in use while he was there; if wooden heater had been there he thinks he would have known it.

Having thus shown what the evidence upon these points is, does it establish the fact that the patentee was not the first and original inventor? The presumption of the law is that he was the first and original inventor, and it casts upon the respondent, who denies it, to show by clear and satisfactory proof that he was not. The evidence in regard to the existence of the wooden heater at the Armstrong mills is very conflicting. On the one hand the witnesses state it was there and used; on the other hand they say that no such heater was there. Two of the witnesses for the respondents say they made the device; yet on the other hand witnesses, who are not impeached, say they worked there during the time that it is claimed to have been made and the time when it is said to have been used, and no such heater was there; and others say they saw it there, and yet others, who were frequently there and familiar with the premises, say that they never saw any such heater there, and if it had been there they would have been apt to have seen it. Again, the time when it is claimed this wooden heater was used was seventeen or eighteen years before the witnesses were testifying, and nothing is heard from it until eleven or twelve years afterward, when it is claimed that a model of it was made; but, then, no effort is made to procure a patent for it or to put it into use for more than ten years after the making of the model. And it is a matter not to be forgotten that James Armstrong, in 1868, took out a patent for a device different from that of the model of 1857, which he claims represented his invention of 1845 or 1846, and that afterward, in 1869, he took out a patent for substantially the same invention represented by said model. If the making of the model constituted invention, I should hold that the proof established the fact that James Armstrong was the prior inventor; but that does not constitute invention, and it can only be used as an item of testimony reflect upon the making and using of the wooden heater in 1845 or 1846. Taking it in connection with the testimony on that point, and weighing all the testimony together, I cannot say that it is of that clear and satisfactory character as requires me to find that James Armstrong invented the device, as claimed, in 1845 or 1846.

It results, therefore, from these findings, that respondents infringe the first and second claims of the second patent; but do not infringe the first and third patents, as alleged in complainant's bill.

SUPREME COURT OF THE UNITED STATES.

WILLIAM MASON, APPELLANT, *vs.* E. H. GRAHAM AND W. ROUSE

[*In Equity.—Appeal from the Circuit Court of the United States for the District of Massachusetts.—October term*, 1874.]

The patent of E. H. Graham, of October 16, 1860, reissued May 28, 1867, for "picker-staff motion in looms," has no relation to the *mere form* of a journal-bearing arm, nor does it consist in arranging a journal-bearing arm in a slot in the rocker. It embraces every combination of a rocker with a bed and loose journal-bearing arms, arranged so as to produce the result described in the specification as effected by the combination.

Inasmuch as defendant employs a combination of a rocker with a bed by loose journals projecting on each side the picker-staff, and the combination is effected by means of a journal-bearing arm, it is immaterial that the form of his journal-bearing arm is unlike that of complainant's, or that its mode of attachment is different, so long as it performs the same function in substantially the same way.

Where defendant had been in the habit of selling the infringing picker-staff motion both separately and attached to looms, in ascertaining his profits upon those sold with the looms, regard should be had to his profits upon those sold separately, rather than to the aggregate profits made by him upon the loom and attachment combined.

If defendant has cheapened the cost of producing the infringing device by an improvement of his own, he is entitled to a corresponding credit in the ascertainment of the profits which complainants are entitled to recover.

[*Benjamin Dean*, for appellant.

J. E. Maynadier, for appellees.]

[This was a suit in equity under letters patent relating to an improved picker-staff motion in looms, granted to E. H. Graham, October 16, 1860, and reissued May 28, 1867, to the inventor and Wanton Rouse, a half-owner in the patent.

The case as decided in the circuit court will be found fully reported in 5 Fisher, 1.

It was appealed by the defendant.]

Mr. Justice STRONG delivered the opinion of the court:

The object of the invention patented to the complainants in the court below was to produce an accurate and sure picker-staff motion in looms by a combination of devices, which, while giving great accuracy of motion, so guides and holds the picker-staff as to enable it to work with the least possible friction and lateral disarrangement.

In all picker-staff motions it is desirable, if not essential, that the end of the staff made to strike the shuttle should move in a right line, so as to drive the shuttle directly along the shuttle-race in the line in which it is desired to play. This has been effected by constructing the lower end of the staff in the form of a rocker, the exterior curve of which is an arc of a circle described from a center corresponding with that point in the staff that strikes the shuttle. This rocker is made to roll on a bed, the face of which is extended parallel to the shuttle-race, and which is placed on the outside of the loom beneath the lay. How to connect the rocker with the bed, so that the picker-staff may be maintained in proper position upon the bed, has been a subject of much inquiry. Various modes had

been suggested before the complainants obtained their patent, and several of these modes had been described in patents for improvements in looms granted to other inventors.

The invention described in the patent to the complainants relates to such a connection. It is primarily a combination of a rocker with a bed by means of loose journals projecting each side of the picker-staff, and arranged beneath it substantially as described in the specification. As in other arrangements for picker-staff motions, the rocker is made to play upon a horizontal bed parallel to and below the shuttle-race, and the bed has a socket passing longitudinally through its base for the passage of the shaft of the loom. The shank of the rocker is made hollow—that is, with a box or bearing extending through its tread upward, into which a shaft-arm or bar is inserted. This bar or shaft-arm is fitted with journals projecting on each side at right angles with the rocker, and resting in eyes formed in the bed-piece, which constitute the journal-bearings. The eyes have inclined slots cut in them, so that they form ears or open boxes, into which the journals are inserted when the parts of the picker-staff motion or the constituents of the combination are put together. Thus the shaft and the journals can readily be removed and replaced, and the journals are free to play without working out of their bearings. The rocker is retracted and caused to move by means of a spiral spring wound loosely around a short shaft below the bed, and attached at one end to a plate which turns freely on the shaft, and the plate is connected by a strap with a hook extending from the under side of the rocker or the lower end of the shaft-arm. This seems to be a sufficient description of the combination.

The patentees, after having described the drawings of their specification, say:

> The first part of this invention relates to the position of the journals. This position is determined by the position of the socket for the picker-staff, which socket is so placed that the point of the picker-staff which strikes the shuttle must move in the required line; and this part of the invention consists in placing the journal at or near this socket, and as near the level of the bed as practicable. In this position there is the least possible wear, and the journals perform all their functions to the best possible advantage. It is obvious that, as every point upon the rocker varies its position in the action of the motion with reference to the bed, it is impossible to connect the journal directly with the rocker, and its box directly with the bed, or *vice versa*. One or the other must be indirectly connected, and it is for this reason that in the motion described the journals are placed upon the arm *g*, upon which the rocker can play up and down. So far as we know, no rocker has ever been combined with its bed by means of journals before this invention.
>
> The second part of this invention consists in forming the boxes or bearings for the journals with such an opening that the journals may be laid in them in putting the motion together, without liability to work out in the operation of the rocker, as plainly shown in the drawings. This method of construction is much cheaper than making the boxes cylindrical, and is quite as efficient in every respect.

The claims made in the specification are:

> 1. The combination of a rocker of a picker-staff with its bed by loose journals projecting each side of the picker-staff, and arranged beneath the picker-staff, substantially as described.
> 2. In combination with the rocker, the bed, and the journals, the open boxes, substantially as and for the purpose described.
> 3. In combination with the rocker and its bed, the journal-bearing arm, operating substantially as and for the purpose specified.

By the arrangement thus described and claimed it is manifest the rocker is prevented from sliding perceptibly on its bed, and it is kept true in its bearings by the arm or bar from which the journals are projected, the arm having also a long bearing in the box of the rocker. The journals, moreover, having bearings in the ears of the bed, steady the rocker, resist any lateral movement, and prevent what is denominated as wabbling. As the picker-staff is made to oscillate, its rocker rises and sinks upon the arm, and thus most of the friction caused by the play of the staff comes upon the shaft or journal-bearing arm, and not upon the tread of the rocker or the bed plate.

Such is the invention patented to the complainants in the reissued patent. Such are the results obtained by it, and such is its mode of operation.

We think the invention has no relation to any mere form of a journal-bearing arm. Nor do we think it consists in arranging a journal-bearing arm in a slot in the rocker. In our opinion it embraces every combination of a rocker with a bed and loose journal-bearing arms, arranged so as to produce the result described in the specification as effected by the combination.

And we have been unable to perceive that the invention was anticipated by any of those devices which the defendant has given in evidence. Of these, four only need be noticed. They are those described in the earlier patents granted to Benjamin Lapham, to David Barnum, to Rensalear Reynolds, and to William Stearns. We do not propose to go into any critical examination of them. The case does not call for it. Of them all it may be said that, while each has a rocker and a bed, no one connects the rocker with the bed by means of loose journals, or by loose journal-bearing arms, and no one of them obtains the beneficial results secured by the invention belonging to the complainants. In Lapham's invention there is one journal on the bed and one on the rocker; both on the same side of the picker-staff. Obviously this device could not prevent wabbling or the sliding of the rocker on the bed. Barnum's invention has no journals, journal-boxes, or journal-bearing arms; nor has the device of Stearns. In the Reynolds patent the rocker is described as held to the bed by means of a strap fastened at one end to the under face of the rocker, and at the other to a point in the groove of the bed-piece, in which the rocker rolls. It is but faintly claimed, if at all, that any of these patents describe the invention of the complainants. The defendant has used them rather as exhibiting the state of the art when the Graham and Rouse patent was granted, and as requiring that patent to be construed to cover only a combination, of which a journal-bearing arm sliding vertically in a hollow place or box in the rocker, and having journals which turn in open boxes in the bed-piece, is an essential constituent. We think, however, they exhibit no such state of the art as requires that construction to be given to the patent, and we cannot perceive that such a construction is justified by the language of the specification and claims.

We come, then, to the inquiry whether the devices made and sold by the defendant are substantially the same as those patented by the reissued patent, or, in other words, whether the picker-staff motion made and sold by the defendant is an infringement upon the complainants' right. Upon this question the opinions of the experts examined are in direct conflict, and we are, therefore, under the necessity of comparing for ourselves the two devices.

We have already said that the object sought to be accomplished by the complainant's invention was the prevention of wabbling of the picker-staff, and compelling it to move steadily without lateral deflection in the required plane. It is not denied that exactly this is the object at which the defendant's motion is aimed. It remains, then, only to determine whether the means by which the intended result is obtained are substantially the same.

That both the combinations connect a rocker to its bed by journals indirectly, employing an arm to effect such indirect connection, is made clear by inspection.

In Mason's motion the arm is attached by a second journal; in the complainant's, by a slot in the rocker. It is true the form and the location of the arms differ; but they perform the same functions, and in substantially the same manner. Both are journal-bearing arms. Both connect the journals, whether they are on the rocker or on the bed, indirectly with the bed in the one case, or with the rocker in the other. Each, then, is a combination of a rocker with a bed by loose journals projecting on each side the picker-staff, and the combination is effected by means of a journal-bearing arm. That the form of the journal bearing arm of the defendant's motion is unlike that of the complainant's, or that its mode of attachment is different, is immaterial, so long as it performs the same function in substantially the same way. We are, therefore, of the opinion that the defendant's picker-staff motion must be considered as practically the same as that patented to the complainants, and, therefore, that the charge of infringement is sustained. The circuit court, then, correctly ordered that the defendant should account.

But we think there was error in the ascertainment of the profits with which he was charged. The master to whom the statement of the account was referred reported that the defendant had made and sold three thousand six hundred and thirty-nine pairs of the infringing motions as a part of looms manufactured in his establishment, and that the profits resulting from the manufacture and sale of such motions had mingled with the profits from the manufacture of looms. He further reported that the cost of making the looms, including the motions, was $59.63; that the cost of making the motion was forty-five and a half cents each, or ninety-one cents for each loom; and that the profits resulting from the manufacture of each loom, including the pair of motions, was $5.64. Assuming these to be the facts, the appellant insists that he should have been charged with only eight cents and six-tenths of a cent as the profit made by him on each pair of motions, that bearing the same proportion to $5.54, the whole profit on the looms, which ninety-one cents, the cost of a pair of motions, bears to $59.63, the cost of the entire loom with the motions. To this we cannot assent. It appears from the master's report that the defendant sold four hundred and fourteen pairs, separately from the looms, at $2 per pair, and two hundred and ninety-seven and a half other pairs for $534.75. These sales furnish a much better measure of profits than is a ratable proportion of the profits on an entire loom. It may fairly be presumed from them that the profits on the sale of looms with the motion attached were increased by the infringing device quite as much as was the profit on the motions sold separately. It does not appear at what profit, if any, the looms could have been sold without the picker-staff motion attached. But the master further reported that the defendant made the infringing motions after a pattern of his own devising; that they cost per pair fifty cents less than the picker-staff mechanism which he had immediately before put upon his looms; that they were made under a patent granted to him, and that they cost about fifty cents less than the motions made by the plaintiffs, the difference in the cost being due to his invention. If this is so, it is clear that the fifty cents saved on each pair, equivalent to fifty cents profit, is not due to the complainant's invention. Were it not for the defendant's improvement, the cost of making a pair of motions would have been, not ninety-one cents, but ninety-one plus fifty cents, or $1.41, and the profits on each pair would have been fifty-nine cents, instead of $1.09, charged to the defendant. Manifestly the complainants are not entitled to the savings or profits resulting from the defendant's own invention.

The defendant, therefore, has been charged by the master's report, confirmed by the court, too much for the profit derived from the sale of four hundred and fourteen pairs of motions sold separately from the looms, and from the sale of two hundred and ninety-seven and a half motions, also sold separately from the looms. For the former he should have been charged $243.26, instead of $451.26, and for the latter $175.52, instead of $263.

We think, also, that the defendant has been excessively charged for the profits made by him on the three hundred and forty-six beds and the one thousand five hundred and forty-eight rockers sold by him at various times for the repair of bridle motions previously made. He has been credited with the cost only, without reference to the fact that the cost was reduced by his own invention.

The complainants have not shown how much the cost would have been had the defendant made them without employing his own improvements. Under such circumstances it appears just to assume that but for the improvement of the defendant the cost of making the bed would have been forty-two cents, instead of twenty-seven and two-tenths, and the cost of making the rockers would have been nineteen cents and two-tenths, instead of twelve cents and four mills, as reported by the master. The consequence of this is, that the profit on the three hundred and forty-six beds sold was only $167.68, and the profit on the fifteen hundred and forty-eight rockers sold was only $471.49.

The decree, therefore, should have been in favor of the complainants for—

1st.	Profits on bridle motions sold on looms	$1,819 50
2d.	Profits on 414 pairs sold separately	243 26
3d.	Profits on 297½ pairs sold separately	175 52
4th.	Profits on the beds sold	167 68
5th.	Profits on the rockers sold separately	471 49
	Total	$2,877 45

A majority of the court is of opinion that the appellant is not entitled to a credit for the $1,000 paid on

the 25th of October, 1869, for which a receipt was then given.

The decree of the circuit court is reversed, and the case is remitted with instructions to enter a decree in favor of the complainants against the defendant for $2,877.45, with costs of suit in the court below.

Each party to pay his own costs in this court.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF OHIO.

JOSEPH INGELS *vs.* PHINEAS P. MAST.

[*In equity.—Before* EMMONS *and* SWING, *JJ.—February*, 1875.]

Semble, That, when the patent on which a recovery is based is for a combination, the complainant may recover simply for the value of the improvement or element that he has added to what was before old.

[Hearing on exceptions to master's report.

The opinion of the court on the question of infringement is reported in 6 Fisher, p. 416. The court there held that complainant's patent was for a combination of four elements—a seed-cup for grain-drills, having, first, a concave hopper; second, a seed-wheel turning therein, with projecting cogs to draw forward the grain; third, an elevated delivery-orifice, so as to make the drill forced feed; and, fourth, cheeks or bosses, between which the wheel turned.

It held that the Strayer patent, earlier in date than that on which the suit was brought, showed all these except the last, to wit, the cheeks.

The master reported damages to the amount of nearly $20,000, upon the basis of a license fee for the *whole combination* covered by the patent in suit and others. There was also other testimony in the record to show the value of the *whole combination*. Exceptions were filed to the report.

Complainant contended that under the decision of Judge Grier in *Livingston* vs. *Jones*, 2 Fisher, and other decisions, he was entitled to the profit on the entire combination, while defendant claimed that, under the rule, in many cases (finally settled in *Whitney* vs. *Mowry*, 16 Wallace,) complainant could recover only for the additional profit that he had made by using the whole combination over what he might have made by using all except the cheeks, the only thing Ingels added to the combination of Strayer; and, as complainant had rested his case without thus apportioning the profits, it was contended that he was entitled to recover nominal damages only.

The court delivered no full opinion, but gave simply its conclusions.]

[*Wood* and *Boyd*, for complainant.
Hatch and *Parkinson*, for defendant.]

EMMONS, *J.*:

1. The testimony, when analyzed, does not show any certain basis upon which the finding of the master can rest. No one witness swears to any license fee that is applicable to the precise thing here used, and for which damages are claimed. There is no claim that the report of the master is warranted by any proof of profits.

2. Subject to reconsideration when the master's further report comes in, it is suggested that the proper measure of damages is the difference between the value of the improvement used by the defendant and any other like device which was open to him without royalty, or by payment of a less royalty.

This is said, notwithstanding the suggestion in Judge Grier's decision in *Livingston* vs. *Jones*, 2 Fisher, that there is no warrant for subdividing the elements in an improvement, and giving the complainant the value only of that peculiar feature in it which he has added. He seems to argue that the portion of the device which is improved must be taken as a unity, and the complainant entitled to its whole value as improved. We rule, for the present, on the contrary, that he is entitled only to the value of that which he has added, and that such a subdivision should be made. See 1 Wallace, *Jones* vs. *Morehead*, which, although not deciding the question of damages, modifies Judge Grier's decision of unity.

3. The master will, however, make an additional report, upon the basis that the complainant is entitled to damages for all the profits which the defendant has made by the use of the improved cheeks described in the patent. This as distinguished from the rule which would confine him to the difference of the value of the cheeks and such as he might have used without royalty.

It will be recommitted to the master to make a further report in accordance with these views.

U. S. CIRCUIT COURT, DISTRICT OF MASSACHUSETTS.

THE BURLEIGH ROCK-DRILL COMPANY *vs.* GEORGE W. LOBDELL *et al.*

[*In equity.—Before* SHEPLEY, *J.—January*, 1875.]

Where acquiescence alone is relied upon as a basis for a motion for a preliminary injunction, the infringement must be palpable.

The fact that a defendant is using a machine openly made and sold, under patents, and which the manufacturers have in good faith put in open competition with the machines made by complainant, honestly believing that they were not trespassing on any rights of complainant, though no defense if he is adjudged at final hearing to infringe, is a reason why the court should hesitate to interfere before the final decree in a case where there is no suggestion of any irremediable injury in the intervening time, or any want of ability to respond to any judgment which may finally be recovered.

[This was a suit in equity brought before the court on motion for injunction *pendente lite*.]

[*C. Smith*, for complainant.
C. H. Drew, for defendants.]

SHEPLEY, *J.*:

This is a motion for preliminary injunction, *pendente lite*.

Although, upon a careful consideration of the evidence in the record, I see no good reason to doubt the validity of the two patents of the complainant, which alone were in issue at the hearing upon this motion, yet there has been no prior judicial adjudication in favor of their validity. The acquiescence in the patent has, it is true, been sufficient to lay the foundation for an injunction *pendente lite* in case of a clear substantial identity between the patented invention and the infringing device; but where acquiescence alone is relied upon as a basis for the motion for a preliminary injunction, the infringement must be palpable.

This is not a case of wilful infringement, or of the use of a device identical with the patented one, or a mere colorable attempt to evade it. The respondents' are using a machine openly made and sold and used under patents, and which in good faith the manufacturers have placed in open competition with the machines made by the complainants, honestly believing that they were not trespassing upon any rights of the complainants. This is no defence if they are adjudged at the final hearing to infringe; but it is a reason why the court should hesitate to interfere before the final decree in a case where there is no suggestion of any irremediable injury in the intervening time, or of any want of ability to respond to any judgment which may finally be recovered.

Without anticipating at this time any conclusions which may with more accuracy and more appropriately be drawn at the final hearing, and, remarking only that, for the purposes of the hearing on this motion, I treat the ninth claim of the patent No. 52,960 as a claim for a combination of three elements, it is sufficient to decide that a case of infringement is not made so clearly to appear as to require any action by the court in the nature of an injunction at this stage of the proceedings.

Motion denied.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date May 18, 1875.]

8,328.—Lamp-Pedestals.—NATHANIEL L. BRADLEY, West Meriden, Conn., assignor to THE BRADLEY & HUBBARD MANUFACTURING COMPANY, same place. Application filed May 4, 1875. Term of patent 7 years.

8,329.—Coat and Hat Hooks.—FRANCIS T. FRACKER, New Britain, Conn., assignor to P. & F. CORBIN, same place. Application filed April 23, 1875. Term of patent 7 years.

8,330.—Carpets.—HEINRICH F. GOETZE, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place. Application filed May 7, 1875. Term of patent 3½ years.

8,331.—Charm-Medal.—CHRISTIAN H. HERSHEY, Philadelphia, Pa. Application filed April 28, 1875. Term of patent 3½ years.

8,332.—Group of Statuary.—HENRY W. HIRSCHFELD, West Meriden, Conn., assignor to THE MERIDEN BRITANNIA COMPANY, same place. Application filed May 4, 1875. Term of patent 7 years.

8,333.—Carpet.—ARTHUR MARTIN, Paris, France, assignor to THE ROXBURY CARPET COMPANY, Boston, Mass. Application filed May 7, 1875. Term of patent 3½ years.

8,334.—Fireman's Trumpet.—FRED. J. MILLER, Brooklyn, N. Y. Application filed March 29, 1875. Term of patent 3½ years.

8,335.—Ornament for Burial-Caskets.—W. MAX REID, Amsterdam, N. Y. Application filed April 17, 1875. Term of patent 7 years.

8,336.—Heating-Stoves.—GARRETTSON SMITH and HENRY BROWN, of Philadelphia, assignors to SHEELER, BUCKWALTER & Co., Royer's Ford, Pa. Application filed May 5, 1875. Term of patent 7 years.

8,337.—Stove.—NICHOLAS S. VEDDER, Troy, N. Y., assignor to COMSTOCK, CASTLE & Co., Quincy, Ill. Application filed May 8, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date May 18, 1875.]

2,513.—Whisky.—BARKHOUSE BROTHERS & Co., Louisville, Ky. (Re-registration.) Application filed November 25, 1871.
"words 'Gold Dust' and the figure of the horse."

2,514.—Kitchen Ranges and Stoves.—BARTLETT, ROBBINS & Co., Baltimore, Md. (Re-registration.) Application filed August 19, 1871.
"words 'Baltimore Kitchener.'"

2,515.—White Lead, Zinc, and Paints.—BAXTER, BELL & Co., New York, N. Y. Application filed April 24, 1875.
"word 'CENTENNIAL.'"

2,516.—Stoves.—PHILO D. BECKWITH, Dowagiac, Mich. (Re-registration.) Application filed November 19, 1872.
"words 'ROUND OAK.'"

2,517.—Soap.—R. M. BISHOP & Co., Cincinnati, Ohio. (Re-registration.) Application filed August 26, 1872.
"words 'Royal Olive Soap.'"

2,518.—Metallic Paint.—F. G. BOURKE & Co., New York, N. Y. (Re-registration.) Application filed December 17, 1870.
"'The New York Copper or Metallic Paint.'"

2,519.—Bronchial Troches.—JOHN I. BROWN & SONS, Boston, Mass. (Re-registration.) Application filed September 7, 1871.
"'Brown's Bronchial Troches.'"

2,520.—Whisky.—JOHN E. CASSIDY, Boston, Mass. (Re-registration.) Application filed April 8, 1872.
"words 'Pure Old Neptune Whiskey.'"

2,521.—Friction-Matches.—JAMES L. CLARK, Oshkosh, Wis. (Re-registration.) Application filed September 14, 1872.
"a star upon the wrapper or package of matches with the words 'Star Matches.'"

2,522.—Stoves and Stove-Trimmings.—CULTER & PROCTOR, Peoria, Ill. (Re-registration.) Application filed November 18, 1872.
"words 'Woman's Rights.'"

2,523.—Stop for Reed-Organs.—J. ESTEY & Co., Brattleborough Vt. (Re-registration.) Application filed December 22, 1871.
"word 'Delecante.'"

2,524.—Reed-Organs.—J. ESTEY & Co., Brattleborough, Vt. (Re-registration.) Application filed September 7, 1871.
"'The Vox Jubilante.'"

2,525.—Paints.—FARRAND, WILLIAMS & Co., Detroit, Mich. Application filed May 8, 1875.
"a representation of a spray of maple leaves."

2,526.—Liver-Pills.—COCHRAN FLEMING, Sewickley, Pa.—(Re-registration.) Application filed March 23, 1872.
"the raised seal and the words 'McLane's Liver Pills.'"

2,527.—Oil-Cans.—JOHN P. HAINES, Irvington, N. Y. (Re-registration.) Application filed April 3, 1871.
"'Magic Disk Oil-Cans.'"

2,528.—Cotton, Woolen, and other Fabrics.—HAMILTON WOOLEN COMPANY, Southbridge, Mass. (Re-registration. Application filed February 28, 1872.
"words 'Tycoon Reps.'"

2,529.—Water-Proof Material.—ALFRED A. HAWLEY, Methuen, Mass. (Re-registration.) Application filed January 31, 1872.
"word 'Repellent.'"

2,530.—Harness.—JAMES R. HILL & Co., Concord, N. H. (Re-registration.) Application filed November 14, 1871.
"words 'The Concord Harness.'"

2,531.—Pocket Cook-Stoves.—HOUGHIN MANUFACTURING COMPANY, New York, N. Y. Application filed May 8, 1875.
"words 'MULTUM IN PARVO,' 'POCKET COOK-STOVE.'"

2,532.—Licorice-Paste.—JAMES C. MCANDREW, New York, N. Y. Application filed April 30, 1875.
"the representation of an oriental ship, as shown in the accompanying fac-simile, either with or without a surrounding line or border, and either with or without any words, letters, or figures added thereto, above or below."

2,533.—Galvanized Sheet-Iron.—McCULLOUGH IRON COMPANY, Philadelphia, Pa. (Re-registration.) Application filed January 24, 1873.

"a spread eagle."

2,534.—Prepared Plumbago.—MORSE BROTHERS, Canton, Mass. (Re-registration.) Application filed March 14, 1872.

"word 'Sun,' either preceded by or not, an adjective, such as the word 'Rising.'"

2,535.—Watches.—HUGH MULLIGAN, Philadelphia, Pa. Application filed April 9, 1875.

"'GENL. GEORGE WASHINGTON, EXHIBITION WATCH, 1876. PHILADELPHIA.'"

2,536.—Boots and Shoes.—CHARLES W. MUNDELL, Brooklyn, N. Y. Application filed May 6, 1875.

"words 'Charles W. Mundell, Noiseless Heel Tap for Boots and Shoes,' and the enlarged letter M, the whole being circumscribed by the heel-shaped marginal line."

2,537.—Shirt-Bosoms.—SOLOMON L. SIBLEY, Boston, Mass. (Re-registration.) Application filed November 7, 1872.

"three lines; a curved line with two straight lines—one at each extremity thereof, and the words 'Sibley's Trade Mark' over or under the center of the curved line."

2,538.—Green Paints.—D. STEINER & CO., New York, N. Y. Application filed April 20, 1875.

"words 'MAGNESIA GREEN.'"

2,539.—Mustard.—SWAIN, EARLE & CO., Boston, Mass. (Re-registration.) Application filed July 12, 1872.

"words 'Golden Mustard,' and a figure of a caster or cruet-stand."

2,540.—Gunpowder.—THE MIAMI POWDER COMPANY, Xenia, Ohio. (Re-registration.) Application filed June 29, 1872.

"a device representing a mounted cannon, with the words Miami Powder Co.' on the side of the cannon."

2,541.—Boots.—JOSEPH H. WALKER, Worcester, Mass. (Re-registration.) Application filed July 15, 1872.

"words 'Saddle-Seam Boot.'"

2,542.—Plumbago or Graphite Lubricant.—AMERICAN GRAPHITE COMPANY, New York, N. Y. (Re-registration.) Application filed March 15, 1872.

"a circle inscribed within an equilateral triangle, and inclosing devices and words as follows, to wit: Within the circle is the figure of a globe mounted upon an axle, representing the north and south poles, and bearing upon its surface the words 'The Perfect Lubricator; Ticonderoga Plumbago of Absolute Purity.' Within the corners of the triangle, and exterior to the inscribed circle, are severally depicted the figures of a steamship under way, a locomotive in motion, and a stationary steam-engine."

2,543.—Liniment.—REUBEN BANES, New Moorfield, Ohio. Application filed April 12, 1875.

"a monogram of the three letters B B B in one character."

2,544.—Bitters.—BYRNE BROTHERS & CO., New York, N. Y. Application filed May 11, 1875.

"words 'GLOBE BITTERS.'"

2,545.—Spool-Thread.—CLARK THREAD COMPANY, Newark, N. J. (Re-registration.) Application filed August 3, 1872.

"the initial letters of the words 'Our New Thread,' or 'O. N. T.,' which are used by us in combination with the words 'Clark's O. N. T. Spool-Cotton.'"

2,546.—Spool-Thread.—CLARK THREAD COMPANY, Newark, N. J. (Re-registration.) Application filed August 3, 1872.

"letters 'O. N. T.'"

2,547.—Lead-Pencils.—ORESTES CLEVELAND, Jersey City, N. J.—Case A. (Re-registration.) Application filed August 10, 1872.

"words 'American Graphite Polygrade Pencils,' together with the word 'DIXON.'"

2,548.—Lead-Pencils.—ORESTES CLEVELAND, Jersey City, N. J.—Case B. (Re-registration.) Application filed August 10, 1872.

"the representation of a crucible."

2,549.—Lead-Pencils.—ORESTES CLEVELAND, Jersey City, N. J.—Case C. (Re-registration.) Application filed August 10, 1872.

"word 'Crucible.'"

2,550.—Lead-Pencils.—ORESTES CLEVELAND, Jersey City, N. J.—Case D. (Re-registration.) Application filed August 10, 1872.

"the letter 'S.'"

2,551.—Lead-Pencils.—ORESTES CLEVELAND, Jersey City, N. J.—Case E. (Re-registration.) Application filed August 10, 1872.

"the letters 'S S.'"

2,552.—Lead-Pencils.—ORESTES CLEVELAND, Jersey City, N. J.—Case F. (Re-registration.) Application filed August 10, 1872.

"the letter 'M.'"

2,553.—Lead-Pencils.—ORESTES CLEVELAND, Jersey City, N. J.—Case G. (Re-registration.) Application filed August 10, 1872.

"the letters 'S. M.'"

2,554.—Lead-Pencils.—ORESTES CLEVELAND, Jersey City, N. J.—Case H. (Re-registration.) Application filed August 10, 1872.

"letters 'V. H.'"

2,555.—Lead-Pencils.—ORESTES CLEVELAND, Jersey City, N. J.—Case I. (Re-registration.) Application filed August 10, 1872.

"the letters 'V. S.'"

2,556.—Lead-Pencils.—ORESTES CLEVELAND, Jersey City, N J.—Case J. (Re-registration.) Application filed August 10, 1872.

"the letters 'V V H.'"

2,557.—Lead-Pencils.—ORESTES CLEVELAND, Jersey City, N. J.—Case K. (Re-registration.) Application filed August 10, 1872.

"words 'American Graphite.'"

2,558.—Stoves.—COMSTOCK, CASTLE & CO., Quincy, Ill. (Re-registration.) Application filed December 10, 1870.

"'ECONOMY.'"

2,559.—Medicated Brandies.—THOMAS DOCKUM & SON, New York, N. Y. Application filed April 30, 1875.

"A monogram consisting of the letters 'D' and 'S,' in white and shaded by black, intertwining with each other, and the character '&,' in black, in the center of the said intertwined letters, is printed upon a gilt ground surrounded with a white border, formed of curved and straight lines meeting one another at angles, the whole forming a peculiar shield."

2,560.—Baking-Powder.—DRIBLER, FURMAN & ALEXANDER, New York, N. Y. Application filed April 22, 1875.

"'Peerless Baking Powder,' together with a representation of loaves of bread."

2,561.—Sewing-Machine Needles.—EXCELSIOR NEEDLE COMPANY, Woloottville, Conn. (Re-registration.) Application filed October 22, 1872.

"word 'EXCELSIOR.'"

2,562.—Cigars.—HAWORTH & WILLIAMS, Newark, N. J. (Re-registration.) Application filed September 26, 1872.

"word 'Diamond,' with the initial letter 'H' above and below the word, inclosed in a rhomboid."

2,563.—Oiling Apparatus.—SAMUEL HUTCHINSON, JR., Salem, Mass. (Re-registration.) Application filed April 22, 1872.

"figure of the said oiling apparatus and the words 'Wick-ed Oiler.'"

2,564.—Medicine.—J. & C. MAGUIRE, St. Louis, Mo. (Re-registration.) Application filed May 27, 1872.

"a design representing a pass in the Andes mountains, showing two natives leading llamas laden with the product of the cundurango. The words (or legend) accompanying the design are 'Maguire's Cundurango Liver and Blood Bitters, [trade-mark,] Heart of the Andes; Home of the Cundurango.'"

2,565.—Filet Under-Garments.—CARL MEZ & SONS, Freiburg, Germany. Application filed April 19, 1875.

"words 'Filet Under-Garments,' 'Carl Mez & Sons, Freiburg,' and the words 'semper bene,' inclosed by a pair of equally-balanced scales."

2,566.—Stoves.—MITCHELL, STEPHENSON & CO., Pittsburg, Pa. Application filed May 11, 1875.

"word 'REVOLUTION.'"

2,567.—Soap.—HENRY T. MUNSON, Washington, D. C. Application filed May 13, 1875.

"word 'SALICYLIC.'"

2,568.—Cigars.—CHRISTIAN C. SAUMS, Baltimore, Md. Application filed April 23, 1875.

"words 'Little Nut,' with a branch of a hazel-tree, with nut on the same, under the above words, and the letters 'C. C. S.' under the branch."

2,569.—Pastilles.—STOWELL & CO., Charlestown, Mass. (Re-registration.) Application filed December 1, 1871.

"words 'Samuel Kidder & Co.'s Asthmatic Pastilles.'"

2,570.—Lubricating-Oil.—THE GALENA OIL WORKS, Franklin, Pa. (Re-registration.) Application filed February 17, 1872.

"words 'Galena Oil,' together with the representation of a star that embraces the letter G."

2,571.—Cigars.—WHITLOCK & ABRAMS, Richmond, Va. Application filed May 11, 1875.

"word-symbol 'IMPREGNABLE' in conjunction with the monogram composed of the letters and character 'W. & A.'"

2,572.—Medicine.—YERBA BUENA BITTERS COMPANY, San Francisco, Cal. Application filed April 18, 1875.

"words 'DR. WARREN'S YERBA BUENA BITTERS.'"

2,573.—Lard, Lard-Oil, and Neat's-Foot Oil.—N. K. FAIRBANK & CO., Chicago, Ill. Application filed May 11, 1875.

"a boar's head."

2,574.—Cigars.—F. HARHNELS, New Orleans, La. Application filed May 12, 1875.

"words 'La Hermosa.'"

LABELS REGISTERED DURING THE WEEK.

[Each Certificate bearing date May 18, 1875.]

240.—Title: "J. N. Richardson, Son & Owdon."—JOHN BULLOCKE, Bay Ridge, N. Y. Application filed May 8, 1875.

241.—Title: "Dr. Brown's Vapor, Electro-Vapor, and Medicated Bath."—G. W. BROWN, Rockfield, Ill. Application filed May 10, 1875.

242.—Title: "Superior Coloring for Butter."—ALEXANDER MAY, Jeffersonville, Ind. Application filed May 17, 1875.

243.—Title: "Directions for Using the Manhattan Patent Compound Lye."—I. N. STERN, Keokuk, Iowa. Application filed May 4, 1875.

244.—Title: "Kimm's 50c Premium Aromatic Bitters."—STEKETEE & KIMM, Grand Rapids, Mich. Application filed May 17, 1875.

245.—Title: "Rupert & White's Botanical Liniment."—ALBERT HENRY WHITE, Somerville, Mass. Application filed May 5, 1875.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., May 19, 1875.

On the petition of ANN JENNETTE HATHAWAY, of Milwaukee, Wis., executrix of JOSHUA HATHAWAY, deceased, authorized by act of Congress approved February 18, 1875, praying for the extension of a patent granted to the said JOSHUA HATHAWAY, on the 3d day of April, 1860, for an Improvement in Devices for Converting Reciprocating into Rotary Motion,

It is ordered that the testimony in the case be closed on the 20th day of July next; that the time for filing arguments and the Examiner's report be limited to the 30th day of July next; and that said petition be heard on the 4th day of August next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

INDEX OF INVENTIONS PATENTED MAY 18, 1875.

	Class No.	No. of Patent.
Acid, machine for making liquid carbonic, W. N. Hill	1	163,376
Alarm, burglar, T. Powell	24	163,524
Animals, sling for shoeing, L. M. Johnson	144	163,378
Bait receptacle, live, R. B. Kepner	143	163,498
Bale tie, W. A. Jordan	7	163,380
Bale tie, J. W. Philp	7	163,522
Bale tie, W. L. Rose	7	163,331
Barrel, J. H. Morrison	40	163,512
Barrel hoop, B. W. Sutherlen	40	163,543
Barrels, drip pan for, J. A. Clark	40	163,360
Bath, portable medicating hot vapor, R. R. Roberts	8	163,413
Bathing apparatus, E. Morse	8	163,327
Battery, galvanic, V. E. Keegan	50	163,318
Bed bottom, P. C. Hard, (reissue)	62	6,436
Bed bottom spring, A. P. Brown	62	163,356
Bed bottom spring, J. Fowler	62	163,370
Beds, cribs, &c., covering for, Foster and Weant	62	163,471
Bedstead fastening, W. H. Elliot	62	163,468
Belting, manufacture of leather, Slemmer and Clark	81	163,337
Binder, temporary, E. Buell	146	163,452
Bird cage, L. P. Reichert	170	163,330
Boot and shoe cleaner, H. H. Holmes	22	163,492
Boot and shoe, gaiter, W. E. Putnam	16	163,525
Boot and shoe metallic counter support, Babcock and Morrison	16	163,349
Boot and shoe nailing machine jack attachment, L. Goddu	16	163,475
Bottle stopper, W. Vom Hofe	1	163,553
Brick and tile machine, C. D. Wrightington	20	163,432
Brick machine, J. K. Caldwell	20	163,299
Brick machine, A. J. Hoyt	20	163,494
Brush holder, W. P. Shank	22	163,536
Buckle, J. Lines	23	163,500
Buggy body, swinging, Carpenter and Grimshaw	31	163,454
Burner, gas, C. D. Payne	64	163,402
Burner, Lamp, L. J. Atwood	90	163,439
Burner, lamp, H. G. Moehring	90	163,508
Butter worker, W. Ryder	45	163,533
Cane, faucet for oil, G. W. Banker	107	163,293
Cans, top for preserving, T. H. Hamilton	58	163,484
Car and carriage heater, J. Schmitt	154	163,415
Car axle box, G. T. Raoul	122	163,409
Car coupling, L. D. Evans	122	163,469
Car coupling, W. Y. Perry	122	163,519
Car coupling, W. F. Starr, (reissue)	122	6,440
Car coupling, J. G. Stricklett	122	163,420
Car coupling, J. T. Wilson	122	163,429
Car heater and ventilator, J. Oliphant	154	163,397
Car, oil, A. P. Odell	122	163,515
Car spring, W. P. Hansell	122	163,485
Car starter, F. D. Hardy	122	163,486
Car ventilator and water cooler, combined, A. J. Morrison	166	163,513
Carburetor, I. W. Shaler	27	163,535
Carbureting air, apparatus for, D. Bickford, (reissue)	27	6,431
Card, postal, A. Petersohn	146	163,520
Carding engine for making bats for felted fabrics, H. J. and W. D. Davies, (reissue)	28	6,432
Carriage, child's, F. H. Jury	31	163,381
Cart, self-loading, T. C. Strawn	31	163,541
Chair, reclining, J. W. McDonough	62	163,549
Churn, reciprocating, G. De Nottbeck	45	163,365
Cigar box, B. Ash	160	163,438
Cigar box tray, G. W. Brown	160	163,297
Cigar box tray, H. R. Heyl	160	163,313
Cigars, mouth piece for, J. Campbell	160	163,358
Cigars, packing, E. Norton	160	163,395
Cloth measure, rotary, W. Hebden, (reissue)	37	6,437
Clothes drier, G. Bent	91	163,353
Coal separator, Bucchley and Thorn	3	163,298
Condenser, surface, W. H. Guild	150	163,482
Cooler, beer, W. Toepfer	19	163,421
Cooler, milk, I. Barrows	45	163,443
Cooler, water, P. Gray	58	163,481
Corks, machine for cutting, G. S. Long	173	163,387
Corn row marker, A. G. Moore	133	163,510
Corn sheller, F. H. Hunter	59	163,377
Corset, J. N. Ames	80	163,433
Corset clasp, W. C. Goodwin	80	163,479
Cotton gin, O. C. Dewey	41	163,465
Cotton sprinkler, C. A. Ramsey	41	163,526
Coupon tag and check, G. R. G. Jones	146	163,496
Crackers, mechanism for cutting and sugaring, Ruger and Hill	6	163,332
Crane, water pressure, C. H. Morgan	118	163,511
Crank wheel, L. Miller	67	163,390
Crib, Buttenburg and Hodges	62	163,357
Cultivator, E. D. Gorham	43	163,372
Cultivator and harrow combined, E. M. Potter	43	163,523
Cultivator, revolving, E. C. Winters	43	163,346
Dental plugger, E. S. Rider	46	163,412
Dental pluggers, attachment to automatic, L. Dunvinage	46	163,306
Despatch apparatus, pneumatic, O. B. Dowd	158	163,366
Dose register, D. L. Hawkins	156	163,486
Drawer pull, W. N. Weeden	24	163,557
Drier and bake oven combined, J. Zimmerman	48	163,564
Drill for drilling metal, D. L. Toppan	100	163,342
Drills from holes, machine for removing broken, J. W. Platt	100	163,406
Drilling apparatus, J. McKay	100	163,503
Dyeing silk fabrics, J. B. C. H. Petitdidier	11	163,521
Electrotype shells, backing, J. S. Brooks	164	163,449
Elevator, H. H. Blake	79	163,354
Engine, compound steam, A. Alexander	150	163,348
Engines, slide valve for steam, E. Armstrong	152	163,437

	Class No.	No. of Patent.
Bancet, S. A. Duman	167	163,367
Beed cutter, J. B. and J. W. B. Nye	59	163,396
Belly joint plate, J. Ives	31	163,495
Bilter, water, C. B. Cooper	167	163,362
Bire and water proof composition, W. S. and F. W. Gray	35	163,373
Bire arms, implement for loading, O. D. Phillips	55	163,404
Bire extinguisher, Murphy and Hearle	118	163,398
Bire plug or hydrant, L. S. Chapman	167	163,301
Blue stopper, ventilating, B. A. Meade	154	163,504
Bood, concentrated extracts for, J. and W. Horlick	58	163,493
Burnace, smoke consuming, J. C. Baum	149	163,295
Burnaces, composition for lining, C. E. Wilson	79	163,345
Burnaces, promoting combustion in, J. C. Tiffany	149	163,547
Burniture duster, O. Griswold	22	163,311
Barments, shaping block for, H. Egleston	38	163,467
Bas and oils, manufacture of, H. M. Martin	66	163 324
Bas apparatus, J. D. Kutz	64	163,385
Bas, apparatus for purifying illuminating, Smith and Farmer	66	163,339
Bas carburetor, W. H. Reed	27	163,528
Bas, manufacture of, H. M. Martin	66	163,323
Bas stove, J. J. West	65	163,344
Basometers, system of gearing for, J. C. Tiffany	68	163,539
Blassware, mold for, J. H. and M. Smith	68	163,424
Bold leaf, booking, J. Varley	54	163,424
Brain, apparatus for steaming, M. H. Steele	57	163,340
Brain binder, J. F. Gordon	74	163,480
Brate, E. S. Renwick, (reissue)	154	6,439
Bame, J. G. Eberhard	72	163,368
Barness saddle, C. Kenny	73	163,321
Barrow, A. H. Whiteside	73	163,428
Barrow, disk, S. G. Randall	73	163,527
Batchet claws, die for forming, J. Palmer	29	163,399
Batchway, self-closing, D. Moore	30	163,509
Bay conveyer, Conner and Rouse	79	163,461
Beating and ventilating apparatus for buildings, O. Kelsey	166	163,329
Binge for blinds and shutters, lock, A. S. Parker	24	163,400
Borse collar, G. F. Beardsley	73	163,444
Borse power, D. Geiser	159	163,472
Borse power, J. S. Schofield	159	163,534
Borseshoe blank, J. T. Walker	60	163,555
Borseshoe blanks, roll for rolling, J. Walker	60	163,554
Borseshoe calk blank bar, J. B. Johnston	60	163,316
Borseshoe calks, die for forming, L. Prichard	60	163,408
Borseshoeing harness, I. P. Pickering	144	163,405
Bose, reel for drying and draining, A. R. Guilder	81	163,374
Bub boring machine, E. M. Henkle	31	163,490
Bydrant, street, Clemens and Morgan	167	163,361
Bydrants, attachment to street, C. M. Vergner	167	163,425
Ice cream freezer, L. B. Woolfolk	58	163,431
Indicator, price, F. Sampf	146	163,542
Jack spool, H. M. Guy	142	163,483
Jag top, H. Wright	88	163,560
Kitchen nse, tool for, J. A. Simonds	88	163,416
Knife grinding machine, J. S. Elliott	70	163,309
Knife, shoe, W. J. Fitz Gerald	16	163,470
Knitting machines, measuring device for, J. P. Reisinger	89	163,410
Lamp, R. S. Merrill	90	163,505
Lamp extinguisher, H. J. Warren	90	163,556
Lamp extinguisher, A. and E. Waterman	90	163,343
Lamp, miner's, J. Sawyer	90	163,414
Lamps, safety extinguisher for, G. F. Edholm	90	163,466
Lathing, metallic, J. W. Hoyt	4	163,315
Laundry register, E. G. Dike	91	163,302
Level, A. B. Wroth	137	163,561
Life preserver, A. Traub	138	163,422
Lumber drier, P. Pfeffer	48	163,403
Mat, door, O. Rice	56	163,411
Meat case or can, convertible, Chambers and McCook	136	163,359
Metals from oxidation, preserving, Ara and Del Bubba	35	163,291
Mill for grating cocoa nuts, &c., J. P. Anderson	88	163,434
Mop, C. B. Clark	22	163,460
Motor, spring, H. Bolton	67	163,447
Nails, machine for cutting, W. Haddock, (reissue)	163	6,435
Needles, machine for polishing the eyes of machine, S. C. Kingman	104	163,384
Nut lock, H. L. Heaton	14	163,489
Oils, storage and delivery tank for explosive and inflammable, P. and G. R. F. Sinibaldi	107	163,538
Oven, coke, L. Schantl	61	163,333
Oxidation, preserving metals from, Ara and Del Bubba	35	163,291
Ozone machine, G. Milson	35	163,391
Pan, evaporating, C. Brownell	155	163,450
Paper barrels, machine for making, M. D. Keeney	109	163,319
Paper box, Arthur and Bentley	109	163,435
Paper boxes, blank for corrugated, A. L. Jones	109	163,379
Pavement, cement, I. Mock	110	163,506
Pill tile, W. E. Van Velsor	156	163,552
Pin, safety, P. M. Doughty	86	163,304
Pipe coupling, Cooper and Sutcliffe	167	163,463
Pipe, device for connecting, holding, and punching sections of sheet metal, M. Stephens	119	163,341
Pipe for lead corroding houses, ventilating, J. D. Richeson	166	163,529
Pipes, distributer for hydraulic, J. M. Crawford	167	163,363
Pistol stock, W. L. Godfrey	55	163,478
Plant protector, M. E. Slocum	63	163,417
Plate, luncheon, J. W. Boteler	88	163,355
Plow, F. R. Bell	114	163,352
Plow, J. P. Zeller	114	163,563
Plow carriage, R. Coreth	114	163,464
Pot, coffee, R. L. Bate	136	163,351
Pot, coffee, S. P. Webber	136	163,426
Pots, spout for coffee, N. S. McFarland	136	163,502
Printer's lead and rule cutter, J. A. Stanion	117	163,540
Printing apparatus, telegraphic, Foote and Randall, (reissue)	50	6,434
Printing, producing gelatine relief plates for, W. H. Mumler	111	163,514
Pump, A. N. Parkhurst	118	163,518
Railway signal, Bolton and Adams	120	163,446
Railway switch, M. H. Davidson	120	163,364
Railway ticket, E. R. Cook	146	163,462
Railway track scales, J. H. Usher	126	163,423
Rain conductor, J. W. Hoyt	126	163,314
Rain spout support, D. Roake	126	163,531
Register, passenger, W. S. Thorn	42	163,546
Register, passenger, Thoss and Trantmann	42	163,544
Roll for reducing old rails, Edwards and Rogers, (reissue)	125	6,433
Roller and harrow, combined land, H. J. Yeargin	73	163,562
Roof, wooden, L. Henkle	126	163,375
Roofing, fire proof, P. G. Tyrrell	126	163,551
Sad iron, self-heating, R. H. Hasenritter	91	163,312
Sad iron shoe, E. Hartsig	91	163,487
Sand and gravel separator, N. J. Keller	153	163,382
Sash balance, J. J. Price	24	163,407
Sash pulley, C. B. Clark	24	163,459
Saw, bush, E. Brown	130	163,296
Saw filing machine, J. McSweeny	131	163,326
Saw handle, A. C. Martin	29	163,325
Saw mill head block, C. R. Ely	130	163,309
Saw mill head block, W. Glue	130	163,473
Saw mills, log turner for, J. Orm	130	163,398
Sawing machine, G. W. Bugbee	130	163,453
Sawing staves, machine for, W. Barber	40	163,350
Scaffold, C. G. Reed	30	163,329
Scales, platform, S. J. Austin	132	163,440
Screw driver, W. F. Patterson	29	163,401
Seat, circus, W. H. Shuey	62	163,537
Separator, grain, Ogborn and Kendrick	159	163,516
Separator, grain, Rider and Reynolds	159	163,530
Sewing machine attachment, F. Henry	134	163,491
Sewing machine table, F. R. Wolfinger	134	163,347
Shaft coupling, Weeks and Metcalf	87	163,558
Shaping block for garments, H. Egleston	38	163,467
Shed, portable, T. L. Wiswell	30	163,559
Shoe, J. H. Hussey, (reissue)	16	6,438
Shoe knife, W. J. Fitz Gerald	16	163,470
Shoe nailing and tacking machine, L. Goddu	16	163,476
Shoe nailing machine, L. Goddu	16	163,477
Shoe soles from nail strips, machine for nailing, L. Goddu	16	163,474
Skate, O. Edwards	143	163,307
Skate, O. Edwards	143	163,308
Skirts, ornamenting, J. Schoenhof	54	163,335
Snow plow, C. Marshall	122	163,501
Spice box, E. Norton	88	163,394
Spinning ring holder, C. E. Trowbridge	142	163,550
Stamp, hand, E. D. Chamberlain	146	163,300
Stave dressing machine, G. A. Shideler	40	163,536
Stone, artificial, Lemon, Cameron, and Halner	153	163 396
Stove, J. Spear	154	163,419
Stove, gas, J. J. West	65	163,344
Stove, heating, J. D. Ayil	154	163,441
Stove, magazine, W. W. Baldwin	154	163,442
Stove pipe shelf, M. Bennet	88	163,445
Stove pipe thimble, Loughlin and Hughes	154	163,499
Stove, reservoir cooking, G. N. Palmer	154	163,517
Stoves, fire pot for, J. Spear	154	163,418
Sugar skimmer and cooler, J. L. Morgan	155	163,392
Table, ironing, P. H. Gafney	91	163,371
Tacking machine, J. W. Carver	16	163,456
Tank for explosive and inflammable oils, storage and delivery, P. and G. R. F. Sinibaldi	107	163,538
Telegraph circuit, fire alarm, J. N. Gamewell	158	163,310
Telegraph, train, A. N. Towne	50	163,549
Towel stand, C. Schermerhorn	62	163,334
Toy cup and ball, C. H. Bass	143	163,294
Trace fastener, C. Robinson	31	163,332
Treadle, Letz and Duever	67	163,322
Truck for brick yards, E. Noonan	31	163,393
Universal joint, R. T. Smith	67	163,338
Valve, oscillating steam, H. P. Jones	152	163,497
Valve, vent, A. Chabot	148	163,458
Valve, water, A. Chabot	167	163,457
Vehicle hub and axle, G. R. Drew	31	163,305
Vehicle seat lock, D. Argerbright	31	163,436
Wagon axles, gage for shaping, D. R. Winter	34	163,430
Wagon brake, E. A. Thompson	31	163,545
Washers, machine for making, I. W. Doeg	14	163,303
Washing machine, O. Baldwin	91	163,292
Washing machine, M. Jones	91	163,317
Washing machine, S. Wells	91	163,497
Water pressure crane, C. H. Morgan	118	163,511
Wave power machine, C. Buckner, Jr	82	163,451
Whiffletree, T. Carrell	31	163,435
Whip socket, J. J. Markel	31	163 388
Wick raiser, H. G. Moehring	90	163,507
Wind wheel, J. J. Kimball	118	163,383
Wire fabric, G. S. Bracher	170	163,448

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MAY 18, 1875.

	Patent No.
Adams and Bolton	163,446
Adler, Clement, and Wiel, assignees, (reissue)	6,438
Alden, F., assignee	163,348
Alexander, A., Compound steam engine	163,348
Allen, B., 2d, and N., assignees	163,387
Allison, J. W., assignee	163,496
American Cable Screw Wire Co., assignee	163,474, 163,475, 163,476, 163,477
Ames, J. N., Corset	163,433
Anderson, J. P., Mill for grating cocoa-nut, &c	163,434
Anderson, W. H., assignee	163,497
Argerbright, D., Vehicle seat lock	163,436
Armstrong, E., Slide valve for steam engines	163,437
Arthur, C. M., and J. Bentley, Paper box	163,435
Ash, B., Cigar box	163,438
Ash, L., & Brother, assignees	163,438
Atkinson, G., assignee	163,561
Atwood, L. J., Lamp burner	163,439
Austin, S. J., Platform scales	163,440
Avil, J. D., Heating stove	163,441
Babcock, H. C., and L. M. Morrison, Boot and shoe metallic counter support	163 349
Baldwin, O., Washing machine	163,292
Baldwin, W. W., Magazine stove	163,442
Banker, G. W., Faucet for oil cans	163,293
Barber, W., Machine for sawing staves	163,350
Barker, E. G., assignee	163,561
Barrows, I., Milk cooler	163,443
Bartlett, F. W., assignee	163,391
Bass, C. H., Toy cup and ball	163,294
Bate, R. L., Coffee pot	163,351
Baum, J. C., Smoke consuming furnace	163,295
Beardsley, G. F., Horse collar	163,444
Bell, F. R., Plow	163,352
Benedict and Burnham Manufacturing Company, assignee	163,357
Bennet, M., Stove pipe shelf	163,445
Bennett and Smith, assignees, (reissue)	6,432
Bent, G., Clothes drier	163,353
Bentley and Arthur	163,435
Bickford, D., Apparatus for carbureting air, (reissue)	6,431
Blake, H. H., Elevator	163,354
Bolton, F. C., and M. Adams, Railroad signal	163,446
Bolton, H., Spring motor	163,447
Booth, C. L., assignee	163,496
Boteler, J. W., Luncheon plate	163,355
Bracher, G. S., Wire fabric	163,448
Brooks, J. S., Backing electrotype shells	163,449
Brown, A. F., Spring bed bottom	163,356
Brown, E., Buhl saw	163 296
Brown, G. W., Cigar box tray	163,297
Brownell, C., Evaporating pan	163,450
Bubier, E. W., assignee, (reissue)	6,438
Buckner, C., Jr., Wave power machine	163,451
Buechley, W., and T. Thorn, Coal separator	163,298
Buell, E., Temporary binder	163,452
Bugbee, G. W., Sawing machine	163,453
Buttenberg, H., and W. R. Hodges, Crib	163,357
Caldwell, J. K., Brick machine	163,299
Cameron, Hainer, and Lemon	163,386
Campbell, J., Mouth piece for cigars	163,358
Carpenter, H. M., and E. Grimshaw, Swinging buggy body	163,454
Carroll, T., Whiffletree	163,455
Carver, J. W., Tacking machine	163,456
Chabot, A., Water valve	163,457
Chabot, A., Vent valve	163,458
Chamberlain, E. D., Hand stamp	163,300
Chambers, A., Jr., and A. McD. McCook, Convertible meat case or can	163,359
Chapin, G. B., assignee	163,342
Chapman, L. S., Fire plug or hydrant	163,301
Clark, C. E., Sash pulley	163,459
Clark, C. B., Mop	163,460
Clark, J. A., Drip pan for barrels	163,360
Clark and Slemmer	163 337
Clemens, G. H., and G. C. Morgan, Street hydrant	163,361
Cleveland, J. F., assignee	163,334
Conner, W. M., and W. I. Rouse, Hay conveyer	163,461
Converse, L. P., assignee	163,528
Cook, E. R., Railroad ticket	163,462
Cooper, A. W., and J. Sutcliffe, Pipe coupling	163,463
Cooper, C. B., Water filter	163,362
Coreth, R., Plow carriage	163,464
Crawford, J. M., Distributer for hydraulic pipes	163,363
Davidson, M. H., Railway switch	163,364
Davies, H. J. and W. D., Carding engine for making bats for felted fabrics, (reissue)	6,432
Davis, J., assignee	163,367
De Hart, C. A., assignee	163,390
Del Bubba and Ara	163,291
De Nottbeck, G., Reciprocating churn	163,365
Dewey, O. C., Cotton gin	163,465
Dike, E. G., Laundry register	163,302
Doeg, I. W., Machine for making washers	163,303
Doughty, P. M., Safety pin	163,304
Dowd, O. B., Pneumatic despatch apparatus	163,366
Drew, G. R., Vehicle hub and axle	163,305
Duever and Letz	163,322
Duman, S. A., Faucet	163,367
Duvinage, L., Attachment to automatic dental plaggers	163,306
Eberhard, J. G., Name	163,368
Edholm, G. F., Safety extinguisher for lamps	163,466
Edwards, J. P., and A. J. Rogers, Roll for reducing old rails, (reissue)	6,433
Edwards, O., Skate	163,307
Edwards, O., Skate	163,308
Egleston, H., Shaping block for garments	163,467
Eberhard, J. G., Name	163 468
Elliott, W. H., Bedstead fastening	163,369
Elliott, J. S., Knife grinding machine	163,469
Ely, C. R., Saw mill head block	163,309
Evans, L. D., Car coupling	163,339
Farmer and Smith	163,453
Fay, J. A., & Co., assignees	163,470
Fitz Gerald, W. J., Shoe knife	6,434
Foote, T. M., and C. A. Randall, Telegraphic printing apparatus, (reissue)	163,471
Foster, J., and W. A. Weant, Covering for beds, cribs, &c	163,370
Fowler, J., Spring bed bottom	163,371
Gafney, P. H., Ironing table	163,310
Gamewell, J. N., Fire alarm telegraph circuit	163 472
Geiser, D., Horse power	163,473
Glue, W., Saw mill head block	163,474
Goddu, L., Machine for nailing shoe soles from nail strips	163,475
Goddu, L., Boot and shoe nailing machine jack attachment	163,476
Goddu, L., Shoe nailing and tacking machine	163,477
Goddu, L., Shoe nailing machine	163,478
Godfrey, W. L., Pistol stock	6,434
Gold and Stock Telegraph Company, assignee, (reissue)	163,479
Goodman, W. C., Corset clasp	163,480
Gordon, J. F., Grain binder	163,372
Gorham, E. D., Cultivator	163,512
Gould, C. H., assignee	163,481
Gray, P., Water cooler	163,373
Gray, W. S. and F. W., Fire and water proof composition	163,454
Grimshaw and Carpenter	163,311
Griswold, O., Furniture duster	163,422
Guild, W. H., Surface condenser	163,374
Guilder, A. R., Reel for drying and draining hose	163,483
Guy, H. M., Jack spool	6,435
Haddock Nail Machine and Nail Company, assignee, (reissue)	6,435
Haddock, W., Nail cutting machine, (reissue)	163,386
Hainer, Lemon, and Cameron	163,316
Hale, R. W., assignee	163,484
Hamilton, T. H., Top for preserving cans	163,485
Hansell, W. P., Car spring	6,436
Hard, P. C., Bed bottom, (reissue)	163,486
Hardy, F. D., Car starter	163,487
Hartsig, E., Sad iron shoe	163,312
Hasenritter, R. H., Self-heating sad iron	163,488
Hawkins, D. L., Dose register	163,528
Hayt, H. C., assignee	163,328
Hearle and Murphy	163,489
Heaton, H. L., Nut lock	6,437
Hebden, W., Rotary cloth measure, (reissue)	163,480
Henkle, E. M., Machine for boring hubs	163,375
Henkle, L., Wooden roof	163,491
Henry, F., Sewing machine attachment	163,313
Heyl, H. R., Cigar box tray	163,424
Hickson, S., assignee	163 332
Hill and Ruger	163,376
Hill, W. N., Machine for making liquid carbonic acid	163,357
Hodges and Buttenburg	163,492
Holmes, H. H., Boot and shoe cleaner	163,493
Horlick, J. and W., Concentrated extract for food	163,494
Hoyt, A. J., Brick machine	163,314
Hoyt, J. W., Rain conductor	163,315
Hoyt, J. W., Metallic lathing	163,499

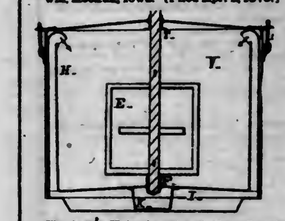
TITLES, DRAWINGS, AND CLAIMS



OF

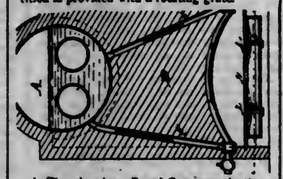
PATENTS GRANTED MAY 18, 1875.

162,291. PRESERVING METALS FROM OXIDATION. Alberto Arn and Mario Del Bubba, Florence, Italy. [Filed Aug. 20, 1874.]

The process of preserving metals from oxidation, which consists in applying to the surface of the metal a composition consisting of quartz, carbonate of potasse, and a metallic oxide, in equal parts, pulverized and mixed together with water to the consistency of a paste, and then exposing the metal thus coated to the air to dry the coating, and afterward submitting it to about 500° centigrade, all as above set forth.

162,292. WASHING-MACHINES. Orea Baldwin, Keokuk, Iowa. [Filed Apr. 2, 1875.]

The boiler V, having the platform I and the spouts H, in combination with the shaft-bearing F on the platform, and its support K, and with the shaft A and side frames or arms E, reaching toward the sides, all arranged to operate substantially as and for the purpose set forth.



162,293. FAUCETS FOR OIL-CANS. George W. Banker, New York, N. Y. [Filed Apr. 14, 1875.]

1. A faucet for metallic cans, consisting essentially of a screw-threaded tube having a closed end, in which a groove is cut partially through the metal, forming a circular disk, a plunger working in said tube, carrying a valve, and provided with a punch for forcing out said disk to form the opening when desired, substantially as described.

2. As an article of manufacture, a faucet for metal cans, consisting of a threaded tube, *c*, plunger *f*, spout *e*, diaphragm *b*, and flange or plate *d*, attached to the top of tube *c*, by means of which the faucet is attached to the can, substantially as described.

162,296. SMOKE-CONSUMING FURNACES. John C. Baum, Cincinnati, Ohio. [Filed Aug. 14, 1874.]

Brief.—A partition at the back of the furnace extends nearly to the grate, and is supported by the boiler circulating tubes. The combustion-chamber at the back of the partition is provided with a rotating grate.

1. The chambers B and C, communicating at the bottom by opening Q, in combination with the continuous grate surface and bottom K K and diaphragm D, substantially as specified.

2. The bridge-wall of the furnace having a curved front surface, in combination with the diaphragm D confronting it, to form in rear of chamber B the chamber C, with the alternately enlarged and contracted portions *o f*, the bottom of said chamber being formed by a grate-surface, substantially as and for the purpose specified.

3. The boiler A and continuous grate surface and bottom K N, in combination with the diaphragm D and its supporting and circulating pipe or pipes, the diaphragm reaching from the boiler to near the grate-surface, all substantially as and for the purpose specified.

4. The combination of the rotary grates L *L'*, toggle-joint I *I'*, rod *b*, and lever F, for the purpose mentioned.

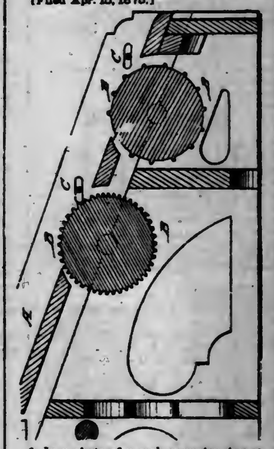
162,296. BUHL-SAWS. Ephraim Brown, Lowell, Mass. [Filed Jan. 9, 1875.]

Brief.—The arms are jointed, so that the tool may be folded and occupy less space.

1. In a buhl-saw frame, the jointed sides B, in combination with and connected by links or plates *c*, held and released by ferrules *d*, substantially as and for the purpose described.

2. The tubular socket E, constructed as described, with an end bushing, *e*, having a shoulder, *i*, and with a side shank, H, and a set-screw, *h*, in combination with the frame-side B, substantially as described.

3. The spring clamp or gripe F, constructed as described, with shoulders *g* and a notch, *n*, in combination with the bushed socket E and its set-screw *h*, and clamping and holding the ends of the saw, substantially as described.



4. The combination of the hollow capped handle K with the tubular bushed socket E, having a shoulder, *i*, a frame-connecting shank, H, and a set-screw, *h*, and with the clamp F, having a notch, *n*, and shoulders *g*, and with the frame-side B, substantially as and for the purpose described.

162,297. CIGAR-BOX TRAYS. G. W. Brown, Philadelphia, Pa. [Filed Sept. 30, 1874.]

Brief.—The cigars are placed in the openings in the tray, and a revenue-stamp placed over the open slots, so that the cigars can be examined without breaking the stamp; but in order to remove one (as in the case of one being sold) the stamp will be canceled over that cigar.

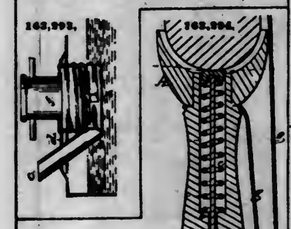
A cigar-tray having openings a at or near one edge, into which the thick ends of the cigars may be introduced, and recesses *f* at the opposite edge for the reception of the tips, all being constructed substantially as set forth.

162,298. COAL-SEPARATORS. WM. Buechley and Theodore Thorn, Pottsville, Pa. [Filed Apr. 15, 1875.]

1. In a chute of a coal-separator, two or more fluted rollers transversely in the bottom thereof, with a spring-rod in front of each roller, for automatically separating the slate from the coal, substantially as herein set forth.

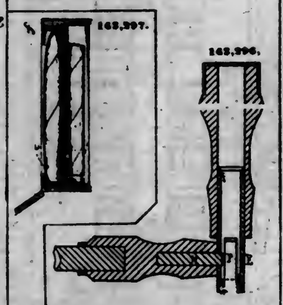
2. The combination of the fluted rollers B, rods C, and adjustable spring-arms D in a chute, A, substantially as and for the purposes herein set forth.

162,299. BRICK-MACHINES. J. K. Caldwell, Philadelphia, Pa. [Filed Apr. 17, 1875.]



1. The combination of the stop-wheels *b c*, the latter provided with a crank, with the rotating mold-wheel A, having pendants *a'* attached, substantially as described.

2. In combination with the rotating mold-wheel A, the spring stop-bolt *m*, lever *o*, and cam *n*, all constructed and arranged to operate substantially as described.



3. The combination, in a brick-machine, of a rotating mold-wheel, one or more plungers, *k*, arranged to enter the molds from above, and the movable section J' of the track, with one or more followers, *o*, with the mechanism for operating said plungers and followers, whereby pressure is applied to the bricks in the mold both from above and below, substantially as set forth.

4. In combination with the rotating mold-wheel, the stationary wiper *r*, the followers *o*, and the track J, having an elevation of sufficient height to raise the face of the followers above the top of the molds, whereby they are cleaned as they pass under the wiper, substantially as described.

162,294. TOY CUPS AND BALLS. C. H. Bass, Medford, Mass. [Filed Apr. 24, 1875.]

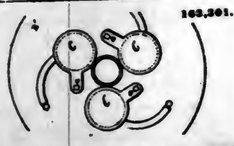
The cup A, with its shank B, provided with a sliding rod or piston actuated by a spring for projecting the ball D from the cup, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

3. The feeding apparatus, consisting of the tubes S and t, with the slides u and x', and the cams f and g, all constructed and arranged to operate substantially as described, whereby the clay is fed to the molds in uniform quantities, as set forth.

4. The slide C, provided with plungers or studs c, arranged to automatically enter and withdraw from the molds, substantially as described.

7. In combination with a rotating mold-frame, carrying a series of followers, p, a circular track, J, having a section thereof movable vertically with the lever F' and the cam E', all arranged to operate substantially as and for the purpose set forth.



162,200. HAND-STAMPS. R. D. Chamberlain, Westfield, N. J. [Filed Apr. 8, 1875.]

In combination with a hand-stamp, strips of rubber characters, arranged in such a manner as to be changed from one character to another by winding on spools or reels, for the purpose of printing, substantially as described.

162,201. FIRE-PLUGS OR HYDRANTS. L. S. Chesman, Washington, D. C. [Filed Mar. 26, 1875.]

Brief.—A hydrant having three or more separate discharge-pipes centered in a vertical position by two horizontal plates, through both of which said pipes pass. The hydrant has sliding valves on the under surface of the lower plate, said valves being operated by vertical valve-rods extending through both plates. The hydrant has also brownell draining siphon-tubes, with flap-valves, and a vertical sliding jacket, with slots and guide-pins.

1. In a fire-plug or hydrant, the several and separate discharge-pipes A, constructed and arranged as shown, in combination with the horizontal plates B B', substantially as and for the purposes specified.

2. The sliding valves C, constructed and arranged as shown, and operated by the valve-rods c and their handles b, in combination with the horizontal plates B B' and the discharge-pipes A, substantially as and for the purposes specified.

3. The branch draining siphon-tubes D, constructed and arranged as shown, and operating by the flap-valve e, in combination with the discharge-pipes A, substantially as and for the purposes specified.

4. The vertically-sliding jacket E, provided with the slots e, in combination with the plates B B', the latter provided with the flange d and guide-pins g, substantially as and for the purposes specified.

162,202. LAUNDRY-REGISTERS. E. G. Dike, New York, N. Y. [Filed Apr. 10, 1875.]

A washing-list indicator or register, adapted for denoting the number of any article, the total number of pieces, and the number of weeks due, by means of a registering-scale, having imprinted or stamped upon its face the letters, words, and figures arranged substantially as shown and described, and provided with a series of pins and perforated holes, or pins or buttons and slides, for the purpose of arbitrarily fixing or pointing out any desired letter, word, or figure on said registering-scale, the whole inclosed within a case or box, and combined, arranged, and operating substantially as and for the purposes as herein shown and described.

162,203. MACHINES FOR MAKING WASHERS. I. W. Doog, New Market, N. H., assignor of one-half his right to Orrin Murray, same place. [Filed Dec. 29, 1873.]

Brief.—An automatic intermittent feed device, operated by a cam on the main shaft; an adjustable hollow punch, mounted within a stock which is adjustably attached to a reciprocating yoke; and a fixed die, inside of which is a yielding sleeve, which acts to strip the blank from the die, and the fixed adjustable center-punch within the sleeve.

1. As an improvement upon the combination composed of the hollow punch e, reciprocating stock C, yoke D', and their actuating parts, the screw-threaded connection to adjust the punch-stock, substantially as described.

2. The yoke D', stock C, hollow punch e, and screw-threaded connection for adjusting the punch-stock, as above claimed, in combination with the fixed die F, sliding sleeve F', and punch E, substantially as and for the purposes described.

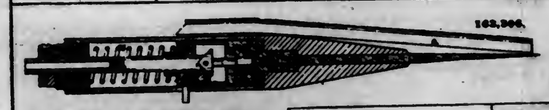
3. The revolving cam B', head-stock I, having pin i, and arm I', in combination with the feed-carriage G, substantially as and for the purposes described.

4. The reciprocating arm I', in combination with the upper sliding jaw G' of the feed-carriage, when said jaw is actuated to clamp and release the iron bar by the intermediate devices through the reverse movement of the arm I', substantially in the manner described.

162,204. SAFETY-FUSE. P. M. Doughty, Louisville, Ky. [Filed Mar. 18, 1875.]

The combination, with the plate or frame A, of the pins B B hinged to the same on a line with each other, and the hook C hinged to the plate outside of the line on which the pins are hinged, substantially as and for the purposes herein set forth.

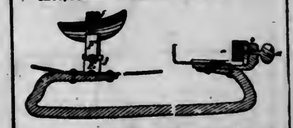
162,205. HUBS AND AXLES FOR VEHICLES. Geo. R. Drew, Millburn, N. J. [Filed Aug. 26, 1874.]



Brief.—For lubricating the spindle, and preventing the admission of dirt.

The combination of the box B with the hub C, and an axle, A, having upon it the bollow collar F, substantially as specified and shown.

162,206. ATTACHMENTS TO AUTOMATIC DENTAL PLUGGERS. Louis Duvinage, Philadelphia, Pa. [Filed Mar. 16, 1875.]

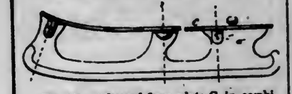


Brief.—A tube for carrying gold-foil is clamped to the plugger-casing, and the vertical movements of the plugger-point feed the gold from it into the cavity of the tooth.

1. The tube p, in combination with the vibrating bar f, for feeding gold-leaf, substantially as and for the purpose set forth.

2. The vibrating bar f, in combination with casing g, cam e, spring d, and tube p, as described.

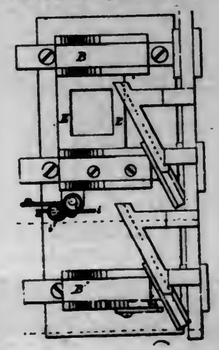
162,207. SKATES. Oliver Edwards, Florence, Mass. [Filed Feb. 8, 1875.]



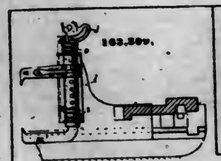
1. The combination of the stationary heel-plate B', having the depression b' and the vertical stud b, with the clamp-plate D and screw d, substantially as described.

2. The combination of the stationary heel-plate B', having depression b' and stud b, clamp-plate D, and screw d, with the adjustable jaw C, substantially as described.

3. The adjustable clamps E, when curved to receive the sole of the boot, and bent outward at the slot f to receive the strap F, substantially as and for the purpose described.



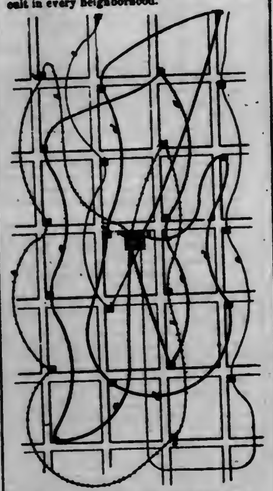
162,208. SKATES. Oliver Edwards, Florence, Mass. [Filed Nov. 26, 1874.]



The lips d' formed from plate C, in combination with the rivet c'', as a means of securing the heel-plate to the riser a'', substantially as described.

162,209. HEAD-BLOCKS FOR SAW-MILLS. Chas. R. Hy, Northfield, Vt. [Filed Aug. 26, 1874.]

Brief.—To obviate the use of a set-bar, all the knees (except the one at the forward end) are directly connected to plates provided with inclined slots, which engage with corresponding inclined projections upon a reciprocating bar; and to economize space at the forward end of the carriage, the knee at that end is caused to take its motion from the next inside knee by means of a platform connecting said knees. The dogs for dogging the log are adjustable on a swinging standard attached to the side of the middle knee, and by means of a spiral spring, operating upon the standard, are held out of the way when not in use.

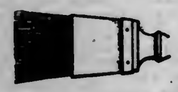


1. The upright B at the forward end of the carriage, combined with the inner upright B' by the bar or platform E, for the purpose described.

2. The combination of the weighted lever i with the cam j, spiral spring e, cylinder l, dogs m and m', and spring-catch n, substantially as described, for the purpose specified.

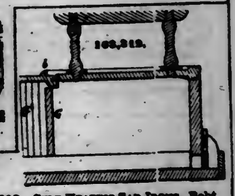
3. The spiral spring e, in combination with swinging dogs, substantially as described, for the purpose specified.

162,210. FIRE-ALARM-TELEGRAPH CIRCUITS. John N. Gazzewell, Hackensack, N. J. [Filed Mar. 20, 1875.]



Brief.—No two contiguous boxes on same circuit, thus avoiding, in great measure, danger of interference, and insuring good alarm-circuit in every neighborhood.

The combination and arrangement, in a fire alarm telegraph, of a series of signal-stations and electric circuits, as herein described, whereby each signal-station throughout the series is in a different circuit from that or those located nearest or adjacent to it, as specified and shown.



162,211. FURNITURE-DUSTERS. Cordon Griswold, Hartford, Conn. (Filed Oct. 9, 1874.)

Brief.—The fiber is bent at the center, and held by a metal ring, which is nailed to a projection upon the wooden handle. A leather finishing-head covers the fibers at the upper part.

As a new article of manufacture the duster herein described, composed of the wooden handle a a', manila fiber b, metal binding-head d, and overlapping head d', nail c, and finish-head e, all constructed and combined in the manner and for the purposes set forth.

162,212. SELF-HEATING SAD-IRONS. Robt. H. Hasscritter, Hermann, Mo. [Filed Mar. 15, 1875.]

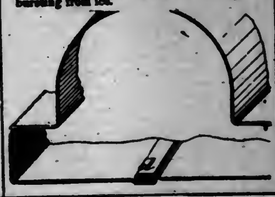
Brief.—A spring holds the pointed door or lid in a vertical position. From the rear to the front compartment the products of combustion must pass under the partition G, or through perforations in it. The chimney is detachable, and may or may not be used.

1. The combination, with a box-iron, of the removable partition G, solid or perforated removable chimney I, and spring e, for the purposes specified.

2. The combination, with the body of a box-iron, of the lid constructed in the two sections H (which is provided with the shoulder b) and H', (which is journaled or hinged in the side plates A,) substantially as and for the purposes set forth.

162,213. CIGAR-BOX TRAYS. H. B. Hoyt, Philadelphia, Pa. [Filed Oct. 12, 1874.]

Brief.—The tray is composed of pasteboard, and is folded to the form shown. The side chambers are perforated for the reception of the cigars, which are to lie crosswise of its length. Over the tips of the cigars, upon one of the chambers, is pasted the revenue-stamp, so that a cigar cannot be removed without canceling the same; yet the cigars can be examined without being removed from the tray.

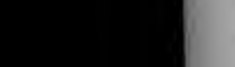


1. The within-described tray, having longitudinal chambers at the sides, and the whole being made of a strip of stiff paper or pasteboard, scored, folded, and secured as set forth.

2. The hollow rib X and its diagonal and notched strip p, all constructed as described.

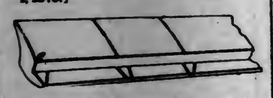
3. The hollow rib W, with its diagonal strip q and lips u, the whole being constructed as specified.

162,214. RAIN-CONDUCTORS. J. W. Hoyt, Springfield, Mass. [Filed Oct. 20, 1874.]



Brief.—The form of the leader is ornamental in appearance, affords a good base for attachment to the building, and is in no danger of bursting from ice.

As a new article of manufacture, a leader for conducting the water from the gutters of buildings, constructed with a hollow rectangular base, in combination with an arched front surface, substantially as and for the purpose described.



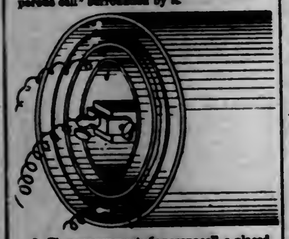
168,215. METALLIC LATHING. J. W. Hoyt, Springfield, Mass. [Filed Oct. 20, 1874.]

Brief.—A mode of securing metallic lathing to the furrings by means of rivets having bifurcated shanks.

The combination of the metallic furring and lathing with rivets having split or bifurcated shanks, substantially as and for the purpose described.

168,216. HORSESHOE-CALK-BLANK BARS. James B. Johnston, Chicago, Ill., assignor to Robt. W. Hale, same place. [Filed Apr. 1, 1875.]

As a new article of manufacture, a calk-blank bar shaped and formed substantially as and for the purpose set forth.

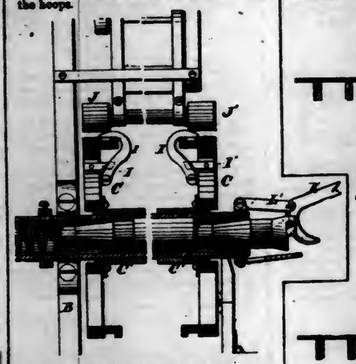


168,217. WASHING-MACHINES. M. Jones, Des Moines, Iowa. [Filed Mar. 11, 1875.]

In a washing-machine, the stationary frame C, having a fixed wash-board, *a*, and an adjustable section, *b*, and a roller, *e*, in combination with a sliding frame, *f f*, carrying wash-board sections *d d* and rollers *g g*, substantially as and for the purposes shown and described.

168,218. GALVANIC BATTERIES. Vincent B. Keegan, Boston, Mass. [Filed Feb. 4, 1875.]

Brief.—Claims that a purely electro-chemical action is secured by the form of battery covered by first claim, and that the wire coil "prevents the confusion of hydrogen gas and the metallic salts within the walls of the porous cell" surrounded by it.



1. The arrangement of a porous cell, *a*, placed within another porous cell, *b*, which shall allow of a space between them to constitute a vessel, and each cell to contain an acid or a salt, which shall be electrically or chemically different in each cell, to act electively with each other and to the negative metal of the battery, in the manner substantially as described.

2. In combination with the porous cell *b*, a coil of wire, *n n' n''*, through which the electric current circulates, said wire surrounding the porous cell, and consisting of a continuation of the wire leading from the zinc pole of the battery.

168,219. MACHINERY FOR MAKING PAPER BARRELS. Marble D. Kenney, Rockton, Ill. [Filed Feb. 17, 1875.]

Brief.—The machine is intended to facilitate the operation of hooping paper barrels by holding the parts in the proper relation to each other during the operation of securing the hoops.

1. The wheels C, composed of hub C', arms or spokes D, and quarters or sections E F, said sections secured to and sliding on the spokes D, and adapted to be operated and expanded by a wedge or cone working in the interior of the hollow axle, substantially as and for the purposes described.

2. In combination with the sectional wheels C C, the rod G, mounted within the hollow axle A, and constructed with enlarged cone or wedge shaped portions, cam-lever K, and coil-spring X, for operating said rod, substantially as described.

3. In combination with the expansible and collapsible wheels C C, the swinging frame J and roller J', as and for the purposes described.

4. In combination with the sections E F, of the wheel C, the retracting-springs H, as and for the purpose described.

5. In combination with the sections E F, of the wheel C, the hooks I and lugs I', as and for the purposes described.

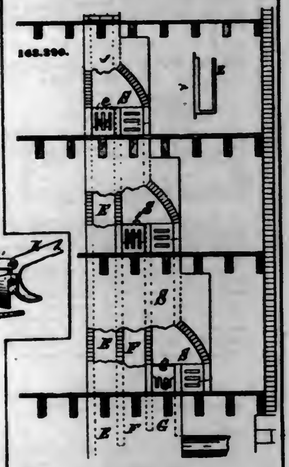
6. The hollow axle A, supported only at one end, perforated to receive the projecting ends F of the sections E of the wheels C, which are secured thereon, and receiving within its interior a wedge or cone shaped rod, G, as and for the purposes described.

7. The combination and arrangement of segmental wheels C C, hollow shaft A, rod G, and cam-lever K, as and for the purposes described.

8. The sections or quarters E, constructed with a projecting portion, F, secured to and sliding on projecting arms or spokes D of the hub C', substantially as and for the purposes described.

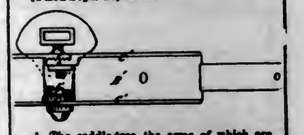
9. In combination with the sections or quarters E, the hub C', permanently secured to the hollow axle A, and constructed with several projecting arms or spokes, D, as and for the purposes described.

10. The sectional wheels C, constructed or provided around its periphery with a recess or groove, *c*, as and for the purposes described.



168,220. HEATING AND VENTILATING APPARATUS FOR BUILDINGS. Orlando Kelsey, Worcester, Mass. [Filed Aug. 10, 1875.]

Brief.—A double or twofold flue the first to introduce heat from the source of supply, the second to exhaust the impure air, the two acting together to produce the desired result. There is no connection, however, between the heat and ventilating flues. The heat and ventilating pipes are separate until united to the escape at the top of the building.



1. The auxiliary ventilating flue or flues S, adjoining the heat-flues E and F and G, and extending from first floor to top of building, and ventilating every story, in combination with the heat-flues E, F, and G, substantially as shown and described.

2. The caps *s*, *f*, and *g*, for forcing the ventilation, substantially as shown and described.

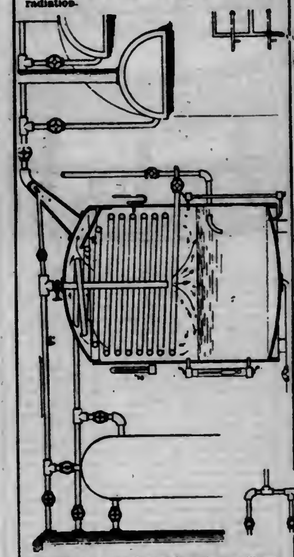
3. The reflectors 2, substantially as shown and described.

168,221. HARNESS-SADDLES. Chas. Kenny, New York, N. Y., assignor of one-half his right to George Walker, Little Falls, N. J. [Filed Sept. 24, 1874.]

1. The saddle-tree, the arms of which are made adjustable and held at any desired angle to each other by means of the toothed ears *e* and the screw *f'*, substantially as and for the purpose set forth.

2. In an adjustable saddle-tree, the wood blocks or pads B', clasped between the metal side pieces C', substantially as and for the purpose set forth.

168,222. TREADLES. George F. Lots and Adolph T. Duerer, Chicago, Ill.; said Lots assignor to said Duerer, and said Duerer assignor of five-ninths his right to E. M. Lots, same place. [Filed Oct. 19, 1874.]



Brief.—A disk affixed to the shaft is rotated by friction-pawls, rocking beam, and two rods connected with the treadle.

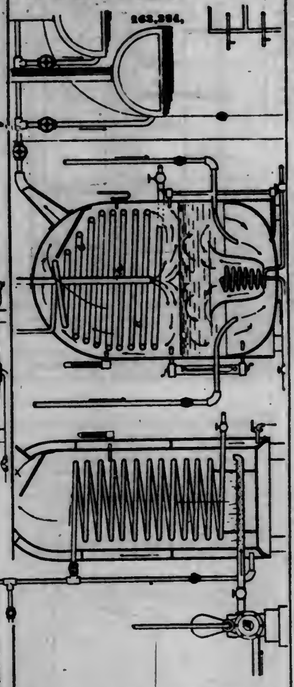
The combination of the beam F, actuated by two treadles, the rock-shaft G, rocker-arms M M, links N N, pawl-heads K K, pawls L L, and springs *o*, with the friction-wheel J, to rotate the driving-shaft of a sewing-machine, substantially as described.

168,223. MANUFACTURE OF GAS. Henry M. Martin, New York, N. Y. [Filed May 5, 1875.]

Brief.—To make a permanent lighting or heating gas, impinges a heated gas or other aeriform fluid (as steam or superheated steam or air) on the surface of liquid hydrocarbon, otherwise unheated, and fixes the vaporous mixture in a highly-heated retort. May assist evaporation by radiated heat within the evaporating-vessel above the surface of the liquid, or may evaporate by such unaided radiation.

1. The process of manufacturing an illuminating-gas, which consists in bringing an aeriform fluid into contact in a closed vessel with the surface of a liquid hydrocarbon not otherwise heated, and then passing the resultant vapors through a hot retort, where they are converted into a fixed gas, substantially as described.

2. The process herein described for treating hydrocarbons in the manufacture of illuminating or heating gas, consisting in carrying off, by means of a heated fluid, the constituents of the hydrocarbon down to any desired specific gravity, and converting them into a fixed gas leaving an oil of any desired density in the vessel, as set forth.



3. The combination of a still provided with means for heating its upper portion with a fixing-retort.

168,224. MANUFACTURE OF GAS AND OILS. Henry M. Martin, New York, N. Y. [Filed May 5, 1875.]

Brief.—Separates the constituents of liquid hydrocarbons by regulated radiated heat above their surface within their closed receptacle. May assist evaporation by heating below surface, or by causing currents within the liquid, which will bring its particles successively to the surface, or by both means. Accomplishes the motion of currents by a small steam-coil assisted by the direction of the inflowing liquid. Makes illuminating-gas by evaporating liquid hydrocarbons by radiated heat in closed vessels above their surface, and fixing the vapors in a highly-heated retort. May at the same time agitate the liquid. May also introduce gas or steam burned, dried, or superheated.

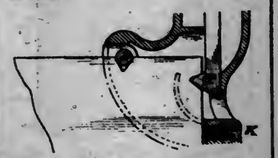
1. The process of separating liquids of different densities, which consists in evaporating off the lighter constituents, by subjecting the liquid in a closed vessel to the action of radiated heat of controllable temperature above its surface as set forth.

2. The process of evaporating liquids in a closed vessel, which consists in subjecting the liquid to the action of radiated heat above its surface, while at the same time it is heated below its surface as set forth.

3. The process of evaporating liquids in a closed still, which consists in subjecting the liquid to the action of radiated heat, above its surface, while at the same time it is kept in motion by convective currents, and fresh portions are continually presented at the surface, as described.

4. The process of manufacturing illuminating gas, which consists in evaporating a liquid hydrocarbon, in a closed still, by radiated heat above its surface, and conveying the vapors into heated retorts, where they are converted into a fixed gas, as set forth.

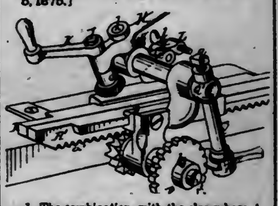
5. The process of manufacturing illuminating gas, which consists in bringing steam, superheated steam, or gas, or other fluid of graduated heat into contact with the surface of a liquid hydrocarbon in a closed vessel, the liquid being kept in constant motion, as described, and passing the commingled vapors, and gas, or steam, into heated retorts, substantially as specified.



6. The process of manufacturing illuminating gas, which consists in bringing steam, superheated steam, or gas, or other fluid of graduated heat, into contact with a liquid hydrocarbon in a closed vessel, the liquid being kept in constant motion, as described, and having its surface subjected to radiated heat to assist evaporation and prevent condensation of vapors, and then passing the resultant mixture into heated retorts, substantially as set forth.

7. The combination of a closed vessel and a steam-coil below the surface of the liquid to produce a current in the vessel, and a supply pipe or pipes, as and for the purpose set forth.

8. A closed vessel, or still, heated above the level of the contents and provided with a steam-coil below the level, substantially as and for the the purpose described.



168,225. SAW-HANDLES. Alex. C. Martin, Hamilton, Ohio. [Filed Apr. 15, 1875.]

Brief.—Crescent saws are attached to their handles, without drilling holes in the blades or the use of rivets, by means of a metal socket having triangular-shaped flanges fitting loosely upon each side of the blade at one corner of the same, and provided with a pivot or stop resting in a notch in the top of the blade, in connection with a catch upon the end of an adjustable screw-rod, which fits in a notch in the end of the blade. The handle is vertically adjustable by a set screw placed in the heel of one of the bearings of the socket.

The socket B C, having the pivot or top L, resting in notches in the top of the saw-blade, and screw K, bearing against the end of the latter, in combination with the adjustable rod F, having the catch P, substantially as and for the purpose described.

168,226. SAW-FILING MACHINES. James McSweeney, Pittsfield, Mass. [Filed Apr. 5, 1875.]

1. The combination, with the clamp-bars A *a'*, of the slides D D', standard E, feathered shaft F, adjustable sleeve G, lever-arm H, and file J, all arranged and operating substantially as described.

2. The adjustable sleeve G, carrying the lever-arm H and file-wheel J, as described, in combination with the reversible arm L and set-screw *l*, for determining the bevel of the teeth, as described.

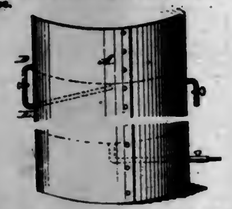
3. The saw-clamp, provided with the rack *a'*, in combination with the slides D D', carrying the grinding-wheel and the indicator-wheel P, all arranged and operating substantially as and for the purpose set forth.

168,227. BATHING APPARATUS. Edward Morse, Stoneham, Mass., assignor of one-half his right to Joseph A. Lovejoy, same place. [Filed Mar. 1, 1875.]

Brief.—By lengthening the funnel into which the steam is admitted by means of a sleeve, the funnel will be more readily filled with steam, and consequently a greater quantity of air will be forced into the chamber.

1. In a bathing apparatus, substantially as described, the pipes C and J and sleeve K, combined to operate substantially as and for the purpose specified.

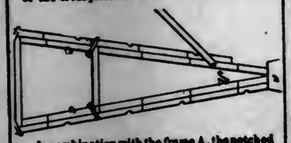
2. In a bathing apparatus, substantially such as described, the funnel R, provided with the sleeve P and aperture Q, in combination with the nozzle O and rubber pipe K, substantially as and for the purpose set forth.



3. In a bathing apparatus, substantially such as described, the chamber H, in combination with the pipes I D O K, substantially as and for the purpose specified.

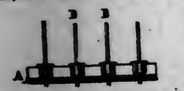
168,227.

163,208. FIRE-EXTINGUISHERS. Alexander Allen Murphy and Charles Coppin Hearle, Montreal, Canada. [Filed Mar. 11, 1875.]



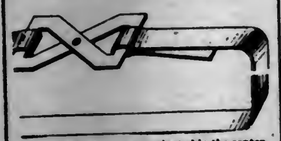
Brief.—A case having two chambers—one an air-compressing apartment, the other a chamber or reservoir containing an extra supply of compressed air to expel the water when fire. The two chambers are connected by a pipe having a suitable valve. The lower chamber is provided with a suitable discharge-pipe.

The air-compressing chamber B, in combination with the chamber or reservoir A, and pipe D E, provided with a valve, substantially as and for the purpose set forth.



163,209. SCAFFOLDS. Clarence G. Reed, Cambridge, Mass. [Filed Apr. 9, 1875.]

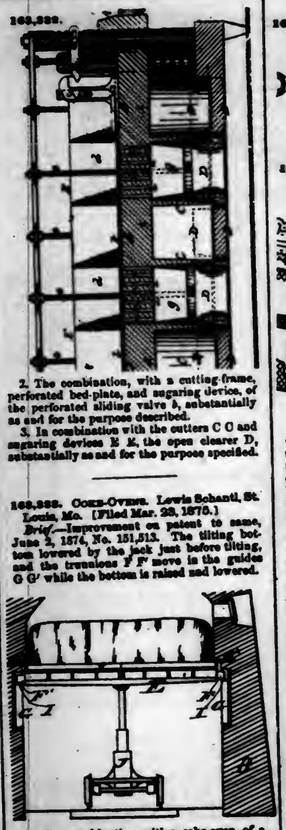
Brief.—The top of the supporting-frame is provided with a notched plate or cleat, for preventing the lateral displacement of the end of the cross-joist thereon.



In combination with the frame A, the notched joist B and the notched cleat *c*, substantially as and for the purpose set forth.

163,210. BIRD-CAGES. Louis P. Reichert, Buffalo, N. Y. [Filed Sept. 8, 1874.]

The combination, with the wires B, of the bands A, provided with lateral extensions D, having perforations *b* formed therein for the reception of the wires B, such parts D being adapted to be folded over and lock the said wires in position, in the manner and for the purpose substantially as shown and described.



163,211. BALE-TIES. W. L. Rose, Wadesborough, N. C. [Filed Jan. 20, 1875.]

The double lever, cross-riveted in the center, opening from both ends to receive the hoops.

163,212. MECHANISMS FOR CUTTING AND SEPARATING CHAMPIGNONS. Jos. W. Roper and Geo. J. Hill, Buffalo, N. Y., assignors to J. W. Roper & Co., same place. [Filed Dec. 24, 1874.]

1. In a crusher and cake cutting machine, in combination with the cutting-frame A, bed-plate B, with perforations *a a a*, the engaging devices E E, having one or more compartments, *d d*, substantially as and for the purpose specified.

2. The combination, with a cutting-frame, perforated bed-plate, and engaging devices, of the perforated sliding valve *b*, substantially as and for the purpose described.

3. In combination with the cutters C C and engaging devices E E, the open clearer D, substantially as and for the purpose specified.

163,213. COKE-OVENS. Lewis Schantl, St. Louis, Mo. [Filed Mar. 23, 1875.]

Brief.—Improvement on patent to same, June 2, 1874, No. 151,513. The tilting bottom lowered by the jack just before tilting, and the trunnions F F' move in the guides G G' while the bottom is raised and lowered.

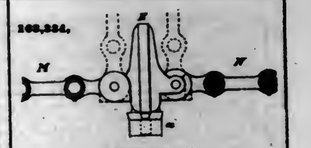
1. The combination, with a coke-oven, of a bottom having a vertical and oscillating movement, substantially as described.

2. The combination of the oven A, walls B B', guides G G', pins I I', and bottom E, substantially as described and shown.

3. The combination of the oven A, walls B B', girders D D', plates *d d*, &c., bottom E, flange *c*, and pins I I', substantially as described.

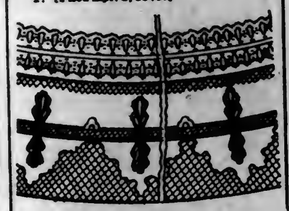
4. In combination with the oven A, walls B B' girders D D', plates *d d*, &c., bottom E, flange *c*, the guides G G', and lowering apparatus J, as and for purpose described.

5. The combination of the oven A, walls B B', girders D D', plates *d d*, &c., bottom E, flange *c*, pins I I', guides G G', substantially as described and shown.



6. The bottom E, trunnions F F', walls B B', guides G G', and lowering apparatus J, substantially as described.

163,214. TOWEL-STANDS. Chas. Schermerhorn, New York, N. Y., assignor to himself and John F. Cleveland, same place. [Filed Oct. 9, 1874.]



Brief.—The detachable ornamental body is provided with a hinged frame on two opposite sides, and is supported on the standard by means of a screw on the lower portion entering a nut in the top of the standard.

The towel-stand described, having the detachable ornamental body E, supported on the stem A by the nut *a*, and provided with two hinged frames, M N, on opposite sides, as and for the purposes specified.

163,215.

163,216. PROCESSES OF ORNAMENTING SKIRTS. Jacob Schoenhof, New York, N. Y. [Filed Apr. 2, 1875.]

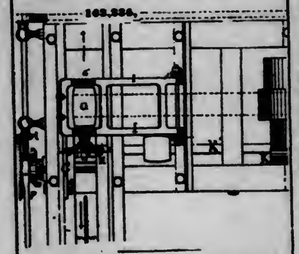
1. The garment having its body combined with a facing-band by means of adhesive material and indentation in an ornamental pattern, so that the outer surface of the garment exposes a facing different from the body and having the appearance of being quilted upon the body of the garment, the same being a new article of manufacture.

2. The garment having its body combined with a facing-band by means of adhesive material and indentation in an ornamental pattern resembling quilting, and also embossed in color, so that the outer surface of the garment exposes a facing different from the body and having the appearance of being quilted upon the body of the garment; and also embossed colored figures, the same being a new article of manufacture.

3. The process, substantially as before set forth, of producing garments with ornamental facing-bands having the appearance of quilted work, by uniting a portion only of the face of the body of the garment with adhesive material and the facing-band, and then indenting the faced portion in ornamental lines by heat and pressure, so as to simultaneously cement the facing to the face of the garment and indent it in ornamental lines.

4. The process, substantially as before set forth, of producing garments with ornamental facing-bands, partly embossed in color and presenting the appearance of quilted work, by overlaying a portion only of the face of the body of the garment with adhesive material and a facing-band, and then both embossing a portion of the face of the garment and indenting the faced portion in ornamental lines by heat and pressure, so as to simultaneously cement the facing to the face of the garment, emboss it in color, and indent it in ornamental lines.

163,217. MACHINES FOR DRESSING STAVES. Geo. A. Shideler, Logansport, Ind. [Filed Feb. 6, 1875.]

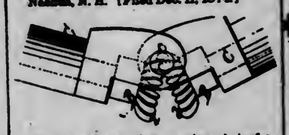


Brief.—The machine dresses both sides of the stave, and through the agency of an adjustable gage, which guides the upper cutter, the stave may be left thicker at the ends than in the middle.

1. The combination of the pivoted cutter-head frame I, having a guide friction-wheel K, with the sliding carriage, having a gage-bar, O', adjusted thereon, and the under cutter H', substantially as and for the purpose described.

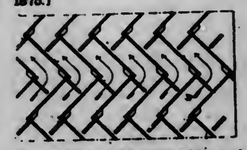
2. The feed-gear, consisting of the combination of the friction-wheels *m n*, upon the shaft L', and the wheels *l o* upon the shaft L, with the adjusting-lever *p*, as and for the purpose specified.

3. The combination of the shaft E, and gearing F F' E, the shaft K' and pulleys K K'', shaft C and pulley K'', shaft L and pulley B'', shaft G and pulley G, and their connecting-belts, with the cutter-heads H and H', bevel friction-wheels *l m n o*, shaft-pin *b'* and rack *b*, and carriage L', all substantially as and for the purpose set forth.



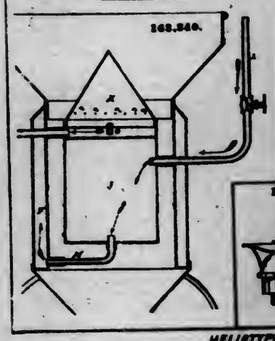
163,226.

163,227. MANUFACTURE OF LEATHER BELTING. Frank G. Slemmer and G. O. Clark, Philadelphia, Pa. [Filed Mar. 20, 1875.]



The within-described process of preparing canvas or other textile fabric for use in the manufacture of the leather belting as patented by us December 10, 1872—that is to say, by thoroughly saturating the material with cement, and stretching and drying it before introducing it between the leather—substantially as and for the purpose set forth.

163,228. UNIVERSAL JOINTS. R. T. Smith, Nashua, N. H. [Filed Dec. 11, 1874.]



The combination of the sections A A of a shaft or arm, gear-wheels B B, having the teeth *d* and strap-boxes C C jointed together by pivots *e e*, which are located as shown, all substantially as and for the purpose described.

163,229. APPARATUS FOR FURNISHING ILLUMINATING-GAS. Chas. V. Smith and Wm. Farmer, New York, N. Y. [Filed Feb. 15, 1875.]

The combination of the series of diagonal or inclined and overlapping plates, placed one above the other, forming zigzag passages, extending through a vertical column, substantially as described, for the purpose of causing the gas to pass through a series of falling films of the heavier matter in its course through the passages.

163,230. APPARATUS FOR STRAINING CHAIN. Michael H. Steele, Cleveland, Ohio [Filed Mar. 20, 1875.]

1. The induction-pipe L, pipe M, pipes N and O, and eduction-pipe P, arranged in relation to, and in combination with, the chamber J, annular chamber F, and distributing-chamber K, in the manner substantially as described, and for the purpose set forth.

2. The chambers J, F, and K, as arranged in relation to each other, and in combination with the pipes N O, provided with a stop-cock, *q*, for admitting spent steam to the wheel and shutting it off therefrom, as the condition of the wheel may require, in the manner substantially as described, and for the purpose set forth.

163,231. DEVICES FOR CONNECTING, HOLDING, AND PUNCHING SECTIONS OF SHEET-METAL PIPE. Melvin Stephens, Brooklyn, N. Y. [Filed Feb. 24, 1874.]

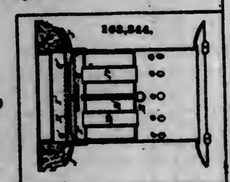
Brief.—A divided hinged cross-piece, *f*, is forced forward, to press the end of one length of pipe over or into another by a screw-stem, *d*, and nut *c*. A punch is situated in the end of an overhanging arm, for making rivet-holes in the joint.

1. The mandrel *a* and the abutment A, in combination with mechanism, substantially as specified, for pressing the lengths of sheet-metal tubing endwise, so as to slip one into the other, substantially as specified.

2. The arm *i*, punch *i*, and gage *a*, in combination with the mandrel *a*, abutment *b*, and mechanism for pressing the lengths of sheet-metal tubing together endwise, substantially as specified.

163,232. DRILLS FOR DRILLING METAL. D. L. Toppan, Somerville, assignor to himself, D. C. Malcom, and H. H. Malcom, East Cambridge, and G. B. Chapin, Medford, Mass. [Filed Apr. 1, 1875.]

Brief.—Spring-pawls arranged in recesses in the spindle, alternately engage with and slip over the ratchet-teeth in the wheels D C, and thus insure the rotation of the drill-spindle in the same direction by opposite motions of the actuating-lever. A handle is employed to steady the drill when employed on light work.



The adjustable handle H, in combination with the sleeve *f*, spindle A, lever G, and bevel-gears C D E, substantially as and for the purpose set forth.

163,233. LAMP-EXTINGUISHERS. Albert Waterman and Elias Waterman, Rutland, Wis. [Filed Apr. 17, 1875.]

Brief.—A recess in the sliding tube for receiving the gas-tube.

163,234.

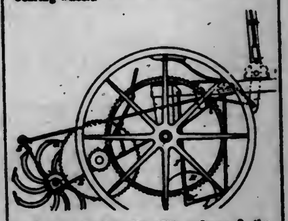
In a lamp-extinguisher, the sleeve *a*, constructed with the recess *b*, as and for the purpose set forth.

163,235. GAS-STOVES. John J. West, Chicago, Ill. [Filed Mar. 5, 1875.]

Brief.—A diffuser, screen, and annular flange arranged above the gas-pipe and fires, for mixing the air and gas.

1. The chamber F, inclosed by the outer walls of the stove, and having therein the ports or openings *c' c'*, in combination with the shield or flange J projecting from the outer walls and arranged somewhat below the said ports, substantially as shown and described, and for the purpose set forth.

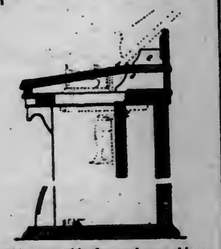
2. The combination of the pipe B', fires D D, annular flange H, and chamber F, having therein the ports or openings *c' c'*, all operating together, in connection with a diffuser, in a gas-stove, substantially as and for the purpose specified.



3. The combination of the pipe B', fires D D, diffuser G, diaphragm F, flange H, openings *c' c'*, and chamber F, substantially as and for the purpose specified.

163,236. COMPOSITIONS FOR LINING FURNACES. Chas. Edward Wilson, New York, N. Y. [Filed Nov. 9, 1874.]

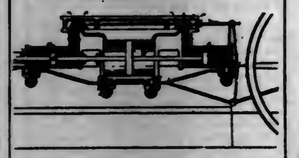
A composition consisting of asbestus, plumbago, and kaolin, substantially as and for the purpose set forth.



163,246. REVOLVING CULTIVATORS. R. C. Winters, Colete, Ill. [Filed Feb. 3, 1875.]

Brief.—A series of disk-colters in a pivoted frame in front of the wheels, and a series of revolving spades in rear of and driven by the bearing-wheels

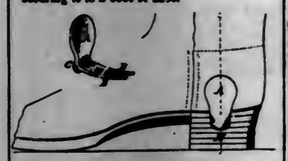
In combination, the tilting frame I, the colters K K, carried by said frame, the frame S, the revolving and spirally-arranged spades *a' a'*, carried by the frame S, the driving-gearing, and the adjusting mechanism, all operating together substantially as described, to the same implement.



163,247. SEWING-MACHINE TABLES. F. R. Wolfinger, Chicago, Ill. [Filed Mar. 10, 1875.]

In a cabinet or table for sewing-machines, the combination of the rest *c*, leaf *f*, hinged thereto, and the hinged bed-plate *a*, whereby the cabinet can be used wholly for a writing-desk or a sewing-machine, substantially as shown and described.

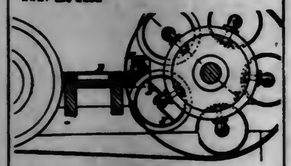
162,848. COMPOUND STEAM-ENGINE. A. Alexander, Pittsburg, assignor to Farrelly Alden, Allegheny, Pa. [Filed Jan. 7, 1875.]



Brief.—The cylinders are in line with the high-pressure cylinders at the ends. The three pistons are on one piston-rod. The valve of each high-pressure cylinder also admits the exhaust steam from said cylinder to the low-pressure cylinder.

The combination of the two steam-cylinders a and c with an auxiliary cylinder, A, each supplied with valves, ports, and pistons, having a common stem, d, the two steam-cylinders operating alternately, and alternately admitting their exhaust steam into the auxiliary cylinder b, to operate the piston therein, while their own pistons are balanced by the free circulation of the exhaust steam around them, substantially as described.

162,849. METALLIC COUNTER-SUPPORTS FOR BOOTS AND SHOES. Henry C. Babcock and Louis M. Morrison, Bennington, Vt. [Filed Mar. 10, 1875.]



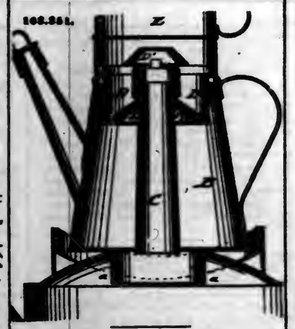
Brief.—The counter-support is re-enforced at the angle, and is provided with tangs for securing it to a boot or shoe.

The described protector and metallic counter-support for boots and shoes, consisting of the flexible barbed tangs B B and a supporting-lip, A, adapted to be applied as shown.

162,850. MACHINES FOR SAWING STAVES. William Barber, Cape Vincent, assignor to himself and Lewis Parker, Lyons, N. Y. [Filed Sept. 27, 1873.]

Brief.—The staves are cut by a band-saw running over pulleys arranged in a circle, one of which is provided with fans for blowing away the dust.

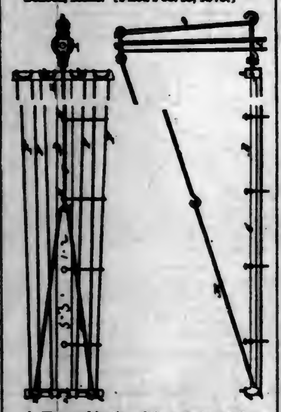
1. The combination, with cylinder saw G, of cross-rolls D, tip-guides E F, and rollers H, all arranged on a frame, substantially as and for the purpose described.



2. The rollers H', provided with wings H, applied substantially as and for the purpose specified.

162,851. COFFEE-POTS. Ezekiel Law Bate, Adrian, Mich. [Filed Apr. 3, 1875.]

The improved coffee-pot, formed of the body portion E, having the base-flange a, and central open-ended steam-tube C, with deflector D', the detachable strainer D, with conical perforated bottom and short central tube, and the detachable cap or vessel B, having a bottom flange for adapting it to connect with the strainer, all as shown and described.



162,852. PLOWS. Francis R. Bell, Marshall, Tex. [Filed Apr. 10, 1875.]

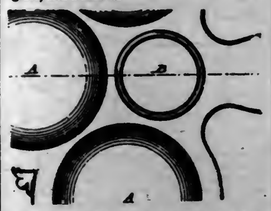
Brief.—The mold-board is made of wood, and along its upper edge is provided with a series of holes, which form oil-chambers, thus keeping the wood saturated, to prevent the tenacious soil from adhering to the board.

A wooden mold-board, F, for plows, saturated with oil, and provided with a number of oil-receiving holes or reservoirs, f', in its edges to keep it saturated, substantially as herein shown and described.

162,853. CLOTHES-DRYERS. George Rent, Seneca, Kans. [Filed Feb. 13, 1875.]

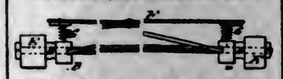
1. The combination of the swinging clothes-frame B, ring I, rods J, M, and O, and swivel-plate, with the post or standard A, all constructed substantially as herein described, for the purpose set forth.

2. The combination of the cords H with the clothes-supporting frame B and cords F, as and for the purpose set forth.



162,854. ELEVATORS. H. H. Blake, Pittsburg, Pa. [Filed Mar. 27, 1875.]

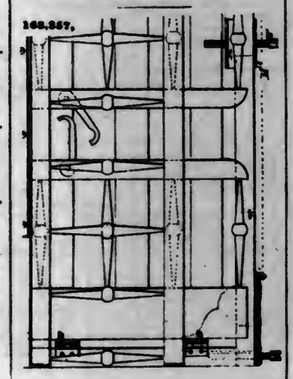
In a passenger-elevator constructed substantially as described, the car having a door arranged to swing outwardly, so as to intersect the landings and act as a stop to prevent the movement of the car while said door is open, as shown and set forth.



162,855. LUNCHEON-PLATES. J. W. Botsler, Washington, D. C. [Filed May 8, 1875.]

Brief.—The plate is divided into several receptacles, to receive different kinds of food, together with a stand for a tea-cup or wine-glass, and a handle.

As a new article of manufacture, the dish or plate herein described, consisting of three or more food-receptacles, A, a holder, B, for cup or glass, and handle C, substantially as shown, and for the purpose set forth.



162,856. SPRING BED-BOTTOMS. Alva P. Brown, Texas, Ohio. [Filed Mar. 20, 1875.]

1. The combination of arched slats A, rests B, springs D, tie-rods C, and the head-blocks E, substantially as specified.

2. The combination of slats F and springs G with the arched slats A and movable rests B, substantially as specified.

162,857.

162,857. CRIBS. Henry Buttenberg and W. R. Hodges, Memphis, Tenn. [Filed June 20, 1874.]

Brief.—By means of the sliding blocks and screw-hooks, the crib can be attached to bedsteads having side rails of irregular form.

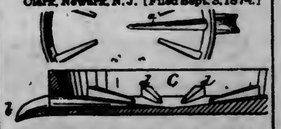
The arrangement, with the slotted front rail of a crib, of the sliding block H' and the screw-hook F, as shown and described, to operate as specified.

162,858. MOUTH-PIECES FOR CIGARS. J. Campbell, Lancaster, Pa. [Filed Apr. 22, 1875.]

Brief.—The device is made of one piece of solid wood, and is formed with a square lateral shoulder, and a bell-shaped opening leading to the smaller end of the tube.

The mouth-piece for a cigar herein described, constructed with its tube and socket of one piece of wood, in the manner substantially as and for the purpose specified.

162,859. CONVERTIBLE MEAT CASES OR CANS. Alex. Chambers, Jr., and A. McD. McCook, U. S. A. [Filed Apr. 23, 1875.]

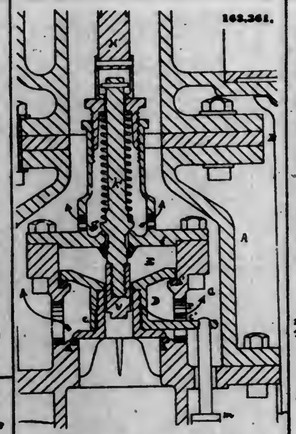


Brief.—Intended for travelers', soldiers', and sportsmen's use. The top or cover forms a dish or plate, and the whole, when assembled, may be placed in the haversack or game-bag.

1. A portable convertible meat can or vessel, consisting of a frying-pan, A, and a detachable food-plate or dish, B, arranged as a raised cover upon a flanged seat, c, on and around the rim of the pan, and a handle, d, hinged at one end to the pan, and conformed to and turned down upon the said raised cover, substantially as shown and described.

2. In combination with the frying-pan A and the removable dish or food-plate B, forming a raised cover on the pan, as described, a handle hinged at one end to the pan, and conformed to and extended across the said raised cover, and having its other end bent or shaped to and sprung over the rim of the pan, and thereby engaged with the latter, substantially as shown and described.

3. In combination with the frying-pan having the loop e thereon, and the detachable dish or food-plate constituting the raised cover on the pan, the handle hinged at one end to the pan, and conformed to and extended across the said raised cover, and having at its other end a carrying-loop, f, extended through the said loop on the frying-pan, substantially as shown and described.



162,860. DRIP-PANS FOR BARRELS. Jno. A. Clark, Newark, N. J. [Filed Sept. 2, 1874.]

The drip-pan C, having an imperforate or solid bottom inclined on the inside toward and provided with groove a, having spout b, and radial ribs d, substantially as and for the purpose set forth.

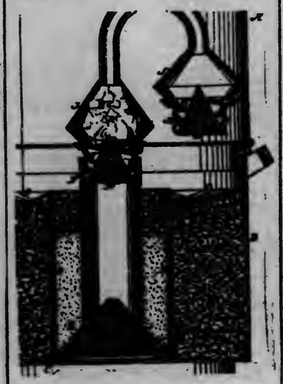
162,861. STREET-HYDRANTS. Gilbert H. Clemens and George C. Morgan, Chicago, Ill. [Filed Mar. 10, 1875.]

Brief.—The hydrant has a water-way extending above the discharge-pipe, and is provided with a loose cap to prevent obstruction; the valve-rod being constructed of part metal and part non-conducting substance, to prevent action of frost. The main valve is held in place by the pressure of water in the chamber above it. The secondary valve being raised, the water escapes to the water-way, while the main valve is lifted by the pressure of water beneath it.

1. A hydrant case or shell, made of two or more parts, A A', in combination with a non-conducting material, B, between the same, substantially as and for the purpose specified.

2. A valve-rod, made partly of metal, h h', and partly of wood, H, substantially as and for the purpose specified.

3. The main valve D, chamber E, and secondary valve g, in combination with the water-way G, substantially as and for the purposes specified.



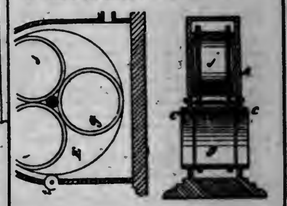
4. In a hydrant, the water-way G, extended above and combined with the outlet K, substantially as and for the purposes specified.

5. The loose cap J, in combination with the water-way G, substantially as and for the purposes specified.

6. The combination of the valve D, loose ring c, and arm c', with the drain-valve m, substantially as described.

162,862. WATER-FILTERS. C. B. Cooper, Nashville, Tenn. [Filed Apr. 10, 1875.]

Brief.—The water is admitted through the perforated cone in the shorting of the siphon, which prevents impurities from entering. It then flows through the sponge and perforated cone of the long leg into a vessel. From thence it passes through the perforated cone at the bottom into the space between the inner and outer vessels, and rises through the sand and gravel in said space, and overflows into the conserve ring. It percolates through the gravel and charcoal in said space, and flows out of the holes in the bottom into a receiver beneath.



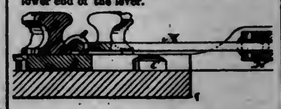
1. The siphon J, provided with a perforated cone, N, at the enlarged end of its short arm, and a sponge and perforated cone, K H, at the enlarged end of its long arm, in combination with the vessels F D C B A, substantially as herein shown and described.

2. The concaved and perforated ring-plate O, in combination with the vessels D C B F A, and with the siphon J and its attachments, substantially as herein shown and described.

162,863. DISTRIBUTERS FOR HYDRAULIC PIPES. John M. Crawford, Philadelphia, Pa. [Filed Mar. 10, 1875.]

Brief.—A disk rotates between the ends of the induction and adduction pipes. It is provided with one through section, one section to close the induction, and another section to close the exit pipe, and allow the water to flow through an escape-pipe. A pointer is placed on the outside of the disk-stem, to indicate the various positions of the disk.

1. A distributer or separator for hydraulic pipes, having the ingress and egress openings C C directly opposite each other, in combination with the diaphragm F, with its pipe-section g, for the purpose of conveying the stream directly through the distributer, without admitting it to the body of the distributer, substantially as above described.



2. The distributer A, with its openings C C and wasteway I, in combination with the diaphragm F, with its connecting pipe-section g, closed pipe-section j, and packed face K, arranged and operated substantially as and for the purpose described.

3. The distributer A, with its openings C C and rotating circular diaphragm E, in combination with the shaft s, crank u, and wheel t, substantially as and for the purpose above described.

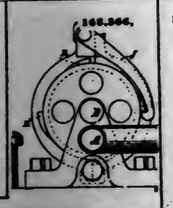
4. In combination with a distributer, A, having a rotating diaphragm, E, the index-finger W, substantially as and for the purpose described.

162,864. RAILWAY-SWITCHES. Minter H. Davidson, Prunytown, W. Va. [Filed Apr. 24, 1875.]

Brief.—An improvement in operating a vibrating frog-rail, consisting of a vibrating lever capable of longitudinal movement by means of a slot in said lever, through which a fulcrum-pin is passed; the lower end of the lever taking into holes in a plate, and being secured therein by a pin. The frog-rail is secured to the operating-lever by a link near the lower end of the lever.

An adjustable rail, E, with the plate D resting on the bed-plate A, having stops C and a lever, E, connected by bar M, the lever being changeable by means of the slot J and fulcrum-pin K and holes H', substantially as and for the purposes described.

162,865. RECIPROCATING CHURNS. G. De Nottbeck, New York, N. Y. [Filed Apr. 17, 1876.]



Brief.—The dasher is hung by a spring to the under side of the churn-cover.

The combination of the dasher F and spring G with the churn-body C and cover H, as shown and described, to operate as specified.

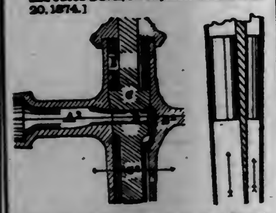
163,266.

163,266.

163,266. PNEUMATIC DESPATCH APPARATUS. Olney B. Dowd, New York, N. Y. [Filed June 13, 1874.]

Brief.—An improved circuit pneumatic dispatch apparatus having a circular receiver for the arrest of packages; a perforated revolving disk-receptacle for their introduction, operated by a lever, pawl, and ratchet; and branches for smaller carriers for way-stations.

1. The combination, with the dispatch-tube and pocket-disk, of ratchet-lever I, pawl J, retention K, and regulating stud-pin L, substantially as specified.



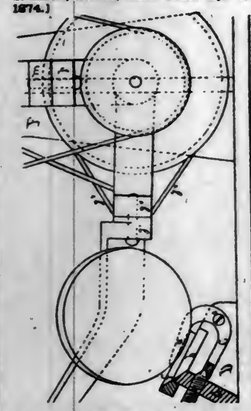
2. The dispatch-carrier H, composed of two caps, H O, and enlarged at the middle by a packing-band, P, substantially as specified.

3. The packing-band D, combined with the middle portion of the carrier, substantially as specified.

4. The pipe A, slotted at Q, and provided with branch R, as and for the purpose specified.

5. The cylinder or tank S, one or more conveve bottoms, T, and a discharging-trap, U V W, in combination with one or more conducting-pipes, entering the tank tangentially, substantially as specified.

163,267. FAUCETS. Stephen A. Dumas, Buffalo, N. Y., assignor to John Irlbacher and Jacob Davis, same place. [Filed June 20, 1874.]

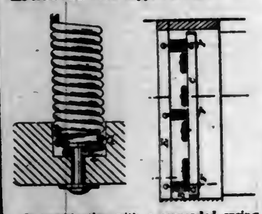


1. The combination, with a chamber, B², and a reciprocating-cylinder, D, located within, and formed in one piece with the said chamber, of the plug C, having the passage E, and surrounded by an annular space, B², provided with a section of a conical seat, A², and the series of holes B², all when constructed and arranged substantially as described, and for the use and purpose set forth.

2. The combination, with the chamber B², of the annular space B², provided with a part of a conical seat, A², around the main passage A², and the series of holes B², all when arranged substantially as and for the use and purpose set forth.

3. The combination, with the annular space or recess, B², serving to protect the seat of the faucet against the effects of compression of the chamber B², of a section of a conical seat surrounding the main passage A² only, substantially as described, and for the use and purpose set forth.

163,268. KNIFE-GRINDING MACHINES. J. S. Elliott, Chelsea, Mass. [Filed Apr. 6, 1874.]



1. The knife-block, constructed as described, with ends D, and inclined back, E, and a recessed top or knife-bed, *b*, and provided with a cam, C, constructed as described, and pivoted to the ends of the block, and with a screw, *c*, for operating the cam, substantially as described.

2. The curved guide L *g* A, or frame-guiding mechanism, in combination with base-supported stand F, and the pivoted swinging frame I, and guiding the latter, substantially as described.

3. The construction of the jointed connection of the beams, viz, the two cars *n* and *p*, or *q* and *p*, pivoted together, as shown, and having upon their adjacent faces the tongues *t* and stops *s*, substantially as described.

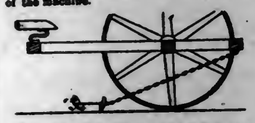
163,269. SPRING BED-BOTTOMS. J. Fowler, New York, N. Y. [Filed Mar. 13, 1875.]

Brief.—The lower coil of the spring is contracted to form a bearing for the head of the rivet, by which the spring is connected with the cross-rails which support the slats.

In combination with a suspended spring bed-bottom, the contracted coil E' of the springs, and the bolt or rivet F, applied to the cross-rails, substantially as shown and described.

163,270. IRONING-TABLES. P. H. Gaffney, Malden, Mass. [Filed Mar. 2, 1875.]

163,268.

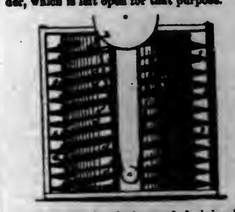


In combination with the skirt-board A, removably attached to a vertical support by the slotted brackets B B and studs C C, the hinged mortised arm *a* and hinged tenoned brace *a'*, said arm and brace operating together to support the board A while the latter is in use, or to be folded up against it under other circumstances, substantially as described.

163,272. CULTIVATORS. Elijah D. Corbam, Hadley, Ill. [Filed Apr. 12, 1875.]

Brief.—The colter and cultivating-shovel are attached to a shoe worn on the foot of the driver, who sits in rear of the axle-tree. Draft-chains connect the shoes to the front portion of the machine.

The foot cultivating-shoe described, consisting of the sole B, shovel *c*, brace *a*, colter *s*, heel support *e*, and set-screw *o*, all constructed, arranged, and operating, as and for the purpose set forth.



163,273. FIRE AND WATER PROOF COMPOSITIONS. Watson S. Gray and F. W. Gray, Philadelphia, Pa. [Filed Apr. 16, 1875.]

Brief.—A fire and water proof compound consisting of twenty-eight gallons coal-tar; five pounds rosin; four gallons dead-oil or benzine; ten pounds chlorate soda, soda-ash, or caustic soda; two gallons boiling water; two gallons shellac-varnish; twenty-five pounds air-slaked lime or dry clay; ten pounds soapstone, marble-dust, ground ore, or brick-dust; five pounds sulphate of iron.

The compound or composition of matter consisting of the ingredients herein set forth, and for the purpose specified.

163,274. MEDIA FOR DRYING AND DRAINING HOSE. Hiram Abraham R. Gelder, Minneapolis, Minn. [Filed Apr. 7, 1875.]

Brief.—Steam, either free or in tubes, may be introduced at the lower end of the cylinder, which is left open for that purpose.

1. A device for drying and draining hose by the application of heat, consisting of the combination of the cylinder *f* and the spiral shelves *g*, for the support of the hose *o'*, substantially as shown.

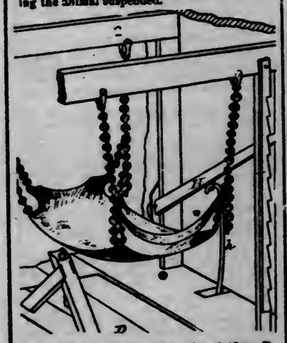
2. The combination of the cylinder *f*, shelves *g*, friction-rollers *h*, and a gearing for revolving the drying and heating cylinder, substantially as set forth.

163,275. WOODEN ROOFS. Leonard Henkle, Rochester, N. Y. [Filed Jan. 16, 1875.]

1. In a wood roof, composed of boards arranged side by side, the boards A A', having doubly inclined upper surfaces *a a'*, substantially as specified.

2. The combination, with a beard, A, having a double inclined upper surface, of the flanges *a* arranged and erected upon the lateral edges of the said board for the purpose of forming gutters *k*, substantially as specified.

163,276. MEDIA FOR DRYING AND DRAINING HOSE. Hiram Abraham R. Gelder, Minneapolis, Minn. [Filed Apr. 7, 1875.]

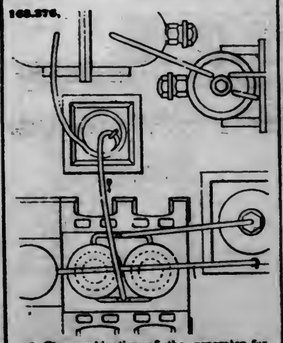


163,277. CORN-SHELLERS. F. H. Hunter, Heltonville, Ind. [Filed Apr. 3, 1875.]

The combination, with the corn-sheller formed of the cross-ribs B and bars A, of the sheet-metal plate D, the same being applied beneath the ribs, and having its ends bent up to form a receptacle for chaff, &c., as shown and described.

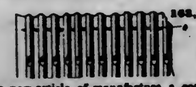
163,278. SLIDES FOR SHOEING ANIMALS. Lafayette M. Johnson, Forest City, Mo. [Filed Mar. 9, 1875.]

Brief.—A platform, which is also a part of the floor, is elevated a short distance above the level of the floor by means of cams and levers, in which position the animal is led onto it, when the sling is adjusted to support the weight. The platform is then lowered, leaving the animal suspended.



1. In a shoeing apparatus, the platform D for raising the animal while securing the suspending devices, substantially as described.

2. The combination of the movable section or platform D, cam-levers E E, connecting-bar G, rod A, lever H, and swinging ratchet-bar I, all constructed substantially as and for the purposes herein set forth.

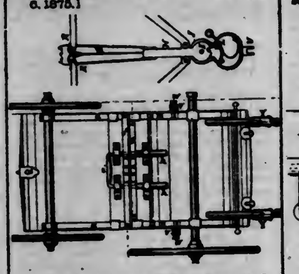


163,279. BLANKS FOR CORRUGATED-PAPER BOXES. Albert L. Jones, Brooklyn, N. Y. [Filed Apr. 10, 1875.]

163,276.

2. The combination of the generator for supplying gas under pressure with the pump or pumps for further compressing the same, and the refrigerator interposed between the pumps and generator, by which the gas is cooled and reduced in volume while under pressure, substantially as described.

163,279.



As a new article of manufacture, a corrugated-paper blank, cross-crimped at *b*, end-lapped at *d*, and notched at *e*, as shown and described.

163,280. BALE-TIES. William A. Jordan, New Orleans, La., assignor of one-half his right to C. S. Roudebush, Crystal Springs, Miss. [Filed Jan. 16, 1875.]

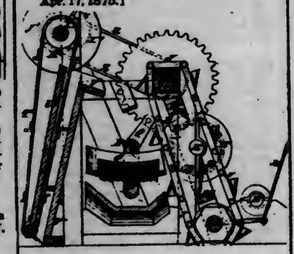
A bale-tie, from the raised portion of which lips extend forward over the band-seat, as and for the purposes set forth.

163,281. CHILDREN'S CARRIAGES. F. Herman Jury, New York, N. Y. [Filed Mar. 6, 1875.]

1. The combination of the spring-stop L with the notched and pivoted head I of the middle bow H and the case J, substantially as set forth.

2. The combination of the back and front bows with the middle bow and shifting inside braces O, for adjusting the back and front bows, all substantially as set forth.

3. The said braces, in combination with the slotted portion of bow H, by the stud-pins R and the headed spring S, substantially as set forth.



4. The combination of the folding handles, having locking-sleeves Y, with a carriage, substantially as specified.

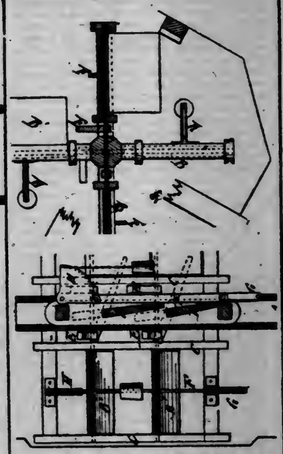
5. The backward-folding body, in combination with backward-folding frame-pieces a, substantially as and for the purpose set forth.

6. The combination of the sliding tapered handle A *d* with the spring-stops and the folding body and frame-pieces, substantially as specified.

7. The top detachably connected to the body by the notched stud U, sockets V, and binding-screws W, substantially as specified.

163,282. SAND AND GRAVEL SEPARATORS. Nicholas J. Keller, Pittsburg, Pa. [Filed Apr. 17, 1875.]

1. The combination of the concave inclined screen O, constructed as described, the inclined rock-shaft P, the rigid arm Q, the connecting-rod R, and the cam S, with the shaft H and elevator I J K, substantially as set forth.



2. The combination of the endless-chain pump or elevator T U V with the elevator I J K and rocking screen O, substantially as described.

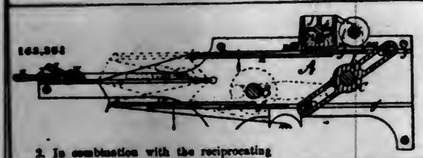
3. The combination of the inclined trough D, the box E', elevator F', and slide G' with the elevator I J K, the rocking screen O, and the endless-chain pump T U V, substantially as described.

4. The combination of the band Z, loose pulley B', ratchet-wheel H', pawl I', and wheel J' with the shaft Y, that drives the elevators T, U, V, and F', and with the shaft H, that drives the elevators I J K, and the screen O, substantially as herein shown and described, and for the purpose set forth.

163,283. WIND-WHEELS. J. J. Kimball, Naperville, Ill. [Filed Nov. 14, 1874.]

Brief.—Horizontal vanes are pivoted to and pendent from, horizontal rods arranged radially to a revolving vertical axis. There is also a stop-bar applied on one side of the baskets or vanes, to hold them to the wind, which is controlled by a weighted lever, and serves as a regulator

The combination, with the vanes B, pivoted horizontally, as shown, of the stop-bars F, pivoted and weighted segmental levers H, and links G, all as shown and described.



163,284. MACHINES FOR POLISHING THE EYES OF MACHINE-NEEDLES. Samuel C. Kingman, Bridgeport, Conn., assignor to Wheeler & Wilson Manufacturing Company, same place. [Filed Mar. 13, 1875.]

Brief.—The threads from the spools first pass under an agitator in a pan containing a mixture of oil and emery. Two reciprocating plates, operated through the medium of a double-slotted lever, are each provided with two projecting spring-arms, the ends of which are furnished with bearing-screws for the grooved rollers, around which the threads are once wound. A series of clamps, operated by cam-levers, secure the shanks of the needles. The levers can be simultaneously operated to release the clamps by a swinging plate pivoted to ears on the clamp carrier.

1. In a machine for polishing the end walls of the eyes of sewing-machine needles, the double reciprocating plates *f* and *f'*, and double slotted lever I, said plates fitted to slide freely in the grooves *g* and *g'*, respectively, and made to reciprocate in opposite directions at the same time by means of the oscillating motion of said lever, substantially as shown and specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

163,284

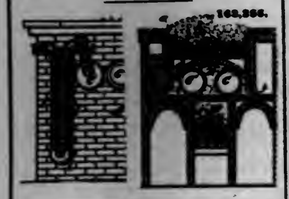
2. In combination with the reciprocating plates *f* and *f'*, the elastic arms *h h' h'' h'''* secured in pairs at one end to said plates, respectively, and the free ends of said arms extending from said plates, substantially as shown and specified.

3. In combination with the elastic arms *h h' h'' h'''*, the grooved rolls *i* and *i'*, fitted to revolve freely in bearings in the free ends of the said elastic arms, substantially as shown and specified.

4. In combination with the elastic arms *h h' h'' h'''* and rolls *i* and *i'*, the screws *o o' o'' o'''* passing through the free ends of said elastic arms, and against the ends of said rolls, for the purpose of regulating the tension of the working portions of the polishing-threads between said rolls, substantially as shown and specified.

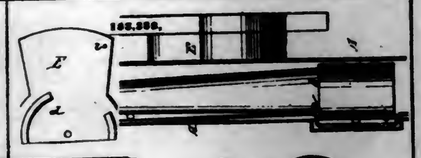
5. In combination with the reciprocating plates *f* and *f'*, elastic arms *h h' h'' h'''* and rolls *i* and *i'*, the plate *n* and the series of two or more lever-clamps, *v v*, and series of two or more cam-levers, *x x*, attached to said plate for the purpose of securing a series of two or more sewing-machine needles to said plate, said plate fitted to slide freely in the grooves *v v* in the frame A, and secured in the two positions in said grooves during the operations of rounding and polishing the upper and lower end walls of the eyes in said needles respectively, substantially as and for the object specified.

6. In combination with the reciprocating plate *f*, the spool-stand *m*, with the spools *l l*, pan *j*, and agitator *k* attached to said spool-stand, all constructed so as to be attached to or removed from said plate simultaneously, for the purpose specified.



7. In combination with the reciprocating plate *f'*, reel *g*, and ratchet-wheel *s* attached to said reel, the pawl *t*, as pivoted to the frame A or other stationary portion of the machine so to cause the point of said pawl to enter one of the teeth of said ratchet-wheel near the termination of the right-hand reciprocating motion of said ratchet-wheel, and revolve the same the distance of one or more teeth during the remaining portion of said motion, substantially as and for the object set forth.

8. In combination with the plate *n*, series of two or more lever-clamps, *v v*, and the series of two or more cam-levers, *x x*, the swinging plate *y*, as pivoted to said plate so as to operate the said lever-clamps and cam-levers simultaneously, when it is desired to release the series of needles from said plate, substantially as and for the object specified.



9. In combination with the double lever I and reciprocating plates *f* and *f'*, the rock-shaft C, lever G, connecting-rod H, disk F, and revolving shaft B, constructed and arranged for the purpose of imparting an oscillating motion to said double lever, and reciprocating motions to said plates, substantially as and for the object specified.

10. The combination of the frame A, revolving shaft B, disk F, connecting-rod H, lever G, rock-shaft C, double lever I, reciprocating plates *f* and *f'*, elastic arms *h h' h'' h'''*, rolls *i* and *i'*, plate *n*, series of lever-clamps *v v*, series of cam-levers *x x*, swinging plate *y*, spool-stand *m*, pan *j*, agitator *k*, spools *l l*, reel *g*, ratchet-wheel *s*, and pawl *t*, all constructed and arranged for the purpose of rounding and polishing the end walls of the eyes of sewing-machine needles, substantially as and for the object set forth.

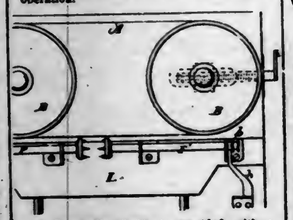
163,285

163,286.

163,285. GAS APPARATUS. John D. Kutz, Sunbury, Pa. [Filed Apr. 20, 1875.]

Brief.—Places the vaporisers in an open chamber, and regulates their temperature by heaping on more or less sand. Catches the drip at the outlet of the vaporizers, while the gas passes on into the fixing retorts.

1. In combination with the furnace of a gas apparatus, the heating-chamber *a*, containing the vaporising-tubes B, and a body of sand surrounding said tubes, whereby the heat is equally distributed, and is regulated in degree, substantially as and for the purpose set forth.



2. The combination of open heating-chamber *a*, containing sand-covered vaporiser B, retorts C C' arranged below said vaporiser, and connected therewith by pipe h, and a dripseal connected to the under side of projecting portion *b'* of outlet-pipe *b* of the vaporiser, as shown and described.

163,286. ARTIFICIAL STONE. Hans Lemon, James A. Cameron, and Hartsell Hainer, Memphis, Tenn. [Filed Dec. 19, 1874.]

Stone made of sharp sand, cement, dolomite limestone, powdered chalk, litharge, hickory-wood ashes, mixed with silicate of soda, and lime-water, when all these ingredients are used in combination, in the proportion hereinbefore stated, and the mode of treating the stone by warm baths of silicate of soda and lime-water alternately and washing in lime, substantially as and for the purposes described.

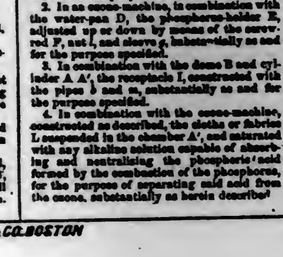
163,287. MACHINES FOR CUTTING CORKS. Geo. S. Long, Forestville, Conn., assignor of two-thirds his right to Burton Allen, 2d, Norman Allen, and Henry W. Porter, same place. [Filed Sept. 8, 1874.]

Brief.—Straight or tapering corks can be cut by means of an endless smooth-edge knife, in connection with a laterally-adjustable carriage provided with two revolving spindles, between which the blank is held during the operation.

1. The endless knife A, provided with a continuous sharp cutting-edge, and running over pulleys B B, substantially as and for the purposes set forth.

2. The combination of the endless knife A, pulleys B B, spindles F F', shipper *b*, cam *h*, and carriage I, substantially as described, and for the purposes set forth.

163,288. WHIP-SOCKETS. Jacob J. Markel, Nankin, Ohio. [Filed Apr. 19, 1875.]

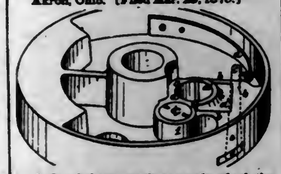


Brief.—The whip may be used without removing it from the socket.

1. The combination of tubular whip-socket A, having box B, with the spring C, having shoulder *c*, for supporting and locking the whip, substantially as set forth.

2. In a whip-socket fastening, plates E and G, pivoted together, in combination with an interior spring, for the purposes set forth.

3. The combination of the recessed plate E, having the groove *e* and hub *f*, the plate G, having flange *d* and pin *f*, and the spring A, all substantially as and for the purposes set forth.



163,289.

163,289. ROCKING-CHAIRS. James W. McDonough, Chicago, Ill. [Filed Jan. 12, 1875.]

The combination of the tilting-arms D D, pivoted to the seat B, the catch E, pivoted to one of the said arms, the notched plate C, attached to the seat, the tilting back F, pivoted to the seat, the foot-rest G, also hinged to the seat, and the flexible connecting-pieces H H, attached to the back, arms, and foot-rest, all arranged and operating together substantially as shown and described, and for the purposes set forth.

163,290. CRANK-WHEELS. Lewis Miller, Akron, Ohio. [Filed Mar. 29, 1875.]

1. In a balance crank or crank-wheel, the combination, with the wrist-pin box, made in two parts—the one, *a*, permanent, and the other, *a'*, adjustable—of the key *c* and holder *d*, as and for the purpose described and represented.

2. In a balance crank or crank-wheel, the oil cup or holder *f*, cast in or on the crank, in combination with its cap, plug, and opening *g*, and the wrist-pin box, as and for the purpose described and represented.

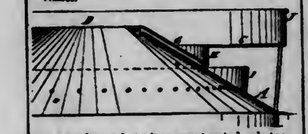
163,291. OZONE-MACHINES. Geo. Milton, Buffalo, N. Y., assignor of two-thirds his right to E. Spondelow and F. W. Bartlett, same place. [Filed Feb. 23, 1874.]

1. The combination of the cylinders A and A', the hollow legs or pipes *a a*, with air-openings *c c*, the air-baffle *f*, with air-holes *n n*, the gutters R, and base Z, constructed to operate as and for the purpose herein described.

2. In an ozone-machine, in combination with the water-pan D, the phosphorus-holder E, adjusted up or down by means of the screw-rod F, nut *l*, and sleeve *g*, substantially as and for the purpose specified.

3. In combination with the dome B and cylinder A A', the receptacle I, constructed with the pipes *b* and *m*, substantially as and for the purpose specified.

4. In combination with the ozone-machine, constructed as described, the cloths or fabrics L suspended in the chamber A', and saturated with any alkaline solution capable of absorbing and neutralising the phosphoric acid formed by the combustion of the phosphorus, for the purpose of separating said acid from the ozone, substantially as herein described.



163,291.

5. In an ozone-machine, the combination of the septums *p p* and the saturated diaphragms B, situated in the upper part of the apparatus, and forming a compartment or chamber communicating with the air-inlet openings *n n*, in order to introduce the air below the said septums *p p* and diaphragms, substantially as and for the purpose set forth.

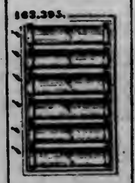
163,292. SUGAR SKIMMERS AND COOLERS. John L. Morgan, Savannah, Ga. [Filed Apr. 24, 1875.]

Brief.—A tight fitting cover applied to the top of the pan allows the froth of the boiling juice to pass up the inverted funnel-shaped cone, and through the opening. Falling back upon another cone, which is perforated, the liquid drains back, cooled and clear, into the vessel.

A cooler and strainer constructed substantially as described—that is, having a large cone, A, with perforations and flanges for the boiler, stop flanges H and I, a short perforated cone, G, horizontal part C, aperture D, and rim-flange J, for the purposes described.

163,293. TRUCKS FOR BRICK-YARDS. Edward Noonan, La Salle, Ill. [Filed Apr. 10, 1875.]

Brief.—The truck is particularly adapted for brick-yards. The shafts are easily detachable and attachable, so that one pair may answer for two trucks, one truck being drawn while the other is being laden.



1. The combination of the wheels A, the axles B, the springs C D, the body E, the platform F, and the cross-bars, king-bolt, and washers G I H J, substantially as set forth.

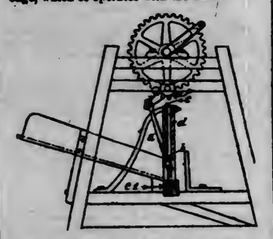
2. The combination of the bars K and the flanged hooks L with the platform F, and the shafts M, substantially as set forth.

163,294. SPICE-BOXES. Edwin Norton, Chicago, Ill. [Filed Nov. 12, 1874.]

The top *a* of a spice-box, formed with shoulder *n*, the depressed portion having perforations *d*, stud *h*, and flange *g*, in combination with the swinging cover *b*, pivoted at *c*, and having flange *f*, and recess *i*, all as and for the purpose set forth.

163,295.

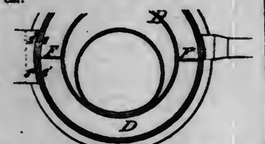
163,296.



163,295. PACKING CIGARS. Edwin Norton, Chicago, Ill. [Filed Apr. 14, 1875.]

As an improvement in packing and preserving the integrity and aroma of cigars, the process of isolating each cigar within a separate rigid case, as described.

163,296. FEED-CUTTERS. Jacob B. Nye and John W. B. Nye, Swatara P. O., Pa. [Filed Sept. 26, 1874.]



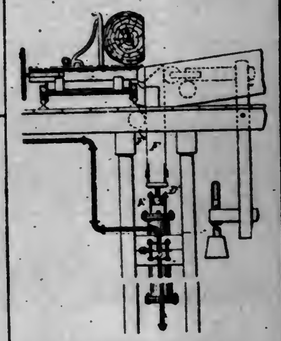
Brief.—The reciprocating cutting-knife is guided between two vertical plates provided with openings, through which the material is fed and delivered. The bottom edge of the opening in the inner plate forms a cutting-edge, which co-operates with the knife.

The guide-plates *c d*, the former being provided with the cutting-edge *c'*, in combination with the knife *b*, pitmen *a e*, and crank-shaft *g*, as and for the purpose set forth.

163,297. CAR HEATERS AND VENTILATORS. J. Oliphant, Allegheny, Pa. [Filed Sept. 26, 1874.]

Brief.—The draft through one of the openings is direct, but when admitted through the other opening it is compelled to pass over the partitions. The water-trough fills the annular air-space horizontally. The flange in the blower creates an eddy in its rear, which facilitates the escape of dirt. The vertical flues admit air both to the top and bottom of the car.

1. The combination of the jacket C, inclosing the annular air-space D, partitions F F', openings *g g'*, and slides *g' g'*, substantially as and for the purpose specified.



2. The flange E, encircling the base of the heater B, and forming, with the wall of the latter, an annular open-top trough, in combination with the jacket C and air-space D, conducting air to the interior of the car, substantially as described.

3. In combination with the car-heater, the blower H, constructed with a sloping bottom and bottom opening, and provided with a vertical flange at its lower edge, as and for the purpose specified.

4. In combination with an apparatus for heating and ventilating cars, a series of vertical flues, rising at every seat or pair of seats from a floor-line, and provided with registers at top and bottom, substantially as shown and described.

163,298. LOG-TURNERS FOR SAW-MILLS. J. Orm, Paducah, Ky. [Filed Apr. 19, 1875.]

Brief.—The turning-bar is attached to the piston-rod of an oscillating steam-cylinder, and is operated by the direct action of steam upon the piston.

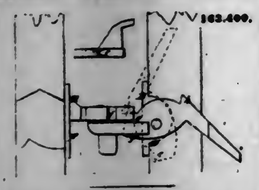
1. In a log-turning device, the spike-bar F, having spikes F', in combination with the piston-rod I'' and piston-head D''' of a steam-cylinder, A, constructed and operating substantially as and for the purposes described.

2. The oscillating steam-cylinder A, having trunnions *a*, and provided with piston-head D''', piston-rod D'', and opening *c'*, in combination with the spike-bar F, reciprocating in directions differing from a perpendicular line, to suit the different sizes of logs to be acted upon, substantially as and for the purposes described.

3. The swinging or oscillating bar I, arm I', having guide-wheel H' attached thereto, and bearing upon the supporting-wheel D', and arm J, supporting weight K, in combination with the reciprocating and oscillating spike-bar F, substantially as shown and described.

163,299. DIES FOR FORMING HATCHET-CLAWS. James Palmer, Newark, N. J., assignor to Charles A. De Hart, same place. [Filed Apr. 17, 1875.]

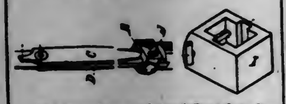
Brief.—The plunger is provided with a small roller on each side near the end—one to operate against the vertical side of the recess in the die, and the other to draw down and form the claw of the hatchet against the opposite side, which is suitably grooved for the purpose.



In the device for forming a hatchet-claw the combination of the bed A and plunger C, substantially as shown, and for the purpose specified.

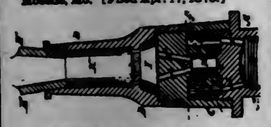
163,300. LOCK-HINGES FOR BLINDS AND SHUTTERS. Abijah S. Parker, Binghamton, N. Y., assignor to the Parker Manufacturing Company, same place. [Filed Dec. 7, 1874.]

Brief.—On one leaf of the hinge is a circular flange with notches, and on the other is a pivoted catch-lever. The short end of the lever drops into the various notches of the flange, and thus secures the blind either wholly or partly open, and also shut. The short arm of the catch-lever is formed wedge-shaped, so as to draw the blind toward the frame and prevent rattling.



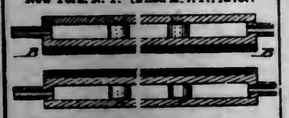
The beveled catch *g*, in combination with the notch *e*, for the purpose of drawing the blind closely into place in the act of fastening, as specified.

163,400.



163,401. SCREW-DRIVERS. Wm. F. Patterson, Boston, Mass. [Filed Apr. 27, 1875.]

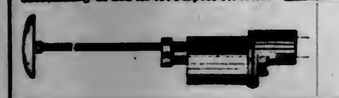
Brief.—The screw-driver is provided with two supplemental reversible blades, pivoted upon the main blade at such point as to have a common center of motion, and secured in place by an internally-slotted and sliding clamp, provided with an eccentric shaft, which fits into suitable slots formed upon one edge of each of the blades.



In a screw-driver, substantially such as described, the blade B, provided with the reversible auxiliary blades U D, and the clamp I, provided with the mortise H, and the eccentric shaft J, all constructed and arranged to operate substantially as and for the purpose set forth and specified.

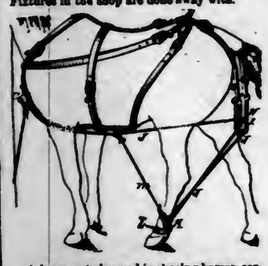
163,402. GAS-BURNERS. Coleman D. Payne, Mocsalla, Mo. [Filed Apr. 17, 1875.]

An improved gas-burner, formed by the combination of the part A, provided with the circular projection *a'* and the holes *a''*, the part C, provided with the circular projection *f'* and the holes *f''*, the tube F, provided with the holes *f'*, the part D, provided with the perforated plate J, and the tip E, with each other, to form the five chambers B G H I K, for the gas to pass through, substantially as herein shown and described.



163,403. LOCKING-DEVICE. Philipp Pfeffer, New York, N. Y. [Filed Apr. 17, 1875.]

In an apparatus for drying lumber, the combination of hollow steam-heated press-plates A and face or lining plates B, having perforations and connecting channels between press-plate and lining, for conveying and issuing of the moisture of the lumber by the action of the press, substantially as herein shown and described.



163,404. REPLACEMENTS FOR LOADING FIRE-ARMS. O. D. Phillips, Lisle, N. Y. [Filed Apr. 24, 1875.]

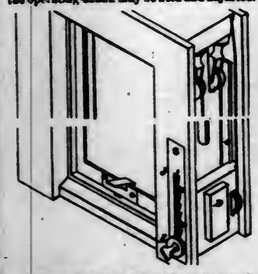
An implement for charging muzzle-loading guns, composed of a perforated muzzle-fitting cup-piece, revolving, and a spring-locked cylinder, with barrels or chambers, and a sliding rod for transferring the charge to gun-barrel, substantially as and for the purpose set forth.

163,405. HORSESHOEING-HARNESS. Isaac P. Pickering, Table Grove, Ill. [Filed Apr. 24, 1875.]

Brief.—The animal's foot is held up by the harness, relieving the smith of all weight. Fixtures in the shop are done away with.

A harness to be used in shoeing horses, constructed substantially as described—that is, consisting of the breast-backle C, back or rump ring E, U-shaped piece H, pulley I, draft-strap J, fetlock-piece L, and pulley K, with the straps connected therewith.

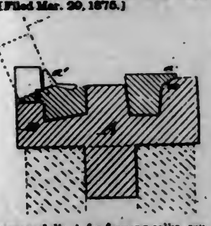
163,406. MACHINES FOR REMOVING BROKEN DRILLS FROM HOLES. John W. Platt, Mineral City, Nev. [Filed Mar. 26, 1875.]



1. The jaws A, tapered and beveled as shown, in combination with the stem C, case D, handle F, and operating-nut E, substantially as herein described.

2. The transverse cylindrical head *b* of the jaws A, in combination with the stem C, said head fitted to slide into a hole in the lower end of the stem C, and retained in place by the case D, substantially as herein described.

163,407. BASH-BALANCES. John J. Prior, San Francisco, Cal., assignor of one-half his right to Philo N. Tryon, same place. [Filed Apr. 2, 1875.]



Brief.—The counterbalancing-weight of the upper sash of a window is so constructed and arranged that it will slide freely in guide-ways inside the window-casing. To this weight is attached a shank, passing through a long vertical slot in the face of the casing, which shank terminates in a lifting button or handle, whereby the weight is slid up or down, and operates the sash, and there is preferably a slotted rack-plate, in the notches of which the operating-shank may be held and adjusted.

1. In combination with a balanced sash, the shank K, passing through the slot O in the casing, and fastened to the weight D inside of the casing, and provided with the button or handle L on the outside of the casing, substantially as and for the purpose described.

2. In combination with the sliding weight D and lifting-button L, operating through a slot, O, in the casing, the slotted rack-plate J and locking-shank K, substantially as and for the purpose described.

163,408. DIES FOR FORMING HORSESHOE-CALKS. Leonard Prichard, Sweet Valley, Pa. [Filed Mar. 20, 1875.]

The improved die A for forming calks, constructed substantially as herein described and shown, with a groove having tapering sides and an inclined edge, *a*, upon which to form the flange *a'*, and a second groove having a vertical wall with a notch cut in the center, into which a portion of the flange is driven to form the spur on the calk.

163,409.

163,409. CAR-AXLE BOXES. G. T. Bacul, Tangipahoa, La. [Filed Feb. 9, 1875.]

1. The bearing A, in combination with the removable lining B and basin D, as described, and for the purpose set forth.

2. The housing C, having flanges *g* and *b'*, in combination with pad *i*, leather flange *c*, and spring *d*, as described, and for the purpose set forth.

163,410. MEASURING DEVICES FOR KNITTING-MACHINES. James Folk Reisinger, Ashland, Ohio. [Filed Dec. 20, 1874.]

Brief.—A standard with a socket for holding the arms and supporting the spring tape-measure and the fastening device.

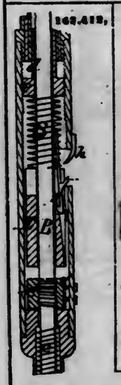
The combination of the spring tape-measure, the supporting-standard, and the fastening device, substantially as described.

163,410.

163,411.

163,411. DOOR-MATS. Orrin Rice, Adrian, Ill. [Filed Mar. 1, 1875.]

Brief.—The rubber ring embracing wick tube and adjuster holds the latter in place.



1. A miner's lamp, having sponge-filled body A, the central spirally wire bound well B, and the funnel-shaped neck-tube E, constructed and arranged as shown and described.

2. The combination of the adjuster G and the rubber ring, with the wick-tube, substantially as specified.

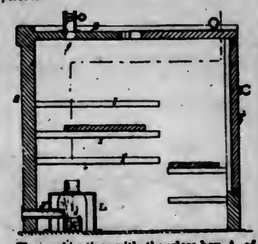
3. The combination of spring L, with the hook J, substantially as specified.

A door-mat formed of the back piece having screw-threaded cavities, and the tufts or bunches of corn-husks secured therein, as shown and described.

163,412.

163,414.

163,412. DENTAL PLUGGERS. R. S. Rider, Catlettsburg, Ky. [Filed Feb. 6, 1875.]

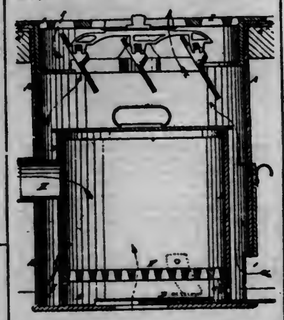


Brief.—On a continuous rod, which serves as both a push and pull plugger, an anvil is adjusted upon a screw-thread, and held from rotating by set-screws inserted in the side of the tubular casing. The tension of the forcing-spring is adjusted by a screw-follower with square tube, which passes over the square stem of a screw-cap.

1. In a dental plugger, the reciprocating rod B, adjustable anvil *c'*, catch *g*, having lip *g'*, and springs *g'*, *f*, and *e*, in combination with the grooved sliding hammer E and slotted tube A, having the tongue *h*, substantially as described, and for the purpose set forth.

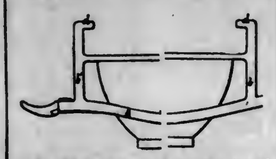
2. The reciprocating rod B, carrying the sliding hammer E and spring S, in combination with the screw-follower *s*, having square tube *d*, square stem *c'*, and screw-cap *b*, substantially as described, and for the purpose set forth.

163,413. PORTABLE MEDICATING HOT-VAPOR BATHS. Robt. R. Roberts, Hot Springs, Ark. [Filed Oct. 31, 1874.]



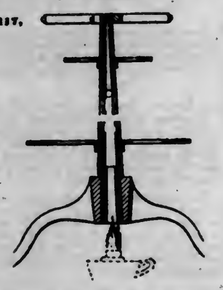
Brief.—An air-inlet is arranged by a tube opening upon the flame of the lamp, whereby circulation of fresh air is maintained, and warmed before coming in contact with the person.

The combination, with the close box A, of the open-ended arch I, the lamp K, and a pipe, N, discharging directly into the flame of said lamp, as shown and described, whereby is secured a healthy circulation of air in the box, while said air is warmed before coming into contact with the person of the bather.



163,415. CAR AND CARRIAGE HEATERS. J. Schmitt, Williamsburg, N. Y. [Filed Mar. 20, 1875.]

Brief.—The springs counteract concussion, and the short exit-pipe sliding in the discharge-pipe allows slight horizontal movement of the fire-pot.

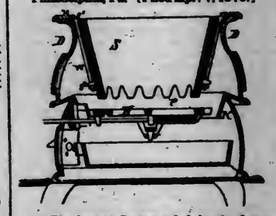


In heaters that hang below a car or coach, the fire-pot D having short pipe H opening into a discharge-pipe at one side of case A, and held by springs in position, as shown and described.

163,416. TOOLS FOR KITCHEN USE. Jos. A. Simonds, Washington, N. H. [Filed Mar. 6, 1875.]

The improved tool above described, formed of the arms A A', hinged together at *a*, each arm having the two uprights *b b'*, connected together by a cross-piece, *c*, and each arm being curved outward between the uprights, as shown.

163,417.

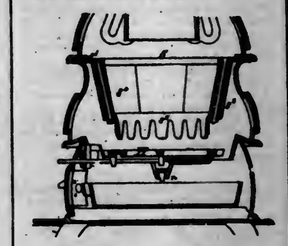


163,417. PLANT-PROTECTORS. Martha B. Slocum, Hornellsville, N. Y. [Filed Apr. 24, 1875.]

Brief.—A hollow standard is supported upon legs high enough to admit a lamp beneath. The standard tapers toward the top, and is perforated along the sides, and is provided with shelves for receiving the flower-pots. A cross-piece is placed upon the top of the standard to support a bead, in order to prevent the escape of heat and moisture.

A device for protecting plants against freezing, composed of a hollow tapering standard with heat-issuing apertures, plant-supporting shelves, and top cross-piece, the whole arranged and applied, substantially as and for the purpose set forth.

163,418. FIRE-POTS FOR STOVES. J. Spear, Philadelphia, Pa. [Filed Apr. 7, 1875.]

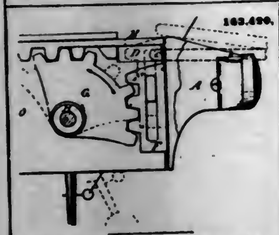


1. The fire-pot S, suspended, by the flange *s'*, from the section D of the wall of the stove, in combination with the supporting-bolts W, connecting the flange *s'* with the lugs *s''*, for the purpose of supporting the lower section of the fire-pot when cracked off, substantially as herein described.

2. The suspended fire-pot S, made in rings, and suspended by the flange *s'* from the section D of the wall of the stove, in combination with the supporting-bolts W connecting the flange *s'* with the lugs *s''*, substantially as herein described.

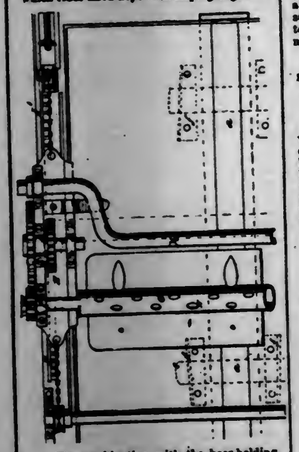
3. The suspended fire-pot S, having its discharge end notched or fingered, in combination with the bolts W connecting the upper flange *s'* and the lugs *s''*, substantially as and for the purpose herein described.

4. The combination of the suspended fire-pot S, having its discharge end notched or fingered, the bolts W connecting the top and bottom of the fire-pot, the clinker-cleaning opening P, and the upper and lower sections with mica lights O and D, as herein described.



163,419. STOVES. J. Spear, Philadelphia, Pa. [Filed Apr. 7, 1875.]

The combination, in a suspended fire-pot, S, of the lower section *s'*, the casing *s''*, the fire-brick lining *s'''*, and the bolts W, connecting the upper flange *s'* with the lower section *s'''*, substantially as herein described.



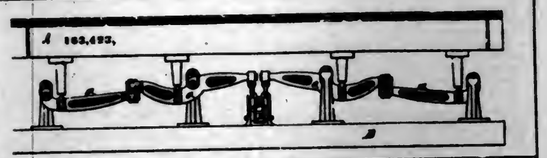
163,420. CAR-COUPLINGS. John G. Strickland, Palo, Iowa. [Filed Oct. 31, 1874.]

The mechanism for coupling and uncoupling railroad-cars, consisting of the box A, with its bumper B, provided with the coupling-notch D, in combination with the segmental rack G, horizontal lock-bar E, vertical bolt F, and levers I, all substantially as and for the purpose set forth.

163,491. BEER-COOLING. Wenzel Toepfer, Milwaukee, Wis. [Filed Mar. 20, 1876.]

Brief.—Air is forced through the revolving of a fan, which is reciprocated horizontally on trucks over the beer-vat. A pipe for cool air, also carried by the truck, passes through the beer. The bottom plates of the vat are fastened together by placing their adjacent edges in a groove between two intervening plates, and forcing the plates together by a clamp, which rides fixed keys with sloping edges.

1. The combination, with the beer-holding vat, of a fan having a hollow perforated shaft and pipe-connections for receiving cold air, and also of contrivances for reciprocating and revolving the fan over the beer, substantially in the manner described.



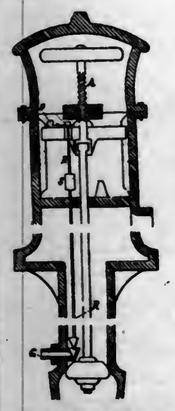
2. The reciprocating trunks E, hollow and perforated fan and the hollow water-conductor X, combined with a beer-vat, substantially in the manner described.

3. The combination of the strips *a b*, clamp *c*, and keys *f* with the bottom plates *a b*, secured together by bolts, in the manner described, for fastening them together.

163,492. LIFE-PRESERVER. Adolph Traub, New York, N. Y. [Filed Mar. 13, 1876.]

A life-preserver provided with long fins E E, tapering to points E I, and held by elastic straps F F, as and for the purpose specified.

163,493. RAILROAD-TRACK SCALES. John H. Usher, Buffalo, N. Y. [Filed Nov. 21, 1874.]



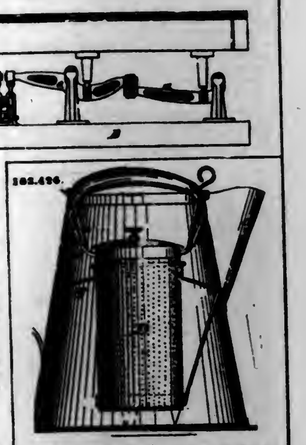
The series of longitudinal connecting and multiplying levers *a a a*, arranged under the platform-stringers A B, to operate independently, substantially as and for the purpose specified.

163,494. METHODS OF BOOKING GOLD-LEAF. John Varley, New York, N. Y., assignor to Stephen Hickcox, same place. [Filed Mar. 20, 1875.]

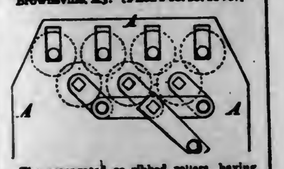
The method herein described of booking gold-leaf, consisting in applying each leaf to a perfectly-dried sheet of tissue-paper or other suitable backing, and then subjecting the same to heavy pressure, substantially in the manner shown and described.

163,495. ATTACHMENTS TO STREET-HYDRANTS. Charles M. Vergnes, New York, N. Y., assignor of one-fourth his right to Clinton W. Sweet. [Filed Apr. 2, 1875.]

Brief.—When the main screw raises the valve to its greatest elevation, the hydrant is closed and the cross-piece raised, and the catch being closed holds up the small rod, and leaves the waste-pipe open. By swinging back the catch the valve may move irrespective of the small rod, and the hydrant remains full. The cylinder on the small rod acts to close the hole through which it passes, and also as a weight.



The arrangement of the rod B E with the cylinder S, put in motion by the main screw A, and the catch D, regulating the action of the waste-pipe G, substantially as described.



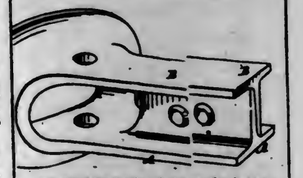
163,496. COFFEE-POTS. Sumner P. Webber, Charlotte, Mich. [Filed Apr. 10, 1876.]

Brief.—Particles of coffee escaping from the detachable strainer are retained below the fine annular strainer. The former is retained in position by spring at the top and a ring and legs at the bottom.

The combination of a coffee-pot having an annular stationary strainer at the inside below the spout, with a detachable coarser strainer for the ground coffee fitted therein and retained at some distance from the bottom by legs and at the top by wire springs, substantially as set forth.

163,497. WASHING-MACHINES. S. Wells, Brownsville, Ky. [Filed Feb. 12, 1876.]

The corrugated or ribbed rollers, having journals working in vertical slots in the side-box A, the rollers B supporting the former, and provided with parallel cranks connected by a bar and operated by an extended crank-lever, all combined as shown and described.

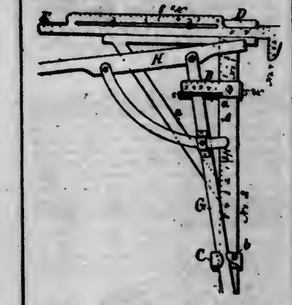


163,498. HARROWS. Addison H. Whiteside, Oswego, Ill. [Filed Apr. 10, 1876.]

Brief.—The harrow-teeth are bent at right angles, and pass through the timber-beams in an oblique direction, and are held in place by angular staples, one end of which passes through the beam at right angles, and so located as regards the teeth that they are held perpendicular to the beam when the draft is in one direction, and incline backward when drawn in the other direction.

1. A harrow-tooth connected to the beam by a right-angled arm at the upper end, fitted in a hole oblique to the cross-section of the beam, substantially as specified.

2. The combination of the staple C, having the outward swell and rearward extension, as described, with a harrow-tooth connected with the beam by a right-angled arm of the upper end, in a hole oblique to the cross-section, substantially as specified.

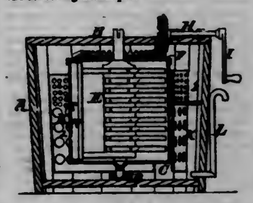


163,499. CAR-COUPLINGS. John T. Wilson, Pittsburg, Pa. [Filed May 5, 1876.]

The draw-bar having the strengthening portion *a a* thereof made solid with the top and bottom bars A B, substantially as and for the purpose set forth.

163,500. GAGES FOR SHAPING WAGON-AXLES. Daniel R. Winter, Newton, Iowa. [Filed Dec. 1, 1874.]

Brief.—The device is intended to assist carriage-makers in giving the proper bend to axles.



1. The instrument composed of the bars A, B, D, E, G, and H, loops C and *c*, and graduated scales Nos. 1, 2, 3, 4, and 5, substantially as and for the purposes shown and described.

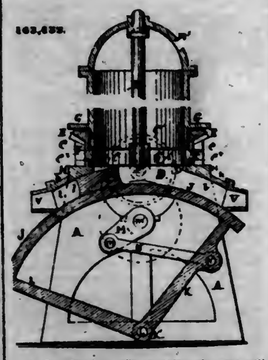
2. The method of ascertaining the required angle of the axis of a spindle, relative to the axis of a carriage-axle, substantially as set forth, and illustrated.

163,501. ICE-CREAM FREEZERS. Lucien B. Woolfolk, Lexington, Ky. [Filed Oct. 24, 1874.]

Brief.—Salt is kept at the top of the brine, while the ice may sink to the bottom of the tub, and may or may not pass beneath the cream-holder. Scraper pivoted on a beveled surface fits a tub of any slant. Outlet-pipe withdraws brine from bottom, and maintains its level to cover the salt. Beater may revolve with cream-pot, but when pinned by M is stationary, and its scraper N operates against the revolving cream-pot.

1. The segments K, in combination with the tub A, the cream-bucket C, the waste-pipe L, the beater E, hinged bar M, cogs F', cog-wheel G, shaft H, and crank I, substantially as set forth.

2. The salt-compartments 1 1, in combination with the ice-compartments 2 2, the tub A, and cream-bucket C, for the purpose mentioned.



3. The ice-compartments 2 2, extending down to the bottom of the brine, in combination with the salt compartments 1 1, the tub A, and the cream-bucket C, as described.

4. The ice-compartments 2 2, extending down to the bottom of the brine, in combination with the salt-compartments 1 1, the tub A, and cream-bucket C, and the waste-pipe L, as described.

5. The scraper N, having a beveled knife-edge, and pivoted at its center to the beater-frame, which is beveled, to permit of sidewise adjustment of the scraper, substantially as herein set forth.

163,502. BRICK AND TILE MACHINES. Chas. D. Wrightington, Fairhaven, Mass. [Filed Apr. 15, 1874.]

Brief.—A reciprocating segment extends the entire length of and forms the bottom of the hopper. This segment has a projection on its outer surface, which operates as a piston for forcing the clay into the mouth-piece.

1. In a brick or tile machine, the pug-mill A', the lower part of said pug-mill or hopper being formed by the rim of the driving-gear E, or by an extension of said rim, or by an annular ring, connected to the said gear E, substantially and for the purpose set forth.

2. In a brick or tile machine, the mud-box or compressing-chamber, having the piston or plunger I secured to the rocking or oscillating segment J J, the latter forming the bottom of said mud-box, and the two having a movement in unison, for the purpose set forth.

3. The combination of the pug-mill or hopper A', having the flange G G, with the posts F F F F, and the bottom plate H H, for the purpose set forth.

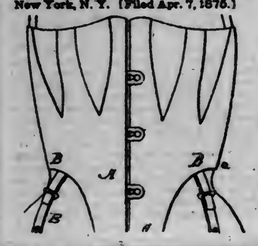
4. The combination of the pug-mill A', having a flange, G G, with the bevel-gear E, the pinion E', the annular ring *e e*, the inclined radial blades C C C C, and the shaft B, for the purpose set forth.

5. The combination of the bevel-gear E, the rim thereof forming the lower portion of the pug-mill A', and the pinion E', with the inclined radial blades or propellers C C C C, for the purpose set forth.

6. The combination of the bevel-gear E, having the annular ring *e e*, with the friction-rollers *a a a a*, for the purpose set forth.

7. The combination of the bevel-gear E, the pinion E', the annular ring *e e*, and the radial inclined blades C C C C, with the bottom plate H H, as described, and for the purpose set forth.

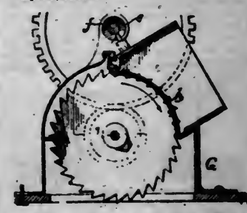
8. The combination of the gear E, the annular ring *e e*, and the radial inclined blades C C C C, with the mud-box D or other receptacle for the clay, as described, and for the purpose set forth.



9. The combination of the pug-mill A' with a segmental mud-box, D, as described, and for purpose set forth.

10. The combination of the mud-box D and the mouth-piece V V with the piston I and the oscillating segment J J, as described, and for the purpose set forth.

11. The combination of the oscillating segment J J, the radial arms K K, and the hub K', with the side frames A A and the bottom plate H H, as described, and for the purpose set forth.



12. The plunger I, oscillating upon the arc of a circle from end to end of a mud-box, and under the main shaft B, as and for the purpose described.

163,503. CORSETS. Josephine N. Ames, New York, N. Y. [Filed Apr. 7, 1875.]

The corset, having its body A B cut and constructed with its bottom flaps *a b* curved in the manner shown and described, for the purposes set forth, and having the shoulder straps and braces D D, the connecting-straps and buckles C, skirt-supporting straps and buckles E, all constructed, combined, and arranged as specified and shown.

163,504. MILLS FOR GRATING COCOA-NUTS. Jno. P. Anderson, Philadelphia, Pa. [Filed Apr. 6, 1876.]

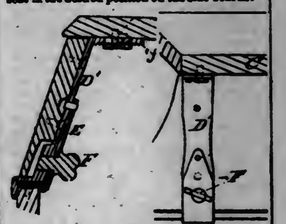
1. The combination in a grating-machine of a series of circular saws, with a slotted segmental shield, substantially as and for the purpose described.

2. The combination of the series of circular saws, and the slotted segmental shield, with a reciprocating hopper, H.

3. The combination in a grating-machine of the circular saws, hopper H, shaft *f*, and scroll cams *c*, whereby a reciprocating movement is imparted to the hopper.

4. The adjustable shield G and its slotted plate A, in combination with the saws, as set forth.

5. The combination of the saws with the slotted stripper-plate *i*.

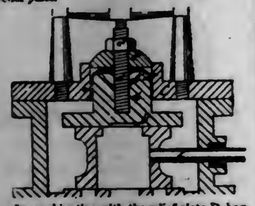


163,505. PAPER BOXES. Charles M. Arthur and James Bentley, Birmingham, Conn. [Filed Apr. 27, 1876.]

As an article of manufacture, the herein-described box, consisting of the principal side A, with the parts E F F projecting from one side, and the flaps P I transversely from the part E, the parts D L projecting from the second side, the part C from the third side, with the transverse flaps G, H, and P on the said part C, the closing side B, and its tongue T projecting from the fourth side, the whole formed and folded from a single piece, as shown and described.

163,506. VEHICLE-SEAT LOCKS. Daniel Argerbright, Troy, Ohio. [Filed Apr. 3, 1876.]

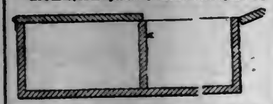
Brief.—An adjustable clamp to secure the seat in the desired position on the side-boards.



1. In a sliding seat, the combination, with the angular bracket D', having jaw *c*, the pivoted booted clamping-plate E, having set-screw F, and the metallic strip *a*, substantially as and for the purpose specified.

2. The bracket D', adapted to be applied to the side of a wagon box, in combination with the bracket D, having a projecting rod, *e*, and support B, whereby the seat will be prevented from twisting and rocking, substantially as specified.

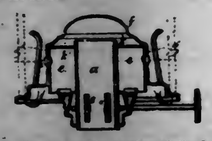
3. The arm *f* of the bracket D', having slot *i* and corrugated under side, in combination with the corrugated washers *g*, screw *s*, and seat *e*, substantially as and for the purpose set forth.



163,437. SLIDE-VALVES FOR STEAM-ENGINES. Edwd. Armstrong, Allegheny, Pa., assignor to himself and James E. Hutchinson, same place. [Filed Mar. 31, 1875.]

Brief.—A concave metallic disk serves to pack the opening in the steam-chest cover, and also allows of a yielding movement to the relief-plate.

In combination with the relief-plate D, having a suitable stem or projection, *d*, an elastic concave metallic disk, *c*, secured to the stem and free at its periphery, substantially as and for the purpose specified.

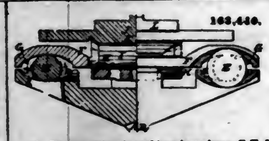


163,438. CIGAR-BOXES. Benjamin Ash, New York, N. Y., assignor to Louis Ash & Brother, same place. [Filed Feb. 26, 1875.]

A cigar-box having the partition *a* and the sectional lids B and C, one hinged and the other removable, as set forth.

163,439. LAMP-BURNERS. L. J. Atwood, Waterbury, Conn., assignor to Plume & Atwood Manufacturing Company, same place. [Filed Apr. 7, 1875.]

Brief.—The chimney-rest, spring chimney-clamps, and deflector connected together, and removable from the screw-neck and wick-tube of the burner.



1. The removable portion of the burner, made with a circular chimney-rest and spring chimney-clamps, a cylindrical body, *g*, and a deflector at the top of the cylinder, all rigidly united together, in combination with the stationary portion of the burner, containing the wick-tube *a*, the air-distributer *k*, and the cylindrical body *c*, over which the removable cylinder *g* is placed when the parts of the burner are put together, and which cylinders are of nearly equal length, so as to firmly sustain the removable portion of the burner, as set forth.

2. The wick-raising wheels, made of sheet metal, with a cylindrical hub on one side, surrounding the shaft, as and for the purposes specified.

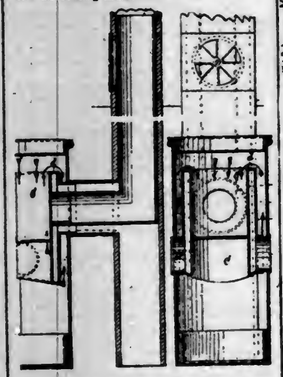
163,440. PLATFORM-SCALES. S. J. Austin, St. Louis, Mo. [Filed Apr. 12, 1875.]

Brief.—Bearing rollers between platform-plates equalize strain upon whole length of the knife-edges.

163,440.

1. The combination of bearing-pieces C F J and rollers E E I, substantially as and for the purpose set forth.

2. In combination with the rollers E E I and pieces C F J the roller-bearings D D H having perforations *d* to allow escape of dirt from the bearings.



3. In combination with the rollers E E I and pieces C F J the bevel-flanges *e*, to prevent derangement of the parts, as set forth.

4. The projections B, in combination with the saddle-piece C and recessed knife-edge bearing A, to prevent endwise movement of the saddle on the knife-edge.

5. The combination of bearing-pieces C F J, rollers E E I, knife-bearing A, and bracket-wings L, for attachment of the platform-timbers, substantially as set forth.

163,441. HEATING-STOVES. John D. Avil, Philadelphia, Pa. [Filed Apr. 26, 1872.]

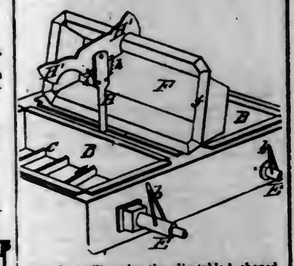
Brief.—To equalize the flow of the products of combustion through and around the central air-heating drum.

The combination, in an air-heating stove substantially as described, of the plate L, provided with openings at its periphery, as described, with the cylinders B and B', which surround the central space C, for the purpose hereinbefore described.

163,442. MAGAZINE-STOVES. William W. Baldwin, Cleveland, Ohio. [Filed Mar. 6, 1875.]

1. The combination, with the reservoir E and opening *f*, of the opening C, made to extend below the lower end of the wall G, substantially as and for the purpose described.

2. The combination, with the perforated reservoir E, the perforations of which communicate directly with the air-space F, and the air-space F, of the flue I and damper *i*, substantially as and for the purpose described.



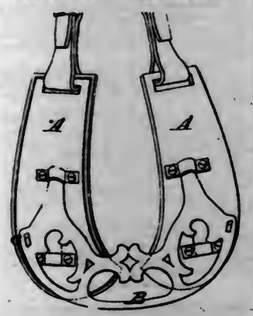
3. The combination, with the perforated reservoir E, the perforations of which connect directly with the air-space F, of air-space F, flue I, and air-register H, substantially as and for the purpose described.

4. The combination, with the combustion-chamber B, perforated reservoir E, the perforations of which communicate directly with the air-space F, and air-space F, of the exit-flue O and flue I, substantially as and for the purpose described.

5. The combination, with the combustion-chamber B, air-space F, and flues O and I, of the air-register H, by which means the draft has direct transit through the reservoir E without passing down by an indirect course, substantially as and for the purpose described.

163,443. MILK-COOLERS. Ira Bertows, Gouverneur, N. Y. [Filed Aug. 7, 1874.]

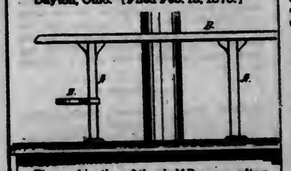
Brief.—An L-shaped outlet-pipe turns on its horizontal arm in a sleeve through the side of the water-pan, and maintains the water at any desired height. The regulating-arm may be inside or outside of the water-pan. When inside a handle operates it, and indicates its inclination. When the milk-pans are tipped upward and inward, the rocking bar and springs hold them.



1. In a milk-cooler, the adjustable L-shaped outlet-pipe E to regulate the height of the water in the cooler, substantially as herein set forth.

2. In a milk-cooler, the combination of the outlet adjustable pipe E and the elbow a on the outside of the cooler, having air-hole or vent *i*, substantially as and for the purposes herein set forth.

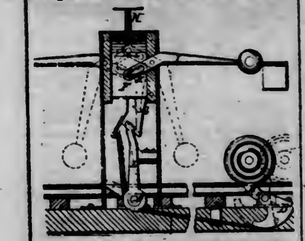
3. In combination with the frame A, coolers B B, and basted pans F F, the standard H with hooks H' H' and springs h h, substantially as and for the purposes herein set forth.



4. The combination of the adjustable L-shaped outlet-pipe E and the pointer *b*, as described, for regulating and maintaining the height of the fluid in the pans, substantially as and for the purposes herein set forth.

163,444. HORSE-COLLARS. G. F. Beardsley, Glen's Falls, N. Y. [Filed Oct. 10, 1874.]

In a horse-collar, the combination, substantially as described, of the concave-convex pads A A, suspended by the strap P, attached to their ends, and connected by a single rigid bow, B, having loops, and hinged to said pads.



163,445. STOVE-PIPE SHELVES. M. Bennet, Dayton, Ohio. [Filed Feb. 13, 1875.]

The combination of the shelf B, surrounding the pipe and provided with projecting hooks, the standards A, constructed as described, and bracket E, substantially as and for the purpose specified.

163,446. RAILROAD-SIGNALS. Festus C. Bolton and Michel Adams, Cleveland, Ohio. [Filed Feb. 15, 1875.]

Brief.—A colored globe or shade is mounted on the apparatus, which is brought down over a light at the same time the arms are raised.

1. The railroad-crossing signal, consisting of the combination, with the pivoted arms I, cord or wire C', and tilting lever B, of the block F and cross-bar H, substantially as and for the purpose described.

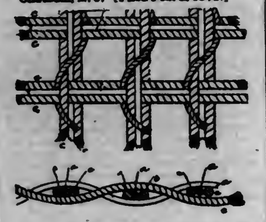
2. The combination, with the arms I and mechanism for elevating them, substantially as described, of the block F, projecting arm G, and spring-hook L, for retaining the said arms in their horizontal position, substantially as and for the purpose described.

3. The combination, with the hook *g* and the spring-hook L, of the tilting lever K, arranged to be operated by the car-wheels, whereby the arms I are released, substantially as and for the purpose described.

4. The combination, with the block F, of the cross-bar H, pans M, and the colored shade, whereby the said shade may be brought down over and a light when the arms are elevated, substantially as and for the purpose described.

163,447. SPRING-MOTORS. Henry Bolton, Brantford, Canada. [Filed Mar. 17, 1875.]

1. The combination of the magazine-spring U with the secondary constant-tension driving-spring I, rigidly attached at one end to a ratchet-wheel upon the main-shaft, and at the other to a loose gear-wheel, substantially as and for the purpose described.

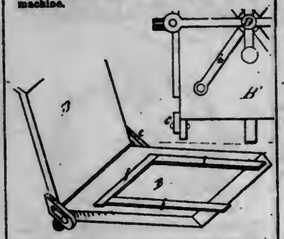


2. The combination, with the magazine-spring U and the driving-spring I, rigidly attached to the shaft at one end, and to the loose gear-wheel at the other, of a stop-wheel, M, rigidly attached to the main shaft, a pawl, Q, and the pin S upon the gear-wheel, substantially as described, for the purpose of rendering the action of the magazine-spring upon the driving-spring intermittent

3. The combination, with the ratchet-wheel I upon the main shaft, of the pawl P, the eccentric O, and the fly-wheel N, for the purpose of rendering the intermittent action of spring U upon I instantaneous, substantially as set forth.

4. The combination, with pawls P and Q, of a lever W', for the purpose of silencing the machine when nearly run down to operate with both springs and continuously.

5. The combination, with a shifting-lever, of a loose pulley, *a*, having a clutch upon one side and a gear-wheel upon the other, to reduce the speed, substantially as described.



163,448. WIRE FABRICS. Geo. S. Brocher, Chatham, N. J. [Filed Feb. 2, 1875.]

As a new manufacture, perforated wire cloth, composed of spring-wires laid with two or more fibrous threads to each wire and with reticulations, substantially as set forth.

163,449. MACHINE ELECTROTYPE-SHELLS. Jas. S. Brooks, Pittsburg, Pa. [Filed Dec. 28, 1874.]

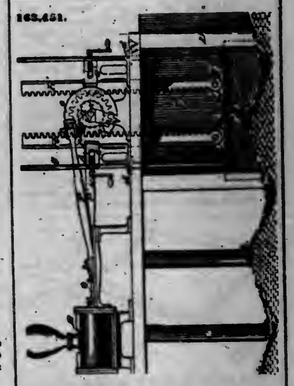
Brief.—Invention claimed in process and machine.

1. The method of producing finished electrotype-backs, consisting in securing the shell, face downward, between true and parallel plates, determining the size and thickness of the back by adjustable straight-edged metallic rules, constructed and adapted to give a true and finished edge, heating all to a uniform temperature, and then pouring the molten metal upon or between the back of the shell and the upper or opposing plate, as described.

2. The apparatus for backing electrotypes, consisting of hinged and swiveled plates H B', frame A, slide C, and heating appliances, supports *a*, arms *b*, pressure D, and guide-rules *f*, combined and operating as described.

163,450. EVAPORATING-PANS. C. Brownell, Troy, N. Y. [Filed Sept. 7, 1874.]

Brief.—Intended to be used beneath ordinary stoves. The rim may be extended to serve as a platform, upon which the stove-legs may rest.



The within-described evaporating-pan, having the separate dish B suspended in the rim A, above the floor, and adapted to serve under stoves and furnaces, as and for the purposes herein specified.

163,451. WAVE-POWER MACHINES. Chas. Buckner, Jr., San Francisco, Cal., assignor of one-half his right to Johann H. A. Ledwig, same place. [Filed Sept. 7, 1874.]

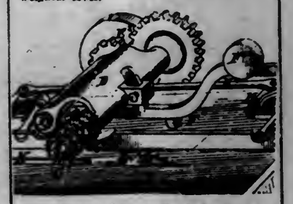
Brief.—A buoy with four guide-rods passing through socket-plates, and provided with adjustable racks for engaging loose pinions, and ratchet-wheels and pawls, operates, by the rise and fall of the waves, a pumping or other apparatus. Wedge-shaped caissons attached to the wharf guide the waves to the buoy. Slide-rests and adjustable blocks with tongues hold the racks in position.

163,451.

1. The buoy B, actuated by the rise and fall of the waves, provided with guide-rods *g g g g*, that operate within the fixed socket-plates *d d d d*, and adjustable racks E E', for engaging the loose pinions V V', pawls *p p'*, ratchet-wheels T T', and pumping or other apparatus E E', as described, substantially as and for the purposes herein set forth and specified.

2. The wedge-shaped caissons C C', attached to the wharf structure W W, in combination with the waves and floating buoy B, substantially as and for the purposes herein set forth and specified.

3. The slide-rests G G', with adjustable blocks A A', provided with tongues *e e' e'*, respectively, in combination with the racks E, E', pivoting onto buoy B, substantially as and for the purposes specified.

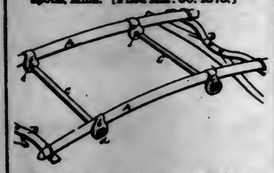


163,452. TEMPORARY BINDERS. R. Buell, Columbus, Ohio. [Filed Apr. 26, 1875.]

The combination of the plate A, provided with the needles B, having the slots C in their upper ends to receive a cord, with the gage D, having the slots or recesses E in its edge, substantially as shown and described.

163,453. SAWING-MACHINES. George W. Bugbee, Cincinnati, Ohio, assignor to J. A. Fay & Co., same place. [Filed Apr. 1, 1875.]

Brief.—The oscillating frame carrying the feeding-rolls is adjustably attached to a weighted lever.



1. The combination of the fixed roll carrying frame D and the weighted lever P F', adjustable on each other, substantially as specified.

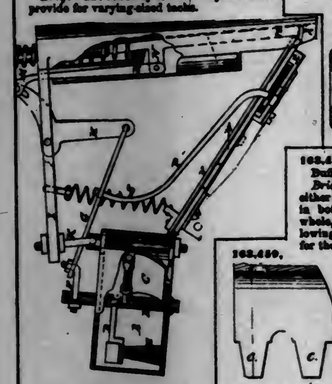
2. The feed-roll-carrying frame D and weighted lever F F', adjustable on each other, in combination with the bottle F', substantially as and for the purpose specified.

3. The combination of the gage G g g, links H² H², and connected quadrants H H' H', with the platen A, substantially as specified.

4. The combination of the gage G g g, links H² H², connected quadrants H H' H', and lever I (with the platen A, having a graduated rack or series of holes, e, substantially as specified.

163,455. SWINGING BUGGY-BODIES. H. M. Carpenter and Ellwood Grimshaw, Minneapolis, Minn. [Filed Mar. 30, 1875.]

The rubber straps b b, provided with the holes a a, in combination with the thoroughbraces A A, cross-bars C C, and steel springs B B, substantially as described.



163,456. WHIFFLETREES. Thomas Carroll, Prairie City, Ill., assignor of one-half his right to F. A. Woodmansee, same place. [Filed Mar. 17, 1875.]

The wheel D, attached to the whiffletree B, and provided with shoulders b b, in combination with the hammer-strap C, having slot f, the tongue A, and bolt e, connecting the whiffletree to the tongue, all substantially as and for the purposes set forth.

163,457. TACKING-MACHINES. James W. Carver, East Boston, Mass. [Filed Apr. 24, 1875.]

Brief.—The roadway is made adjustable to provide for varying-sized tacks.

1. The combination of the box A and spindle B, provided with the scoops C and brushes E, substantially as and for the purpose set forth.

2. The combination of the spindle B, provided with the brushes E and scoops C, with the piston-rod and hammer a, and the intermediate system of rods and levers, as shown, when arranged for joint operation, substantially as and for the purpose described.

3. In combination with the box A, the frame I, and its swivel-connections K, the cylinder G and the raceway V W W', substantially as and for the purpose set forth.

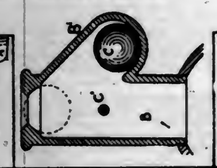
4. The combination of the raceway c, the spring c, and the pivoted hook T, as and for the purpose specified.

5. The combination of the hook T, the rod P, and the slotted bar G with the spindle B, provided with brushes and scoops, substantially as set forth.

6. The adjustable plates W W', forming the raceway, and having the curved ends c', in combination with the recessed end of the cylinder C, whereby the tack is brought to a position under the hammer, and then driven in, substantially as and for the purpose set forth.

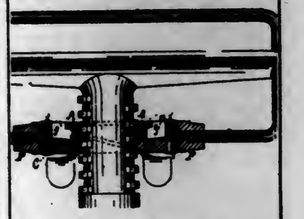
7. The combination of the adjustable plates V W W', for adaptation to tacks of different sizes, substantially as described.

163,458. WATER-VALVES. A. Chabot, San Francisco, Cal. [Filed Jan. 21, 1875.]



Brief.—The shaft above the valves is filled with water from the reservoir, which keeps the main valve to its seat. To the small valve is attached a weight equal to that of both valves. The small valve being raised from its seat, water will enter the delivery-pipe through the spaces between the feathers on said valve and fill the pipe, thus balancing the main valve, when it will be necessary to exert a force sufficient to lift its actual weight to open it.

The valve A, with its equalising-valve D, seating over pipe B, for the purpose as specified.

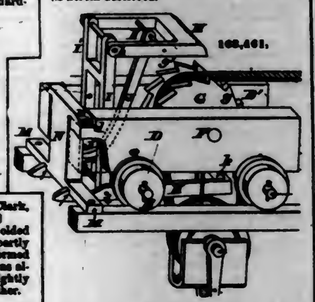


163,459. VENT-VALVES. A. Chabot, San Francisco, Cal. [Filed Feb. 26, 1875.]

In a vent or air valve, the spherical float C, in combination with the pocket B' and guard-pin C', substantially as described.

163,460. MOPS. Charles B. Clark, Buffalo, N. Y. [Filed Mar. 15, 1875.]

Brief.—The side slots, through which the ears of the nut pass in adjusting the latter to place, are finally closed by the pieces that clamp and hold the binding-wire.



The collar C, with slots c c, and clamping-arms F F, provided with tongues f f, in combination with the nut A, substantially as constructed and arranged.

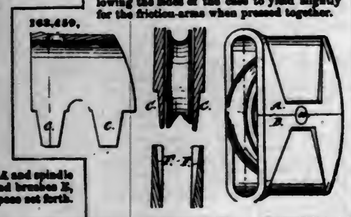
163,461. HAY-CONVEYERS. Wm. M. Conner and W. I. Rouse, Burlington, Ky. [Filed Apr. 23, 1875.]

Brief.—On an overhead inclined track a carriage is hauled by a rope from the load passing over a ratcheted pulley thereon. The pawl is struck free by the carriage reaching the limit of its descent, hooks at the same moment springing under a lateral bar, to be released by impact on the ascent of the load.

1. In combination with the carriage D D' E c c E' c' c' and track A A' N, the ratchet-pulley G g, pivoted pawl H h, trigger J, drag-rope F, and sheave E e, as and for the purpose specified.

2. The latches K L K' L', pivoted at f f' to the carriage, and provided with a cross-bar, h, which prevents contact of said latches with the pulley G, whenever the former are disengaged from the transverse rail M of the track, as herein described.

163,461.

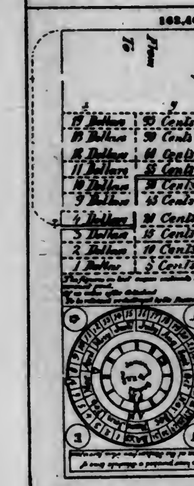


163,462. RAILROAD-TICKETS. E. R. Cook, Trenton, N. J. [Filed July 19, 1875.]

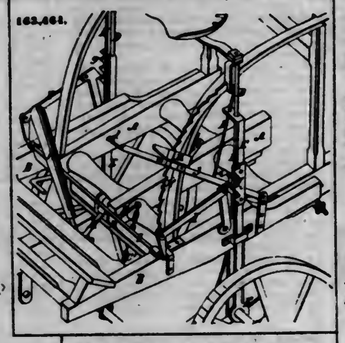
1. The coupon-ticket provided with detachable dollar spaces, and detachable cent spaces, arranged in different detachable columns, as shown and described.

2. A railroad way-ticket, provided with detachable dollar and cent spaces, arranged in different detachable columns, and also with the dial or equivalent device, substantially as set forth.

163,463. SAND-PULLEYS. Charles B. Clark, Buffalo, N. Y. [Filed Mar. 15, 1875.]



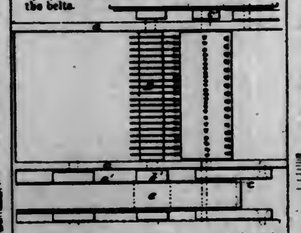
Brief.—The axle-bearings being molded either wholly in one part of the case or partly in both, and the ends of the case formed whole, with screw-holes cast therein, thus allowing the sides of the case to yield slightly for the friction-arms when pressed together.



163,450.

A sash-pulley case formed in two parts, A B, when the line of division is made horizontally from front to rear, so that the arms C C and the ribs D F F, together with the axle-bearings a a and screw-holes b b, may be molded and cast in the manner described and shown, substantially as and for the purpose set forth.

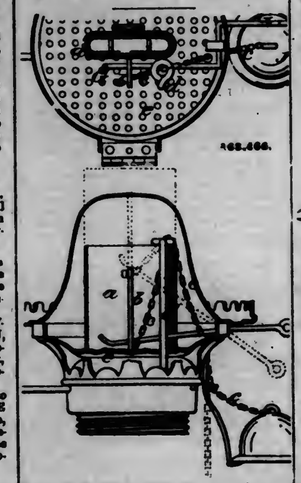
163,464.



163,465.

163,465. COTTON-GINS. Orville C. Dewey, Wheeling, W. Va. [Filed Mar. 27, 1875.]

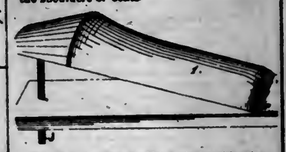
Brief.—Through the medium of the oblique arms of the belt wheels on each side, these belt wheels accommodate themselves automatically to the strain of the belt, and when the belt is comparatively loose upon the belt wheels, the contact of those wheels which are carried on the arms with the friction-wheels of the saw-shaft and brush-shaft will be kept up by the movement of these belt-wheels and the belts.



The combination, with the saw-shaft and brush-shaft, of the automatically-adjustable belt-wheels c c', the belt-wheels a' b, the belts c c', and the friction-wheels b' c', respectively arranged each between a pair of said belt-wheels on the relatively opposite ends of the saw-shaft and brush-shaft, substantially as shown and described.

163,466. PIPE-COUPLINGS. A. W. Cooper and John Sutcliffe, Chicago, Ill. [Filed June 24, 1874.]

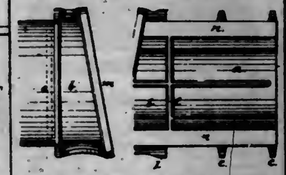
Brief.—An externally-threaded tube, provided with conical threaded ends, in combination with internally-threaded nuts with plain conical internal bearing-surfaces at the ends for the pipes, and adapted to work together, and form an external and an internal screw-thread upon the enlarged ends of said pipes, while the clamping-surfaces are brought to gether upon the same, to form the packing and secure the joint.



The combination of the externally-threaded tube A, provided with conical threaded ends, with the internally-threaded nuts F F, provided with plain conical internal bearing-surfaces at the ends, as set forth, for the pipes B and C, and adapted to work together and form an external and internal screw-thread upon the enlarged ends of said pipes, while the clamping-surfaces are brought together upon the same, to form the packing and secure the joint, substantially as herein described.

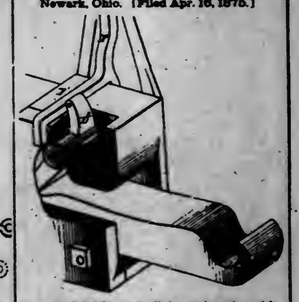
163,466.

163,467. SHAPING-BLOCKS FOR GARMENTS. Henry Erleston, St. Joseph County, Mich. [Filed Dec. 30, 1874.]



Brief.—The block is for stretching, pressing, and shaping the bottoms of pantaloons and the shoulders of coats.

The forming block No. 1, in combination with the table or board No. 2 and adjusting-screw No. 3, when constructed and arranged to operate substantially as herein described, and for the purpose specified.

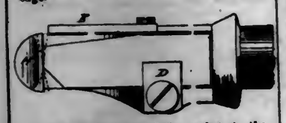


163,468. BEDSTEAD-FASTENINGS. William H. Elliot, New York, N. Y. [Filed Apr. 1, 1874.]

Brief.—The curved surface of the body of the tenon fits into a correspondingly-formed recess or mortice in the end of the rail, and a cleat which rests against the flattened edges of the tenon holds it firmly in place. The diagonal head and flanges enter the post-mortice.

In a bedstead-fastening, the tenons consisting of the curved plate a, provided with the thickened and flattened edges a, forming the body thereof, the flanges c, transverse rib b, head b, and diagonal flanges m, all constructed substantially in the manner and for the purpose set forth.

163,469. CAR-COUPLINGS. L. D. Evans, Newark, Ohio. [Filed Apr. 16, 1875.]



1. A pivoted trigger, D, in combination with a coupling-bar and a draw-head, A, and provided with a retaining weighted arm, D', for dropping into the recess of the coupling-bar, and a vertical arm, D', passing up through the draw-head, substantially as set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

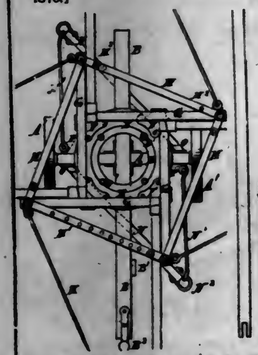
2. The combination, with a trigger, D, pivoted within a draw-head, A, and provided with a downwardly-projecting arm, D^1, and a vertically-projecting arm, D^2, passing up through the draw-head A, of a lever-arm, a coupling-bar, C, having one or both ends, C^2, curved and provided with recesses C^1, substantially as set forth.

163,470. SHOE-KNIVES. W. J. FitzGerald, New Haven, Conn. [Filed Mar. 9, 1875.]

Brief.—The socket or knife-holder is provided at its end with a rocking guard, to adapt the knife to different curves of the sole-edge.

1. The combination of the socket A, the knife C, and the rocking guard H, substantially as described.

2. The combination of the socket A, the cutter C, rocking guard H, and guide E, substantially as described.



163,471. COVERINGS FOR BEDS, CRIBS, &c. John Foster and William A. Weant, Salisbury, N. C. [Filed Oct. 2, 1874.]

Brief.—The cover is composed of two sections, one being pivoted to and folding within the other, and the latter is hinged to supporting-frame, so that it can be turned over to obtain access to the bed, in which position it is supported by brackets attached to the supporting-frame.

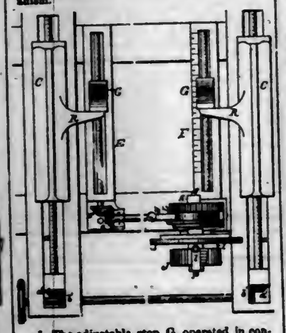
The cover constructed, as described, of the frame-work and the netting, and having a pivoted movable portion, F, in combination with the hinges G, the brackets H, and the frame-work of the bed or crib, substantially as and for the purpose described.

163,472. BOARD-POWERS. Daniel Geiser, Waynesborough, Pa. [Filed Mar. 24, 1875.]

1. In combination with the frame formed of the beams G, the auxiliary frame H, attached to the outer ends of the beams G, so as to form diagonal braces, substantially as set forth.

2. The auxiliary frame constructed with pins H^1 H^2, engaging the levers I and bars N, for compactly and securely packing such pieces for transportation.

3. In combination with the beams G, the brackets F, attached to the annular plate E, and constructed with recesses, one to receive the end of one beam, and the other to receive the outer end of another beam, and yet another to receive the inner end of the levers I, substantially as set forth.



4. In combination with the levers I, the brackets F, constructed with a series of plates, forming recesses to receive the levers and hold them, in connection with a stationary eye, at different inclinations, substantially as set forth.

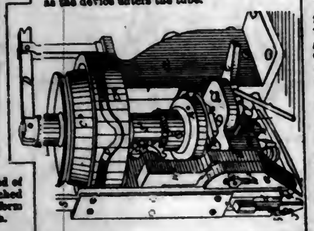
5. In combination with the two-wheeled truck of a horse-power, a beam, B, at right angles to the axle A, and adjustable legs B^1, substantially as set forth.

6. In combination with the axle A of the truck which supports a horse-power, the adjustable bars N and rods N^1, attached thereto for securing the horse-power, substantially as set forth, when either down or mounted.

163,473. SAW-MILL HEAD-BLOCKS. Wm. Glue, Muskegon, Mich. [Filed Apr. 30, 1875.]

Brief.—A moving gage-block is first adjusted to the thickness of the piece of lumber to be cut; the log is then set to it by means of an independently-operating setting mechanism.

1. The adjustable stop G, operated in connection with a saw-mill head-block, substantially as and for the purpose specified.



2. The quadrant O, provided with an adjustable stop, P, for regulating the throw of the lever I, to suit saws of different thickness.

3. The wheel L, with its friction-pulley M, in combination with the pinion *f*, screw *e*, and stop G, as set forth.

4. The gear L, with its friction-pulley M, in combination with the spring *g* and brake N, as and for the purpose specified.

163,474. MACHINES FOR NAILING SOLES FROM NAIL-STRIPS. Louis Goddu, Winchester, assignor to American Cable-Screw-Wire Company, Boston, Mass. [Filed Apr. 20, 1875.]

Brief.—A vibrating nail-strip carrier is provided, adapted to automatically deliver to the cutting-jaws and nail-tube strips varying in width, as desired. The cutting jaws, when closed, form the nail-tube, compress the nail, form a head thereon, and release the nail just as the device enters the tube.

1. In a machine for nailing boots and shoes, with nails cut from a strip, the combination, with the driver *d*, of jaws *j f*, between which the nail is cut from a strip and the head formed by compression by the same movement which effects the severance of the nail, substantially as herein set forth.

2. The combination, in a machine for nailing boots and shoes, of jaws *j f*, adapted to sever a nail from the strip, then compress the nail and form a head, and become a tube and guide for the nail and driver, substantially as and for the purpose described.

3. The combination, in a nail cutting and driving machine for boots and shoes, of a driver, *d*, and a nail-strip carrier adapted to feed the strip and deliver the severed nail to a compressing and head-forming tube directly in the line of the driver without transfer of the severed nail from the point of entrance, substantially as and for the purpose stated.

4. The combination, in a nailing-machine for boots and shoes, of a driver, cutting-jaws, nail-compressing and head-forming tube and guide, and a carrier adapted to automatically deliver nail-strips of different widths, as may be required, directly to the line of the driver and the jaws, essentially as herein set forth.

5. The combination, in a nailing-machine for boots and shoes, of a driver, *d*, with a fixed cutter, *j*, and a jaw, *f*, having a movement toward and from the fixed jaw, the two forming a nail-compressing tube-guide when closed, substantially as and for the purpose stated.

6. The combination, in a nailing-machine for boots and shoes, of a nail-driver, a nail-strip carrier, and jaws having cutting-edges, and a nail-forming guide into which the nail-strip is fed, the nail cut, and its head formed thereby, and driven through said guide-jaws to complete the operation, substantially as herein set forth.

7. The combination, in a nailing machine for boots and shoes, of a nail-driver, a nail-strip carrier and jaws having cutting edges, and adapted to compress the nail and form a head thereon, with mechanism for operating the jaws, substantially as herein set forth.

8. In a machine for nailing boots and shoes, the jaws *j f*, with cutting-edges, forming, when closed, a nail-tube or guide for compressing the nail and forming a head thereon, and adapted, one or both, to automatically yield or open slightly just previous to the descent of the driver, substantially as and for the purpose described.

9. The combination, with the movable jaw *f* and its carrying-arm *b* in a nailing and driving machine, and the eccentric *c*, by which said jaw is operated, of the adjustable ball-and-socket-joint brace-connection *c' c'' c'''*, whereby the cutting-jaw has a positive action directly from the driving-shaft, substantially as herein set forth.

10. The combination, in a nailing-machine for boots and shoes, of a nail-strip carrier, A, having a vertical back-piece, *i*, carrying the feeding-ratchet stems *k l* for the nail-strips, with automatic operating ratchet-pawls *m*, carried by a yoke-slide, *n*, and operated by an eccentric-cam, n^1, on the driving-shaft *c*, whereby the feed of the nail-strip is effected with certainty, substantially as herein set forth.

11. The combination, in a nailing-machine for boots and shoes, of a shifting nail-strip carrier, A, having two separate and independent nail-guides, *h*, and a vertical back-piece, *i*, carrying two separate and independent feed-ratchet stems, having milled feeding portions *k*, with a horizontally-operating cam-yoke, *n*, carrying two separate and independent ratchet-pawls, *m*, whereby either ratchet-pawl can be engaged, and the other rendered inoperative by throwing the nail-strip carrier from one side to the other, without arresting the action of the machine, substantially as herein described.

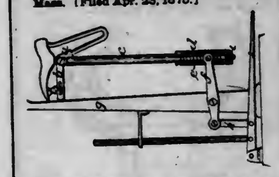
12. The combination, in a nailing-machine for boots and shoes, of a nail-strip carrier, A, with the movable jaw-carrier *b*, the pivot-stem *g* of the former being concentric with and inclosed by a sleeve-bearing, *f*, of the jaw-carrier, whereby the adjustment of said strip-carrier is made concentric and in co-operation with the action of the movable jaw, substantially as herein set forth.

13. The combination, in a nailing-machine for boots and shoes, of a nail-strip carrier, provided with a vertical back-piece, *i*, which carries the feeding-ratchet stems *k l* of a stop-opening, *f*, within the frame, and within which the back-piece moves, the ends of which opening serves to limit the throw of the strip-carrier to bring the front end of the strip-guides therein at a point in line with the driver and the opening between the jaws, substantially as herein set forth.

14. In a nailing-machine for boots and shoes, a pivoted nail-strip carrier, having nail-strip passages A A, in combination with the driver and a nail-forming tube and guide, to which it operates to feed and deliver nail-strips of different widths, substantially as herein described.

15. The combination, in a nailing-machine for boots and shoes, of a pivoted vibratable nail-strip carrier, A, having a vertical back-piece, *i*, carrying the feeding-ratchets, with a shifting slide-bar, B, seated in the frame, and suitable devices for imparting it to a sliding movement to shift the nail-carrier, substantially as herein set forth.

16. The combination, in a nailing-machine for boots and shoes, of a vibratable nail-strip carrier, A, and the slide-bar B, with a device for applying the changing force to shift such carrier irrespective of the operation of the jaws, whereby an automatic shifting movement of the nail-strip carrier is effected previous to the feeding and cutting of the next nail, and without arresting the action of the machine, and without regard to the action of the jaws, substantially as herein set forth.



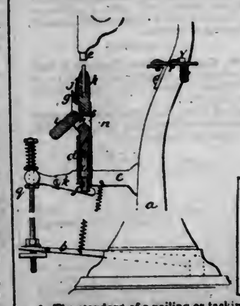
17. The combination, in a nailing-machine for boots and shoes, of a vibratable nail-strip carrier, with a slide-bar, B, connecting therewith, a pivoted triangular driver, *p*, connecting with such slide-bar, and an actuating pivoted lever, *i*, having a sliding tongue, *n*, for operating upon the cam-face of the pivoted driver, substantially as and to produce the results herein set forth.

18. The combination, in a nailing-machine for boots and shoes, of the cutting and nail-forming fixed and movable jaws *j f*, with the abutments a^1 a^2 in the frame, and movable jaw-carrier *b*, whereby a firm support is given the jaws to sustain them under their cutting and nail-forming action, substantially as herein set forth.

19. The combination in a nail-cutting and driving machine for boots and shoes, of a driver-bar, *a*, with its operating cam *c* formed upon the surface of the horizontal balance-wheel c^2 of the machine, whereby the blow of the driver is derived directly from the balance-wheel upon the main shaft, substantially as herein set forth.

20. The combination, in a nailing, cutting, and driving machine for boots and shoes, of a driver-bar, *a*, with its operating cam *c* and balance-wheel c^2, with the friction-clutch pulley c^3, whereby the balance-wheel of the machine serves the several purposes of a regulator for the speed of the machine, a driver for the driver-bar, and a means for applying the power and stopping the machine, substantially as herein set forth.

163,475. JACK ATTACHMENTS FOR NAILING-MACHINES FOR BOOTS AND SHOES. Louis Goddu, Winchester, assignor to American Cable-Screw-Wire Company, Boston, Mass. [Filed Apr. 23, 1875.]



1. A jack for shoe-tacking machines, having its pivoted bar-support *b*, constructed with a spring-branch, *h*, integral therewith, in combination with the toe-support *i*, whereby the work is sprung and automatically held in position for operation upon the toe-support, without separate appliances for the purpose, substantially as herein set forth.

2. The combination of the swiveling jack-support *c* and a guide-sleeve, *d*, therefor, open at both ends and provided with a spring-cushion, *e*, with a stop-nut, *i*, whereby to limit the amount of the jack to a working position with respect to the nose, as herein set forth.

3. The combination, with the treadle of a shoe-tacking machine, of a work-supporting jack, the yielding swiveling jack-rod *c*, and its guide-sleeve *d*, with the pivoted arm *f* and the link *h*, by which a jointed flexible connection of the jack is effected with the treadle, substantially as herein set forth.

163,476. SHOE NAILING AND TACKING MACHINES. Louis Goddu, Winchester, assignor to American Cable-Screw-Wire Company, Boston, Mass. [Filed Apr. 23, 1875.]

1. The standard of a nailing or tacking machine, provided with and sustaining the laterally-adjustable elastic plate-bearer *r* and the pivoted work-support *b*, whereby either may be moved into or out of action with the driver-nose *e*, according to the kind of work to be done, the device *b* being adapted rigidly for heel-work, and the device *r* for sole-work in tacking on rands and sole-tape, substantially as herein set forth.

2. The combination, with the driver-nose of a tacking-machine, of the pivoted support *b*, provided with the shoulder *s*, and the pivoted handle-arm *i*, provided with the shoulder *n*, whereby the said arm serves as a handle by which to lock the work-support in or out of working position, as herein set forth.

3. The combination, with the driver-nose of a tacking-machine and a vertically-presenting work-support, *b*, of a pivoted locking-arm, *i*, and the operating-treadle *k*, whereby the work-support is maintained in a working position, substantially as herein set forth.

4. The combination, with the work-support *b*, of the slotted stem-carrier *g*, the pivoted handle-arm *i*, fixed sleeve *d*, and the treadle *k*, whereby the sleeve is carried by the standard, and the work-support by the treadle, as set forth.

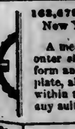
5. The combination, in a tacking-machine having a vertically work-presenting pivoted support, *b*, of a cushioned connection for such support with the treadle, consisting of the pivoted arm *k*, and the cushioned connecting-rod *l m*, having a free connection with the pivoted arm, whereby the work-support has a cushioned action with regard to the nose-driver, and also an automatic adjustment with the nose independent of the action of the treadle, essentially as herein described.

6. The combination, with the pivoted work-support *b*, the slotted stem-head *g*, which carries it, and the arm *i*, which locks it in position, of a spring, *j*, acting against the slotted head *g*, whereby to automatically carry the support in true position with regard to the nose-driver, as herein described.

7. The combination, with the driver-nose of a tacking-machine, of a swinging flexible plate-bearer, *r*, pivoted to the standard for lateral adjustment in relation to the driver, essentially as herein described.

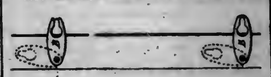
8. The combination, with a pivoted flexible plate-bearer, *r*, for supporting and presenting upon its flat surface the work for the action of the driver-nose, with an inverted anvil, *n*, carried by said bearer in the line of the driver, as and for the purpose stated.

163,477. SHOE-NAILING MACHINES. Louis Goddu, Winchester, assignor to American Cable-Screw-Wire Company, Boston, Mass. [Filed Apr. 23, 1875.]



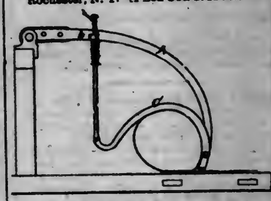
1. The combination, with the driver-bar of a nailing-machine for boots and shoes, of a wooden spring of two or more branches, carried by and fixed directly upon the head of the machine, to operate the driver-bar without support for the outer ends of the spring-bars, substantially as herein set forth.

2. The combination, with the driver-bar of a shoe-nailing machine, of a wooden spring of two or more branches, united at their outer ends and provided with a fulcrum-point and adjusting-screw, all carried by the head of the machine, as herein set forth.



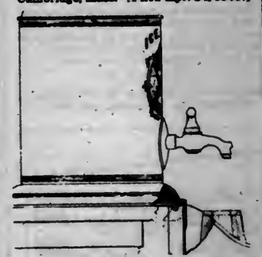
3. The combination, with the turret *b* and the spring-bars, of the yoke-clamp *d*, secured by the concave seats *f f* and the clamp-screw *e*, to make a firm carrier for the spring-bars, one branch whereof being bolted to the yoke, as specified.

163,478. PISTOL-STOCKS. W. L. Godfrey, New York, N. Y. [Filed Mar. 4, 1875.]



A metallic pistol-stock constructed with an outer shell of sheet metal struck up to any form and size, and interlined with a re-enforce plate, also struck up to form and size fitting within the shell, and caused to adhere to it in any suitable manner.

163,479. CORSET-CLASPS. W. C. Goodwin, New Haven, Conn. [Filed Nov. 23, 1874.]



A corset-clasp, consisting of the strip A, with the catches or fastenings B pivoted thereon, substantially as and for the purpose specified.

163,480. GRAIN-BINDERS. Jas. F. Gordon, Rochester, N. Y. [Filed Oct. 3, 1874.]

In combination with the vibrating binder-arm A, the spring compressor-bar C, pivoted at or near the outer vibrating or swinging end thereof, substantially as set forth.

163,481. WATER-COOLERS. Peter Gray, Cambridge, Mass. [Filed Apr. 24, 1875.]

The combination, with a water-cooler or liquid-holder, of a removable tumbler-holder or drip-cup attached to, and sustained by, the cooler, substantially as described.

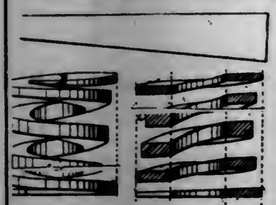
163,482. SURFACE-CONDENSERS. William H. Guild, Williamsburg, Brooklyn, N. Y. [Filed Feb. 19, 1875.]

163,488.

In combination with the condensing-tubes D E, rising, respectively, from the top plates of the chambers B C, the escape-tube G, rising from the bottom plate of chamber C, and extending through the same into the interior of the condenser, substantially in the manner herein shown and described.

163,489. JACK-SPOOLS. Henry M. Guy, Worcester, Mass., assignor, by mesne assignments, to Dubora C. James, same place. [Filed Mar. 28, 1873.]

As a new article of manufacture, a spool provided with heads formed of pressed pulverized leather, substantially as specified.



163,490. TOPS FOR PRESERVING-CANS. T. H. Hamilton, Baltimore, Md., assignor of one-half his right to James H. Shansbury, same place. [Filed Apr. 6, 1875.]

Brief.—A flat-bottomed groove is formed in the can-top. The cap is provided with a horizontal flange to fit said groove, the solder being applied between the parts. The groove forms a guide for the soldering-iron.

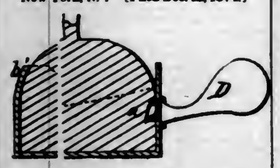
The can-top A, provided with the opening B and the groove C, having flat bottom *a*, in combination with the cap D, provided with the rim *b* and flat flange *d*, substantially as and for the purposes herein set forth.

163,491. CAR-SPRINGS. Walter P. Hansell, Pittsburg, Pa. [Filed Jan. 26, 1875.]

1. A spiral spring made from a bar having a uniform flatwise and edgewise taper from the ends to the middle, and from the middle to the ends, substantially as and for the purpose set forth.

2. A spiral car-spring, coiled from a bar tapering edgewise from the middle to the ends, to give the greatest strength to the middle coils of the spring, as set forth.

3. A spiral car-spring having broad, thin, flat end coils, thick center coils, a cylindrical central opening, and a double conical contour, substantially as set forth.



163,492. CAR-STARTERS. Franklin D. Hardy, Delavan, Ill., assignor to Chas. L. Booth and Dexter D. Hardy, same place. [Filed Mar. 30, 1875.]

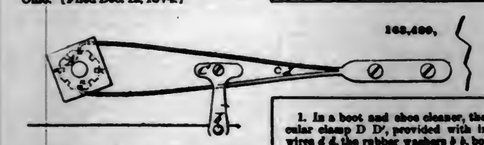
Brief.—A lever, the butt of which is an outward and upward extending cam, over which drops a hook pivoted near it.

The lever *a*, constructed with the fan-shaped head a^1, having the curved edge a^2, and provided with the studs *b*, and having the hook *c*, slotted at c^1, and pivoted thereto so as to turn on the upper side thereof, and so that the slot c^2 will pass over the head a^1, substantially as and for the purpose set forth.

163,493. SAD-IRON SHOES. Emil Hartzig, New York, N. Y. [Filed Dec. 12, 1874.]

The combination, with an ordinary sad-iron, having at its heel a hole, *a*, of the sad-iron shoe C, having the front lip *b'*, spring-finger D, and bevel-catch *b*, substantially as described.

163,494. DOSE-REGISTERS. D. L. Hawkins, Elizabeth, N. J. [Filed Mar. 27, 1875.]



Brief.—The time at which the next dose of medicine is to be taken is indicated by turning the disk, provided with numerals upon its beveled side, to the stationary pointer.

The medicine-register, consisting of a circular, movable, truncated pyramid, B, having twelve sides numbered as described, and combined with a pointer, which is secured rigidly to a base, A, as set forth.

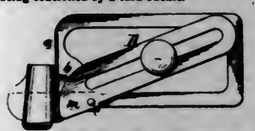
163,495. NUT-LOCKS. Horace L. Heston, Lilly Chapel, assignor of one-half his right to Benjamin F. Roberts, West Jefferson, Ohio. [Filed Dec. 12, 1874.]

163,496.

1. The improved nut-lock, formed by a nut with grooved extension or shank, in connection with a forked double spring provided with bent or hook-shaped ends, entering into grooves on opposite sides of shank, substantially as specified.

2. The pivoted cam-piece, placed intermediately between the legs of the spring, and provided with operating lever-handle and drop-pin at outer end, in combination with the double spring and a socket-hole of the plate or other object to which the nut-lock is applied, for releasing the spring from the nut, and retaining the same in that position, substantially as specified.

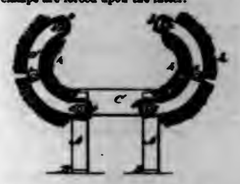
163,497. MACHINES FOR BORING HUBS. E. M. Heskin, Springfield, Ill. [Filed Aug. 6, 1874.]



Brief.—The wheel is secured to a revolving table, and the hub bored by a stationary cutter, around which the wheel is revolved.

The combination of the head D, with concavity E, legs *c c*, and set-screw *d d*, the arms F F, and sleeve C, cast in one piece with the mandrel G and tool *e*, all constructed substantially as set forth.

163,498. SEWING-MACHINE ATTACHMENTS. Frank Henry, Philadelphia, Pa. [Filed Apr. 24, 1875.]



Brief.—A plate provided with a notched edge for the reception of the lip of a hemmer or other sewing-machine attachment, the lip being controlled by a turn-buckle.

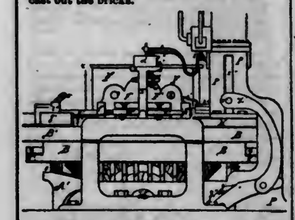
A sewing-machine attachment in which are combined a plate, A, constructed for the reception of the lip *b*, a slotted lever or arm, D, hinged to and adjustable on the said plate, and a turn-buckle, *m*, for retaining and releasing the said lip, all substantially as set forth.

163,499. BOOT AND SHOE CLEANERS. H. H. Holmes, Council Bluffs, Iowa. [Filed Jan. 19, 1875.]

Brief.—The side clamps are semicircular, and between them is a wire which forms an indentation in the broom material when the clamps are forced upon the latter.

163,499.

1. In a boot and shoe cleaner, the semicircular clamp D D', provided with interposed wires *d d*, the rubber washers *b b*, bolts *c*, and nuts *e*, all substantially as and for the purposes herein set forth.



2. The combination of the standards A A, having feet B B, and scraper C, with semicircular clamp D D' at each end for the attachment of the brushes *h*, substantially as and for the purposes herein set forth.

163,493. CONCENTRATED EXTRACTS FOR FOOD. James Horlick and Wm. Horlick, Chicago, Ill. [Filed Oct. 12, 1874.]

The concentrated extract for food, consisting of wheat flour, malt flour, wheat bran, and bicarbonate of potash, substantially as herein set forth.

163,494. BRICK-MACHINES. Andw. J. Hoyt, Philadelphia, Pa. [Filed Nov. 20, 1874.]

Brief.—A horizontal mold-table, with four series of molds, is intermittently revolved by cam action at its periphery. A continuous circular track beneath, of different elevations, actuates the posts and followers in their progress, to receive the clay above to sustain the downward pressure, the re-pressure, and to cast out the bricks.

1. The combination of the segmental disks *q q* on the vertical shaft L with the segmental concave stops q' q'' in mold-table B B', substantially as specified.

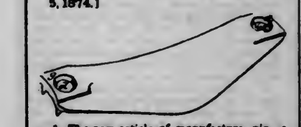
2. The two curved plates A and a^1, posts *b*, pin a^2, and cam-wheel R, in combination with the follower-posts and revolving mold-table, all operating substantially as set forth.

3. The supporting plate b^1, lever *b*, and spring *c*, in combination with the cam x^1 and a^2, pins *r*, and follower-stems *o o o*, all working automatically, as herein set forth.

4. The cam-roll X, main driving-shaft *i*, re-pressure-track *y y*, stems *o o o*, follower and re-pressure-plate H H', in combination with a revolving mold-table, B B', substantially as described, and for the purpose herein set forth.

5. The combination of the bar K'' and its connections k^1 k^2 c' c'' with the dies d^n d^m, for the purpose herein specified.

6. The combination of the intermittent cog-wheel 5, with the wheel 6, 9, 10, and 11, and the reciprocating hopper F, all operating substantially as specified.



7. The friction-roll-adjusting stop, in combination with the steam die-head K', and the revolving mold-table B B', substantially as described and set forth.

8. The combination of the step J and standards K K with the mold-table and vertical shaft N, as arranged and described.

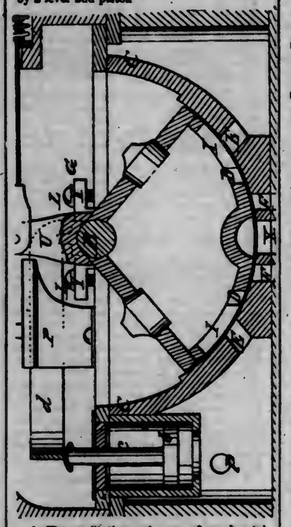
9. The segmental cam-disk *w w*, with its concentric grooves s^1 s^2, cam-teeth thereon, the T-groove with its bases, the bolts and nuts for fastening the teeth to the disk, in combination with the vertical rods w' w' and the connecting valve-levers, all operating substantially as herein described.

10. The combination of the main driving-shaft, vertical shaft N, disks *w w*, and the brick-removing device, all working in combination as described.

163,495. FELLY-JOINT PLATES. Jas. Ives, Mount Carmel, Conn., assignor to Ives, Woodruff & Co., same place. [Filed Aug. 5, 1874.]

1. The new article of manufacture, viz., a felly-joint plate made of malleable cast metal, and with tapered sides or wings, bolt-holes and nut-seats, all as and for the purpose set forth.

2. A cast-iron felly-joint plate, having dowel-pins, tapering wings, bolt-holes, and nut-seats formed in the manner and for the purposes described.



163,496. COUPON TAGS AND CHECKS. Geo R. G. Jones, Memphis, Tenn., assignor of one-half his right to Joseph W Allison, same place. [Filed Jan 2, 1875.]

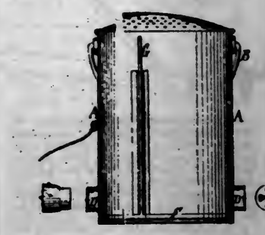
The within described baggage check, consisting of the tag A, provided with the wire B, and having its face divided into the duplicate C and original D with suitable instructions and numbers printed thereon, substantially as and for the purposes herein set forth.

163,497. OSCILLATING STEAM-VALVES. H. P. Jones, Keokuk, Iowa, assignor of one-half his right to Wolf H. Anderson, Rock Island, Ill. [Filed Apr. 3, 1875.]

Brief.—Steam is admitted from the middle chamber to the inside of the valve, from which it is delivered to the cylinder through ports in the shell of the valve. The valve rotates in adjustable bearings, and is held to its seat by a lever and piston

1. The oscillating valve A, of quadrantal form, having slots D I in its periphery, substantially as described.

2. The adjustable boxes G for journals B, combined with pillow-block E, leading from cups Y into oil-receivers T, substantially as described.



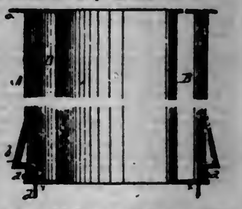
3. Stuffing-box J, combined with the two-part spool N, spring O, and valve-rod Z, substantially as described.

4. The lever *d* and piston *b*, combined with the adjustable boxes G and valve-trunnions B, substantially as described.

5. The adjustable fulcrums *e e* and the keepers P P, combined with valve A, piston *b*, and lever *d*, operated as described.

163,498. LIVE-BAIT RECEPTACLES. Robert B Kepner, Washington, D C [Filed Apr. 22, 1875.]

Brief.—For readily replenishing the supply of fresh water, and examination of the live bait for use, or removal of dead fish from the rest



1. The live-bait receptacle, consisting of the shell or bucket A, having tubular openings D D, protected by wire or wire-netting, perforated false bottom F, and handle or lifter G, the whole combined and arranged substantially as and for the purpose specified.

2. The shell or bucket A, having tubular openings D D, protected by wire or wire-netting, perforated false bottom F, handle or lifter G, and perforated cover C, the whole combined and arranged substantially as and for the purpose specified.

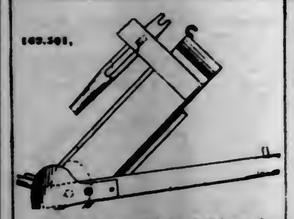
3. A live-bait bucket, consisting of the shell A, having tubular openings or perforations D D, suitably protected, perforated false bottom F, handle or lifter G, perforated cover C, and spring-latch, the whole constructed, combined, and arranged to operate substantially as described, and for the purpose specified.

163,499. STOVE-PIPE THIMBLES. Charles M. Loughlin and John S. Hughes, Bevier, Mo [Filed Nov. 21, 1874.]

Brief.—The springs being pressed inwardly, the thimble is readily removed.

1. In a stove-pipe thimble, the hoop or thimble A, provided with flange *a* at one end, and sockets *b b*, near the other end, as and for the purpose set forth.

2. The hoop or thimble A, having flange *a*, and sockets *b b*, in combination with the ventilator B, composed of two cylinders of different diameters connected by perforated heads, and the spring-catches *h h*, all substantially as and for the purpose herein described.



163,500. BUCKLES. Jno. Linen, Waterbury, Conn., assignor to Smith & Griggs Manufacturing Company, same place. [Filed Nov. 23, 1874.]

The herein-described buckle, consisting of a sheet-metal plate, slotted to form the several bars, all of which are in substantially the same plane with the frame, the tongue A hinged to one of the bars, and with the loop B, at the end opposite the tongue, directly over the bar 5, all substantially as specified.

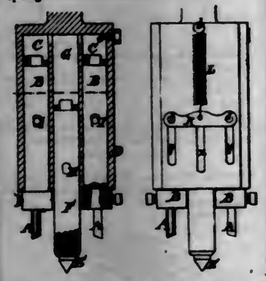
163,501. SNOW-PLOWS. Calvin Marshall, North Easton, Mass. [Filed Oct. 7, 1874.]

162,501.

1. In combination with the draft-frame, the pivoted snow-plow, composed of two converging side boards, a rear cross-log, and a central keel, said plow capable of being adjusted in respect to the draft-frame, substantially as and for the purpose set forth.

2. A snow-plow provided with a supplementary metallic keel or cutter extending below the plow proper, substantially as described.

3. In combination with the keel-board and its receiving-frame, the vibrated slotted lever, provided with a forked forward end, adapted to engage with a staple on the draft-frame, as set forth.

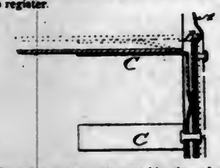


162,502. SPOUTS FOR COFFEE-POTS. N. S. McFarland, New York, N. Y. [Filed Apr. 26, 1875.]

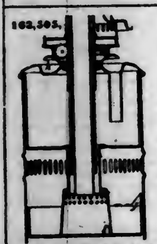
A spout constructed as herein described, so as to form, when attached to a vessel, a chamber, C, below the outlet *a*, and a channel connecting said chamber with the body of the vessel, whereby said chamber is enabled to constantly hold a quantity of liquid, and thereby prevent the escape of aroma, whether the liquid in the body of the vessel stands above or below the outlet *a*, substantially as set forth.

162,503. DRILLING APPARATUS. John McKay, Newcastle-on-Tyne, England. [Filed Feb. 23, 1875.]

Brief.—A head having chambers opening into each other at the rear end, and fitted with rams, the two former carrying cutters, and the latter carrying a centering-point. The chambers are filled with liquid to equalize the pressure of the cutters and center, and the rams are held back against the liquid by spring.



1. The combination, in a head-stock for drilling and boring machines, of the center-pin E, adapted to a chamber, O, with the cutter-rams F, adapted to chambers C, the said chambers communicating with each other, and containing liquid, as and for the purpose set forth.



2. The combination of the center-pin E and its ram F, and the rams B, carrying the cutters A, and under the control of springs L, with the communicating chambers C C C, containing liquid, as specified.

162,504. VENTILATING-FLUE STOPPERS. Baron A. Meade, Newark, N. Y. [Filed Aug. 26, 1874.]

Brief.—The springs which hold the flue stopper in place cross each other over the center of the stopper or cap, and are attached thereto by the rivet, which also holds in place the register.

In a flue-stopper, the combination of the metallic spring-strips C C, crimped and crossed at right angles to each other, and fastened to the pivot that secures the movable register-plate B and the flue-plate A, substantially as shown and described.

162,505. LAMPS. Rufus S. Merrill, Boston, Mass., assignor to Herman G. Moehring, Rufus S. Merrill, Wm. B. Merrill, and John Merrill, same place. [Filed May 1, 1875.]

1. The annular oil-receiving recess, formed in the top of the metallic lamp-body around the lamp-collar, in combination with an oil conducting tube or tubes, leading from said recess into the lamp-body, as shown and set forth.

2. The lamp-body or oil-reservoir, in combination with an extension or well projecting below the bottom of, and communicating with, the oil-reservoir, and a central draft-tube, which, with said well, forms an annular chamber for reception of the lower portion of the tubular wick, substantially as shown and set forth.

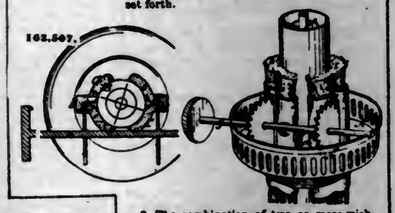
3. The lamp-body, and the annular wick-receiving chamber, projecting below the bottom of said body, and formed by the union of the central draft tube, and an outer enveloping jacket, as described, in combination with a drip-cup, constituting the base of the lamp, and provided with a tubular perforated stem, which is detachably connected with the lower end of the annular wick-receiving chamber, substantially as shown and set forth.

4. The lamp-body, the detachable drip-cup, constituting the base of the lamp, and the tubular connecting stem, through which air is admitted to the central draft-flue of the lamp, in combination with an outer perforated shell or receptacle, into which the lamp fits, and from which it is removable, substantially as set forth.

5. The detachable drip-cup, formed to constitute a base for the lamp, when the latter is removed from the outer shell or jacket, and provided with a discharge-spout and shield, and a central perforated stem, having at its base an opening, through which the drip may pass into the cup, substantially as set forth.

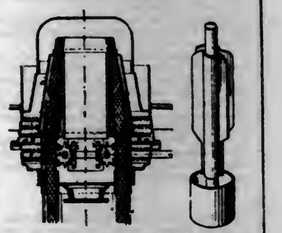
162,506. CEMENT PAVEMENTS. Isidor Mock, Brooklyn, N. Y. [Filed Apr. 6, 1875.]

Brief.—The cement sections are separated by beveled strips of wood covered with tarred paper, to facilitate their removal. The subsoil is dusted for the same object, and pyramidal blocks of wood are inserted in the upper central face of the cement when fluid, into which screw-rings can be inserted when it is desired to lift the blocks.



1. In combination with the sections of a cement pavement formed directly on the ground, the triangular-shaped wood-parting-strips D, having on each side a layer of tar paper or other material, substantially as and for the purpose specified.

2. The combination of the pyramidal plugs E, with the sections B, of a cement pavement, said plugs being molded into the cement, substantially as and for the purpose described.



162,507. WICK-RAISERS. Herman G. Moehring, Philadelphia, Pa., assignor of one-half his right to Rufus S. Merrill, W. B. Merrill, and Joshua Merrill, Boston, Mass. [Filed May 1, 1875.]

1. A wick-tube formed on one of its sides with an offset, bulge, or corrugation to receive a portion of the wick which is crimped or bent therein, in combination with a wick-raiser working through an opening in said bulging part or offset of the tube upon the crimped portion of the wick, substantially as set forth.

2. The combination of two or more wick tubes, each formed with an offset, bulge, or corrugation to receive a crimped portion of the wick, as described, with wick raising pinions or ratchets, one for each tube, working through openings in the bulging parts of the tubes upon the crimped parts of the wicks, and a single rotary shaft or spindle, upon which all the pinions are fixed, substantially as set forth.

162,508. LAMP-BURNERS. Herman G. Moehring, Philadelphia, Pa., assignor of one-half his right to Rufus S. Merrill, W. B. Merrill, and Joshua Merrill, Boston, Mass. [Filed May 1, 1875.]

1. In an Argand lamp-burner, the combination, with two or more independent wick-tubes, of a central draft-tube and an external wick-assembling shell, which, with the central draft-tube, forms an annular chamber to receive the wicks from the independent tubes, and assemble them in the form of an annular wick, substantially as set forth.

2. In an Argand lamp-burner, the combination of the following instrumentalities, namely: two or more independent wick-tubes, a central draft flue or tube, a wick-assembling shell, which extends above the wick-tubes, surrounds the central draft-tube, receives the wicks from said independent tubes, and assembles them around the central draft-tube in the shape of an annular wick, one or more lateral air-passages, located between the wick-tubes, and leading to the central draft-flue or tube, substantially as shown and described.

3. A lamp-burner formed with a filling orifice or passage extending through it from top to bottom, substantially as shown and set forth.

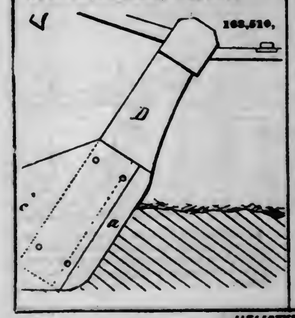
4. In an Argand lamp-burner, a central draft flue or tube, which communicates with the oil-reservoir of the lamp, and constitutes a passage through which the lamp may be filled, substantially as set forth.

5. In an Argand lamp-burner, the combination, with a central draft flue or tube formed to communicate with the lamp-reservoir, as described, of a plug or stopper within the tube, closing the said channel of communication, and removable through the upper end of the tube, substantially as shown and set forth.

6. In combination with the central draft flue or tube of an Argand burner, an inner draft-regulating tube concentric with the central draft-flue, and formed with an opening or openings for reception of a portion of the air admitted to the said draft-flue, substantially as set forth.

7. In combination with the central draft-flue, the inner concentric draft-regulating tube and one or more transverse vertical plates or partitions, substantially as shown and described.

8. In combination with the central draft-flue or tube, the removable plug or stopper, formed with a stem, by which it may be lifted out from the flue, and a cup or receptacle for catching ashes that may drop from the wick into the draft-flue, as set forth.



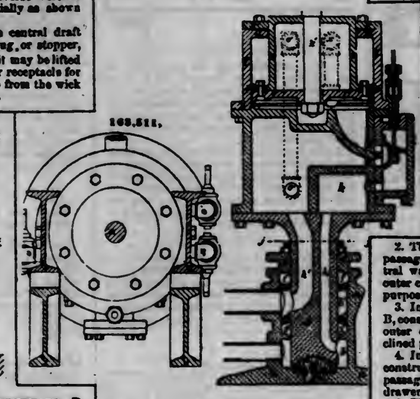
162,509. SELF-OILING HATCHWAYS. D. Moore, Brooklyn, N. Y., assignor to S. I. Thursby, same place. [Filed May 1, 1875.]

Brief.—The car is raised by telescopic tubes operated by hydraulic pressure. The hatches are without apertures, and are carried up by the car in its ascent, and deposited in its descent. Rubber cushions on the hatches deaden the concussion, and centering nipples and sockets are provided for properly centering the hatches upon their seats.

1. The tight hatches, in combination with an elevator operated from below, substantially as described, and for the purpose specified.

2. The cushions *a a*, in combination with the hatches and elevator, substantially as described.

3. The centralizing nipples *f f*, and corresponding cavities *f' f'*, in combination with the elevator, substantially as described.



162,510. COMB-ROW MARKERS. Albert G. Moore, Uniontown, Pa. [Filed Mar. 6, 1875.]

Brief.—The marking teeth leave the furrows wide and flat.

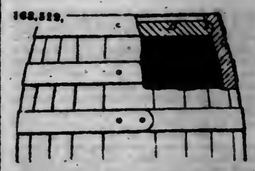
In a land-marker, the inclined teeth D, constructed with rounded front edges *e*, flaring wings *e e*, and flat bottom, substantially as shown and specified.

162,511. WATER-PRESSURE CRANES. C. H. Morgan, Worcester, Mass. [Filed Feb. 17, 1874.]

Brief.—Water-ways through and around the step-spindle made tight by suitable packing crossed with pressure and exhaust chambers, which communicate by a slide-valve with cylinder containing a piston, presenting a greater pressure-area on its under side than on its upper. Pipes with cocks connect the upper portion of cylinder with pressure and exhaust chambers, by which economy of water or accelerated speed may be obtained on light lifts.

1. In combination with the stand-case *a* of a water-pressure crane, and the step-spindle *g* turning therein, the annular spaces *b b'* and gland *c*, and interposed packing between them, and the pressure and discharge passages *h h'*, as and for the purpose described and represented.

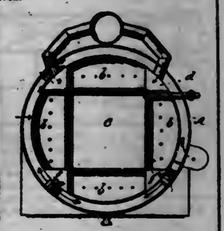
2. In combination with the step-spindle *g*, and the vertical passages *h h'* through it, the chambers *k* and *k'*, ports *n p p'*, and valve and valve-chest *m l*, as and for the purpose described and represented.



3. In combination with the cylinder *q*, the differential piston *r s* and lifting piston-rod *x'*, as and for the purpose described and represented.

4. In combination with the water-chambers *h* and *h'*, cylinder *q*, and differential piston *r s*, the connecting-pipes *o*, *o'*, and *x*, and valves *w*, *w'*, and *w''*, all as and for the purpose described and represented.

162,512. BARRELS. Josiah H. Morrison, Portsmouth, N. H., assignor to himself, W. J. Most, C. H. Gould, and W. D. Varrell, same place. [Filed Apr. 23, 1875.]



Brief.—For the purpose of giving greater strength to the edge of heads and staves in barrels, casks, and kegs for holding liquor, the barrel is provided with a peculiar-formed seam, consisting of an arc-joint made by cutting a concave groove in the inner ends of the staves, and providing the head with a convex edge.

A crozo for barrels, casks, and kegs, consisting of the arc-joint *a' b'*, constructed and applied, substantially as and for the purpose specified.

162,513. COMBINED GAS-VENTILATORS AND WATER-COOLERS. Andrew J. Morrison, Troy, N. Y. [Filed Feb 6, 1875.]

1. A combined water-cooler and ventilator, substantially as described, wherein the air to be cooled is caused to pass through suitable passages in contact with ice chambers, as specified, and afterward filtered from all impurities by coming in contact with water in a drip-pan arranged below a centrally-located water-tank to receive the drippings therefrom, as set forth.

2. The inner cylinder B, provided with air-passages *d d* and *f f*, ice-chambers *b*, and central water tank C, in combination with the outer cylinder A, substantially as and for the purpose specified.

3. In combination with the inner cylinder B, constructed substantially as described, the outer cylinder A, annular space *g*, and inclined partition *h*, for the purpose set forth.

4. In combination with the inner cylinder B, constructed, as described, with suitable air-passages and ice-chambers, the drip-pan or drawer D, for the purpose set forth.

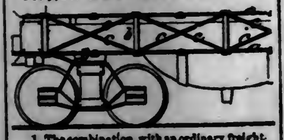
5. The combination, with the outer cylinder A and annular space *g*, having inclined partitions *h h*, of the inner cylinder B, provided with air-passages *d d* and *f f* and ice-chamber *b*, as and for the purpose set forth.

6. The water-cooler and ventilator herein described, consisting of the outer cylinder A, with cover I, inner cylinder B, provided with central water tank or reservoir C, ice-chambers *b*, air-passages *f f* and *d d*, and cover H, tubes *s s*, main pipe E, and drip-pan or drawer D, substantially as described.

162,514. PROCESSES OF PRODUCING GELATINE RELIEF-PLATES FOR PRINTING. Wm. H. Mumler, Boston, Mass. [Filed June 2, 1874.]

1. The process herein described of obtaining level, straight, and true surfaces on gelatinous films, from which to produce relief-plates for printing from, by grinding the surface of said film with emery-cloth or other suitable abrading material properly extended upon and secured to a true flat surface of wood or other suitable material, substantially as described.

2. The process of producing relief-surfaces upon gelatine plates by photographing or printing from a photographic negative the picture to be reproduced upon the surface of said gelatine plate, grinding the surface of the plate either before or after printing thereon the picture, and then treating it with acetic acid, substantially in the manner herein set forth and described.



3. The process herein described of producing gelatine relief-plates by photographing or printing from a photographic negative or positive upon the surface of the gelatine plate the picture to be produced in relief, treating the plate with acetic acid until it has eaten away the gelatine to as great a depth as possible without injury to the lines, removing the acid and coating, or filling the parts acted

upon by the sand with a paste made of bone-black and any suitable gum, or with indelible ink, black shellac-varnish, or other opaque or semi-transparent substances, then exposing the plate in the direct rays of light without the negative or positive plate, and after removing the paste or other opaque or semi-transparent substances, treating the gelatine plate with acetic acid a second time, substantially as described.

4. In the process of producing relatine rub'r plates, treating the plate, after a partial relief has been produced, to a coating of bone-black paste, india-ink, black shellac-varnish, or other opaque or semi-transparent substance, substantially in the manner herein described, for the purpose specified.

5. The method of preventing the emery or other abrading material from scratching the surface of the gelatine plate by filling the interstices of the abrading-surface with tallow or equivalent material, substantially as described.

163,515. OIL-CARS. Albert P. Odell, Oil City, Pa. [Filed Jan. 2, 1875.]

1. The combination, with an ordinary freight-car, of a truss and an oil-tank, suspended below the floor of the car by the truss, all substantially as and for the purpose set forth.

2. The combination, with an oil-tank, of the car-floor H, having trap-door h and raised sides and ends J J, substantially as set forth.

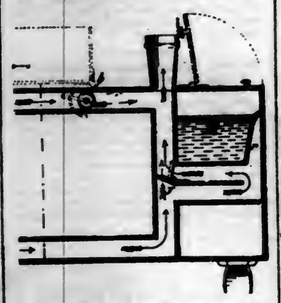
163,516. GRAIN-SEPARATORS. Harrison Osborn, Richmond, Ind., and T. T. Kendrick, New York, N. Y. [Filed Apr. 19, 1875.]

Brief.—Improvements in means for supporting and actuating the upper and lower shoe; improved "sheat-board" and deflecting devices for blast; adjustment for fan-doors.

1. A shoe-board for grain-separators, formed in two or more parallel, or nearly parallel, planes or steps, E E', having the space between said steps closed by inclined board e to deflect and concentrate the blast upon the fan, substantially as set forth.

2. The shoe J, suspended at its rear end by straps K, and supported at its front or feed end upon roller l, reciprocating upon corrugated cross-bar M, said shoe being guided thereon by yokes J', as and for the purpose set forth.

3. The shoe U, pivoted and sliding on horizontal rod b, and with one end riding upon roller F over corrugated bar d, to impart an oscillation and jar to said shoe during its movements, as set forth.



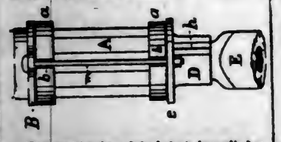
4. Two or more vertical wind-guides, Q, placed in front of the middle of the fan-wings, substantially as and for the purpose herein set forth.

5. The horizontal adjustable wind-guides q, pivoted to the upright adjustable wind-guides Q, substantially as and for the purpose set forth.

6. The fan-doors r and pointed blocks s, in combination with notched cleats c, substantially as and for the purpose set forth.

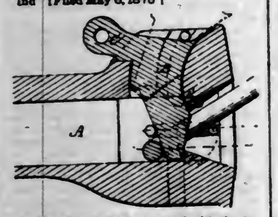
163,517. RESERVOIR COOKING-STOVES. C. N. Palmer, Elmira, N. Y. [Filed July 23 1874.]

Brief.—The products of combustion may pass directly through the aperture in the damper in the top flue.



1. In combination with the top plate D of the fire-box, and the elevated top D' of a step-stove, the folding oven H, constructed as herein described, with hinged plates h h' h², adapted to be turned back completely away from the top plate D, as set forth, or to be entirely removed.

2. The combination of the oven A, the front flue B, the fire-box C, located with its top at the mid-height of the said front flue, the folding oven, consisting of hinged plates h h' h², and the register m, communicating from the interior of the oven H to the rising portion of the flue B, all as specified.



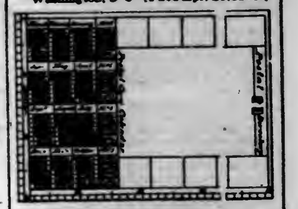
163,518. PUMPS. Alinus N. Parkhurst, Logansport, Ind. [Filed Apr. 17, 1875.]

Brief.—Flanged collars are secured to the ends of the tubing and the stock, adjacent to the cylinder, and the whole secured together by long bolts, the said bolts occupying notches in the flanges of the cylinder.

The combination of the baked-clay cylinder A, having flanges a a, provided with notches b, long bolts m, collar B, having lugs provided with bolt-holes c, upper tubing C, flanged collar D, having ribs A, and lower tubing E, constructed substantially as and for the purpose set forth.

163,519. CAR-COUPLINGS. Wm. V. Perry, Beaver Dam, Wis., assignor to the Perry Safety Car-Coupling Company, Kokomo Ind. [Filed May 6, 1875.]

1. The draw-head A, provided with the interior transverse ridges f f' and the tapering head b, substantially as and for the purposes set forth.



2. The coupling pin B, having concave front curve x, straight front edge c, and convex back curve z, the curves being concentric, substantially as and for the purposes set forth.

3. In a car coupling, the combination of the flat bar D and rod h with the slotted plate E, provided with the transverse groove m, substantially as and for the purposes set forth.

4. The combination of the draw-head A, having the ridges f f', and the fork G, shaft n, and arm H, substantially as and for the purposes set forth.

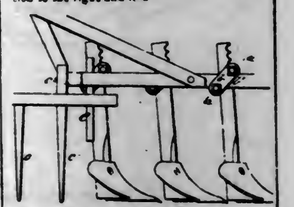
5. The combination, with the link-adjusting device G n H and shaft or rod I, of the chain p, spring K, and arm J, projecting from said rod, substantially as and for the purposes set forth.

163,520. POSTAL-CARDS. A. Petersohn, Washington, D. C. [Filed Apr. 20, 1875.]

A postal card provided upon the surface opposite to that on which the address is designed to appear with a blank space for manuscript, surrounded by spaces for advertisements, a calendar, a measure, and a partially-concealed perforation, all arranged as and for the purposes hereinbefore set forth.

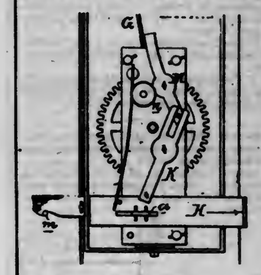
163,521. PROCESSES OF DYEING SILK FABRICS. Jean Baptiste C. H. Fettididier, St. Denis, France. [Filed Apr. 27, 1875.

The herein-described improvement in the process of dyeing fabrics wholly or in part silk, consisting in the solution of the dye in alcohol or similar solvent, combined with a fatty and resinous mordant, and subsequently passing the dyed fabric through a bath of benzine, for dissolving the said fatty and resinous mordant.



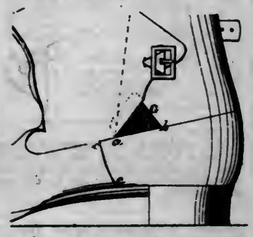
163,522. BALE-TIES. John W. Philp, Humboldt, Tenn. [Filed Apr. 20, 1875.]

A cotton-bale tie consisting of the plate a, having the slots b c c, as described, in combination with the wire g, looped and interlocked or crossed at e with each other on the under side of the plate, whereby the strain is directly upon the wire hoop instead of the plate, as specified.



163,523. CULTIVATORS AND HARROWS COMBINED. Elias M. Potter, Rutherford Depot, Tenn. [Filed Feb 13, 1875.]

Brief.—A rectangular frame consisting of three beams, each carrying a cultivator-tooth, with handles secured to the outer ones. To the middle beam, at its rear end, is attached a triangular harrow, which has a limited vibration to the right and left.



In combination with the plow stock A the triangular harrow, loosely connected by means of the pin c, and limited in lateral vibration by the steady-pins c' c², substantially as described.

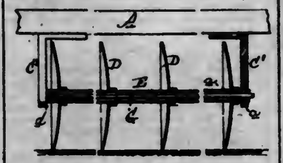
163,524. BURGLAR-ALARMS. Thos. Powell, Philadelphia, Pa. [Filed Apr. 17, 1875.]

A burglar-alarm in which are combined the spring sliding bar H and its catch, the levers K and M, and the escapement-arm G of clock-work mechanism.

163,525. GAITER BOOTS AND SHOES. Wm. B. Putnam, Boston, Mass., assignor of one-half his right to H. S. Jenkins, same place. [Filed Apr. 20, 1875.]

In combination with a gaiter having the front quarter overlapping the rear quarters, and fastened by an ankle-strap, as described, elastic gores G, inserted at or immediately back of the point of junction between the instep-piece and upper or main part of the shoe, and operating to produce a close fit over the instep, and to hold down the rear strap, in the manner set forth.

163,526. COTTON-SPINDLES. Croghan A. Ramsey, Schulenburg, Tex. [Filed Mar. 8, 1875.]



Brief.—A reservoir for containing liquid, of any convenient form for being carried on the cantle of a saddle, is provided with two flexible pipes attached near the bottom, and terminating with a perforated sprinkler. When these are depressed below the level of the surface of the liquid, a discharge in the form of a fine spray is introduced, and when elevated above the surface of the liquid the flow ceases

The combination, in a cotton-worm destroyer, of the fluid-vessel A, with the flexible ejecting-hose B B, having flaring nozzle-sprinklers b b, and hooks or fastening devices for holding the nozzles in elevated positions upon the vessel, whereby the rider has control both over the discharge of the fluid and the direction thereof upon the rows of plants, as described.

163,527. DISK-HARROWS. Silas G. Randall, Greene, N. Y. [Filed Mar. 17, 1875.]

Brief.—The concave disks for each series are mounted upon a hollow shaft, which is hung upon short journals projecting inward from the hangers. A small rod with a head on one end, and a screw-nut or pin on the other, passes through both journals and the hollow shaft, to prevent the hangers from spreading.

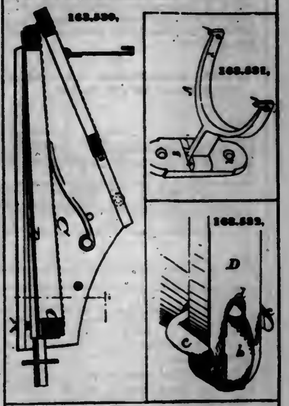
The combination of the hangers, having the lateral journals a, with the tubular axle mounted on said journals, and the shaft G, passing through the axle and connecting the hangers together, substantially as and for the purpose described.

163,528. GAS-CARBURETERS. William H. Reed, Chicago, Ill., assignor of part of his right to Warren A. Wells, Henry C. Hayt, D. J. Small, Henry Jones, and L. P. Converse, same place. [Filed May 10, 1875.]

Brief.—Two independent spiral passages extend through the chamber side by side, one containing the hydrocarbon and absorbent material, and the other a non-conducting material.

An air-carbureter having a double convolute wall, forming two separate and independent convolute chambers, a b, inside of a case, A, in one of which chambers is an absorbent, and in the other a substance which is a poor conductor of heat, substantially as described.

163,529. VENTILATING-PIPES FOR LEAD-CORRODING HOUSES. James D. Richeson, St. Louis, Mo. [Filed May 1, 1875.]



1. The tapering pipe-section having perforated sides A, projecting cap B, and corner brackets C, substantially as and for the purpose set forth.

2. In combination with the pipe-sections, as described, the bracket-screws D, substantially as and for the purpose set forth.

163,530. GRAIN-SEPARATORS. Michael C. Rider and George W. Reynolds, Loveville, Pa. [Filed Nov. 7, 1874.]

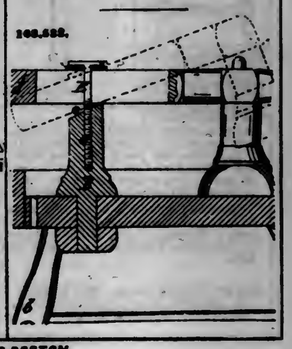
Brief.—Device for adjusting the inclination of a sieve.

In a grain-separator, the frame C', in combination with the adjusting-screws d, screws C, and depressing-springs S, substantially as and for the purpose set forth.

163,531. RAIN-SPOUT SUPPORTS. D. Rosier, Haverhill, Mass. [Filed Apr. 14, 1875.]

Brief.—The base-plate is provided with a dovetail socket, to receive the dovetailed head of the furcated brace.

1. The fastening-plate E, tapered and provided with the dovetail socket, as described, and for use with the separate furcated brace provided with the dovetailed head to enter such socket.



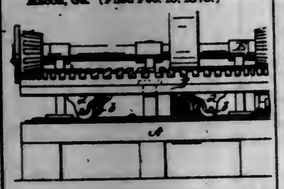
2. The dovetailed and furcated braces A, provided with the studs f f and the screw-bolts e e arranged with it, and for use as specified.

3. The tapering base-plate E, provided with the socketed flange, as described, in combination with the furcated brace A, provided with the dovetailed head a, the holes e e, and the studs f f, all being substantially as specified.

163,532. TRACE-FASTENERS. C. Robinson, Eau Claire, Wis. [Filed May 4, 1875.]

Brief.—The guard prevents the brace from falling down and slipping off the head.

In combination with the T-shaped hooks B b, secured within the end of a whiffletree with its cross-bar b in a vertical position, the guard C, pivoted upon the inner portion of said hook, and having lateral arms c and c, which engage with the ends of said cross-bar, substantially as and for the purpose set forth.



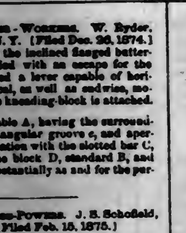
163,626. BUTTER-WORKERS. W. Ryder, Cattaraugus, N. Y. [Filed Dec. 26, 1874.]

Brief.—Within the inclined flanged butter-receptacle, provided with an escape for the whey, is supported a lever capable of horizontal and vertical, as well as endwise, motion, to which the kneading-block is attached.

The inclined table A, having the surrounding flange *a*, rectangular groove *c*, and aperture *d*, in combination with the slotted bar C, provided with the block D, standard B, and pivoted pin E, substantially as and for the purpose set forth.

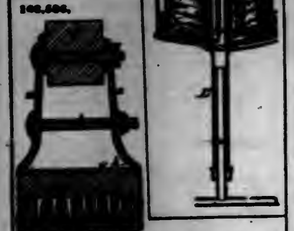
163,627. HORSE-POWERS. J. S. Schofield, Macon, Ga. [Filed Feb. 16, 1875.]

The combination, in a horse-power, of a frame, A, having circular track *a*, and the master-wheel B, having castings *d d*, carrying the flange-rollers *b b*, all substantially as set forth.



163,628. CARBURETERS. Ira W. Shaler, Brooklyn, N. Y. [Filed Mar. 22, 1875.]

Brief.—The carburetor is constructed to slide on a rod attached to the ceiling. The pipe leading to the burners is extensible. The rolls of wicking are twisted upon wires.

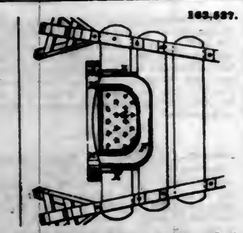


1. The communicating pipes H and I, in combination with the oil-reservoir A and pipe *l*, as and for the purpose set forth.

2. The packing *n*, twisted upon wires *n*, and placed in frames *p* within the interior perforated shell K, substantially as herein set forth.

163,629.

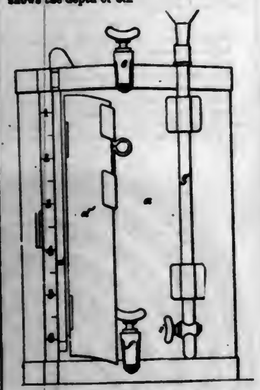
163,630.



163,630. BRUSH-HOLDERS. W. P. Shenk, Clifton, W. Va. [Filed Nov. 7, 1874.]

Brief.—The side pieces clamp the brush-back at their lower ends, and receive the handle upon a pivot at their upper ends. Midway in the bolt for drawing the parts together.

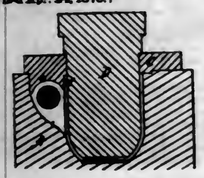
The adjustable clamping device, which holds the brush rigidly, consisting of the hook-shaped arms *a*, clamping-bolt *f*, and the pivot-bolt *e* for the handle, substantially as herein set forth.



163,631. CIRCUS-SEATS. Wm. H. Storey, St. Paul, Minn., assignor to David C. Price, same place. [Filed Jan. 26, 1875.]

A show-seat consisting of the frame F, the back H, formed of a single piece of bent wood, pivoted to the sides of the said frame, and the jointed braces K, the back H being constructed to fold around and closely embrace the seat-frame, in order that the upper surfaces may be flush, as and for the purpose specified.

163,632. STORAGE AND DELIVERY TANKS FOR EXPLOSIVE AND INFLAMMABLE OILS. Pierre Sinibaldi, Paris, France, and Geo. R. F. Sinibaldi, London, England; said Geo. R. F. Sinibaldi assignor, by mesne assignments, to said Pierre Sinibaldi. [Filed Mar. 6, 1875.]

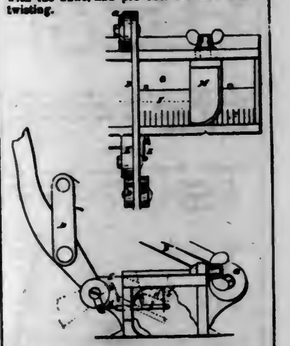


Brief.—The receptacle contains oil suspended against the top by water. When oil is to be drawn off, water is poured into the funnel, which leads to the bottom by pipe, thus forcing by displacement from the faucet at the top the same amount of oil. A gage shows the depth of oil.

1. In a device for the conveyance or storage of inflammable materials, the combination of the following elements: the pipe *g*, provided with the cock *i*, draw-off cocks *e* and *f*, and cistern *a*, substantially as described.

2. The combination, with the cistern or vessel for containing the petroleum or other gaseous liquid, of the water-admission pipe *g*, the oil-discharge pipe *e*, and the taps or cocks for controlling the said pipes and the gage *d*, substantially as herein set forth, and for the purpose specified.

163,633. MOLDS FOR GLASSWARE. John H. Smith and Matthew Smith, Pittsburg, Pa. [Filed Apr. 24, 1875.]

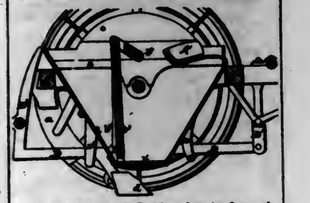


1. The process herein described form forming handles and ornamental projections upon glassware, by forcing the glass around a removable mandrel, which crosses the mold or a portion thereof.

2. The combination of mold A and mandrel B, substantially as and for the purpose specified.

3. The combination of mold A, mandrel B, and ring C, having the projection *c*, substantially as and for the purpose set forth.

163,640. PRINTERS' LEAD AND RULE CUTTERS. Judson A. Stanton, Cleveland, Ohio. [Filed Feb. 12, 1875.]



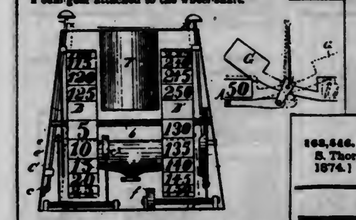
Brief.—The part cut off is received upon a hinged leaf, which descends at the same time with the knife, and prevents the rule from twisting.

The drop-leaf F, lever I, links J K, and springs *c*, in combination with the lever C, links D, knife B, and table A, in the manner substantially as described, and for the purpose specified.

163,641. SELF-LOADING CARTS. Thos. C. Strawn, Perry Township, Fayette County, assignor to himself and N. Q. Speer, Belle Vernon, Pa. [Filed June 12, 1874.]

Brief.—The plow-beams are hinged at the forward end to a standard, and provided at rear with a guide-piece and lifting-lever. A spring forces the plow outward by pressing against the guide-piece. The hopper-box has the lower portion of rear side and bottom hinged and operated by levers, so as to discharge the load close against an embankment.

1. The plow-beam D, hinged at its forward end to the standard D^1, and provided at its rear end with a guide-piece D^2, passing in rear of frame A, in combination with the lifting-lever E, substantially as and for the purpose specified.



2. The plow-beam D, hinged to the standard D^1, and provided with guide-piece D^2, in combination with the spring D^3, constructed substantially as and for the purpose specified.

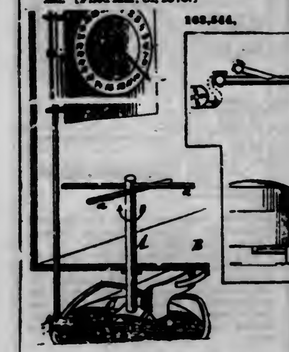
3. The plow-beams D, D, hinged at their forward ends to the standards D^1 D^1, and provided at their rear ends with guide-pieces D^2 D^2, in combination with each other and with the spring D^3, substantially as and for the purpose specified.

4. The hopper-shaped box, having the lower portion *b* of the rear side and the bottom *b'* thereof hinged, and provided with the supporting-levers b^2 and b^3, substantially as and for the purpose specified.

163,642. PRICE-INDICATORS. F. Sumpf, St. Louis, Mo. [Filed Mar. 4, 1875.]

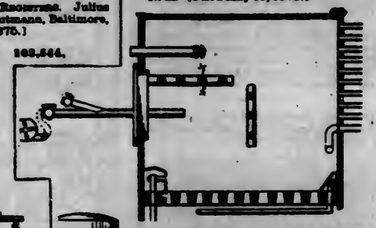
Brief.—The numeral-wheels are secured to and simultaneously rotate with a common shaft, which is provided at one end with a ratchet-wheel, operated through the medium of a pawl and spring-bar. When the highest number upon the wheel B has been presented at the opening in the face of the frame or case, the lowest number upon the wheel B' will next appear at another opening in the face of the frame. At the juncture of change of numbers from one wheel to the other (seriatim) the fact is announced by a pin on the ratchet-wheel striking the bell-hammer mechanism. An arrangement of levers is provided to alternately cover and uncover the openings in the face of the case, thereby exhibiting the numerals of one wheel only, till its highest number has been presented, after which that opening is closed and the other exposed. The levers are pivoted to a common center, and operated by a cam-gear attached to the wheel-shaft.

1. In a price-indicator and register device, the combination of the wheels B B', having figures, the stem C, spring *c'*, ratchet-wheel D, its pin *a*, the stem *c'*, rock-shaft *d'*, arbor *d''*, bell E, all arranged to operate in a casing, A, as herein shown and described, and by means whereof the price to be paid is indicated and stands registered, in the manner and for the purpose set forth.



2. The movable plate G, arm *g*, lever *g'*, its pin *g''*, gear-wheel I, having cam-flange *h'*, pinion H in combination with wheels B B', to operate in manner and for the purpose set forth.

163,643. BARREL-HOOPS. R. W. Sutherlen, Fillmore, Minn. [Filed May 20, 1874.]



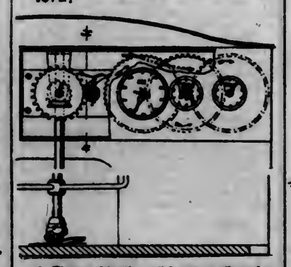
The beveled hoop A, having tapering ends, and secured together by the strap B, having its ends *b b* bent or inclined and driven into the face of the hoop, and wrought-nails *a a* passing twice through the strap, and clinched into the hoop, as herein set forth.

163,644. PASSENGER-REGISTERS. Julius Thoss and Adolph Trautmann, Baltimore, Md. [Filed Mar. 31, 1875.]

163,644.

The method herein described of promoting combustion and intensifying heat in furnaces, by simultaneously admitting hydrogen and carbonic-oxide gases and heated air to the same, and commingling and mixing the two at the moment they enter the furnace, substantially as described.

163,645. WAGON-BRAKES. E. A. Thompson, Daleville, Ala. [Filed Dec. 7, 1874.]

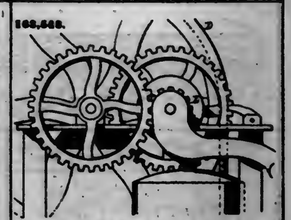


Brief.—When the catch is in place the strain comes on the shorter chain, which draws on the lever that brakes the wheel. When the catch is removed the strain comes on the other chain, which acts on the lever that releases the wheel.

The brake lock-chain hook for wagons, consisting of the lever-hook *c e e'*, in combination with the chains *c d*, the locking and unlocking trigger-loop A, and the tongue *f*, as shown and described.

163,645.

163,646. PASSENGER-REGISTERS. William S. Thorn, New York, N. Y. [Filed Oct. 21, 1874.]

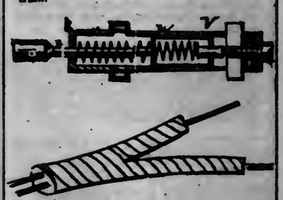


1. The combination, with a turnstile and a registering mechanism, of an intermediate mechanism, communicating the motion in either direction, of the stile to the register, substantially as and for the purposes set forth.

2. The combination, with the rotating shaft of a turnstile, of the piece U, recessed on its under side, and the spring S, substantially as and for the purposes set forth.

163,647. ATOMIZING COMBUSTION IN FURNACES. Joseph C. Tiffany, Portsmouth, N. H. [Filed May 10, 1875.]

163,648.



1. The combination, with the gasometer or gas-holder, of a train of multiplying gearing, connected at one end, by a suitable cord, with the gas-holder, and the other by means of a cord with a suitable weight, to counterbalance said gas-holder, as and for the purposes herein set forth.

2. The combination of the shaft O C', weighted pulley D, and gear-wheels O H, of such relative diameters that a light weight on the pulley will counterbalance a heavy weight at shaft C', substantially as herein described.

163,649. TRAIN-TELEGRAPH. A. N. Towne, San Francisco, Cal. [Filed Dec. 26, 1874.]

Brief.—The insulated cylinder or circuit-breaker is designed for use with an elastic conducting-cord extending from end to end of the train.

1. A signal apparatus for railway-trains, consisting of two complete electric circuits connecting with the opposite poles of a differential magnet, one of which circuits passes through the entire length of the train, so that when the train-circuit is ruptured the remaining circuit will cause the armature of the magnet to vibrate back and forth and ring a bell, substantially as above described.

2. The insulated cylinder or circuit-breaker *c*, with its screw *a*, in combination with the spindle *t*, with its short barrel *u* and surrounding spring *s*, said barrel *u* having the projecting spring-rod V, substantially as and for the purpose above described.

163,650. HOLDERS FOR SPINNING-RINGS. Chas. H. Trowbridge, Whitinsville, Mass. [Filed Apr. 7, 1875.]

1. The combination, with the ring and ring-rail of the clamp-like holders for holding and adjusting the ring, substantially as described.

2. The clamp-like spinning-ring holder *c*, composed of the bars *d*, flanges *e*, and top plate *f*, slotted to receive a holding-screw, and adapted to hold a ring-race, substantially as described.

163,651. FIRE-PROOF ROOFINGS. Peter G. Tyrrell, New York, N. Y. [Filed Apr. 17, 1875.]

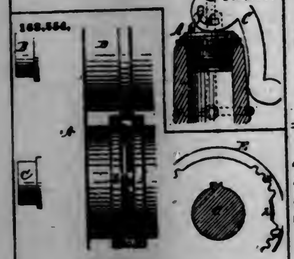
Brief.—A fire-proof roof-plate formed of a corrugated sheet of sheet metal, strengthened and supported by brass-rods, and filled with non-conducting fire-proof material.

The brass-rods B, in combination with a corrugated sheet-metal roofing and a non-conducting substance, substantially as specified.

163,551.

163,555.

163,552. PILL-TILE. Wm. H. Van Velsor, Philadelphia, Pa. [Filed Apr. 14, 1875.]



As an article of manufacture, a pill-tile of ground glass.

163,553. BOTTLE-STOPPER. W. Vom Hofe, New York, N. Y. [Filed Jan. 20, 1875.]

Brief.—A metallic plate which is connected on one side to a flanged stopper, while from its other side rise two lugs, which form the bearings for a fixed pin, and between which operates a cam-lever, that has its fulcrum on a ball, which swings on pivots projecting from a band that is secured to the neck of a bottle; said cam-lever being provided with an eccentric slot, which rests on the pin secured in the lugs of the metal plate, so that the ball is swung up over the mouth of the bottle. The stopper can be depressed and held in position by turning the hand-lever against the side of the bottle. By raising the lever the stopper is withdrawn.

The cam-lever C, provided with an eccentric slot, *f*, in combination with a ball, D, swinging on the neck-band *e* of a bottle, and with a pin, *a*, secured in lugs rising from a metal plate, A, to which the stopper B is attached, all constructed and operating substantially in the manner herein shown and described.

163,554.

163,555.

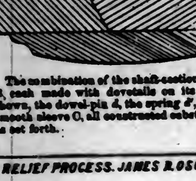
163,554. ROLLS FOR ROLLING HORSESHOE-BLANKS. James T. Walker, Albany, N. Y. [Filed Apr. 17, 1875.]

Brief.—The improvement is in the construction of the rolls only; a collar on the lower roll having recesses in which the toe-calk is formed, and peculiarly-shaped projections for indenting the nail-holes, on each side of which is a collar for confining the blank laterally, while the collar on the upper roll confines it vertically.

1. In a machine for rolling horseshoe-blanks, the collar G, provided with the projecting punches d and cut-out portions A, substantially as and for the purposes herein set forth.

2. The combination of the side collars E and H and the intermediate collar G, provided with the projecting punches d and cut-out portions A, substantially as and for the purposes set forth.

3. The combination of the roll D, provided with the circumferential flange *a*, and the roll formed of the collars E H and intermediate collar G, all constructed substantially as and for the purposes herein set forth.

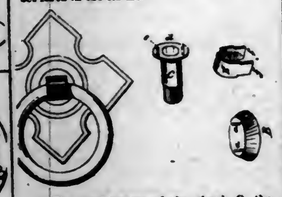


163,556. HORSESHOE-BLANK. James T. Walker, Albany, N. Y. [Filed Apr. 17, 1875.]

Brief.—The indentations C for the nail-holes have their inner sides straight, while the other three sides are beveled or inclined.

The straight rolled horseshoe-blank described—that is to say, having the toe-calk projection B solid therewith, and of about half the width of the bar, and the indentations C, of the shape substantially as described, for the nail-holes, as and for the purposes set forth.

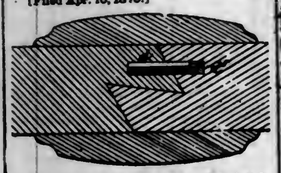
163,556. LAMP-EXTINGUISHER. Henry J. Warren, Lexington, Mass. [Filed Feb. 16, 1875.]



Brief.—The weight restores the sliding tube, acting directly thereon, when it has been raised to extinguish the flame.

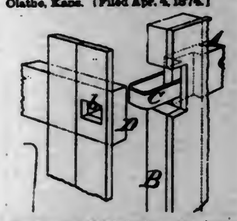
The weight B, with its vertical rod *d*, in combination with the lever *e* for operating directly upon the sleeve *c* on the wick-tube, all constructed and arranged substantially in the manner and for the purpose set forth.

163,557. DRAWER-PULLS. W. N. Weeden, Waterbury, Conn., assignor to Benedict & Burnham Manufacturing Company, same place. [Filed Mar. 27, 1875.]



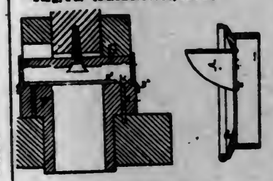
Brief.—The novelty consists in details of the manufacture, and putting together, whereby the cost of production is lessened, as fully set forth in the claims.

1. The combination of the shank C, the boss B, constructed with slots *a*, and the loop or socket E, constructed with tenons *f*, corresponding to the said slots *a*, substantially as set forth.



2. The combination of the boss B, constructed with slots *a*, the headed shank C, constructed with slots *c*, and the loop E, constructed with tenons *f*, the said parts united by means of the said tenons and slots, substantially as set forth.

163,558. SHAFT-COUPLINGS. P. B. Weeks and Martin Metcalf, Battle Creek, Mich. [Filed Apr. 16, 1875.]

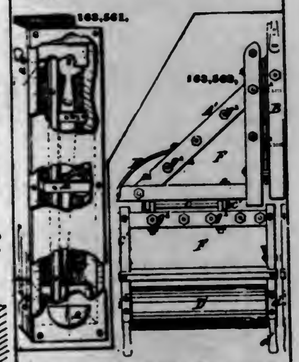


The combination of the shaft-sections A and B, each made with dovetails on its end, as shown, the dowel-pin *d*, the spring *b'*, and the smooth sleeve C, all constructed substantially as set forth.

163,559. PORTABLE SEEDS. T. L. Wescott, Olathe, Kans. [Filed Apr. 4, 1874.]

The bars A A B B halved together, in combination with bars D D, notched into bars B B, and confined thereto by means of staples C C and wedges *c c'*, in the manner and for the purposes described.

163,560. JUG-TOPS. Homer Wright, Pittsburg, Pa. [Filed Nov. 17, 1874.]



The jug-top consisting of the lip A, body B, and drip-flange B', the lip being secured to the drip-flange by means of tangs upon one and slots in the other part, substantially as and for the purpose specified.

163,561. LEVELS. Alfred B Wroth, Winterset, Iowa, assignor of two-thirds his right to R. G. Barker and Geo. Atkinson, same place. [Filed Aug. 10, 1874.]

The leveling-beam *c c*, having a central pendent weight, *d*, and vertical indicators *f f* at its ends, when mounted and arranged in the case A, having openings *a a*, and provided with the plumbing-lever , substantially as and for the purposes shown and described.

163,561.

163,562.

163,562. COMBINED LAND-ROLLERS AND HARROWS. Henry J. Yeargin, Liberty, Tenn. [Filed Mar. 31, 1875.]

Brief.—Two triangular harrow-frames are pivoted to a center-beam, which also forms the draft-bar. At the rear of each triangular section is hinged a rectangular frame, the forward section of which is supplied with cutters or teeth that have a rearward inclination. Behind these in each section, is mounted a roller.

1. The combination of the main harrow-frames A A', tongue B, and rear harrow-frames C C', all hinged and arranged as set forth.

2. The combination of frames A A', tongue B, frames C C', hinged as shown, the extended arms *d*, and handles *d'*, as set forth.

3. The combination, in a harrow composed of sections hinged together, of two independent rolls, D D', as and for the purpose set forth.

4. The combination of the harrow-frames A A' C C', hinged as set forth, the inclined cutting-teeth G G', and the rolls D D', as described.

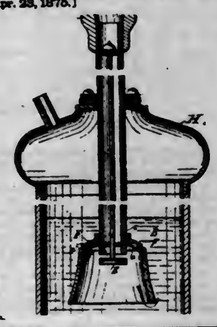
163,563. PLOWS. John P. Zeller, South Bend, Ind. [Filed Jan. 20, 1875.]

Brief.—The front section of the mold-board is detachable, and secured by a wing, which laps by the standard on the landside. To its lower angle is fitted the share, secured by a hook and bolt.

In a plow, the combination of the plow-point D, provided with lug *b*, and the colter E, provided with the wing G, the point and colter being constructed, as described, of separate pieces, and detachable independently of each other, substantially as herein set forth.

163,564. COMBINED DRIERS AND BAKE-OVENS. Jno. Zimmerman, Mansfield, Ohio. [Filed Jan. 14, 1875.]

Brief.—Hinged dampers between the furnace-case and the hood, for controlling the supply of air. A supplemental non-conducting partition for converting the drier into an oven.



1. In combination with the furnace D and hood E, the dampers *c c*, as and for the purpose set forth.

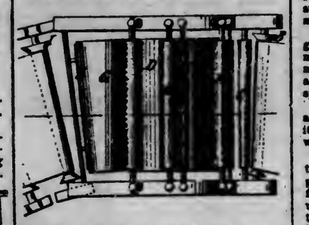
2. The casing A and furnace D, in combination with the diaphragm S, said diaphragm being constructed of wood, with a sheet-metal sheathing, as described, and for the purpose set forth.

REISSUES.

4,421. APPARATUS FOR CARBURETING AIR. Dana Bickford, New York, N. Y. Patent No. 51,126, dated Nov. 28, 1865. [Filed Apr. 28, 1875.]

1. In a carbureter, an inlet-tube made adjustable vertically to adapt the same to the quantity of liquid in the vessel.

2. In a carbureter, the combination, with an inlet-tube, of an inverted cup having a flaring or bell-shaped mouth, the tube entering the top of the bell, whereby the air or gas flows downward through the tube and into the bell, and is thence distributed.



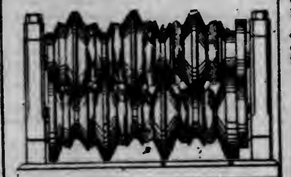
3. A carbureter provided with a bell or inverted cup for receiving the gaseous matter, made adjustable relatively to the quantity of liquid in the vessel.

4. A closed vessel for containing liquid hydrocarbon or its equivalent, in combination with an inlet-tube for conducting into it gaseous bodies to be carbureted therein, and with an inverted cup, bell, or cone appended to and in direct communication with such tube.

5. The described apparatus, as composed of the vessel A, provided with a cover, H, and a stuffing-box, *d*, the bell-shaped vessel or cup C, its tube D, and valves E and F, substantially as and for the purpose set forth.

4,422. CARDING-ENGINES FOR MAKING BATS FOR FELTED FABRICS. Henry J. Davies and W. D. Davies, Brooklyn, N. Y., assignors to Bennett & Smith. Patent No. 155,603, dated Sept. 29, 1874. [Filed Apr. 12, 1875.]

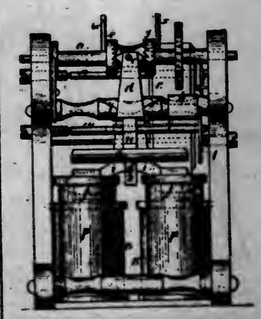
Brief.—Wool is fed from an endless apron stretched over conical rolls to the carding-cylinder, and from a conical doffer to a delivery-apron stretched over conical rolls, whereby a web of concentric curvature, suitable for felting into skirts, is produced.



1. The doffer G, of conical form, substantially as and for the purpose herein specified.

2. The feeding-apron A, of varying length throughout its width, and its conical rollers B B, in combination with the carding-cylinder D, substantially as specified.

3. The delivery-apron H, of varying length throughout its width, in combination with the conical doffer of a carding-engine, substantially as herein set forth.



4,423. ROLLS FOR REDUCING OLD RAILS. John P. Edwards, Cleveland, Ohio, and Ambler J. Rogers, Jackson, Mich. Patent No. 154,720, dated Sept. 8, 1874. [Filed Mar. 5, 1875.]

Brief.—A pair of rolls having a series of grooves whose margin axes lie oblique to the axes of the rolls, and are in form and dimensions adapted to the reduction of a railroad-rail to a rectangular bar.

Rolls A and B, provided with a series of reducing-grooves, the said grooves formed at an angle with the axes of the rolls, substantially as set forth, whereby a railroad-rail or butt-end, &c., may be simultaneously reduced in depth and thickness, and formed into a bar of different sectional area, and of the same or different form, without lapping or crimping its external surface, for the purpose set forth.

4,424. TELEGRAPHIC-PRINTING APPARATUS. Theodore M. Foote and Chas. A. Randall, Brooklyn, E. D., N. Y., assignors, by mesne assignments, to the Gold and Stock Telegraph Company, New York city. Patent No. 105,060, dated July 5, 1870. [Filed Apr. 24, 1875.]

1. A type-wheel rigidly secured to its shaft, and controlled by an escapement and step-by-step motion, in combination with a unison-stop that is disconnected by the printing mechanism, substantially as described.

2. The combination, with a printing-telegraph instrument, of a unison that arrests the movement of the type-wheel shaft, an electro-magnet, to throw the unison out of action, and one main-line circuit, substantially as specified.

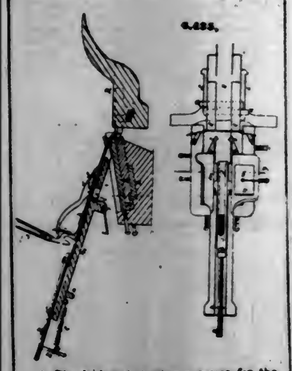
3. In a printing-telegraph, the unison mechanism brought into action by the type-wheel or its shaft, to arrest the movement of such type-wheel, substantially as specified.

4. In a printing-telegraph instrument, a type-wheel and its shaft rigidly secured together, in combination with an escapement for moving or controlling the type-wheel, a unison mechanism for adjusting or setting the type-wheel, and an electro-magnet for effecting the printing, all automatically controlled from the sending-station through one main circuit.

5. In a printing-telegraph instrument, a type-wheel, in combination with a unison that operates to stop both the type-wheel and the motor that carries the same when the unison is effected, substantially as specified.

6. A compound helix, consisting of three pairs of electro-magnets, C' C C G' G C, having a switch-bar, F, passing through the core of the middle pair C C, in combination with the relay-magnet, type-wheel, and printing-magnets, and circuit-connections, arranged and operating substantially as set forth.

7. The double pallet *e*, oscillating between the teeth of the ratchet-wheels *s f*, that face each other upon the type-wheel shaft *a*, in combination with the magnets B B', substantially as and for the purposes described.



8. The oscillating anchor *y*, and pins *w q*, in combination with type-wheel shaft, and with the printing-lever, or any part connected to the same, substantially as and for the purposes set forth.

9. A paper-feeding mechanism, composed of one elastic roller, and a second roller or an oscillating foot, and operated from the printing-lever of the telegraphic-printing apparatus, as herein described.

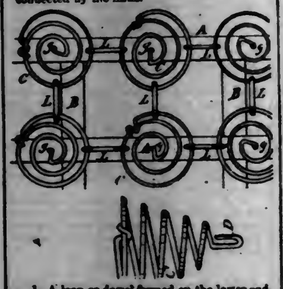
4,425. MACHINES FOR CUTTING NAILS. Worcester Haddock, Pittsburg, Pa., assignor, by mesne assignments, to the Haddock Nail-Machine and Nail Company. Patent No. 144,845, dated Nov. 25, 1873. [Filed May 11, 1875.]

Brief.—The dies in the gripper-head are fastened by stirrups and wedges. Two prongs, *i*, over which the plate is fed, remove the scrap on the retraction of the nippers. To receive lateral movement of the vibrator is compensated for by an elastic device, through which power is communicated to it, and the bed-piece is held against forward movement by a dowel-piece, and is adjustable outward, when too short from use or grinding, by grinding off the edge of the dowel-piece.

6,425.

1. The die-box A, having a recess for the reception of a stop, B, provided with a projection, C, fitted to a recess in the bed-piece D, substantially as herein described, and for the purpose set forth.

2. The plate-nipper consisting of the jaw *e*, and pivoted jaw *f*, in combination with the locking device consisting of the adjustable slide h, link *i*, and pivoted lever *j*, said parts constructed, arranged, and operating with relation to each other, substantially as herein described, and for the purpose set forth.



3. In combination with the vibrator *m*, having opening *k* and the tongs for griping the plate, the forked lever *i*, substantially as described, and for the purpose set forth.

4. The connecting-rod *o*, furnished with a hook, *t*, in combination with the plate *w*, having openings *w'*, and held in position with relation to vibrator *m*, through the medium of rods *s*, and springs *f*, substantially as herein described, and for the purpose set forth.

5. In combination with the vibrating gripping-head K of a nail-cutting machine, the hooks *n*, and keys *o*, arranged and operating substantially as herein described, and for the purpose set forth.

6,426. BED-BOTTOMS. Pulaski C Hard, Wadsworth, Ohio. Patent No. 136,156, dated Feb. 25, 1873. [Filed Dec. 31, 1874.]

Brief.—The barbed dowel or loop on the lower end of the spring holds the spring firmly in the slot, their upper and larger ends being connected by the links.

1. A loop or dowel formed on the lower end of a bed-spring, substantially as shown and described.

2. The combination of the spring C, having a loop or dowel, D, formed upon the lower end thereof, with the link L and slats A and B, substantially as shown and described.

6,427. ROTARY CLOTH-MEASURER. William Hebden, Boston, Mass., assignor to himself and Daniel Potter. Patent No. 146,337, dated Jan. 13, 1874. [Filed Apr. 20, 1875.]

Brief.—Has an adjustable guiding and tension rod for different thicknesses. Spring-clamp holds end of cloth, the clamp actuating a lever to operate a brake, stopping the machine when end of cloth is reached.

6,427.

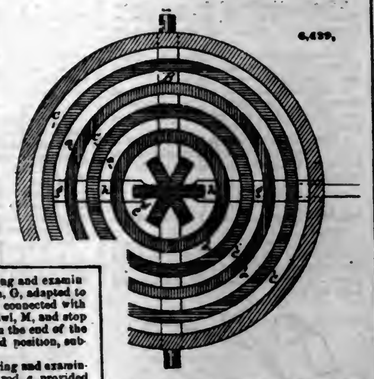
1. In a machine for measuring and examining cloth, &c., a spring-clutch, G, adapted to hold one end of the cloth, and connected with so as to operate a brake or pawl, M, and stop the roller B and index *t*, when the end of the cloth has reached the desired position, substantially as described.

2. In a machine for measuring and examining cloth, &c., an adjustable rod, *g*, provided with arms *f f'* turning on said rod, and held or released by screw nuts *e*, substantially as and for the purpose specified.

6,428. SHOES. John H. Hussey, Baltimore, Md., assignor, by mesne assignments, to Adler, Clement & Wiel, and E. W. Bubier. Patent No. 153,820, dated Aug. 4, 1874. [Filed Apr. 24, 1875.]

1. The flange D, formed from the middle-sole, and making a part of the same, said flange being cut from the inside toward the edge of the sole around the toe, and projecting above the upper surface of the sole from which it is cut, substantially as and for the purpose specified.

2. The flange D, formed from the sole C, and making a part of the same, said flange being cut from the inside toward the edge of the sole, and projecting above the upper surface of the sole, in combination with the in-sole B and the upper E, substantially as and for the purpose set forth.

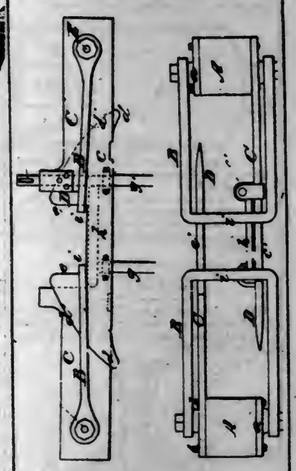


6,429. GRATES. Edward S. Renwick, Millburn, N. J. Patent No. 87,112, dated Feb. 23, 1869. [Filed Apr. 17, 1875.]

Brief.—The connections between the movable rings being subjacent, they do not interfere with the coal on the surface of the grate.

1. The combination, substantially as before set forth, of the central hub, turning on an upright axis, the stationary circular grate-bar, the movable grate-bar, and the subjacent connections between the turning hub and the movable grate-bar.

2. The combination, substantially as before set forth, of the stationary circular grate-bar, two movable grate-bars, constructed to turn on an upright central axis, and the subjacent connections between the movable grate-bars.



6,429.

3. The combination, substantially as before set forth, of the central hub, turning on an upright axis, the stationary circular grate-bar, the movable grate-bar, the subjacent connections between the central hub and the movable grate-bar, and the journals upon which the grate may be tipped.

4. The combination, substantially as before set forth, of the stationary circular grate-bar, two movable grate-bars, constructed to turn upon an upright axis, the subjacent connections between the said movable grate-bars, and the journals upon which the grate may be tipped.

6,430. CAR-COUPLINGS. William F. Starr, St. John, Canada. Patent No. 159,975, dated Feb. 16, 1875. [Filed Apr. 17, 1875.]

1. The combination of lifting-loop F, having the cross-bar *h*, with guides *f*, substantially as and for the purpose set forth.

2. In a car-coupler, the vertically-vibratory coupling-link B and the rigid barbed and notched coupling-arms C, in combination with the lifting-loop F, provided with cross-bars *h*, so that both links may be uncoupled at one and the same operation, substantially as set forth.

3. The notched and barbed arms C, in combination with draw-block A or frame-work of a car, and the coupling-link B, spanning both arms C, all substantially as set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 21. TUESDAY, MAY 25, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, EASTERN DISTRICT OF PENNSYLVANIA.

THE UNION PAPER COLLAR COMPANY *vs.* HENRY J. WHITE.

[*In equity.—Before* MCKENNAN, *Cir. J.—Decided April*, 1875.]

The first claim of the reissued patent of Walter Hunt, of October 22, 1872, (original, July 25, 1854,) which is for "a shirt-collar composed of paper and muslin, or its equivalent, so united that the muslin will counteract the fragile character of the paper," construed to be for "a shirt collar composed of paper and muslin, or its equivalent, united by paste, glue, or other appropriate sizing, by means of which union the fragility of the paper is re-enforced by the fibrous strength of the muslin, and the necessary cohesiveness of the fabric thus secured."

Although paper and muslin or linen cloth were before united and used for maps, &c., this was not analogous to the use Hunt made of these materials, nor in anywise suggestive of his invention.

He produced a new device by giving a new form to an old substance, and, by suitable manipulation, making its peculiar properties available for a use to which it had not before been applied. This involved invention, and, in view of the great practical benefits resulting from it, invests the product with special patentable merit.

Notwithstanding the fact that the patent has been reissued seven times, the law presumes that the last patent was granted to correct accidental or inadvertent mistakes in the original. The only test of the validity of the Commissioner's action is, whether he has allowed a reissue for a different invention from that covered by the original patent, or for what was not therein described, claimed, or indicated.

The claim for "a shirt-collar composed of paper and muslin, or its equivalent, so united that the muslin will counteract the fragile character of the paper," is not for the mere effect resulting from the union of paper and muslin, nor for the fabric thus produced, nor for the special mode of preparing it; but it covers the use of it for making collars, where its constituents are incorporated with each other, so that the textile strength of the one is made available to re-enforce the fragility of the other.

The original patent describes a standing collar composed of cloth with paper on *both* sides; but both the invention and the claim are more comprehensive than this, and include a collar with paper on *one* side only, and this, too, when the collar is *turned over*, so as to expose the cloth surface only to observation.

The patent is not infringed by collars of paper with a simple cloth re-enforcement at the button-holes.

Characteristic resemblance is the fairest test of substantial identity.

[*George Harding*, for complainant.
J. J. Coombs and *E. Wetmore*, for defendant.]

MCKENNAN, *Circuit J:*

The complainants are the owners, by several mesne assignments, of a patent granted to Walter Hunt on the 25th of July, 1854, for a new article of manufacture, consisting of a collar made out of paper and muslin, so combined, formed, and manipulated as to adapt it to use as such. This patent was duly extended for seven years from the date of its expiration, and was reissued on the 22d of October, 1872, No. 5,109. The validity and infringement of this reissued patent are the subjects of this contention.

I do not think the legal presumption that Hunt was the first and original inventor of the article of manufacture for which he obtained a patent is at all shaken by the proofs in the cause. It is true that paper and muslin or linen cloth were before united and used as a fabric for maps, &c.; but this was not analogous to the use to which Hunt adapted them, nor was it in anywise suggestive of his invention. He was the first to discover the adaptability of this material to a use not cognate to any to which it had before been applied, and, by appropriate manipulation, to give it a useful and practical form. He thus not only supplied the public with a new article of manufacture, but he demonstrated unknown susceptibilities of the material out of which it was made. This is something more than the mere application of an old thing to a new purpose. It is the production of a new device by giving a new

form to an old substance, and, by suitable manipulation, making its peculiar properties available for a use to which it had not before been applied, thereby distinguishing it from all other fabrics of the class to which it belongs. This seems to me to involve an exercise of the inventive faculty, and, in view of the great practical benefits resulting from it, to invest the product with special patentable merit.

The patent in controversy is the seventh reissue of Hunt's original patent. This multiplication of reissues is of itself suggestive of a purpose to cover intervening improvements, and some phrases in the specification of the last reissue may, not without semblance of reason, be treated as having that significance. It is difficult to suppose that so many reissues, with considerable intervals of time between them, were necessary to correct accidental or inadvertent mistakes in the specification and claims of the original patent; and yet the correction of these is the only legitimate purpose of a reissue. This practice has been strongly disapproved by the Supreme Court on more than one occasion.

In *Carlton* vs. *Boker*, (17 Wall., 471,) Mr. Justice Bradley remarks: "We think it proper to reiterate our disapprobation of these ingenious attempts to expand a simple invention of a distinct device into an all-embracing claim, calculated by its wide generalizations and ambiguous language to discourage further invention in the same department of industry, and to cover antecedent inventions."

Whatever reason there may be to suspect that the motive of the patentee was to give undue elasticity to his patent, still the law presumes that the reissue was granted to correct an inadvertent omission in the original, because it commits to the Commissioner of Patents the conclusive determination of that question, and the only test of the validity of his action is, whether he has allowed a reissue for a different invention from that covered by the original patent, or for what was not therein described, claimed, or indicated.

The claim in the reissue which, it is urged, avoids it, is as follows:

> A shirt-collar composed of paper and muslin, or its equivalent, so united that the muslin will counteract the fragile character of the paper.

Construing this in connection with the specification, its obvious import is, that the patentee sought to secure as his invention a shirt-collar composed of paper and muslin, or its equivalent, united by paste, glue, or other appropriate sizing, by means of which union the fragility of the paper is re-enforced by the fibrous strength of the muslin, and the necessary cohesiveness of the fabric is thus secured.

Now, is not this described, or, at least, clearly indicated, in the original patent? In that patent the nature and distinguishing qualities of the invention are thus stated:

> Attempts have been made at various times to manufacture shirt-collars of paper; but they have never been extensively introduced, nor has anything lasting or beneficial resulted therefrom, on account of the fragile nature of the material, which rendered it liable to be easily broken and defaced, while it was liable to be quickly soiled and entirely destroyed if exposed to either rain or perspiration.
>
> The object of my present invention is to produce a shirt-collar that shall not be easily broken, while it shall have sufficient elasticity to bend to the motions of the head, that shall possess the beauty and whiteness of the most carefully-dressed linen collar, and at the same time shall preserve itself unsoiled for a much greater length of time, and shall cost originally less than the washing and dressing of a linen collar; and my invention consists in making the collars of a fabric composed of both paper and cloth, and in subsequently polishing the same by enameling or burnishing, or in any suitable and efficient manner.

This statement distinctly identifies the subject of the first claim of the reissued patent. The invention to which it refers is said to be a shirt-collar consisting of paper and muslin, the qualities of which are cheapness of cost, smoothness of surface, flexibility, cohesiveness, and impermeability to moisture. It is not expressly declared that muslin is combined with paper to "counteract the fragile character" of the latter, but this is so distinctly indicated as to be equivalent to a direct expression of it. A substitute for paper collars is proposed, which are stated to be mainly objectionable on account of the fragile character of the material out of which they are made. This infirmity the inventor proposes to cure by the addition of a textile material, which obviously has no other function or object; and, in describing the mode of carrying his invention into effect, he directs how the paper and muslin are to be combined to secure for the fabric the necessary and desired qualities. Clearly, this distinctly indicates, and is broad enough to cover, "a shirt-collar composed of paper and muslin, so united that the muslin will counteract the fragile character of the paper."

But it is urged that the contested claim is merely for an abstract result, and is, therefore, void. Certainly it is the settled law that a mere principle, or result, or mode of operation, is not patentable. So, therefore, in *O'Reilly* vs. *Morse*, (15 How., 62,) the eighth claim of Morse's patent was adjudged to be void, because it sought to appropriate the use of electro-magnetism for marking or printing characters at a distance, independently of the means by which this natural agency was thus utilized; and in *Burr* vs. *Duryee*, (1 Wall., 31,) it was held that a mode of operation, irrespective of the mechanism by which it was effected, would not be patentable.

Is the claim in this patent obnoxious to this objection? In one sense it is for a result, but only in the sense in which any fabric or device is the result of the means employed to produce it. It is not for the mere result of a union of paper and muslin in a shirt collar, independent of the corporeal substance which embodies it; but it is for a thing fabricated in a given form, for a specific purpose, and out of materials so united that the combined fabric is impressed with the peculiar qualities which belong to each of its constituents. A collar made of these materials in mere juxtaposition is not within the range of the patentee's conception; but when they are incorporated, so as to constitute substantially a single fabric, and are used for the purpose for which he was the first to discover their adaptability, it is an invasion of his right.

The claim, then, is not for the mere effect resulting from a union of paper and muslin, nor for the fabric thus produced, nor for the special mode of preparing it; but it covers the use of it for making collars, where its constituents are incorporated with each other, so that the textile strength of the one is made available to re-enforce the fragility of the other; and such original application of it to the production of a most useful article the inventor can lawfully claim to appropriate.

Does the defendant infringe this patent?

Hunt's invention consists of two elements or parts—first, of a collar with reference to the materials out of which it is made, and their union so as to secure certain qualities; and, second, of the subsequent manipulation of this collar, by which a smooth surface is given to it, and it is rendered impervious to moisture.

The defendant manufactures and sells shirt-collars made of muslin or linen cloth pasted to a sheet of paper. Fundamentally they are the same with the collar described in Hunt's patent, because they are composed of muslin, or its equivalent, and paper, so united as to utilize the same properties contemplated by Hunt in the union of the same elements; but it is sought to differentiate them, for the reasons that the defendant attaches a sheet of paper to but one side of the cloth, and that the collar is turned down, with the cloth surface only burnished and exposed to view.

The first reason rests upon an undue limitation of the scope of Hunt's invention. In his original patent, in explaining a mode of carrying his invention into practice, he describes a collar with paper on both sides of the cloth. Although he does not limit himself to any form of collar, yet the description is evidently applicable to the standing collars then in fashion, and the double coating of paper was suggested as best adapted to collars of that class; but, as has already been said, his invention was more comprehensive than this, and it was clearly indicated in his original specification. It is appropriately claimed in the reissued patent in controversy, the authorized purpose of which was to protect it fully. Clearly the terms of that claim are broad enough to embrace the collars made by the defendant; but, at any rate, I do not think a double coating of paper on one side of the cloth changes the identity of the fabric described by Hunt. It is still composed of the same constituents, so united as to embody the same properties which he first proposed to utilize, and the difference is only apparent and formal. Characteristic resemblance is the fairest test of substantial identity.

Nor is there any better foundation for discrimination in the fact that the defendant's collars are turned down, and the cloth surface only is exposed to observation.

Hunt's patent is not limited to any particular form of collar, and the polishing of the cloth surface pertains exclusively to the manipulation of the collar after it is made to fit it for use. It does not in any sense change the fundamental character of the fabric out of which it is formed, and, therefore, does not affect the applicability of the first claim of the reissue.

The defendant also manufactures collars entirely of paper, with patches of muslin pasted around the button-holes to give additional strength at these points, and these are claimed to infringe the patent. I do not think so. Hunt did not contemplate any such restricted combination of paper and muslin. His collar was composed, throughout its whole body, of paper and muslin, and this was necessary to secure and embody the properties which he intended to make available. Nor could he successfully claim such a device. He did not invent paper collars, nor the application of cloth to button-holes to strengthen them. Such re-enforcement had been long before applied to button-holes in leather curtains, sails, and other fabrics. It was merely, therefore, the application of an old device to an analogous and well known use, for which no one could obtain a patent.

The complainants are entitled to an injunction to continue in force until the 25th day of July next, when the patent will expire, and to an account, and a decree will be entered accordingly.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date May 25, 1875.]

8,338.—Burial-Casket.—FRANKLIN A. FIELD, Everett, assignor to THE NEW ENGLAND CASKET COMPANY, Boston, Mass. Application filed April 28, 1875. Term of patent 7 years.

8,339.—Base-Panel for Vases.—MELVILLE D. JONES, Boston, Mass. Application filed April 19, 1875. Term of patent 7 years.

8,340.—Border for Vases.—MELVILLE D. JONES, Boston, Mass. Application filed April 19, 1875. Term of patent 7 years.

8,341.—Panel for Vase-Pedestals.—MELVILLE D. JONES, Boston, Mass. Application filed April 19, 1875. Term of patent 7 years.

8,342.—Telegraph-Key.—CHARLES W. LEWIS, Chicago, Ill., assignor to THE WESTERN ELECTRIC MANUFACTURING COMPANY, same place. Application filed April 12, 1875. Term of patent 14 years.

8,343.—Ornamental Star.—WILLIAM MARTIN, Philadelphia, Pa. Application filed March 17, 1875. Term of patent 7 years.

8,344 to 8,351, inclusive.—Carpets.—JOSEPH M. CHRISTIE, Kidderminster, England, assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass. Applications filed May 12, 1875. Term of patents 3½ years.

8,352 to 8,354, inclusive.—Backs of Lounges.—GEORGE HARTZELL, Philadelphia, Pa., assignor to JOHN P. REIFSNEIDER, ALFRED D. REIFSNEIDER, WILLIAM H. GOSNELL, and GEORGE HARTZELL, same place.—Cases A, B, and C. Applications filed April 2, 1875. Term of patents 3½ years.

8,355.—Neck-Tie.—REGINALD R. PARKER, Indianapolis, Ind. Application filed April 24, 1875. Term of patent 3½ years.

8,356.—Lamp-Posts.—WILLIAM TWEEDDALE, Brooklyn, N. Y. Application filed May 15, 1875.

8,357.—Cigar-Box.—HENRY ZIMMERMANN, Chicago, Ill. Application filed April 25, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date May 25, 1875.]

2,575.—Clothes-Wringers.—BAILEY WASHING AND WRINGING MACHINE COMPANY, (the name of said company having been changed to BAILEY WRINGING-MACHINE COMPANY,) Woonsocket, R. I. (Re-registration.) Application filed February 5, 1873.

"word 'Excelsior.'"

2,576.—Clothes-Wringers.—BAILEY WASHING AND WRINGING MACHINE COMPANY, (the name of said company having been changed to BAILEY WRINGING-MACHINE COMPANY,) Woonsocket, R. I. (Re-registration.) Application filed February 5, 1873.

"word 'Novelty.'"

2,577.—Lead for Painters' Use.—BOSTON LEAD COMPANY, Boston, Mass. (Re-registration.) Application filed February 23, 1872.

"eight-pointed star and the fac-simile of the company's corporate seal, or the words 'Boston Lead Company, incorporated 1829.'"

2,578.—Soap, Toilet Preparations, &c.—COLGATE & CO., New York, N. Y. (Re-registration.) Application filed July 8, 1872.

"words 'CASHMERE BOUQUET.'"

2,579.—Soap, Toilet Preparations, &c.—COLGATE & Co., New York, N. Y. (Re-registration.) Application filed July 8, 1872.

"the design of ashield, which contains two garlands of leaves, as shown, and which is crossed obliquely by a band that contains the letters 'C. & Co.'"

2,580.—Cigars.—F. DE BARY & Co., New York, N. Y. Application filed April 19, 1875.

"word 'Home,' with the other features of the label as described."

2,581.—Leather.—EAGLE TANNING WORKS, Chicago, Ill. (Re-registration.) Application filed August 18, 1871.

"an oval shape, containing the words 'Trade Mark, Eagle Tanning Works,' with a cut of a flying eagle."

2,582.—Coffee, Spices, Baking-Powder, &c.—ELMER H. GARBUTT & Co., New York, N. Y. (Re-registration.) Application filed April 18, 1872.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 13, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 24, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture	2,500
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS	6,000
BRIDGES; including ferry-guards, girders and columns, piers	408
CARDING, CLOTH, CORDAGE, KNITTING, SILK, SPINNING, WEAVING	4,800
RAILWAYS, complete, about	3,500
ELECTRICITY, (in progress,) to July, 1871	888
TEXTILE, (in progress,) to July, 1871, about	4,800

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., May 19, 1875.

On the petition of ANN JENNETTE HATHAWAY, of Milwaukee, Wis., executrix of JOSHUA HATHAWAY, deceased, authorized by act of Congress approved February 18, 1875, praying for the extension of a patent granted to the said JOSHUA HATHAWAY, on the 3d day of April, 1860, for an Improvement in Devices for Converting Reciprocating into Rotary Motion,

It is ordered that the testimony in the case be closed on the 20th day of July next; that the time for filing arguments and the Examiner's report be limited to the 30th day of July next; and that said petition be heard on the 4th day of August next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

INDEX OF INVENTIONS PATENTED MAY 25, 1875.

	Class No.	No. of Patent.
Addressing machine, H. H. Herr	146	163,774
Advertising device, C. W. Reed	54	163,608
Alarm, burglar, F. H. Hunter	24	163,779
Apple parer, E. L. Schauck	88	163,813
Axle box, F. Keiser	122	163,783
Baby tender and crib combined, A. Baird	62	163,625
Bale tie, J. M. Goldsmith	7	163,649
Bale tie, J. N. Smith	7	163,815
Bale tie, cotton, J. W. Philp	7	163,803
Barrel faucet attachment, A. Zoller	167	163,717
Barrel making machine, J. Y. Chapman	40	163,740
Bed bottom, W. Wood	62	163,714
Bed bottom, invalid, Ogborn and Kendrick	62	163,684
Bed bottom, spring, E. O. Bennett	62	163,627
Bed bottom, spring, E. P. Carter	62	163,574
Bedstead fastening, W. H. Elliot, (reissue)	62	6,447
Bedstead fastening, W. H. Elliot	62	163,757
Bell pull, C. Clay	24	163,741
Bill file, C. Davis, Jr	146	163,750
Bird cage mat, A. B. Hendryx	170	163,772
Bolts, device for rounding the ends of, J. Nelson	14	163,797
Boot and shoe, laced, P. Plant	16	163,804
Box making machine, J. Kisor	30	163,788
Brewing, E. H. Wiegand	19	163,827
Bridge, iron, J. B. Eads, (reissue)	21	6,444
Bridge, iron, J. B. Eads, (reissue)	21	6,445
Bridge, iron, J. B. Eads, (reissue)	21	6,446
Bronzing machine, W. J. Barber	54	163,722
Bucket, dinner, F. E. Heinig	88	163,654
Buckle or fastener, Lockwood and Ware	23	163,596
Bullets, device for swaging, W. D. Hillis	32	163,656
Burner, Argand gas, E. R. Walker, (reissue)	64	6,453
Burner for lanterns, vapor, Brown and Watkins	90	163,634
Burner, gas, F. H. McGeorge	64	163,600
Butter coloring compound, J. C. Roriek	45	163,610
Butter package, H. W. Campbell	45	163,573
Car axle box, A. A. Freeman, (reissue)	122	6,449
Car brake, J. Y. Smith	122	163,612
Car coupling, W. H. Adams	122	163,718
Car coupling, P. Brown	122	163,633
Car coupling, Conner and Fritz	122	163,746
Car coupling, L. W. Powis	122	163,806
Car coupling link, J. M. Clem	122	163,743
Car doors, device for operating street, D. R. Hart	121	163,770
Carpet stretcher, A. D. Williams	62	163,712
Carriage, child's, W. Wuerz	31	163,715
Carriage curtain fastening, C. P. Ketterer	31	163,663
Carriage jack, R. Eldridge	79	163,756
Carriage jack, H. E. Nittenger	79	163,798
Cartridge box, G. E. Bringman	32	163,570
Chain and wheel for transmitting power, J. H. Whitney	67	163,832
Chair, pivot, J. Lemman	62	163,790
Chair, tilting, J. M. Waters	62	163,705
Chairs, &c., Bottom for, C. D. Flynt	62	163,760
Cigar box, C. A. Siecke, (reissue)	160	6,458
Circuit closer, electrical, L. L. Duerden	50	163,753
Clothes pounder, W. H. Castle	91	163,739
Coal hod, J. B. Driscole	154	163,752
Copper bottom for kettles, A. Cummings	136	163,747
Corset, L. H. Foy, (reissue)	80	6,448
Corset, C. L. Olmstead	38	163,685
Cotton seed huller, F. Streuby	41	163,702
Crimping machine, O. Noack	16	163,602
Cup, berry, D. W. Kniffin	63	163,665
Cylinder cam, M. J. Carney	67	163,738
Dental flask, W. C. Tracy	46	163,615
Dental mirror, T. Cogswell	46	163,578
Dentists, vulcanizing apparatus for, H. M. Edson	84	163,755
Desks, folding seat for school, U. Smith	62	163,611
Drills, steam engine for rock, J. Brandon	150	163,631
Drills, valve movement for rock, D. Kennedy	124	163,785
Drying sized fabrics, mechanism for, W. H. Palmer, Jr	37	163,801
Eaves trough hanger, J. F. and L. Hees	126	163,655
Elevator, hydraulic, T. Stebins, (reissue)	118	6,459
Engine for rock drills, steam, J. Brandon	150	163,631
Engine governor, steam, A. Kendall	60	163,662
Engine, portable steam, L. Sweet	150	163,823
Engine, reciprocating steam, C. W. Hermance	150	163,773
Engine, rotary, O. Burnett	150	163,572
Engine, traction, W. H. Milliken	94	163,681
Engines, fire kindler for steam fire, F. Beaufait	118	163,723
Engines, oscillating valve for steam, W. Haddock	152	163,651
Fabrics, mechanism for drying sized, W. H. Palmer, Jr	37	163,801
Fan, helical cone suction, J. White	12	163,710
Fans, apparatus for mounting, G. Brueck	165	163,731
Fanning apparatus for rooms, P. J. Bender	165	163,628
Fare register, Rummig and Uderitz	42	163,695
Felly plate, J. Y. Sitton	31	163,698
Fence, farm, Hoffman and Shoemate	52	163,658
Fence, iron, M. G. Freeman	52	163,761
Fence post, E. Powell	52	163,692
Ferro manganese, manufacture of, A. Jullien	35	163,782
Fire arm, breech loading, W. H. Elliot	18	163,646
Fire arm, breech loading, O. M. Robinson	18	163,810
Fire place, J. F. Merrill	154	163,678
Fire plug, water motor, W. W. Harding	167	163,652
Fracture box, C. Westerkamp	156	163,829
Furnace, air heating and ventilating, S. W. Kimble	154	163,786
Furnace, metallurgic, T. D. Morgan	99	163,795
Game and other boards, C. F. Morgan	143	163,601
Game board, Bourn and Vermilye	143	163,630
Garments, apparatus for cutting out, K. McKenzie	38	163,674
Gas apparatus, Smith and Goldthorp	27	163,817
Gas purifier, G. H. Wells	66	163,706
Gas purifiers, center valve for, R. Briggs	66	163,569
Gas retort, W. Smith	66	163,818
Gate, farm, W. H. Pratt	52	163,693
Gate, sliding, J. P. McMurray	52	163,675
Generator, sectional steam, G. H. Starbuck	148	163,820
Glassware, manufacture of, W. C. King	68	163,787
Glove fastening, S. W. Glenn	38	163,764
Grain binder, J. H. Whitney	74	163,830
Grain tally, S. A. Hazelton	159	163,590
Harrow, C. Boswell	73	163,736
Harvester rake, J. H. Mears, (reissue)	74	6,454
Harvester rake, C. Wheeler, Jr	74	163,708

2,579.—Soap, Toilet Preparations, &c.—COLGATE & CO., New York, N. Y. (Re-registration.) Application filed July 8, 1872.

"the design of a shield, which contains two garlands of leaves, as shown, and which is crossed obliquely by a band that contains the letters 'C. & Co.'"

From July 1, 1869, to December 13, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1873, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture	2,500
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS	6,000
BRIDGES; including ferry-guards, girders and columns, piers	408
CARDING, CLOTH, CORDAGE, KNITTING, SILK, SPINNING, WEAVING	4,800
RAILWAYS, complete, about	3,500
ELECTRICITY, (in progress,) to July, 1871	888
TEXTILE, (in progress,) to July, 1871, about	4,800

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., May 19, 1875.

On the petition of ANN JENNETTE HATHAWAY, of Milwaukee, Wis., executrix of JOSHUA HATHAWAY, deceased, authorized by act of Congress approved February 18, 1875, praying for the extension of a patent granted to the said JOSHUA HATHAWAY, on the 3d day of April, 1860, for an Improvement in Devices for Converting Reciprocating into Rotary Motion,

It is ordered that the testimony in the case be closed on the 20th day of July next; that the time for filing arguments and the Examiner's report be limited to the 30th day of July next; and that said petition be heard on the 4th day of August next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

INDEX OF INVENTIONS PATENTED MAY 25, 1875.

	Class No.	No. of Patent.
Addressing machine, H. H. Herr	146	163,774
Advertising device, C. W. Reed	54	163,608
Alarm, burglar, F. H. Hunter	24	163,779
Apple parer, E. L. Schauck	88	163,813
Axle box, F. Keiser	122	163,783
Baby tender and crib combined, A. Baird	62	163,625
Bale tie, J. M. Goldsmith	7	163,649
Bale tie, J. N. Smith	7	163,815
Bale tie, cotton, J. W. Philp	7	163,803
Barrel faucet attachment, A. Zoller	167	163,717
Barrel making machine, J. Y. Chapman	40	163,740
Bed bottom, W. Wood	62	163,714
Bed bottom, invalid, Ogborn and Kendrick	62	163,684
Bed bottom, spring, E. O. Bennett	62	163,627
Bed bottom, spring, E. P. Carter	62	163,574
Bedstead fastening, W. H. Elliot, (reissue)	62	6,447
Bedstead fastening, W. H. Elliot	62	163,757
Bell pull, C. Clay	24	163,741
Bill file, C. Davis, Jr.	146	163,750
Bird cage mat, A. B. Hendryx	170	163,772
Bolts, device for rounding the ends of, J. Nelson	14	163,797
Boot and shoe, laced, P. Plant	16	163,804
Box making machine, J. Kisor	30	163,788
Brewing, E. H. Wiegand	19	163,827
Bridge, iron, J. B. Eads, (reissue)	21	6,444
Bridge, iron, J. B. Eads, (reissue)	21	6,445
Bridge, iron, J. B. Eads, (reissue)	21	6,446
Bronzing machine, W. J. Barber	54	163,722
Bucket, dinner, F. E. Heinig	88	163,654
Buckle or fastener, Lockwood and Ware	23	163,596
Bullets, device for swaging, W. D. Hillis	32	163,656
Burner, Argand gas, E. R. Walker, (reissue)	64	6,453
Burner for lanterns, vapor, Brown and Watkins	64	163,634
Burner, gas, F. H. McGeorge	64	163,800
Butter coloring compound, J. C. Rorick	45	163,810
Butter package, H. W. Campbell	45	163,573
Car axle box, A. A. Freeman, (reissue)	122	6,449
Car brake, J. Y. Smith	122	163,612
Car coupling, W. H. Adams	122	163,718
Car coupling, P. Brown	122	163,633
Car coupling, Conner and Fritz	122	163,746
Car coupling, L. W. Powls	122	163,806
Car coupling link, J. M. Clem	122	163,743
Car doors, device for operating street, D. R. Hart	121	163,770
Carpet stretcher, A. D. Williams	62	163,712
Carriage, child's, W. Wuerz	31	163,715
Carriage curtain fastening, C. P. Ketterer	31	163,663
Carriage jack, R. Eldridge	79	163,756
Carriage jack, H. E. Nittenger	79	163,798
Cartridge box, G. E. Bringman	32	163,570
Chain and wheel for transmitting power, J. H. Whitney	67	163,832
Chair, pivot, J. Lemman	62	163,790
Chair, tilting, J. M. Waters	62	163,705
Chairs, &c., Bottom for, C. D. Flynt	62	163,760
Cigar box, C. A. Siecke, (reissue)	160	6,458
Circuit closer, electrical, L. L. Dnerden	50	163,753
Clothes pounder, W. H. Castle	91	163,739
Coal hod, J. B. Driscoll	154	163,752
Copper bottom for kettles, A. Cummings	136	163,747
Corset, L. H. Foy, (reissue)	80	6,448
Corset, C. L. Olmstead	38	163,685
Cotton seed huller, F. Streuby	41	163,702
Crimping machine, O. Noack	16	163,602
Cup, berry, D. W. Kniffin	63	163,665
Cylinder cam, M. J. Carney	67	163,738
Dental flask, W. C. Tracy	46	163,615
Dental mirror, T. Cogswell	46	163,578
Dentists, vulcanizing apparatus for, H. M. Edson	84	163,755
Desks, folding seat for school, U. Smith	62	163,611
Drills, steam engine for rock, J. Brandon	150	163,631
Drills, valve movement for rock, D. Kennedy	124	163,785
Drying sized fabrics, mechanism for, W. H. Palmer, Jr.	37	163,801
Eaves trough hanger, J. F. and L. Hess	126	163,655
Elevator, hydraulic, T. Stebins, (reissue)	118	6,459
Engine for rock drills, steam, J. Braudon	150	163,631
Engine governor, steam, A. Kendall	60	163,662
Engine, portable steam, L. Sweet	150	163,623
Engine, reciprocating steam, C. W. Hermance	150	163,773
Engine, rotary, O. Burnett	150	163,572
Engine, traction, W. H. Milliken	94	163,681
Engines, fire kindler for steam fire, F. Beanfait	118	163,723
Engines, oscillating valve for steam, W. Haddock	152	163,651
Fabrics, mechanism for drying sized, W. H. Palmer, Jr.	37	163,801
Fan, helical cone suction, J. White	12	163,710
Fans, apparatus for mounting, G. Brueck	165	163,731
Fanning apparatus for rooms, P. J. Bender	165	163,628
Fare register, Rummig and Uderitz	42	163,695
Felly plate, J. Y. Sitton	31	163,698
Fence, farm, Hoffman and Shoemate	52	163,658
Fence, iron, M. G. Freeman	52	163,761
Fence post, E. Powell	52	163,692
Ferro manganese, manufacture of, A. Jullien	35	163,782
Fire arm, breech loading, W. H. Elliot	18	163,646
Fire arm, breech loading, O. M. Robinson	18	163,810
Fire place, J. F. Merrill	154	163,678
Fire plug, water motor, W. W. Harding	167	163,652
Fracture box, C. Westerkamp	156	163,829
Furnace, air heating and ventilating, S. W. Kimble	154	163,786
Furnace, metallurgic, T. D. Morgan	99	163,795
Game and other boards, C. F. Morgan	143	163,601
Game board, Bourn and Vermilye	143	163,630
Garments, apparatus for cutting out, K. McKenzie	38	163,674
Gas apparatus, Smith and Goldthorp	27	163,817
Gas purifier, G. H. Wells	66	163,706
Gas purifiers, center valve for, R. Briggs	66	163,569
Gas retort, W. Smith	66	163,818
Gate, farm, W. H. Pratt	52	163,693
Gate, sliding, J. P. McMurray	52	163,675
Generator, sectional steam, G. H. Starbuck	148	163,820
Glassware, manufacture of, W. C. King	68	163,787
Glove fastening, S. W. Glenn	38	163,764
Grain binder, J. H. Whitney	74	163,830
Grain tally, S. A. Hazelton	150	163,590
Harrow, C. Boswell	73	163,736
Harvester rake, J. H. Mears, (reissue)	74	6,454
Harvester rake, C. Wheeler, Jr.	74	163,708

	Class No.	No. of Patent.
Harvester rake, J. H. Whitney	74	163,831
Heddle frame, E. S. Pike	95	163,691
Hook, mousing, Johnson and Adams	23	163,660
Hydrant, Fisher and Fiske	167	163,759
Inking apparatus for hand stamps, D. A. Edsall	146	163,585
Inkstand, S. Darling, (reissue)	146	6,443
Jack, lifting, Fayette and Meeker	79	163,647
Jack, lifting, W. Livingstone	79	163,791
Jib bank, C. W. Clements	138	163,577
Journal bearing and pitman connection, C. Wheeler, Jr.	87	163,707
Kettles, copper bottom for, A. Cummings	136	163,747
Key fastener, H. Stretcher	93	163,822
Kiln, charcoal, W. Sparrow	61	163,700
Label holder, C. F. Barker	146	163,566
Ladder, extensible fire, J. M. Birchler	30	163,725
Ladder, extensible fire, Covel, Chace, and Weaver	30	163,580
Lamp chimney, O. D. Warfield	90	163,826
Lathe dog, C. B. Davis	100	163,640
Lathe rest, J. E. F. Leland	172	163,670
Lathes, planing attachment for metal turning, A. Hoffmann	100	163,657
Lightning rod standard, Reyburn and Martin	50	163,807
Liquids, apparatus for filtering, T. R. Sinclaire	167	163,814
Lock for bags, &c., G. Bernheim	93	163,629
Lock, permutation, E. Grah	93	163,767
Loom, J. L. Norton	95	163,799
Loom harness frame, Casey, Auel, and Johnson	95	163,575
Loom harness motion, G. Crompton, (reissue)	95	6,442
Loom shuttle, J. Rigby	95	163,609
Loom shuttle binder, A. Mallory	95	163,671
Lubricator, C. E. Holt	87	163,591
Mail bag fastener, R. Lee	162	163,789
Meats, apparatus for preserving, W. C. Marshall, (reissue)	58	6,452
Meats, preserving, W. C. Marshall, (reissue)	58	6,451
Milking tube, S. A. Smith	45	163,816
Mill, feed, O. B. Knapp	59	163,664
Millstones, machine for dressing, Savage and Coleman	153	163,811
Molding machine, Peet, Poland, and Willis	173	163,604
Moldings, apparatus for enameling, W. Wallick	54	163,825
Motion for machinery, stop, J. W. Askie	67	163,624
Motor, J. G. Peterson	67	163,689
Mowing machine, Wheeler and Case	74	163,709
Music leaf turner, Cohen and Dietz	102	163,637
Musical instruments, machine for trimming keys of, M. Pratt, (reissue)	173	6,455
Nail blanks, machine for making wrought, T. T. Wood	103	163,619
Nails, machine for heading wrought, T. T. Wood	103	163,620
Net, fly, L. B. and G. W. Lee	72	163,668
Organ attachment, reed, H. R. Moore	106	163,682
Overalls, S. Deutsch	38	163,751
Oxide of zinc, making white, J. G. Trotter	107	163,704
Packing for pistons, steam, C. L. Eastman	151	163,584
Packing machine, A. Ralph, (reissue)	57	6,457
Painting machine, W. W. Marsh	107	163,598
Pantaloons, apparatus for shaping, J. Kraft	38	163,666
Pantaloons, apparatus for shaping, Viets and Shaw	38	163,617
Paper and cloth, machinery for uniting, C. H. Denison	109	163,589
Paper pulp engine, F. A. Cushman	108	163,638
Paper pulp engines, grinding cylinder for, C. J. Bradbury	108	163,728
Paper ruling machine, W. O. Hickok	15	163,777
Pavement, wood, Filbert and Hoffman	110	163,758
Piano forte, upright, B. E. Colley	112	163,745
Pipes, joint for lead, A. B. Goodall	167	163,588
Plane iron, J. J. Ralya, (reissue)	29	6,462
Planing machine, C. B. Beall	173	163,567
Planing machine, C. R. Patterson	173	163,802
Planter, cotton seed, J. Dana	133	163,748
Planter, potato and seed, W. H. Whitman	133	163,711
Plow, swivel, J. Hapgood	114	163,589
Plow, wheel, Keys and De Mier	114	163,595
Plows, row gage for, W. E. Stanley	114	163,701
Pocket book fastening, L. Messer	146	163,794
Power, chain and wheel for transmitting, J. H. Whitney	67	163,832
Press, cotton, T. D. Power	7	163,805
Press, hydraulic, C. Peper	118	163,606
Press, hydraulic, C. Peper	118	163,607
Printer's galley, H. H. McWilliams	117	163,677
Propeller, steering, W. F. Zoehe	139	163,716
Pump, D. J. Gorton	118	163,766
Punching machine, C. A. Corman	119	163,579
Quicksilver, machine for saving, J. W. Varney	3	163,616
Radiator, steam, S. J. Geoghegan	147	163,763
Radiator, steam, G. B. Riggins	147	163,808
Railway heads, stopping mechanism for, R. W. Hunton	120	163,593
Railway rammer head, M. A. J. Wimpee	120	163,835
Railway switch, street, G. T. Jacobs	120	163,780
Railway tunnels, &c., ventilation of, J. Dixon	166	163,643
Refrigerating apparatus, G. H. Chinnock	58	163,576
Regulator with dash pot, pressure, Ball and Fitts	167	163,721
Regulator with safety valve, pressure, Ball and Fitts	167	163,720
Rubber, hand, R. I. Patterson	91	163,688
Rudder post bearing, J. N. Bitting, Sr	137	163,726
Saddle, spring, C. H. Harris	73	163,769
Safe, &c., fire proof, W. A. Shepard	128	163,614
Sails, reefing, I. Solomon	138	163,819
Sash holder, W. B. Blackman	24	163,727
Sash holder, R. R. Calkins	24	163,635
Saw filing machine, Wilson and Noble	131	163,834
Saw setting machine, Heunsch and Beyer	131	163,776
Scaffold, W. Burge	30	163,733
Scraps or offal, apparatus for treating or drying, G. S. Allyn	96	163,565
Seat for school desks, folding, U. Smith	62	163,611
Seat, school, B. Allen	62	163,622
Seat, school, I. N. Pelroe	62	163,605
Sewing machine, G. S. and A. L. Darling	134	163,639
Sewing machine ruffling attachment, J. D. Sourwine	134	163,699
Sewing machine table hinge, H. B. Keiper	134	163,661
Sheet metal, die for forming, H. Martyn	136	163,793
Shingling bracket, A. P. Fletcher	30	163,587
Shirt, J. C. Dunham	38	163,644
Shovel, coal, J. D. Tallmadge	154	163,703
Shutter bower and fastener, G. F. S. and C. Zimmerman	24	163,621
Sign, illuminating, C. H. Seawell	54	163,697
Skirt supporter, M. P. Bray	38	163,730
Sleighs, thill coupling for, C. H. Johnson	31	163,781
Soap, apparatus for variegating, G. C. Wenzel	26	163,828
Soap, impalpable, J. P. Byran	26	163,571
Spark arrester, locomotive, A. Berney	94	163,568
Spectacles, J. Gall	157	163,648
Spinning machine spindle, Rabbeth and Atwood, (reissue)	142	6,456
Spool holder, C. T. Cleaveland	38	163,742
Stair curves, instrument for scribing, A. Beck	29	163,626
Stamps, inking apparatus for hand, D. A. Edsall	146	163,585
Starch lubricant, M. E. Robinson	11	163,809
Stave jointer, J. J. Ralya, (reissue)	49	6,461
Steamer and boiler, C. Busch	154	163,733
Stench traps, drain screw attachment for, W. A. Butler	8	163,737
Stereoscope, revolving, J. F. Steward	157	163,613
Stocking supporter clasp, E. L. Howard	23	163,778
Stone extracting tool, N. R. Cheadle	124	163,636
Stone impervious to moisture, &c., rendering artificial, McMurtrie and Chambers	107	163,676
Stool, camp, N. R. Allen	62	163,623
Stove, G. W. Herrick	154	163,775
Stove grate, H. P. Ohm	154	163,800
Stove implement, L. S. Hoyt	154	163,659
Stove, heating, A. Brown, (reissue)	154	6,441
Stove, magazine, W. Doyle	154	163,589
Stove, magazine heating, G. H. Timmerman	154	163,824
Stove platform, C. Brownell, (reissue)	154	6,460
Strainer, milk, J. W. Bray	45	163,632
Straw cutter, B. Belcher	59	163,724
Street sweeper, O. W. Kellogg	110	163,784
Stuffing box, A. J. Myers	151	163,796
Sugar, manufacture of hard, E. Langen	155	163,667
Swing, S. McClevey	143	163,599
Table, folding, G. H. Williams	62	163,833
Table slide, extension, G. B. Lyman	62	163,792
Thill coupling C. O. Gardiner	31	163,762
Thill coupling, G. G. Larkin, (reissue)	31	6,450
Thill coupling, S. J. Wiser	31	163,713
Ticket, L. Brush	146	163,732
Toy, J. B. Safford	143	163,696
Toy gun, W. H. Martin	143	163,673
Trace carrier and back loop, spring, W. Davis	72	163,641
Trap, animal, G. W. Kelley	143	163,594
Trap, fly, Arandall and Runyan	143	163,719
Trap, hog, H. Ogborn	144	163,603
Umbrella, folding, U. G. Steinmets	145	163,821
Valve movement for rock drills, D. Kennedy	124	163,785
Valve, safety, T. Walker	148	163,618
Valve, pressure regulator with safety, Ball and Fitts	167	163,720
Vegetable cutter, J. F. Goolsbee	59	163,765
Vehicle pole tip, Grimshaw and Osgood	31	163,768
Vehicle seat, Cloud and Craig	31	163,744
Vehicle top, L. Sawyer	31	163,812
Wagon brakes, shoe for, J. Grimste	31	163,650
Wagon tires, device for heating, S. B. Hopkins	60	163,592
Wagons, brake for hay, W. Harper	31	163,653
Washing machine, R. G. Orwig	91	163,686
Watch crystals, clamp for grinding, A. C. Norton	36	163,683
Watch key, A. and F. Hathaway	36	163,771
Watch regulator, J. A. Miller	36	163,680
Watches, mainspring for, Rice and Burbank	36	163,694
Water wheel, I. Mallery	168	163,672
Water wheel gate, G. W. Dunn	168	163,754
Well point, driven, D. A. Danforth	51	163,749
Windmill, W. T. Burrows	118	163,734
Windmill, J. Cushman	118	163,581
Windmill, I. Lehmer	118	163,669
Windmill, W. W. Marsh	118	163,597
Window blind, S. W. Merrill	30	163,679
Window blind, J. Peyer	30	163,690
Wood boring machine, J. Faraday	173	163,586
Wool mixing machine, S. R. Parkhurst	28	163,687
Wool, &c., to free them from impurities, treating, O. Braun	28	163,729
Wrench, pipe, G. D. Dean	100	163,642
Wringing machine, Eisenhart and Lauer	91	163,645

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MAY 25, 1875.

	Patent No.
Adams and Johnsen	163,660
Adams, W. H., Car coupling	163,718
Albertson, C. H., assignee	163,572
Allen, B., School seat	163,622
Allen, N. R., Camp stool	163,623
Allyn, G. S., Apparatus for treating or drying scraps or offal	163,565
Anderton, J., assignee	163,626
Arandall, C., and W. C. Runyan, Fly trap	163,719

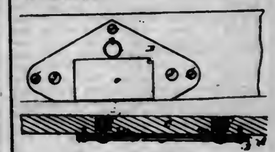
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED MAY 25, 1875.

163,565. APPARATUS FOR TREATING OR DRYING SCRAPS OR OFFAL. Gurdon S. Allyn, Groton, Conn. [Filed Apr. 16, 1875.]

Brief.—Steam is admitted to the hollow head, and passes through the pipes, heating the mass. Escaping into the opposite hollow head, it passes out through the hollow journal. By its escapement past an inverted funnel, which opens into the tank, the steam sucks out the vapor generated by the heated pipes within. The tank revolves.



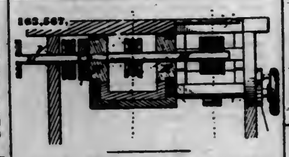
1. The combination of the tank A, hollow cylinder-heads B B, with hollow journals a b, and the pipes C C, connecting said heads, and running parallel with the axis of the cylinder, substantially as herein set forth.

2. The combination of the tank A, T-shaped pipe D E, and the pipe G, conducting the exhaust through the horizontal part E of the pipe, substantially as and for the purposes herein set forth.

163,566. LABEL-HOLDERS. C. F. Barker, North Bridgton, Me. [Filed Apr. 21, 1875.]

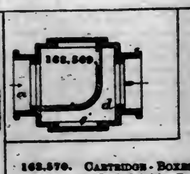
Brief.—The card or label is held between spring-plates, and shown through an aperture in outside plate.

1. The card or name-plate holder, substantially as described, composed of the shouldered and slotted plates A B and their elastic connections, all constructed, arranged, and applied essentially as specified.



2. The said name-plate holder, as composed of the shouldered and slotted plates, their elastic connections, and one or more spurs or points projecting rearward from the front plate, all as represented.

164,567. PLANING-MACHINES. Charles R. Beall, Hamilton, assignor of one-half his right to Theodore Greville Massie, Cincinnati, Ohio. [Filed June 1, 1874.]

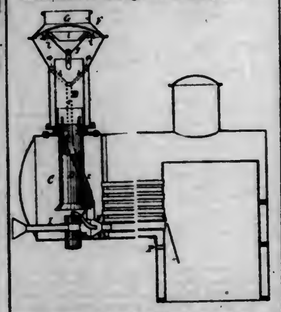


Brief.—Two distinct operations can be performed upon the table at the same time, by means of two mandrels made independently operative by two pulleys upon the same counter-shaft.

The combination of fixed mandrel U, adjustable mandrel M, counter-shaft s, cones o o', clutch-pulleys f g, grooved sleeves h, and the lever j, substantially as and for the purposes set forth.

163,567.

163,568.



163,570.

163,568. SPARK-ARRESTERS FOR LOCOMOTIVES. Alfred Berney, Somerville, Mass. [Filed Jan. 27, 1875.]

Brief.—The sparks and cinders are forced from an enlarged tube by a jet of steam through an auxiliary protecting-tube to the fire-box. A deflector is placed in front of said tubes in the fire-box, to prevent the flame from entering them. An outside air-inlet is arranged in advance of the deflector, by which it is kept cool and the air heated. Air from the front of the locomotive is also admitted to the fire-box through the auxiliary tube.

1. The combination of the enlargement or auxiliary chamber H with the air-blast pipe I, the return-flue K, and the conduit c from the annular chamber a, such chamber surrounding the chimney, and being provided with means, as described, for intercepting sparks from the chimney and deflecting them into it, the said chamber, in order that they may be drawn from it by the air-blast or current into the auxiliary chamber, and from thence forced by said blast into and through the return-flue E and thence into the fire-place.

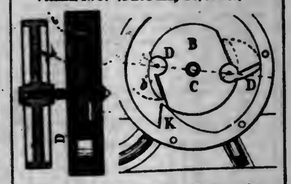
2. In combination with the enlargement or chamber H, the air-blast-pipe I, and the return-flue E, applied to a boiler and its smoke-box, as set forth, a pipe or pipes, f or m, to lead steam from the steam-blast pipe, or from the steam-space of the boiler, or both, into the said chamber H, spark-inductor C, all being substantially and for the purpose as described.

3. The combination, with the deflector, arranged in the fire-place, and with the rear ends of the return-flues, as shown, one or more air-inlets, P, arranged in advance of the deflector, all substantially as and for the purpose or purposes as set forth.

4. The re-enforce guard-tube R, in combination with the return-flue K, the blast-pipe I, and the conduit c, to lead the cinders from the chimney down into the pipe K, all being substantially as described.

163,569. CENTER-VALVES FOR GAS-PURIFIERS. Robert Briggs, Philadelphia, Pa. [Filed Oct. 12, 1874.]

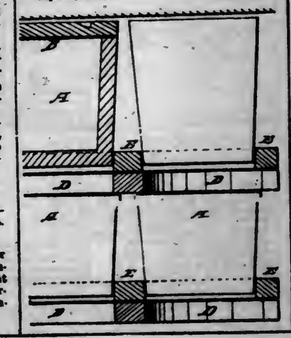
A center-valve for gas-purifiers, the lower chamber B of which is provided with openings a a' and e e', and a partition, l, so that the course of the gas through the said center-valve may be changed at pleasure, all substantially as set forth.



163,570. CARTRIDGE-BOXES. George H. Bringman, Philadelphia, Pa. [Filed Oct. 20, 1874.]

A circular box, A, provided in the center with the inverted cup C, having aperture a, with slots b b, in combination with the lid B, provided with the central T-shaped projection D, for the purposes herein set forth.

163,571. INFLAMMABLE SOAPS. J. P. Bryan, Canton, Ohio, assignor to the Central Soap Company, same place. [Filed Mar. 20, 1875.]



The process, substantially as herein described, consisting in mixing with any saponaceous compound such substance or material as shall render the mass readily pulverizable when drying and grinding the mass, whereby it is reduced to an impalpable powder, substantially as and for the purposes described.

163,572. ROTARY ENGINES. Oswald Burnett, Irvington, assignor of three-fourths right to C. H. Albertson and Benj. Hall, Vienna, N. J. [Filed May 27, 1874.]

The combination, with the cylinder A, having cam J and abutment K, of the grooved disk B, having side depressions b e f and tongues c', and the valves D, pivoted to said tongues c', and formed of two parts, one part consisting of the head a and laterally-extending face b', and the other part of the head a and toe-piece G, all constructed, arranged, and operating substantially as and for the purpose set forth.

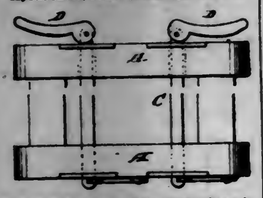
163,573. BUTTER-PACKAGES. Hardy W. Campbell, Montgomery Centre, Vt. [Filed Apr. 2, 1875.]

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

The boxes A, constructed as described, in combination with the cross-bars D, frames E, and the cases C, all as and for the purposes herein specified.

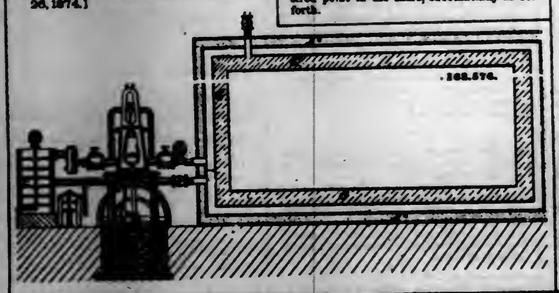
163,576. SPRING BED-BOTTOMS. B. P. Carter, Arcade, N. Y. [Filed Apr. 24, 1875.]

Brief.—The flexible strap is wound around the transverse bar, one end of it being attached to the end of the slat, and the other to the loop of the spring. Pressure or weight upon the slat unwinds the strap from the bar against the spring, which rewinds the strap, and restores the slat to its position when the pressure is removed.



1. The combination, with a bed-bottom slat constructed of two spring-bars connected together at their ends, of a block or wedge arranged between said spring-bars, and capable of being moved or adjusted in the space between the bars, for increasing or decreasing the elasticity of the slat, substantially as described.

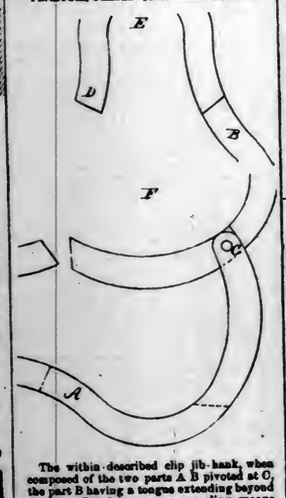
2. In combination with the slat of a bed-bottom, the flexible strap *g*, transverse bar H, and the spiral spring, having a loop to which the strap is attached and arranged on the transverse bar, substantially as and for the purpose described.



3. The combination, in a bed-bottom, of a slat composed of two spring-bars, having at each end a flexible strap, a transverse roller or bar, and a coiled spring arranged on said roller or bar, and having a central loop, to which the end of the strap is attached, and branching arms for holding the spring in place, substantially as described.

163,575. HARNESS-FRAMES FOR LOOMS. J. B. Casey, Henry Ansel, and Jas. Johnson, Mystic River, Conn. [Filed Apr. 7, 1875.]

The combination, with the harness-frame A B, having slots or mortises in its side pieces, of the rods or bars C C, having eyes at one end, the eccentric levers D D pivoted at the other end of said rods, and the hooks *b b*, whereby the rods can be readily withdrawn and inserted, the several parts being arranged and operating together, as and for the purpose herein set forth.



163,576. REFRIGERATING APPARATUS. O. H. Chiancok, Brooklyn, N. Y. [Filed Oct. 26, 1874.]

1. The combination of an ice-making machine, so termed, and a refrigerating-shell cooled or operated by the said machine, and surrounding in whole or in part a chamber closed against the access of external air, substantially as and for the purpose set forth.

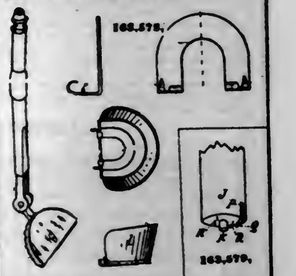
2. The combination, with an ice-making machine, so termed, a refrigerating shell cooled or operated by the said machine, and arranged to cool a chamber closed against access of external air, of the ice-box provided between such shell and chamber, substantially as and for the purpose herein set forth.

163,577. JIB-HANKS. Chas. W. Clements, Yarmouth, Canada. [Filed Mar. 29, 1875.]

The within-described clip jib-hank, when composed of the two parts A B pivoted at C, the part B having a tongue extending beyond the pivot C and into a corresponding groove in the part A, and both parts, where they form the smaller loop, formed as sister-hooks, substantially as and for the purpose herein set forth.

163,578. DENTAL MIRRORS. T. Cogswell, Boston, Mass. [Filed Mar. 16, 1875.]

Brief.—The mirror has one straight edge for convenience in placing it below the gums. It is also rotated in its own plane upon a central pivot, and held fixed at any point by corrugations upon its casing. A napkin-holding and a cheek-holding device are combined with the mirror.



1. The mirror *g*, of the form shown in Figs. 1 and 3, pivoted to a shank, *c*, attached to a handle by means of either a jointed or rigid connection, as set forth.

2. A mouth-mirror rotating in its own plane around a point of attachment within said plane, and having provision for retention at any desired point in the same, substantially as set forth.

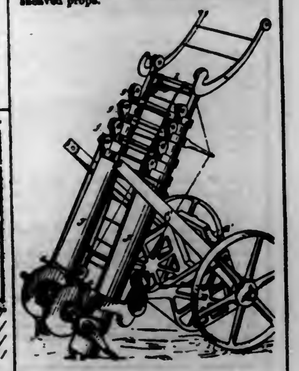
3. The combination of a mouth-mirror with a movable double-jawed shank, A, provided with a locking device, as and for the purpose set forth.

4. A napkin-holding device, in combination with a mouth-mirror, substantially as and for the purposes described.

5. A tongue or cheek holding device, in combination with a mouth-mirror, substantially as and for the purposes set forth.

163,579. PUNCHING-MACHINES. Charles A. Corman, Wayland, Mass. [Filed Apr. 23, 1875.]

Brief.—Ornamenting devices are secured to the end of the punch-bar, so that when the hole for the eyelet is cut by the rotation of the punch-bar the ornamentation is effected around the eyelet.



1. In a punching mechanism, constructed and operating substantially as described, the combination of the punch K and stude R, substantially as and for the purpose specified.

2. In a punching mechanism, substantially such as described, the combination of the punch K, studs R, and wheel Q, substantially as set forth.

3. The combination of gears F H, collet G, bar J, punch K, and yielding bed I, substantially as set forth and specified.

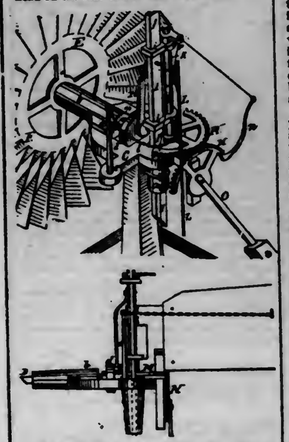
163,580. EXTENSIBLE FIRE-LADDERS. Benj. F. Covel, B. L. Chace, and J. M. Weaver, Fall River, Mass. [Filed Dec. 29, 1874.]

Brief.—The ladder consists of a pair of telescopic sections secured together by cross-braces. A flexible rope ladder is attached to the upper section, and as the sections are extended by means of ropes and pulleys, the ladder is unwound from a drum which is secured to the lower section. The lower section is pivoted to the forward end of the carriage-hounds, and when the rear truck is disconnected from the front truck the sections are thrown into position for use, and are adjusted to any desired angle by ropes passing over sheaved props.

1. In combination with the telescopic frames moved simultaneously, the flexible ladder and ladder-drum, whereby the ladder is raised with the frames and tightened at any altitude, substantially as hereinbefore set forth.

2. In combination with the forward end of the truck, the drum and ropes for lifting the frames off and onto the pillar of the front axle, substantially as hereinbefore set forth.

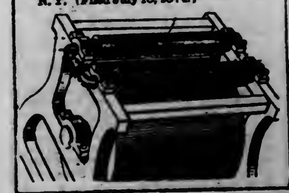
3. The box B' secured to the casting K by a T-shaped bolt, whereby the rear portion of the truck is enabled to adapt itself to inequalities of surface, and whereby the telescopic frame may be raised to any required angle, substantially as hereinbefore set forth.



4. The combination of the rear truck, and derrick-arms pivoted thereto, with the ceiling-ropes and drums, arranged as described, so that the ceiling of the ropes will automatically elevate the derrick-arms to the proper altitude, and bend the telescopic frames, substantially as hereinbefore set forth.

5. The derrick-arms G G' pivoted to the axle of the rear truck and adapted to be elevated and sustained in position without the aid of a prop, substantially as hereinbefore set forth.

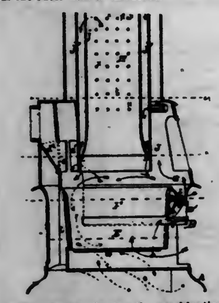
6. The box B', constructed as described, with the recesses G', in which the ends of the frames J J rest when ready for transportation.



163,581. WHEELS. Joseph Cushman, Thomson, Ill. [Filed Oct. 27, 1874.]

Brief.—It consists in a rod secured to the turn-table, and serving as the pivot of the guide-vane, the rod being placed out of the axial plane of the wheel-shaft, and provided with guides, in which moves the operating-slide, the latter element being connected by a pitman-rod of peculiar shape with a crank-head on the rear end of the wheel-shaft.

The pivot-rod K of the guide-vane, secured to the frame of the turn-table out of the axial plane of the wheel-shaft, and provided with guides *i*, in combination with the slide I and crank-head *d* of the wheel-shaft D, substantially as shown and described.



163,582. MACHINERY FOR UNITING PAPER AND CLOTH. Chas. H. Denison, New York, N. Y. [Filed July 16, 1874.]

The combination, in a machine for uniting paper to cloth, of the steam drying-cylinder for drying the paper and cloth, and the hollow carrier-roll for carrying the same, provided with pipes for introducing water for cooling said carrier-rolls to keep the surface moist and prevent paste from accumulating thereon, substantially as described.

163,583. MAGAZINE-STOVES. Wm. Doyle, Albany, N. Y. [Filed Dec. 16, 1874.]

Brief.—To heat by air-heating passages which discharge into the room, by heat reflected through windows, and by radiation from the outer wall of the stove.

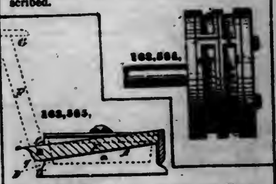
1. In a stove or heater, the combination of the sectional fire-pot, comprised by the cooking section F and fuel-burning section E, with space *a* between, and the lower section provided with a grate, and its upper margin closing to the wall of the ash-chamber, with the flame-space *h* leading from the upper margin of the lower section to the combustion-chamber J, substantially as and for the purpose set forth.

2. The combination, with the sectional fire-pot, having a space between the sections, and a flame-space or passage-way, *h*, leading from the upper margin of the lower section of the fire-pot to the combustion-chamber above, of the air-heating flue K and tubes L, discharging into the said flame-space, substantially as and for the purpose set forth.

3. The descending flues *f f* and their extended continuations *f' f'*, leading from the combustion-chamber into the base-flues I and I', in combination with the flame-space or passage-way *h* and the mica lights E', set opposite the flame passage or space *h*, whereby the stove may be rendered capable of warming a room from its lower parts by the united operations of the hot gases circulating through the said flues and base, and the heat radiated from the flame in the flame-passage through the mica lights, substantially in the manner set forth.

4. In a stove or heater, the chamber *l*, communicating with the interior of the fuel-reservoir, the outer air of the room, and the combustion-chamber, in combination with the flame passage or space *h*, surrounding the upper portion of the fire-pot, and the descending flues *f f*, leading the hot gases laterally from the discharge end of the reservoir, whereby the mingled air and gas from the chamber *l* may be drawn in contact with the flame and hot gases from the flame passage or space *h* for their better combustion, substantially as and for the purpose set forth.

163,584. STEAM-PACKINGS FOR PISTONS. Chas. L. Eastman, Concord, N. H. [Filed Feb. 16, 1874.]



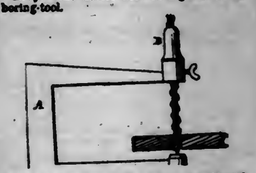
Brief.—The packing-rings have outside grooves, which communicate with the inside of the cylinder, to which steam is admitted, making a differential pressure on the rings, to hold them out against the inside of the cylinder.

1. The combination of the piston-head and follower, and the split rings *a*, *b*, and *c*, forming together a steam-chamber in the piston, said rings being fastened together, freely moving around between the head and follower, and furnished with steam-passages leading directly from said chamber to the channels in the perimeter of the external rings *b* and *c*, as and for the purpose described and represented.

2. In combination with the spider and ring *c*, the adjusting devices C D, for keeping the piston-head central in relation to the cylinder, substantially as described.

3. The combination of the valve A with the slots or cut-aways in the opening in which it works, and with the head and follower of the piston, as and for the purpose described and represented.

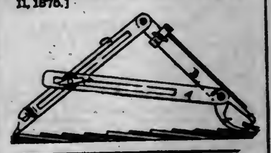
4. The combination of the piston-head and follower, the spider, the rings *a*, *b*, and *c*, and the steam-ways through them, whereby a steam-chamber is formed in the piston-head without other mechanisms, and a steam-tight packing is produced solely by the action of the steam, and without any wedge, spring, or other pressure exerted on the surface of the inner ring from the center outward, as represented and described.



163,585. INKING APPARATUS FOR HAND-STAMPS. David A. Bidell, New York, N. Y. [Filed Apr. 24, 1875.]

Brief.—Hinges the "stamp-rack" to the base or pad-holder, so as to fold down, as shown in Fig. 3, to facilitate packing for transportation purposes.

As a new article of manufacture, the combined rack and pad, constructed with the rack G F, working on the pivot *g*, pad or pads *a*, and the base *e*, the whole combined for use and operation substantially as herein set forth.

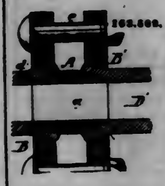


163,586. WOOD-BORING MACHINES. John Faraday, Chester, Pa., assignor of one-half his right to William P. Kirk, same place. [Filed May 7, 1874.]

Brief.—The device acts as a guide to the boring-tool.

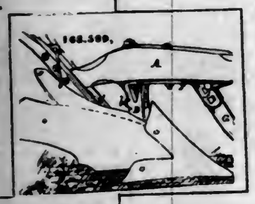
The combination of the screw-auger D with the sleeve B, nipple C, and the frame A, substantially as and for the purpose herein before set forth.

163,587. SEINGLING-BRACKETS. Alfred P. Fletcher, Middletown, Conn. [Filed Mar. 11, 1875.]



The combination, in a staging-bracket, of the slotted brace A, pivoted to the beam B at *b*, the toothed jaws *f* and *g*, the jaw *f* carried by the beam B, being curved, and the jaw *g* carried by the brace A being flattened, so that its upper side will form a portion of the level support for the staging when adjusted in position upon the roof, the slotted upright C provided at its lower end with the shoes *d d* upon the feet D D', and hinged at *e* to the beam B, the screw-bolt E, the thumb-nut F, and the washer *c*, and the collar *m*, formed with the projections *p*, and provided with the thumb-screw *n*, as described.

162,588. JOINTS FOR LEAD PIPES. Albert B. Goodell, Philadelphia, Pa., assignor of one-half his right to John W. Biddle, same place. [Filed Sept. 15, 1874.]

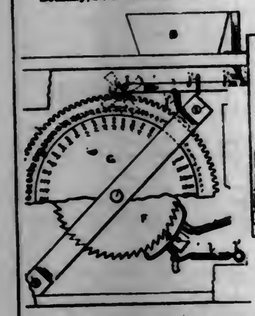


Brief.—The flaring ends of the pipes are drawn tightly upon the internal tubular block by means of the clamping-plates, whose central openings are tapered to conform to the shape of the pipe at the point of coupling. The plates are drawn together by bolts.

The combination, with the flaring ends of the pipes D D' and internal tubular block A, of the plates B B', having openings with bevel edges, and the screw-bolts *c c*, all as set forth.

162,588.

162,589.



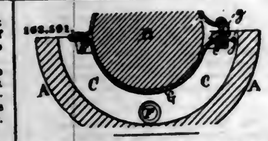
162,589. SWIVEL-PLOWS. Joab Hapgood, Shrewsbury, Mass. [Filed Oct. 27, 1873.]

Brief.—The coiter is attached to the front end of a lever pivoted to the under side of the beam, and is automatically moved to be in line with the land side when turned on either side.

The combination, with the beam A, moldboard E, and standard B of the lever F and *i*, pivoted at *a b*, supporting-loop K, and cutter-blade G, said parts being constructed and arranged for operation substantially as herein set forth.

162,590. GRAIN-TALLIES. S. A. Haselton, Bethany, N. Y. [Filed June 10, 1874.]

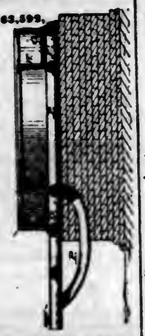
1. The wheel E, having the projection T, arranged to operate in combination with the dial G, ratchet-wheel F, and pallet-lever K, having the arm L, and spring *l*, substantially as and for the purpose specified.



2. The pallet-lever K, having the hand-lever M operating in combination with the ratchet-wheel F and dial G, substantially as and for the purpose specified.

162,591. LUBRICATORS. Charles H. Holt, Boston, Mass. [Filed Oct. 26, 1874.]

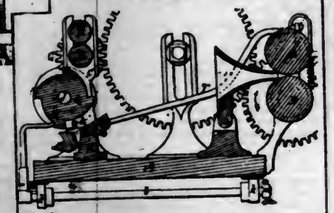
Brief.—The bearing is centrally grooved, within which the clamp secured to the journal revolves. Said clamp is detachable, and has wings or projections, by means of which oil is carried from the reservoir to the journal.



The detachable clamp-ring C, having projections *g g*, in combination with journal B and bearing A, having groove G, substantially as and for the purpose set forth.

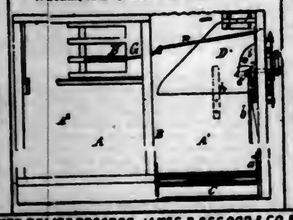
162,591.

162,592. DEVICES FOR HEATING WAGON-TIRES. Stephen B. Hopkins, Comeaut, Ohio. [Filed Mar. 13, 1875.]



162,592.

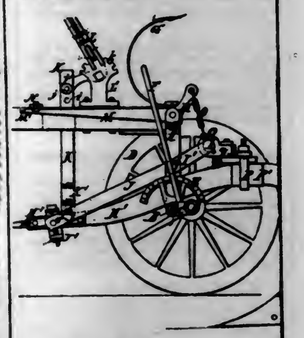
The improved tire-heating apparatus herein described and shown, consisting essentially of the annular metallic furnace F, and the two internally-perforated annular tubes F, connected thereto and to the main blast-pipe for supplying air to the furnace on both sides of the tire.



162,593. STOPPING MECHANISMS FOR RAILWAY-HEADS. R. W. Hunton, Fall River, Mass. [Filed Apr. 26, 1875.]

Brief.—For shifting the belt and stopping the machine when the sliver passing between the condensing or delivering rolls is above or below a given thickness.

The levers T, pivoted to the boxes of the upper roll, the tripper S, connected with such levers, the ratchet-wheel Q, shaft J, sleeve K, sketch N, rod *e*, rock-shaft *i*, and dog *m* with shipper-rod *h*, combined for operation as described, whereby the changes in position of the two condensing-rolls relatively to each other are transmitted to the belt-shipper.



162,594. ANIMAL-TRAPS. Geo. W. Kelley, Wabash, Ind. [Filed Oct. 1, 1874.]

The combination of the box A with partition B, door C, gate G, connecting-rods *b n*, treadle D with stop *i*, catch *p*, and the shaft *d*, provided with spring *m*, crank-pin *o*, and arm *k*, all constructed and arranged substantially as and for the purposes herein set forth.

162,595. WHEEL-PLOWS. John Keys and John R. De Mier, Coultersville, Ill. [Filed Feb. 20, 1875.]

Brief.—The arched axle is journaled in the crank-axles, which are held and adjusted by spring-levers and ratchets. Arms are pivoted on the axle and to a yoke carrying the front end of the plow-beam, which is raised by an elbow-lever.

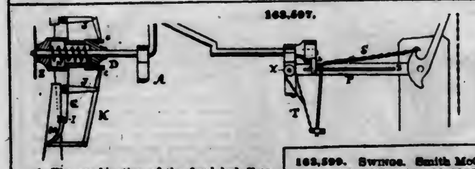
1. The arched axle A, constructed with the spindle *a b*, in combination with the short crank-axles C, confined loosely thereon by nuts *c*, in the manner and for the purpose herein described.

2. The side bars J, pivoted to the sides of the arched axle, and connected at their front ends by a pivoted yoke, J', in combination with the bar K, ball-crank lever L, and a suitable stop device, L', substantially as and for the purpose described.

3. The perforated swiveling yoke K' on the pivoted side bars J J, in combination with the turning sleeve Q *q* on the vibrating bar I, whereby the front and rear of the beam are supported and allowed movements in a vertical plane.

4. The combination, with the arched axle A, tongue G, and plow H H', of the rear and front corresponding supports I J J' K and the levers L and M, substantially in the manner and for the purpose described.

162,596. BUCKLES OR FASTENERS. Samuel T. Lockwood and John M. Ware, Chicago, Ill. [Filed Apr. 26, 1875.]



As a new article of manufacture, the buckle or fastener A, consisting of the part or body *a*, adapted for attachment by means of rivets to the part to which it is to be applied, having thereon the vertical pin *a'*, and provided with one or both of the lateral arms *c c*, detached at one end from the part or body *a*, substantially as specified.

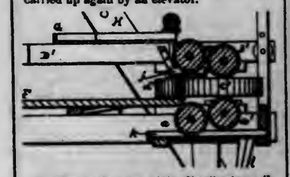
162,597. WINDMILLS. William W. Marsh, Sycamore, Ill. [Filed Feb. 26, 1875.]

Brief.—A spring arranged within a sliding head applied to the main shaft forms the head out, and keeps the fans in position. A disk, which nearly fills the space between the inner ends of the fans in high winds, assists in driving the fan-frame against one of the supports of the wind-wheel, whereby the spring is compressed and the fans thrown out of the wind more or less.

162,597.

1. The combination of the fixed hub E on the outer end of the shaft and the sliding head D, cut out to form a recess and a covering for the spring, with the spring N and shaft C, substantially as and for the purpose specified.

2. The combination of the rocking bars or shafts I with the levers or arms M, bars or rods L, and levers K with the fans H, sliding head D, hub E, and spring N, substantially as specified.



3. The plate F, covering the central space, in combination with a sliding main shaft C, substantially as and for the purpose specified.

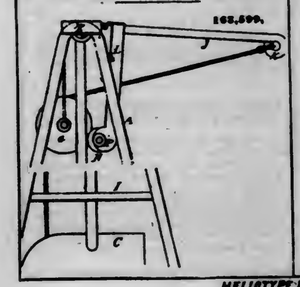
4. The combination of the weighted rod V, adjustable collar U, and chain S, with the rod Z and the rear end of the main shaft C, substantially as and for the purposes specified.

5. The combination of the lever R, chain S, and chain or cord Y with a sliding main shaft, substantially as and for the purposes specified.

162,598. PAINTING-MACHINES. William W. Marsh, Sycamore, Ill. [Filed Feb. 26, 1875.]

Brief.—The strips are fed between four rollers, which paint the four sides simultaneously. As the paint runs down over the rolls from upper trough, it is received by a drip-pan and carried up again by an elevator.

1. The combination of the distributing-rollers *a b*, painting-rollers *a' b'*, with paint-reservoir G, trough *f*, drip-trough *k*, and suitable pulleys and frame, substantially as and for purpose specified.



2. The rollers *a a'*, *b b'*, *c c'*, and *d d'*, in combination with paint-receptacles G *j k* and suitable pulleys and supporting-frame, constructed substantially as and for the purpose specified.

3. The combination of the rollers *a a' b b' c d d'* with paint-receptacles G *j k*, table F, and suitable pulleys, and frame with adjustable bars D D', substantially as and for the purpose specified.

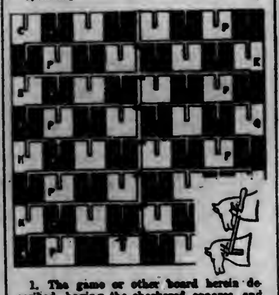
4. In a painting-machine, the elevator H, in combination with paint-receptacles G *j k*, rollers *a a'*, *b b'*, *c*, and *d*, and suitable pulleys and frame, substantially as and for the purpose specified.

5. The distributing-rollers *a b*, and painting-rollers *a' b'*, in combination with the table F and a table to receive the painted strips, the rollers and tables arranged on a line, whereby long strips can be painted and the parts placed close together, as and for the purpose specified.

162,599.

162,600. SWINGS. Smith McCleverr, Chicago, Ill. [Filed Apr. 12, 1875.]

The swing B C, combined with the sheave G, arms L L J, and rope H, as and for the purpose set forth.

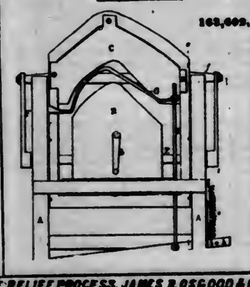


162,601. GAS-BURNERS. F. H. McGeorge, Corning, N. Y. [Filed Mar. 30, 1875.]

Brief.—The tube conducts the heat derived from the flame-slit and side perforations.

The combination of the shell, having the small side openings, with the internal heating-tube, as described.

162,602. GAME AND OTHER BOARDS. Chas. F. Morgan, Cleveland, Ohio. [Filed Feb. 8, 1875.]



1. The game or other board herein described, having the checkered squares, and provided with slots arranged from the outside border to every square thereof, substantially as and for the purposes described.

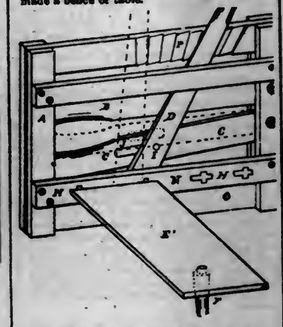
2. In combination with a slotted game or other board, the double-faced pieces, connected by a bar, arranged to pass from one position to another in the board by means of the said slots, substantially as described.

3. In combination with a slotted board, the double-faced pieces, with handles attached, substantially as and for the purposes described.

4. A game or other board provided with slots extending through the said board, the said slots being arranged as described, so that a character or piece may be moved by a person on either side of the board from one position to any other position on the said board, substantially as and for the purposes described.

162,602.

162,603. CRIMPING-MACHINES. O. Noack, Baltimore, Md. [Filed Mar. 17, 1875.]



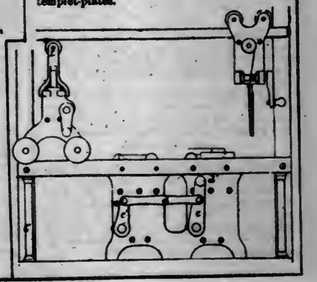
Brief.—The clamp-bars, which hold the leather in position upon the jaws, are vertically adjustable, and operated by a lever.

1. The clamps G, pivoted to the frame A, and adapted, to be raised, when not in use, by means of a reactionary spring, in combination with the plate C and lower die-plates B, substantially as herein specified.

2. The clamps G, adjustably connected to the rods *g*, in combination with the treadle h and swinging bar *k*, substantially as and for the purpose set forth.

162,604. HOG-TRAPS. Harrison Ogborn, Richmond, Ind., assignor to Saml. Watson, same place. [Filed Mar. 9, 1875.]

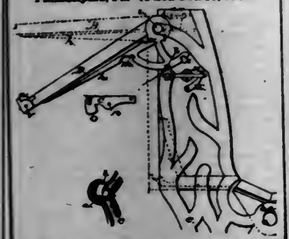
Brief.—The trap stands in or forms the exit-door of an inclosure. One of its vertical bars is pivoted above. Near the ground it and the next bar are concaved on contiguous sides. A transverse bar carries a pin, which moves in a slot in the pivoted upright bar, widening and closing the space between the vertical bars, near its handle moving over a ratchet-surface. The hog may thus be held by the neck, or by tilting the machine he may be thrown upon his side, the side guiding-boards being then made a bench or table.



1. The jaws B C, in combination with the lever D, slot J, pin I, and ratchet F, constructed and operating substantially as and for the purposes set forth.

2. The detachable table E', secured to the upright N by the tenons E and mortises H, in combination with the jaws B C and frame A, substantially as and for the purposes set forth.

162,605. MOULDING-MACHINES. Samuel J. Peet, M. C. Poland, and John C. Poland, Jr., Boston, and Jos. W. Willis, Canton, assignors, by mesne assignments, to the Peet Moulding-Machine Company, Boston, Mass. [Filed Aug. 13, 1874.]



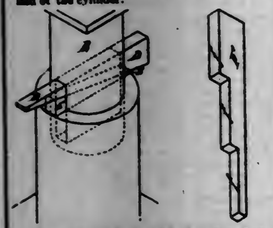
Brief.—Semi-flasks are placed over templet-plates, through which the patterns project, and arranged to be withdrawn by mechanism. The sand is packed in the flasks about the patterns by means of a ram mounted on a movable carriage, the ram being also capable of transverse movement to reach all parts of the flasks. The bosses on the semi-flasks facilitate the operation of fitting them to the templet-plates.

1. In a machine, substantially as described, for making sand molds for castings, the combination of the two templet-plates, the patterns, the sand-flasks, and a carriage movable horizontally, and provided with a ram capable of having compound or vertical and horizontal movements, the whole being constructed and arranged to operate substantially as set forth.

2. The sand-flasks when formed with projections or bosses a^2 a^3, &c., as and for the purpose set forth.

163,605. SCHOOL-SEATS. Isaac N. Peirce, Philadelphia, Pa. [Filed Oct. 15, 1874.]

1. The seat-joint, consisting of the standard *a*, provided with the pivot-*e* *e*, having a rounded or oval projection or cam, *b*, formed thereon, in combination with the seat-arm *c*, having an opening, *f*, for the said pivot, and an oval chamber, *g*, to receive the cam *b*, as and for the purpose set forth.



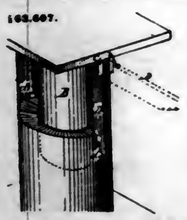
2. The lid B, provided with the book-rest F F, turning one-quarter around upon the wire pivots V V V V, and having the book-ledges *q q*, substantially as described.

3. The wire bolt *y* and cover H, provided with the notch or hole *s*, in combination with the lid B, having the pin or block projection X upon its under side, to engage with the bent wire bolt *y*, and force it up into the notch or hole *s*, substantially as described.

4. The desk-lid attachment I, having the notches *k l m* in combination with the latch C, having the projections *p* and springs E, and wires *t t*, and lever *v*, substantially as described.

163,606. HYDRAULIC PRESSES. C. Feper, St. Louis, Mo. [Filed Apr. 19, 1875.]

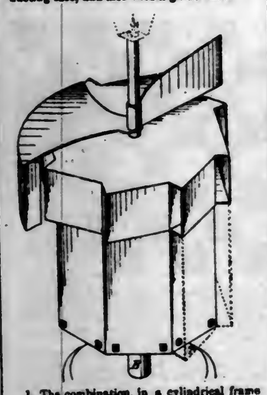
Brief.—A keyway is made in the ram, and a key of varying thickness, which may consist of two complementary wedges, or of one piece having a series of bearing-faces parallel to and at different widths from the base of the key, is inserted, its lower edge to bear on the end of the cylinder.



1. The key F, having offset bearings *f*, in combination with the ram B, having slot *b*, of hydraulic presses, fit the purpose of supporting the ram stationary, substantially as set forth.

2. In a hydraulic press, the inclined planes D and E, in combination with the cylinder and platen, for the purpose of supporting the ram stationary, substantially as set forth.

163,607. HYDRAULIC PRESSES. C. Feper, St. Louis, Mo. [Filed Jan. 26, 1875.]



Brief.—Pivoted to the platen are keys formed with offset bearings, which engage with the top of the cylinder as the ram is raised, and by means of which the ram can be retained in a "true" position after the required pressure has been produced.

In a hydraulic press, the keys D, in combination with the cylinder and platen, for the purpose of supporting the ram stationary, substantially as set forth.

163,608. ADVERTISING DEVICES. Cullin W. Reed, Chagrin Falls, Ohio. [Filed Nov. 13, 1874.]

Brief.—A cylindrical frame is loosely mounted upon a fixed vertical shaft, to exhibit advertisements placed upon its panels, which are "tangentially connected" with it, and by which manner of connection the wind causes the frame to rotate. It is also provided with a rotary guard, to conduct currents of air upon the surfaces or buckets projecting laterally from its body. The guard is constructed with a concave receiving and conducting face, and also with a guide-vane.

1. The combination, in a cylindrical frame supported upon a fixed axis, of a series of side panels tangentially connected with the frame for receiving and displaying characters, advertisements, &c., substantially as described.

2. The combination of a series of buckets for receiving currents of air with the cylindrical frame-work, constructed for displaying characters, advertisements, &c., and a central axis or standard for supporting the frame, substantially as described.

3. The combination, with a cylindrical or polygonal-shaped frame-work for displaying characters, advertisements, &c., of a rotary guard for conducting currents of air upon surfaces or buckets projecting laterally from the frame-work, substantially as described.

4. The guard, constructed with a concave receiving and conducting face, and with a guide-vane, in combination with a cylindrical or polygonal-shaped frame, constructed for displaying characters, advertisements, &c., substantially as described.

163,609. LOOM-SHUTTLES. John Rigby, Chicopee, Mass. [Filed Apr. 13, 1875.]

Brief.—The device is for stopping the loom when the warp-threads break or knot. A hook is so arranged as to be carried off a bearing when it comes in contact with a warp-thread, and the downward movement of the hook allows a pivoted latch to drop sufficiently far to bring its beveled point in position to catch the weft-thread and break it, thereby putting in operation the stopping mechanism.

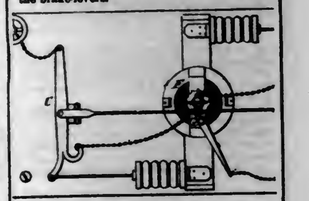
In a loom-shuttle, the fixed frame *c*, provided with a chamber, *d*, and a projecting support, *f*, the loosely-pivoted latch *e*, having a bevel-point, *h*, and connected, by a cord, *m*, to the hook *h*, all combined and operating together, as and for the purpose set forth.

163,610. BUTTER-COLORING COMPOUNDS. John C. Borick, Wauseon, Ohio. [Filed Aug. 6, 1874.]

An antiseptic coloring matter composed of the annotto, curcuma, and bromo-chloralum, mixed together in about the proportions set forth

---

163,611. FOLDING SEATS FOR SCHOOL-DESKS. Uriah Smith, Battle Creek, Mich. [Filed Dec. 4, 1874.]



Brief.—The seat is pivoted to the arms and braces, and not to the standards, and the parts are so arranged that when the seat is folded the back edge thereof rises instead of the front edge, as heretofore.

The combination of the arms C and braces B with the seat S and standards D, constructed to operate substantially in the manner and for the purpose herein set forth.

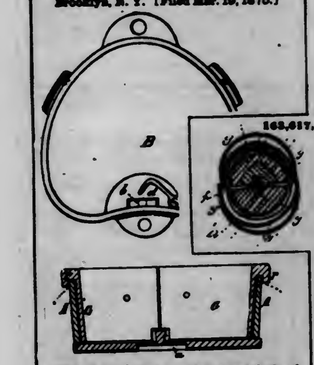
163,612. CAR-BRAKES. John Y. Smith, Pittsburg, Pa. [Filed Apr. 6, 1875.]

Brief.—A spiral spring secured to the car-frame is wound up and set at its full tension by a pawl and ratchet. The spring, when released, revolves a spindle, which winds the brake-chains attached to transverse brake-levers. A vacuum-diaphragm is mounted on each side of the frame, and attached to the brake-levers by rods. The exhaustion of the air contracts the diaphragm, which acts in combination with the spindle to set the brake. A hand-pulley is also attached to the ends of the brake-levers.

In combination with the transverse lever C to operate the brakes of a railway-car, the hand-brake, the vacuum-chamber, and the spring for setting the brake, substantially as set forth.

163,613. REVOLVING STEREOSCOPES. J. F. Steward, Piano, Ill. [Filed July 13, 1874.]

1. The case A B, the part B being in sector-jar form, and the glass *a* in sides and top, in combination with eye-glass C, bar *c*, and pins *f*, substantially as and for the purpose specified.



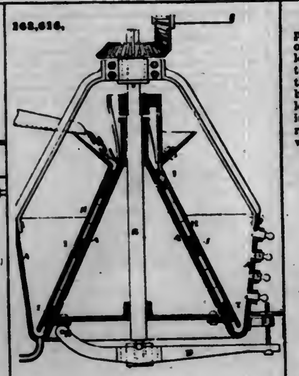
2. The device herein described, consisting essentially of the parts A B, glass *a* in sides and top, curtains *e*, *e'*, and *d*, and the eye-glass C, all combined as and for the purpose herein described.

163,614. FIRE-PROOF SAFES, &c. William A. Shepard, New York, N. Y. [Filed Jan. 6, 1874.]

Portable safes, vaultrooms, or stationary closets for buildings, made of double walls, which are lined with slate-paper, and which have filled between them either anthracite-coal ashes or a mortar composed of plaster-of-paris and the ashes of anthracite coal, substantially as described.

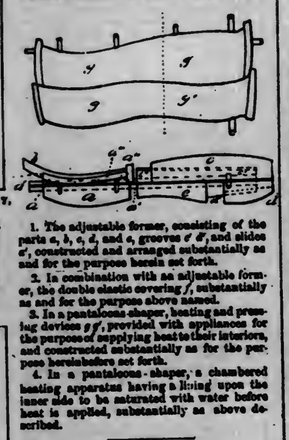
163,615. DENTAL FLASKS. Wm. O. Treat, Brooklyn, N. Y. [Filed Mar. 19, 1875.]

1. The combination, with a dental flask, of the sectional detachable beating-plates G, arranged to slide outward in the removal of the plaster from the flask, substantially as and for the purpose set forth.



2. The combination of the outwardly-projecting hook-lugs *r*, provided upon the beating-plates G, with the notches *r'*, formed in the edge of the section A and the section C of the flask, substantially as and for the purpose set forth.

3. The cap B, constructed with the dovetail-stud *c* and hook *d*, in combination with the dovetail-notch *a* and staple *b* of the section A, substantially as and for the purpose set forth.



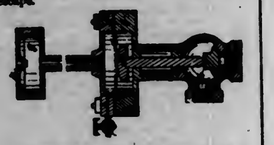
163,616. MACHINES FOR SAWING QUICKSILVER. John W. Varney, Virginia City, Nev., assignor of one-half his right to J. B. Hereford, same place. [Filed Oct. 21, 1874.]

Brief.—Seven fluted quicksilver in tailings by rubbing gently in the device shown. Shoes are of rubber, wood, or leather, dovetailed into the conical muller. Inner cone is copper-lined. Bottom of pan is covered with quicksilver.

The combination of the tub A, with its central cone, the revolving conical muller H, with its rubbing-shoes I, the hollow shaft B, and the mechanism for revolving the muller, all constructed and arranged to operate substantially as described.

163,617. APPARATUS FOR SHAPING PANTALOONS. Ellen E. Vieta and Chas. B. Shaw, Boston, Mass. [Filed Apr. 27, 1875.]

1. The adjustable former, consisting of the parts *a*, *b*, *c*, *d*, and *e*, grooves *c' d'*, and slides *a'*, constructed and arranged substantially as and for the purpose herein set forth.

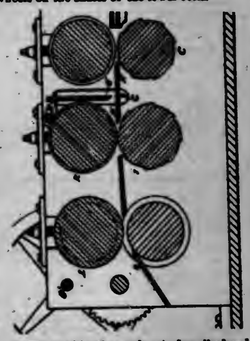


2. In combination with an adjustable former, the double elastic covering *f*, substantially as and for the purpose above named.

3. In a pantaloons shaper, heating and pressing devices *g g'*, provided with appliances for the purpose of supplying heat to their interiors, and constructed substantially as for the purpose hereinbefore set forth.

4. In a pantaloons-shaper, a chambered heating apparatus having a lining upon the inner side to be saturated with water before heat is applied, substantially as above described.

163,618. SAFETY-VALVES. Thos. Walker, Philadelphia, Pa. [Filed Feb. 9, 1875.]



Brief.—The chamber and column above the diaphragm are filled with mercury to weight the valve. When the pressure in the boiler rises above the desired height, the mercury will be forced into the receiver, the valve released, and the excess of steam allowed to escape.

The combination of the chamber *b c*, perforated pipe-disk *c*, bolster or piston *d*, hollow column or pipe *f*, receiver *g*, cover *h*, and cock *i* with the valve *a*, substantially as and for the purpose set forth in the annexed specification.

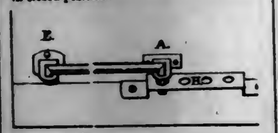
163,619. MACHINES FOR MAKING WROUGHT-NAIL BLANKS. Thos. T. Wood, Chicago, Ill., assignor to Geo. B. Griffin, same place. [Filed Jan. 6, 1875.]

Brief.—The header has sufficient lost motion, by virtue of the slot in the end of bar, to allow the jaws to close upon the nail before it advances, and also to allow them to separate and release the nail before the receiver is again actuated.

1. The combination, as herein described and shown, of the rollers C and F, the knives G and G', and the rollers J and K, substantially as and for the purposes specified.

2. The combination, as herein described and shown, in a machine for making wrought-iron nails, of one or more pairs of forming-rollers, of the knives G and G', and of the slitting-rollers L and L', substantially as and for the purposes specified.

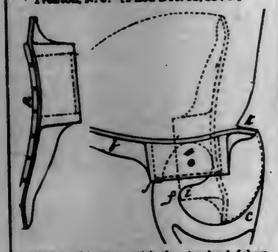
3. The combination, substantially as described, of forming-rolls, knives, knife-actuating mechanism, slitting-rolls, and an intermittent-feed mechanism, whereby the bars are forced, fed to the knives, there stopped and cut, and then fed forward and slit, all operating together in connection with each other and driving mechanism, in the same machine, for the purposes set forth.



163,620. MACHINES FOR HEADING WROUGHT-NAILS. Thomas T. Wood, Chicago, Ill., assignor to George B. Griffin, same place. [Filed Jan. 6, 1875.]

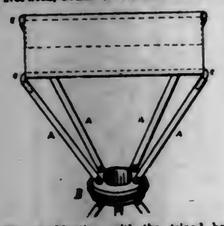
Brief.—Two pairs of forming-rollers, the upper rolls of which are plain, while the lower ones are serrated throughout their entire lengths, and knives or cutters interposed between them, which serve the plate into sections, the said sections being slit into strips or blanks by a pair of slitting-rollers after they leave the second pair of forming-rolls. An intermittent rotation is given to the forming-rollers by pawls, which engage with ratchet-wheels on the shafts of the lower rolls.

In combination, the pivoted levers J J, provided with the jaws *c' c'*, the toggle K K, pivoted to the said levers, and the reciprocating blocks B and B', loosely jointed to each other and pivoted to the toggle, substantially as and for the purposes specified.



163,621. SHUTTER BOWERS AND FASTENERS. G. F. S. Zimmerman and C. Zimmerman, Frederick, Md. [Filed Feb 20, 1875.]

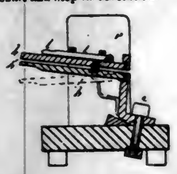
Brief.—A swinging bar or brace, with downward-projecting point, is hinged to the shutter near its lower inside corner, and at the opposite corner of the shutter a plate with hole through it is likewise attached. These are combined with a suitable socket and a plate having a series of holes, both of which are secured to the window-sill, in such manner that the downward point of the brace passes intermediately through a hole in the plate on the shutter into corresponding holes of the sill plate, thus securely fastening the shutter in closed position.



The fastening formed by the end of the brace D passing down through the hole C in plate A into a corresponding hole in plate H, in combination with the permanent attachment of the brace to the shutter at E and the socket F, as above described.

163,622. SCHOOL-SEATS. Benjamin Allen, Trenton, N. J. [Filed Dec. 18, 1874.]

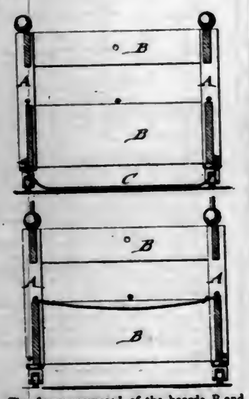
The combination, with the standard *f*, having an elongated opening, *e*, and shoulders *j k*, of the seat-arm *b*, having an oblong rectangular mortise, which is partly closed at the bottom by a flange, *d*, and provided with the pin *g*, projecting into said mortise, the arm being held upon the standard by the elastic plate *a*, sprung into the mortise and resting upon the flange *d*, all as and for the purpose set forth.



163,623. CAMP-STOOLS. Nelson R. Allen, Norwich, Conn. [Filed Dec. 26, 1874.]

The combination, with the tripod base, formed by the three tubular legs A screwed into the beveled annular central piece B of the seat-frame, consisting of four similar tubular interchangeable arms, screwed into the same central piece B, having the parallel side rods *a a* inserted into their upper ends, and provided with the seat C, for the purpose of making a cheap, light, and rigid pocket-chair, as herein described.

163,624. STOP-MOTIONS FOR MACHINERY. John W. Askin, Melrose, Mass. [Filed Feb. 20, 1875.]



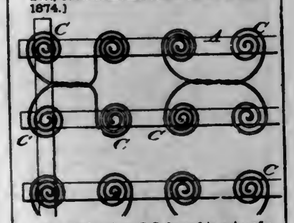
Brief.—Two levers pivoted to an upright embrace the shaft, the latter having a projection thereon, which, when brought in contact with the projection on the bolt connected to one of the levers, will cause them to gripe the shaft and stop its revolution.

In combination with the shaft *b*, provided with the rod or projection *d*, the levers *h h'* and slide *i*, provided with the rod *p*, substantially as and for the purpose herein specified.

163,625. COMBINED BABY-TENDERS AND CRIBS. Arlette Baird, Riverhead, N. Y. [Filed Mar. 29, 1875.]

Brief.—The side and end boards of the frame are provided with headed pins or buttons on their upper and lower edges. A suitable canvas or other stretcher is attached to the upper buttons to form a crib, or a carpet is attached to the lower ones to form a "baby-tender."

The frame composed of the boards B and posts A, the side-boards having fastening devices along their upper and lower edges, as shown and described, whereby a stretcher, D, or floor-covering, C, may be attached, according as the frame is to be converted into a crib or baby-tender, as set forth.

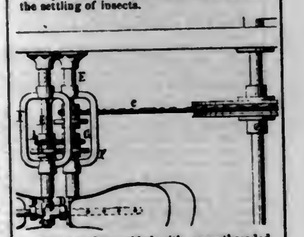


163,626. INSTRUMENTS FOR SCRIBING STAIR-CURVES. Andrew Beck, Philipsburg, Pa. [Filed May 16, 1874.]

Brief.—The table over which the pencil moves is made in two parts, and is adjustable up or down, and to any inclination. The pencil-carrying head is upon a horizontal rod, which slides through the center-post. The motion of the pencil to or from the center-post is determined by a templet, which corresponds with the sweep or curve of the stairs, and against which the head and pencil are drawn by a spring or weight.

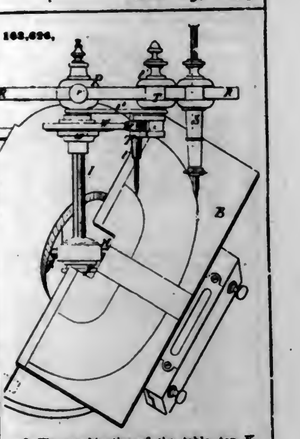
1. The combination of the base A, three posts, B C, rocking cross-bar D, three posts, F G, and cross-bar H for supporting the shaft I adjustably in place, substantially as herein shown and described.

2. The combination of the arms E and set-screws *e'* with the center post F and the rocking cross-bar D for plumbing the shaft I, substantially as herein shown and described.



163,627. SPRING BED-BOTTOMS. E. O. Bennett, Crawfordsville, Iowa. [Filed Nov. 7, 1874.]

The spiral springs C C, formed in pairs of a single wire, the pairs being attached by twisting together their connecting-wires, substantially in the manner as described, and for the purpose set forth.

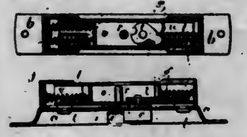


163,628. FANNING APPARATUS FOR ROOMS. Philipp J. Bender, New York, N. Y. [Filed Sept. 21, 1874.]

Brief.—For cooling the air, and to prevent the settling of insects.

The joint C, provided with screw-threaded sockets, in combination with the fans A, having the screw-threaded shanks B, the locking-nuts D, vertical shaft E, and hanger F, all being constructed and arranged to operate substantially as and for the purpose described.

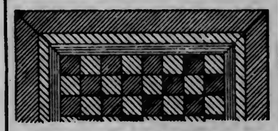
163,629.



3. The combination of the table-top K, curved bars L, and set-screws *g'* with the cross-bar H and side posts G, substantially as herein shown and described.

4. The combination of the spirit-levels M and set-screws *m'* with the side edges of the table-top K, substantially as herein shown and described.

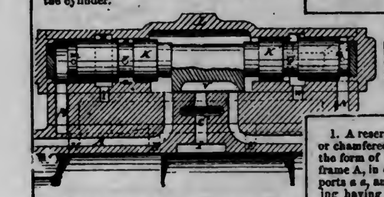
5. The combination of the ellipse-plate W and its hub *w'*, and set-screw *w''*, with the shaft I, head P, bars R, arm T, and tilting table-top K, substantially as herein shown and described.



163,629. LOCKS FOR BAGS, &c. Gustave Bernheim, New York, N. Y. [Filed Apr. 19, 1875.]

1. The latch *e* upon the sliding plate *i*, that connected to the moving end *f* of the bolt-case, in combination with the stationary portion *g* of said case, and the box-shaped base *c*, into which the latch projects, substantially as set forth.

2. The latch-plate *i*, sliding between the base *a* and stud-plate *c*, and having a projection, 2, extending up through a mortise in the stud-plate *c*, in combination with the tumbler *t*, swinging upon such stud-plate, and the yielding presser *s*, substantially as and for the purposes set forth.

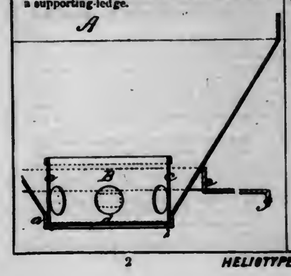


163,630. GAME-BOARDS. A. O. Bourn, Providence, R. I., and Wm. G. Vermilye, New York, N. Y. [Filed Mar. 13, 1875.]

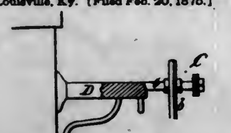
A game-board composed of a foundation of india-rubber, or a compound thereof, and having cloth squares, points, &c., after the manner of inlaying, on one or both of its surfaces, substantially as and for the purposes specified.

163,631. STEAM-ENGINES FOR ROCK-DRILLS. James Brandon, New York, N. Y. [Filed Oct. 31, 1874.]

Brief.—Steam is admitted to and exhausted from the small cylinder, to actuate the valve, by means of the main piston and the ports in the cylinder.



The valve-piston K K', having grooves *a a'* and passages *n n' r r'*, combined with a steam-chest, L, having grooves *s s' M N W Y* and passages H H' E E', as and for the purpose specified.

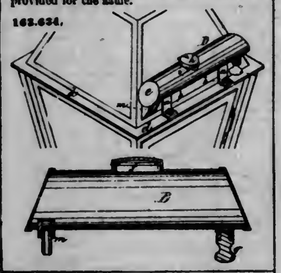


163,632. MILK-STRAINERS. John W. Brey, La Harpe, Ill. [Filed Apr. 17, 1875.]

Brief.—The bottom consists of a detachable sieve with a perforated rim, which rests upon a supporting-ledge.

In a strainer the detachable sieve B, having a perforated rim, *c*, and the funnel-shaped vessel A, having a cylindrical part, *a*, and a supporting-ledge, *b*, combined and arranged substantially as specified.

163,633. CAR-COUPLINGS. Perry Brown, Louisville, Ky. [Filed Feb. 20, 1875.]

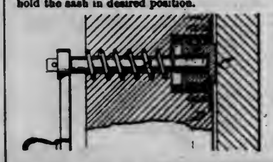


1. The combination, with an endwise-movable draw-head and a coupling-pin, B, having rod *b*, of the bifurcated arm D and slide C, substantially as specified.

2. The rollers J, separated by rollers *r'*, and vertically movable in a horizontal plane in vertical grooves in the chamber of the draw-head, substantially as specified.

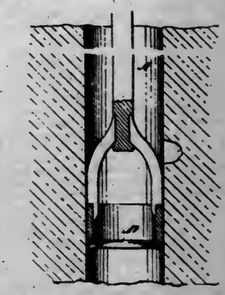
163,634. VAPOR-BURNERS FOR LANTERNS. Frederick A. Brown and Albert H. Watkins, Boston, Mass. [Filed May 6, 1875.]

Brief.—The feed-pipe extends within the reservoir, to form a trap for water and other impurities, and a separate discharge-outlet is provided for the same.



1. A reservoir, B, for vapor-burners, beveled or chamfered off at its ends to correspond to the form of the upper portion of the lantern-frame A, in combination with the legs or supports *a a*, and provided with a supply-opening having a hinged cap or cover, *b*, constructed and applied substantially in the manner and for the purpose set forth.

2. A reservoir for vapor-burners, having the feed-pipe *m* extending above the level of its bottom to form a trap, and provided with a discharge-outlet, through which water or impurities may be drawn off, substantially as described.

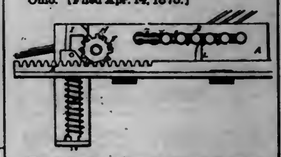


163,635. SASH-HOLDERS. R. R. Calkins, St. Joseph, Mo. [Filed Apr. 3, 1875.]

Brief.—A screw-threaded bolt, operated by a crank-handle, is let into the sash, and provided with a flanged and spring-acted clamp, likewise recessed into the sash; a ring-shaped face-plate, automatically acted on by the spring, pressing against the window-frame, to hold the sash in desired position.

The combination, with sash, of the crank screw-bolt A, socket C, having shoulder *c*, ring-shaped face-plate D, and spring *b*, all constructed and arranged substantially as and for the purposes specified.

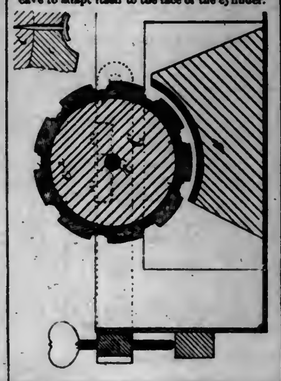
163,636. STONE-EXTRACTING TOOLS. N. R. Cheadle, Delta, Ohio. [Filed Feb. 20, 1875.]



1. The method of removing stone in well-boring by first cutting under them, and then dislodging them with a drop, as set forth.

2. The bit B, twisted and tapering to a median point, as and for the purpose specified.

3. A stone-drop, D, applied in well-boring to break or dislodge stones, in the manner described.

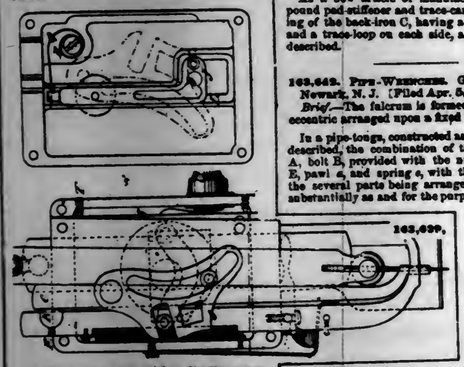


163,637. MUSIC-LEAF TURNERS. Gustavus M. Cohen and Gregor Dietz, Cleveland, Ohio. [Filed Apr. 14, 1875.]

The sliding catch I, ratchet-wheel H, pinion F, and shaft G, in combination with the slide D, lug L, and frame A, substantially in the manner as described, and for the purpose set forth.

163,638. PAPER-PULP ENGINES. Francis A. Cushman, Lebanon, N. H. [Filed Apr. 21, 1875.]

Brief.—The grinding-cylinder is faced with stone segments, held to the core by curved metal stripe set in longitudinal depressions in the stone. The bed-plate is of stone, concave to adapt itself to the face of the cylinder.



1. The stone-faced grinding-cylinder, having longitudinal grooves in its surface, in combination with the concave stone bed-plate, substantially as described.

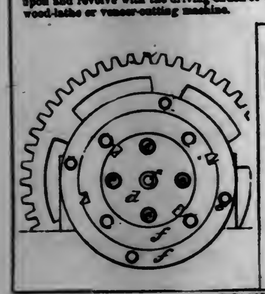
2. The grinding-wheel C, when constructed of separate sections or segments *c*, and attached to the periphery of an interior drum of wood or metal by means of the joining-plates *d*, substantially as described and set forth.

162,639. SEWING-MACHINES. George S. Darling and Augustus L. Darling, Watertown, N. Y. [Filed Dec. 12, 1874.]

Brief.—A piece operated by a screw at the head of the presser-bar impinges upon the helper-bar, pressing against the needle-bar, and serves to take up the wear of these parts. The needle-bar is connected to the cam-bar by a link, pivoted at its upper end to the thread-tube, and at its lower end to the cam-bar by a stud on said link, which enters a hole in the cam-bar. The lower edge of the tumbler that connects the presser-bar is provided with a cam-surface for operating the take-up, and a screw on axis upon the lever connected with the crank-disk as to adjust the length of the stitch.

1. The combination of the adjusting-piece E and screw F with the presser, helper, and needle-bar, substantially as specified.

2. The combination, with cam-bar, having a hole and groove leading therefrom, the needle-bar, and the thread-tube, of a pivoted link, provided with a stud, substantially as described.



3. The combination of screws *a f*, tubes *b d*, held together by screws *f*, and the elastic washers *f f*, with the plate A, as shown and described, for the purpose specified.

4. The tumbler F, having the take-up-actuating cam O arranged on the lower end, substantially in the manner described.

5. The take-up slide J, in combination with the cam O on the tumbler F, substantially as specified.

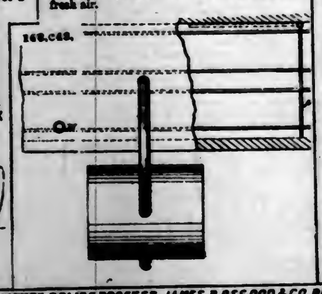
162,640. LATHE-DOGS. Calvin B. Davis, Canandaigua, N. Y. [Filed May 1, 1875.]

Brief.—A series of concentric rings, provided with tubular spurs, are made to slip upon and revolve with the driving-shaft of a wood-lathe or veneer-cutting machine.

In a lathe-dog, the concentric and detachable spurred rings *f*, adapted to be locked against rotation independently of each other, and of a central spurred disk, substantially as specified.

162,641. SPRING TRACE-CARRIERS AND BACK-LOOPS. William Davis, Petaluma, Cal. [Filed Jan. 18, 1875.]

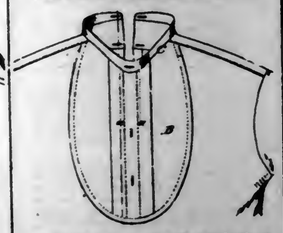
As a new article of manufacture, a compound pad-stiffener and trace-carrier, consisting of the back-iron C, having a top loop, A, and a trace-loop on each side, as shown and described.



162,642. PIPE-WRENCHES. Geo. D. Dean, Newark, N. J. [Filed Apr. 5, 1875.]

Brief.—The fulcrum is formed of a double eccentric arranged upon a fixed axis.

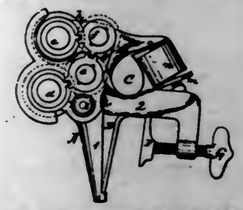
In a pipe-tongs, constructed as herein before described, the combination of the eccentrics A, bolt B, provided with the nut D, washer E, pawl *e*, and spring *e*, with the shanks C, the several parts being arranged to operate substantially as and for the purpose set forth.



162,643. VENTILATION OF RAILWAY-TUNNELS, &c. Joseph Dixon, New York, N. Y. [Filed Apr. 24, 1875.]

Brief.—To deal with a less body of air, the tunnels are divided into sections of a mile or so. Midway of these are placed fan-blowers, connected by suitable pipes extending right and left into the tunnel at any desired elevation. Partitions occupying the entire space crosswise of the tunnel are formed by pivoted or folding doors. The exhausted air escapes by a pipe leading from the blower to the surface of the ground, while other pipes supply fresh air.

The combination of one or more partitioning-doors and a blowing apparatus with the tunnel, substantially as herein shown and described.



162,644. SHIRTS. John C. Dunham, Buffalo, N. Y. [Filed Apr. 17, 1875.]

A shirt-body having front B united only at the top with collar-band, and down the center to point *a a*, leaving its outer edge entirely free to yield to the movements of the wearer, substantially as and for the purpose specified.

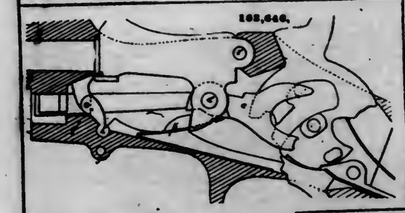
162,645. WRINGING-MACHINES. Chas. A. Eisenhart and Edmd. B. Louer, York, Pa. [Filed Sept. 23, 1874.]

Brief.—The rollers are operated by four gear-wheels, two of which are in fixed bearings, and two yielding and connected to the others by links. The frames are connected by flanged ears and gudgeons. The clamping-jaws are held in place by flanges and tongues. The upper roll is adjusted by a spring and clamping-jaw, and all held to a tub by a screw-clamp.

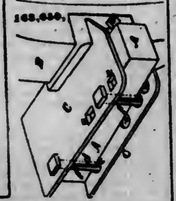
1. In a clothes-wringer, the fixed pinions *d a*, movable pinions *c f*, links *g h*, and rolls B D, in combination with the jointed castings A C, substantially as and for the purpose described.

2. In a clothes-wringer, the bearing C, constructed with flanged ears *e*, fitting over and embracing gudgeons *b* on casting A, as herein shown and described.

3. The clamp-jaws E, constructed with flanges *f* and tongue *f*, in combination with legs 1 and 2, substantially as shown and described.



4. The bearing C of the upper roll in combination with the clamp-jaw E and spring *n*, substantially as and for the purpose described.

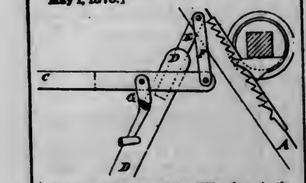


5. The combination, with the bearing C, spring *n*, and jaw E, of the plate F and adjusting-screw, substantially as and for the purpose described.

162,646. BREECH-LOADING FIRE-ARMS. W. H. Elliott, New York, N. Y. [Filed May 17, 1875.]

1. In a fire-arm, the breech-block of which is operated through the medium of a hammer and double pawl, the arrangement of the hammer on one side of the center of the receiver, to make room for the double pawl without widening the receiver, and so that it may have the most direct action, substantially as set forth.

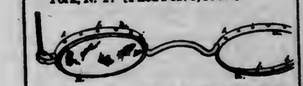
2. The combination of a retractor-spring, *i*, and retractor, when said spring is arranged between the retractor and the operating-shoulder, and a breech-block, which operates as a retainer of the shell after it has been started by the positive movements of the retractor, the combination and operation being substantially as described.



3. The hammer, provided with a cam, in combination with the double pawl *e*, provided with shoulder *e'*, whereby the breech-block is raised so as to conceal the point of the retractor, as herein set forth.

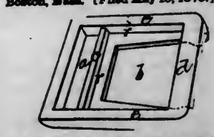
4. The combination, with the double pawl, having the spring-bearing surfaces, as described, of a fixed spring, adapted to operate upon opposite sides of its center of movement, and to hold the breech-block in its several positions, as well as to operate the double pawl, substantially as herein specified.

5. In a breech-loading fire-arm, the front surface of whose breech-block has a movement substantially at right angles with the axis of the bore, a cartridge-retractor, having a body with a thin upper edge, which serves as a partition to prevent the entrance of sand to the lock or limb work, substantially as herein set forth.



6. The breech-block, provided with projections *c* to fill the retractor, cut in the rear end of the barrel, for the purpose of affording a complete annular support for the head of the cartridge, and of forming a stop for the upward movement of the breech-block, as herein described.

162,647. LIFTING-JACKS. John B. Fayette and Lorenzo Meeker, Oswego, N.Y. [Filed May 1, 1875.]



The combination of the lifting-bar A, the brace-bar B, the lever C, the socket-plate D, the sliding bar E, the connecting-bars F, and the bracket G with each other, substantially as herein shown and described.

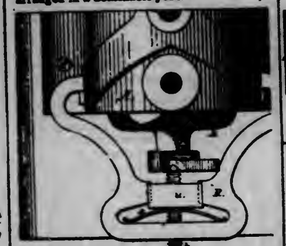
162,648. SPECTACLES. Joseph Gall, New York, N. Y. [Filed Feb. 5, 1875.]

The lens-frame *a*, provided with perforations 1 1, substantially as described.

162,649. BALE-TIES. J. M. Goldsmith, Boston, Mass. [Filed May 15, 1875.]

1. In a bale-tie, the plate A, having rectangular slot *a*, oblong slot *b*, with its lateral and end bars overhanging a recess, *r*, and lugs upon its under side, adapted for use substantially as specified.

2. The buckle-plate A, having slots *a b*, an overhanging ledge and lugs, in combination with the notched end of a strap-iron binder, substantially as specified.

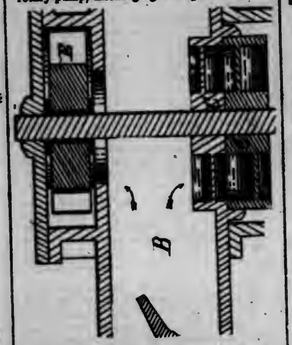


162,650. SHOES FOR WAGON-BRAKES. JNO. Grimsto, Milton, Cal. [Filed Mar. 17, 1875.]

Brief.—Box attached to shoe slips over brake-bar, and is fastened thereto by bolts fitting into grooves on the bar.

The combination of brake-bar A, having grooves *d*, three-sided box C having bolts *e e*, brake-shoe B, and bolts *f f*, substantially as and for the purpose set forth.

162,651. OSCILLATING VALVES FOR STEAM-ENGINES. Worcester Haddock, Pittsburg, Pa. [Filed Mar. 24, 1874.]



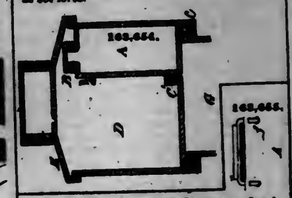
Brief.—Lateral wear of the conical valve is compensated for by a spring and set-screw arranged in a detachable yoke.

The case A and conform valve D, provided with openings, as shown, in combination with the detachable bridle R, screw *t*, nut *u*, and spring *s*, when arranged and operating substantially as herein shown and described.

162,652. WATER-MOTOR FIRE-PLUGS. W. W. Harding, Philadelphia, Pa. [Filed May 3, 1875.]

Brief.—The water in the inlet-pipe is controlled by a valve, and when admitted operates a turbine water-wheel, which drives a rotary pump, discharging through a nozzle.

The water-motor fire-plug herein described, consisting of an inlet-pipe, B, a motor, O, an outlet-pipe, D, and a pump, E, the force of the water on the motor acting on the pump to force a column of water through a nozzle, N, substantially as described.



162,653. BRAKES FOR HAY-WAGONS. WM. Harper, Senecaville, Ohio. [Filed Mar. 20, 1875.]

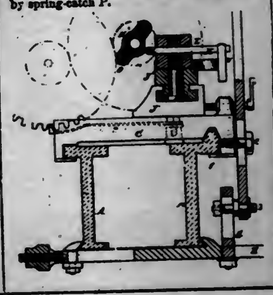
The curved pivoted lever T, in combination with the rear end of the wagon body, the cord U, the rods S O, crank-shaft P Q R, and sliding brake-bar *l*, whereby the weight of the longer lever-arm keeps the brakes ordinarily from the wheel, all substantially as set forth.

162,654. DINNER-BUCKETS. F. H. Hoenig, Louisville, Ky. [Filed Feb. 20, 1875.]

The within-described dinner-bucket, composed of the detachable portions A D O, secured together by the cover E and flanges O O', constructed and arranged substantially as set forth.

162,655. HAY-TROUGH HANGERS. Jacob F. Hess and Lenard Hess, Massillon, Ohio [Filed Mar. 23, 1875.]

The wire-clasp F, with hooks *f f*, in combination with the cross-bar C and trough A, substantially as and for the purpose specified.

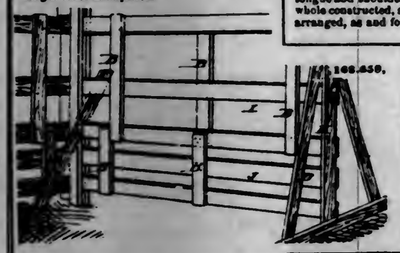


162,656. DEVICES FOR SWAGING BULLETS. William D. Hillis, Elgin, Ill. [Filed Feb. 27, 1875.]

In a device for forming a double-pointed bullet, the setting-die C, and the pinion-die B, each having an equal recess, *c*, in the shape of a conical or conoidal frustum in combination with a tubular block, A, substantially as specified.

162,657. PLANING ATTACHMENTS FOR METAL-TURNING LATHES. Axel Hoffmann, New York, N. Y. [Filed Mar. 1, 1875.]

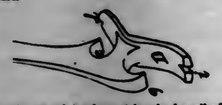
Brief.—An adjustable clamp for attaching to the bottom of the lathe-shears, slotted for the reception of a slotted bearing-post for the lever, which lever is for reciprocating the bed, and with it the cutting-tool, longitudinally with the lathe. The article to be operated upon is centered in the lathe, and held from turning by spring-catch P.



1. A removable planing attachment for turning-lathes, constructed substantially as described—that is, having a clamp, D, lever E, bed C, tool-holder bed J, spring N, and feed-spring P.

2. The arm G, in combination with the adjustable clamp D, lever E, bed C, and lathe-shears A, for the purposes described.

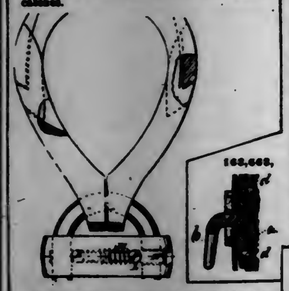
163,658. FARM-FENCES. David L. Hoffman and P. M. Shoemate Aullville, Mo. [Filed Mar. 6, 1875.]



Brief.—The panels are formed of detachable longitudinal sections, which are separated and attached end to end when a low and longer fence is required.

The combination of the detachable sections I and J and the posts supporting them, as shown and described, whereby the sections may be arranged one above the other, or end to end, as set forth.

163,659. STOVE IMPLEMENTS. L. S. Hoyt, Ridgefield, Conn. [Filed Mar. 20, 1875.]

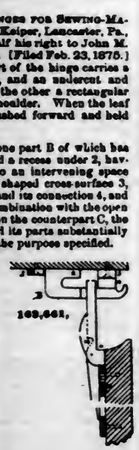


Brief.—A lid and cover-lifter and pot-handle.

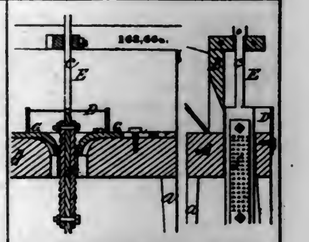
The improved implement herein described, consisting of the handle A, provided with the hooking-lip *a*, recess *c*, projections *d* and D, the latter having the notch *i* and the hook *f*, as a new article of manufacture.

163,660. MOUSING-HOOKS. N. B. Johnson and Samuel Adams, Chelsea, Mass. [Filed Apr. 17, 1875.]

Brief.—The two parts of a mousing-hook are kept closed by an adjustable slide, which is fastened on a link by means of spring-catches.



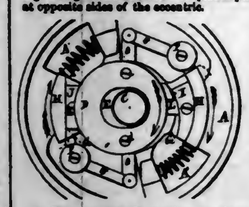
1. The combination of a mousing-hook, consisting of two parts, with a link and slide thereon, and operating substantially as shown and described.



2. The combination of a mousing-hook and a link, with an adjustable slide, which slide is fastened on the link by means of spring-catches J J, and grooves or channels in the link, as described.

163,661. TABLE-HINGES FOR SEWING-MACHINES. Henry B. Keiper, Lancaster, Pa., assignor of one-half his right to John M. Keiper, same place. [Filed Feb. 23, 1875.]

Brief.—The one part of the hinge carries a cross-lug and recess, and an undercut and projecting hook, and the other a rectangular opening and abrupt shoulder. When the leaf is raised it can be pushed forward and held upright.



A table-hinge, the one part B of which has a flat surface, 1 2, and a recess under 2, having open sides, as also an intervening space between 2 and the T-shaped cross-surface 3, the narrowed base 6, and its connection 4, and terminal hook 5, in combination with the open tongue and shoulder on the counterpart C, the whole constructed, and its parts substantially arranged, as and for the purpose specified.

163,662. GOVERNORS FOR STEAM-ENGINES. A. Kendall, Cleveland, Ohio. [Filed Nov. 20, 1874.]

Brief.—The eccentric is moved at right angles to the shaft by the governor-balls, acting through cams and inclined planes placed at opposite sides of the eccentric.

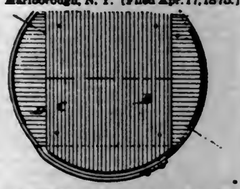
1. The eccentric D, having an elongated hole, E, therein, wings G G', inclined plane J, cam I, and shaft C, in the manner substantially as described, and for the purpose set forth.

2. The inclined plane J, and cam I, as arranged to operate in combination with the eccentric D, in the manner as and for the purpose set forth.

3. The combination of the eccentric D, keys L M, wings G G', inclined plane J, cam I, shaft C, links *e' e'*, balls P P, links Q Q, springs A', and wheel A, all arranged and combined to operate in the manner as set forth, and for the purpose specified.

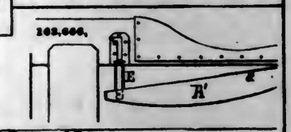
163,663. CARRIAGE-CURTAIN FASTENINGS. Chas. P. Ketterer, New York, N. Y. [Filed Apr. 2, 1875.]

Brief.—The curtain is secured at the top. The hook is turned up, put through the button-hole, and then turned down, which fastens the curtain.



As a fastening for carriage-curtains, the combination of plate *a*, screws *d*, and the bent-headed pin *b* that passes through a countersunk hole in said plate *a*, all substantially as set forth.

163,664. FEED-MILLS. O. B. Knapp, Brandon, Wis., assignor to himself and R. C. Kelly, same place. [Filed Mar. 27, 1875.]



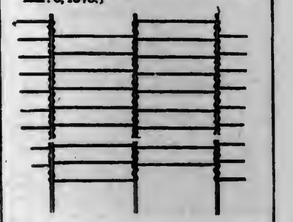
1. The combination of a reciprocating shaft, E, having detachable corrugated plates *f*, with the curved detachable and adjustable corrugated plates G, substantially as specified.

2. The combination, with a hopper, C, reciprocating grinding-shaft E, and plates G, of a supplementary feeding-box, D, constructed and arranged substantially as specified.

163,665. BERRY-CUPS. Dewitt W. Kniffin, Marlborough, N. Y. [Filed Apr. 17, 1875.]

A berry-cup made of wood-veneering, having a bottom of two thicknesses fastened together with the grain of the wood at right angles, one part having tenons which pass through slots in the body, and hold the bottom to the body, substantially in the manner shown and described.

163,666. APPARATUS FOR SHAPING PANTALOONS. John Kraft, Newark, N. J. [Filed Jan. 30, 1875.]



1. The arms A and A', in combination with the locking device E and spring *a'*, substantially as and for the purposes set forth.

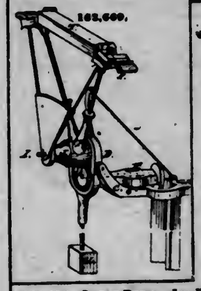
2. The irons F, in combination with the curved arm A, formed and adapted to operate in conjunction therewith, substantially as and for the purposes specified.

163,667. MANUFACTURE OF HARD SUGAR. Eugen Langen, Cologne, Germany, assignor to F. O. Matthiessen and Wiechor's Sugar-Refining Company, Jersey City, N. J. [Filed Mar. 17, 1875.]

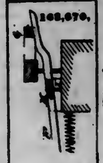
The improved process of converting granular sugar into hard or loaf sugar herein described, which consists in subjecting granular sugar, when mechanically mixed with a strong sugar solution, to heat, for the purpose of superficially dissolving the sugar-crystals, and then cooling and hardening the mass in molds, in the ordinary manner.

163,668. FLY-NETS. Luther B. Lee and George W. Lee, Ridgewood, N. Y. [Filed Mar. 6, 1875.]

As an article of manufacture, a cord for the cross-bars or strands of fly-nets, stitched as and for the purpose specified.



163,669. WINDMILLS. Isaac Lahmer, Greenfield, Ind. [Filed Mar. 24, 1875.]



Brief.—Consists in devices for securing the cross-bars which form the outer frame of the wheel to the radial arms, and to the rods to which the disk of the wheel is fastened; also, in the method of pivoting the wind-wheel below the central hub from which the arms diverge, so that with a weight attached to the lower end of an oblong head piece, into which one of the cog-wheels is secured, a proper equipoise may be maintained.

1. The combination, with a wind-wheel of the character described, of the bevel-wheels G and H, and for the purpose set forth.

2. The devices N E Q for securing the outer ends of the rods L and arms O to the transverse bar T, as described.

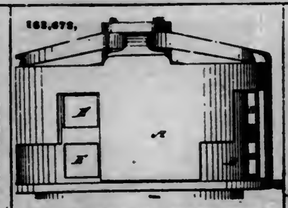
3. The combination of the wind-wheel with the shafts S and I, bevel-wheels G H, and oval head-piece D, for the uses and purposes expressed.

163,670. LATHE-RESTS. Jas. R. F. Leland, Baltimore, Md. [Filed Dec. 19, 1874.]

Brief.—The device acts in such a manner as to prevent vibration in articles of irregular form during the process of turning.

The self-adjusting spring-rest F, having pin G and slot H, combined with a lathe-bed having stud I and a cutting-tool, as and for the purpose specified.

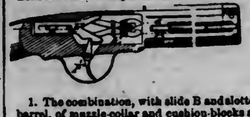
163,671. LOOM SHUTTLE-BINDERS. Amos Mallory, Mystic Bridge, Conn. [Filed Oct. 7, 1874.]



Brief.—The ordinary shuttle-box swell is dispensed with, and the binder is so constructed as to act as check, relief, and swell, the picker-stick bearing upon the outer end to bring the binder firmly against the side of the shuttle.

The lever C having the inclined surface *b*, and rounded surface *a*, and its inner end provided with the extension *d* and lug *e*, substantially as and for the purposes herein set forth.

163,672. WATER-WHEELS. Isaac Mallory, Dryden, N. Y. [Filed Mar. 13, 1875.]

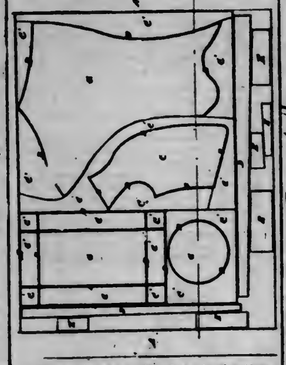


Brief.—The gate is made with openings on opposite sides and opposite each other. These are so arranged in regard to the chute-openings that the water may be entirely shut off; or two or more of the chute-openings may be uncovered, or one or more for each of the two openings in the gate. The water may be admitted to only the lower tier of buckets in the wheel, through two or four openings; or, by moving the gate farther, two or four chute-openings are uncovered for the upper tier of buckets, so that water may be admitted through two, four, six, or eight openings successively, according to the amount of power required.

In combination with a turbine wheel, C, having two sets or tiers of buckets, arranged one above the other, and a chute-curb, B, having two tiers of chutes, E, the revolving gate A, provided with a series of openings, J J and K K, all constructed and relatively arranged as herein shown and described.

163,673. TOY GUNS. William H. Martin, Mobile, Ala. [Filed Mar. 20, 1875.]

Brief.—Pressure upon the trigger urges a fork-piece forward, compressing toward each other the tails of the pivoted, spring-jaws E, thus opening the jaws and freeing the arrow-headed hook, to impel the missile in its front.



1. The combination, with slide B and slotted barrel, of muzzle-collar and cushion-blocks arranged on a toy gun, as and for the purpose described.

2. The combination, with the barrel and stock, of arrow-head slide B B' and spring-jaws E, as and for the purpose set forth.

3. The combination, with spring-jaws E, having divergent rear arms, of the trigger-operated slide F, constructed and arranged as and for the purpose described.

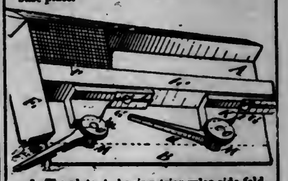
163,674. APPARATUS FOR CUTTING OUT GARMENTS. Kenneth McKenzie, Hamilton, Canada. [Filed Oct. 24, 1874.]

The combination, with chase A, of cutters B, pattern-blocks C, interfilling blocks C', foot-sticks D, and quoins E, as and for the purpose specified.

163,675. SLIDING GATES. J. P. McMurray, Oregon, Mo. [Filed Oct. 24, 1874.]

Brief.—A crane-like arrangement, by which a sliding gate may be elevated and depressed. When partially withdrawn it may be revolved as upon an axis.

The apertured plate T, pulley S, cord R, and post-pin V, in combination with bracket B F and rod E, as shown and described, to support the gate at different elevations.



163,676. PROCESSES OF RENDERING ARTIFICIAL STONE IMPERVIOUS TO MOISTURE, AND PREVENTING EFFLORESCENCE THEREON. Wm. McMurtrie and Benj. Chambers, Jr., Washington, D. C. [Filed May 12, 1875.]

1. The process, substantially as described, of rendering artificial stone impervious to moisture, and preventing efflorescences thereon by mixing with the ordinary constituents of the stone in the process of manufacture the soluble, earthy, or metallic sulphates, singly or together, in the form of a powder, and then a solution of the fatty acids.

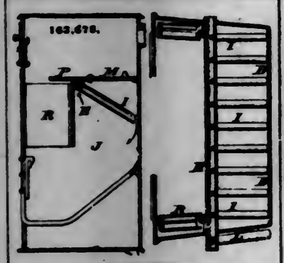
2. The process, substantially as described, of rendering artificial stone impervious to moisture, and preventing efflorescences thereon by adding to the surface of such stone after manufacture, or already in use, a solution of the earthy or metallic sulphates, and then a solution of the fatty acids.

163,677. PRINTERS' GALLEYS. Henry H. McWilliams, Sacramento, Cal. [Filed Mar. 20, 1875.]

Brief.—The side and end ledges of the galley are formed by folding over the edges of the base-plate, and soldering the first fold to the base, so that the second fold shall be at right angles thereto. A second plate having a single square ledge, similarly formed, is slotted to fit over studs in the base-plate. The studs carry eccentric-headed levers, which, acting against sliding projections on the ledge, lock the type between it and the ledge on the base-plate.

1. The plate A, having triangular side fold C and end fold E, combined with a slotted plate, B, having quadrangular fold F on the inner side, and adjustable transversely, as and for the purpose specified.

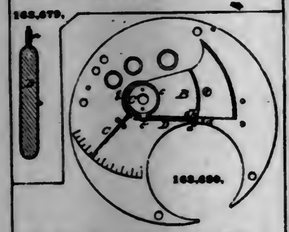
2. The slotted slides G G and eccentrics M M, in combination with the movable plate B and bar F, for the purpose described.



163,678. FIRE-PLACES. John F. Merrill, Cincinnati, Ohio. [Filed Apr. 10, 1875.]

Brief.—The stove may be used as either an open or magazine stove.

2. The combination of swinging tubular front H I and open-front stove or fire-place, forming the magazine J, as and for the purpose set forth.



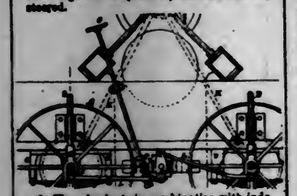
3. In combination with the grated front H I of magazine J, the folding doors R.

4. The combination, in an open stove or fire-place, of the auxiliary grate H I, forming the magazine J, the hinged doors R, and cover M, as set forth.

163,678. WINDOW-BLINDS. S. W. Merrill, Maynard, Mass. [Filed Apr. 14, 1875.]

The encompassing band A and eyelet *e*, arranged together and combined with the blind-slat D and its connection-bar B, substantially as specified.

163,679. WATCH-REGULATORS. John A. Miller, Paducah, Ky. [Filed Feb. 2, 1875.]



Brief.—A watch-regulator in which the screw operating the regulator-arm is attached to the side of the bridge, and connected by a screw-nut with the collar of the regulating-arm.

1. The screw-shaft D, secured to the balance-bridge B, turning in a bearing in plate *d'*, and working in nut *e* on collar *c*, substantially as and for the purpose described.

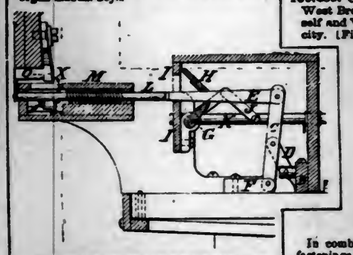
2. The combination of the screw-shaft D on balance-bridge B, and working on nut *e* on yoke *a*, and the pointer-arm C, having the slotted end *a*, with the hair-spring *c*, substantially as and for the purposes described.

163,680. TRACTION-ENGINES. William H. Milliken, Sacramento, Cal. [Filed Apr. 10, 1875.]

Brief.—Parts adapted to pass without straining over inequalities, and to be readily steered.

1. The wheels A, in combination with independent axles B, yoke D, pivots, and body, substantially as set forth.

2. The independent axles, in combination with jointed sections of the main axle, middle sections of the same, body provided with fixed bearings for the same, and the driving-wheel carried thereby, substantially as set forth.



3. The combination of the wheels, independent axles, horizontally-oscillating yoke D, and rock-shaft N, substantially as and for the purpose set forth.

4. The combination of equalizing-beam Q and springs S with the body and the horizontally-oscillating independent wheels, substantially as set forth.

5. The combination of pivoted yokes D with the body, each having vertical movements relatively to the other, substantially as set forth.

163,682. REED-ORGAN ATTACHMENTS. H. R. Moore, Erie, Pa. [Filed Nov. 14, 1873.]

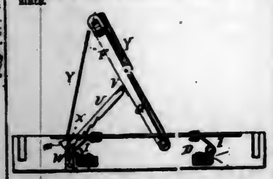
Brief.—Vibrating tongues are arranged vertically upon a sound-board, and are sounded by an improved action operated by the usual organ manual-keys.

1. The picker-action herein described, consisting essentially of the rod L, with its coiled spring and the picker X, in combination with the slot N, bar P, and spring R, substantially as specified.

2. In combination with the subject-matter of the preceding claim, (of claim 1,) the vibrators V and sounding-board T, substantially as described.

3. The stationary bar R, levers O D E, and block F of the key A, in combination with cam G, lever I, draw-rod K, and gravity-lever H, substantially as described.

4. In combination with the subject-matter of the preceding claim, (of claim 3,) the picker-action L M P R, substantially as and for the purpose set forth.



163,683. CLAMPS FOR GRINDING WATCH-CRYSTALS. Arthur C. Norton, Monona, Iowa. [Filed Mar. 20, 1875.]

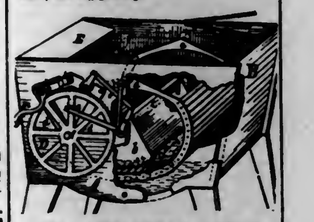
The revolving elastic-faced disks A and B on independent axles C, in combination with jointed clamping-arms D E and a clamp-screw, G, substantially as specified.

163,684. INVALID-BED BOTTOMS. Harrison Ogborn, Richmond, Ind., and T. T. Kendrick, New York, N. Y. [Filed Apr. 15, 1875.]

Brief.—The staples guide the ratchet-bars in their movement over the detent-blocks, and the triangular blocks on the lower ends of the ratchet-bars prevent them from passing entirely through the staples when the head-rest is lifted. The ratchet-bars are released and the head rest lowered by means of the cords. The cords attached to the slats and to the upper cross-bar of the head-rest form a support for the back when the head-rest is elevated, and also form an intermediate support for the slats.

1. The ratchet-bars U U, hinged at their upper ends to the side pieces F F, and having at their lower ends the triangular blocks *a a*, in combination with the detent-blocks W W, beveled at their upper ends, the staples X X, and the cord Y, one end of said staple being set into the block W, while the other end embraces the ratchet-bar U, and passes into the side rail, all as shown, and for the purposes set forth.

2. The series of cords Q, connected at their lower ends to the series of slats S, and at their upper ends to the cross-bar O of the head-rest, substantially as and for the purposes set forth.

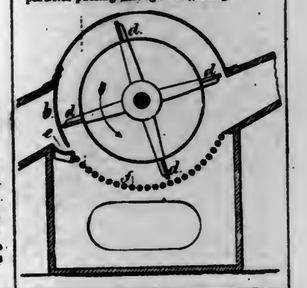


163,685. CORSETS. Chauncey L. Olmstead, West Brookfield, Mass., assignor to himself and Waterman & Mayer, New York city. [Filed Apr. 6, 1875.]

In combination with a corset, the hoop *b*, fastenings *c d*, spring-braces *e a*, and pockets *l*, all constructed and arranged to operate substantially as and for the purposes set forth.

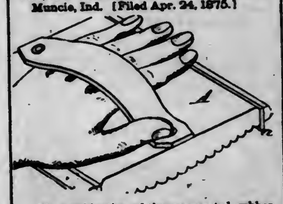
163,686. WASHING-MACHINES. Ruben G. Orwig, Des Moines, Iowa. [Filed Feb. 12, 1874.]

Brief.—Two reciprocating rubbers moving in opposite directions by means of levers, links, and cog-gearing.



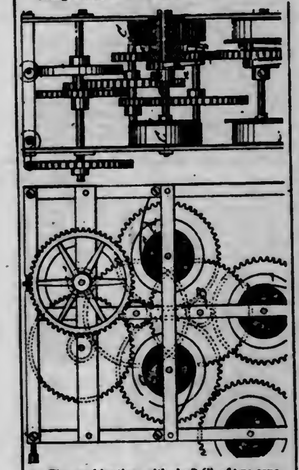
1. In a washing-machine, the moving carrier and wash-board *a a*, and the oscillating pressing and rubbing device *b b* on the rock-shaft *c*, when arranged and suspended relative to each other in the tub A, substantially as and for the special purposes shown and described.

2. The combination of the driving-wheel D, pitman *e*, crank *c*, carrier and wash-board *a a*, pinion and crank *g*, pitman *o*, crank *n*, shaft *c*, and rubbing and pressing device *b b*, substantially as and for the purposes shown and described.



163,687. MACHINES FOR MIXING WOOL. S. R. Parkhurst, Mount Clair, N. J., assignor to Emily R. Parkhurst, same place. [Filed Feb. 18, 1875.]

Brief.—The fibers of different-colored wool, blown from a picker, accumulate against the fingers and project between them, and, being struck by the beaters, are carried down, matted together, and removed off the ends of the fingers and over the grating, and thus thoroughly mixed together, the dirt and foreign particles passing through the grating.



The rangs of fingers *b* at the end of the trunk *a*, in combination with the revolving beaters *d* and grate *f*, substantially as set forth.

163,688. HAND-RUBBERS. R. I. Patterson, Muncie, Ind. [Filed Apr. 24, 1875.]

The combination of the corrugated rubber A and the rubber pieces *a a* at the ends thereof, substantially as described.

163,689. MOTORS. Jacob G. Peterson, Morganton, N. C. [Filed Mar. 13, 1875.]

The combination, with shaft C, of two separate springs, one coiled directly on it, and the other on a circumjacent sleeve, as and for the purpose specified.

163,690. WINDOW-BLINDS. Johann Peyer, Wahring, (near Vienna,) Austria, assignor to Jos. R. Von Wesseley, New York, N. Y. [Filed Aug. 6, 1874.]

Brief.—The gudgeons are made separate from the slats, and are attached by a metallic clasp and screw. They are, furthermore, furnished with two eccentric pins, which pass through curved slots in the metal face-plate of the frame, and there connect with rods which are attached to all the slats similarly, and cause them to move in unison.

1. In a Venetian blind or shutter, the slat A, provided with the pin *d* eccentric to the gudgeon *c*, in combination with the fillet *b*, having curved slot *e*, and rod C, substantially as and for the purpose hereinbefore described and set forth.

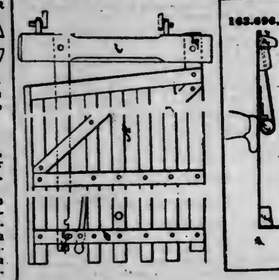
2. The clamp D, made with the pins *a d*, disk *m*, jaws *i l*, and screw *n*, the screw having its outer part larger than the inner, substantially as herein shown and described.

163,691. HEDDLE-FRAMES. Edwin S. Pike, Worcester, Mass., assignor to Geo. Crompton, same place. [Filed Apr. 24, 1875.]

1. A heddle-bar locking device adapted to be secured, substantially as described, to the heddle-bar, to hold it in position.

2. The combination with the heddle-frame, and its bars of heddle-bar locking devices applied only to the heddle-bars, and removable therefrom, substantially as described.

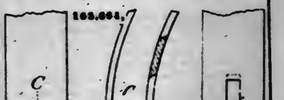
163,692. FENCE-POSTS. Eugene Powell, Delaware, Ohio. [Filed Jan. 25, 1875.]



1. The combination of the sheet-metal post A, having a widened base or stool portion formed in one piece therewith, and the stool C, extending longitudinally, or in the direction of the fence, and made separate from the post, substantially as herein described.

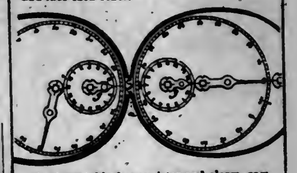
2. The combination of the post A, brace-rods B, stool C, and sleeves or rings E, substantially as set forth.

163,693. FARM-GATES. W. H. Pratt, Prattville, Mich. [Filed Feb. 5, 1875.]



Brief.—The rear end of the bar, which passes longitudinally between the rails of the gate, is pivoted to the swinging upright. Its front end extends between other uprights, and is provided with hooked notches, which engage with a pin through the uprights when the gate is to be supported off the ground.

The end notched and pivoted latch-bar F, combined with pivoted gate A and hinged post C, as and for the purpose specified.



163,694. MAINSPRINGS FOR WATCHES. C. W. Rice and Asa L. Burbank, Worcester, Mass. [Filed Nov. 25, 1874.]

The mainspring, having its outer turn or coil constructed with a hook, C, and a catch E, or their equivalents, so as to form a clasp or guard restraining and holding the spring when nearly run down, and allowing it to turn backward in the barrel without damage, substantially in the manner and for the purpose above set forth.

163,695. FARE-REGISTERS. J. A. Rummig, New York, and Christoph J. Uderitz, Williamsburg, N. Y. [Filed Feb. 20, 1875.]

Brief.—A portable fare-register composed of two half-shells, and each containing a fixed dial-plate, rotary pointer, fixed gong, and projecting lever, for actuating the pointer and clapper to the gong, the two gongs being of different pitch, and the instrument when closed, the faces of the dials being concealed, and faces each other.

1. A portable fare-register and alarm, composed of two half-shells, *b* and *d*, one of said half-shells containing a fixed dial-plate and rotary pointer, a fixed gong, and a projecting lever, B, for actuating the pointer and the clapper of the gong, the other half-shell also containing a fixed dial-plate and rotary pointer, a fixed gong, and a projecting lever, B, for actuating the pointer and the clapper of the gong, the two gongs being of different pitch, all arranged so that when the instrument is closed the two dial-plates will be concealed and face each other, substantially as and for the purpose herein shown and described.

2. The combination of the pawls *m o*, carrying the pins *s t*, with the slide D and eccentric *u*, substantially as and for the purpose herein shown and described.

163,696. TOYS. Jas. B. Safford, Buffalo, N. Y., assignor of one-half his right to T. A. Jebb, same place. [Filed Feb. 20, 1875.]

Brief.—A spring is attached underneath the toy figure, and by its snap gives the figure a somersault. The snap is delayed by a friction-lug. An improvement upon the skip-jack.

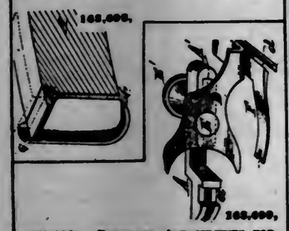
1. The combination, with the actuating spring placed on the under side of the toy, of a frictional stop, arranged substantially as described, to permit the spring to release itself, as set forth.

2. The combination, with the base of a toy, of the springs C C, arms *d d*, bar *S*, and a suitable stop, substantially as and for the purpose hereinbefore set forth.

3. The combination, with the springs C C, arms *d d*, and bar *S*, of one or more frictional stop-blocks, B, substantially as and for the purpose hereinbefore set forth.

163,697. ILLUMINATING-SIGNS. C. H. Seawell, St. Louis, Mo. [Filed Aug. 1, 1874.]

A
A
A



1. As a new article of manufacture, the metallic plate or sign-board A, having letters B painted thereon, and backed by a semi-transparent glass plate, C, said letters having perforations or drill-holes b to indicate or produce their outline at night, in combination with one or more illuminating-burners, as herein described.

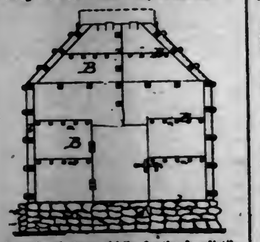
2. In combination with a lantern, A, having the letters painted thereon, and perforations to indicate the outlines of said letters, the semi-transparent glass plate C and one or more illuminating-burners, E, as set forth.

168,698. FELLY-PLATES. James Y. Sitton, Due West, S. C. [Filed Apr. 5, 1875.]

The clip C, provided with the vertical parallel side ears or flanges G G, as and for the purpose specified.

168,698.

168,699.



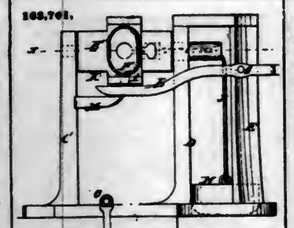
168,699. RUFFLING ATTACHMENTS FOR SEWING-MACHINES. John D. Rowbrige, Indianapolis, Ind. [Filed Nov. 11, 1874.]

Brief.—The ruffling-blade and the lever-arms that engage the needle-bar are made in one piece. The bracket by which the ruffler is held to the head of the machine is slotted, and the fulcrum of the blade-piece adjustable in the slot to vary the length of ruffle.

The combination of the slotted bar A A', horizontally-adjustable fulcrum-pin E, and the ruffler compound of lever D *d S*, and finger F, constituting a single unchanging piece, all substantially as and for the purpose specified.

168,700. CHARCOAL-KILNS. W. Sparrow, Hancock, Mass. [Filed Oct. 30, 1874.]

Brief.—Designed for use where soft coil for covering the wood is not easily obtainable.



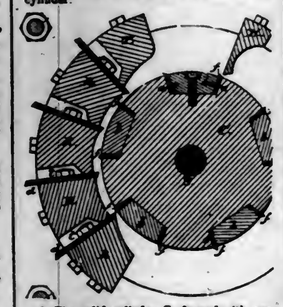
A sectional charcoal-kiln for the dry distillation of wood, composed entirely of thin metal sheets, which are formed into sections B B, and adapted to be placed on, and combined with a perforated foundation, C, of stone, substantially as specified.

168,701. ROW-GUARDS FOR PLOWS. Wm. Edwin Stanley, Montezuma, Ga. [Filed Feb. 27, 1875.]

Brief.—Pivoted in uprights upon the plow-beam is a hollow shaft for the reception of a reversible marking-rod. The journal on which the marking-shaft is secured is hollow for the passage of a cord that extends downward, and to the lower end of which is attached a weight (moving in guides) for retracting the shaft to its normal position, should it meet an obstruction. By a pivoted two-pronged lever the shaft is turned from side to side.

1. The marker-socket F, pivoted to its supporting-shaft E', and having a weighted cord connected to it, substantially as specified.

168,701.



2. The marker-socket F, connected to a reversing-shaft, E', having a reversing and supporting fork, L, combined with it, in the manner described.

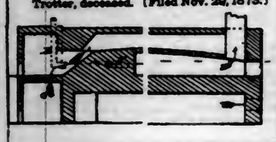
3. The combination of the notched hollow reversing shaft E', pivoted marking-socket F, and weighted cord J, substantially as specified.

4. The combination of the guide-posts D with the supporting-posts D, reversing shaft E, marking-socket F, and fork L, substantially as herein described.

168,702. COTTON-SEED HULLERS. Ferdinand Streuby, New Orleans, La. [Filed July 21, 1874.]

Brief.—Mode of securing the knives to the cylinder.

1. The solid cylinder C, formed with segmental recesses in its periphery, into which fit the removable segments *b*, to secure the knives *f*, as described.



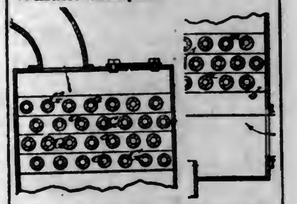
2. The tongue *c*, in combination with the solid segment and grooved knife *f*, as specified.

168,703. COAL-SHOVELS. James D. Tallmadge, Chicago, Ill. [Filed Mar. 1, 1875.]

The combination, in a coal-shovel, of four wires doubled and bent into eight tines with protruding shanks, and the ferrule by which they are held together, all substantially as set forth.

168,704. PROCESSES OF MAKING WHITE OXIDE OF ZINC. Chas. W. Trotter, Brooklyn, N. Y., administrator of Jonathan G. Trotter, deceased. [Filed Nov. 29, 1873.]

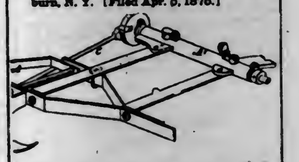
The method or process of working the ores of zinc or galvaniser's dross when mixed with coal by the auxiliaries of free hydrogen and oxygen gases, generated in the reducing-chamber or oxidising-chamber, by the decomposition of different currents of steam projected into and upon the ignited charges of ore and coal on the bed of the oven, substantially as and for the purposes set forth.



168,705. TILTING CHAIRS. J. M. Waters, Cincinnati, Ohio. [Filed Sept. 9, 1874.]

In a tilting chair provided with a suitable frame, E G G, and stop-arm D, the spring B, attached rigidly at one end at or near the swivel-bolt, projecting thence forward toward the front of the chair, then bent back upon itself, and having its other end so secured by the seat or abutment H upon the rear of the chair-seat A as to secure the compression of the spring when the chair is tilted back.

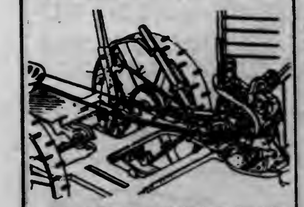
168,706. GAS-PURIFIERS. George H. Wells, Nashville, Tenn. [Filed Apr. 24, 1875.]



Brief.—The rods are of bamboo or other cane. The grids set one over another within the case, and the rods of adjacent grids are in different vertical planes.

1. A gas-scrubber, composed of cane rods or other similar material, substantially for the purpose herein described.

2. In a gas-purifier, a series of sectional grids, composed of cane rods or other similar material, substantially as and for the purpose set forth.

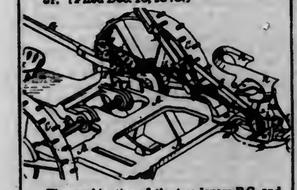


168,707. JOURNAL-BEARINGS AND PITMAN-CONNECTIONS. Cyrenus Wheeler, Jr., Auburn, N. Y. [Filed Apr. 5, 1875.]

1. The combination of the tubular frame A', shaft *h*, and crank-wheel D, bushings *a a*, and oil-holes and covers 1 2, as and for the purpose described and represented.

2. The combination of the crank-wheel D, pitman C, and the pitman-connection, composed of the slotted cap *g*, ball 6, and its trunnions *e e*, and the hollow screw *i*, as and for the purpose described and represented.

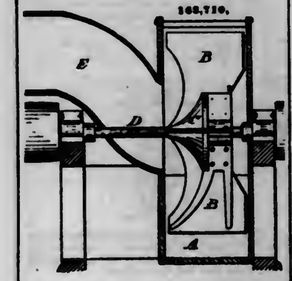
168,708. HARVESTER-RAKES. Cyrenus Wheeler, Jr., Auburn, N. Y. [Filed Dec. 16, 1873.]



1. In combination with the lever C and its bell-crank *a*, the connecting-rods *b d*, the former attached to the track of the rake-stand, or to a rigid piece connected thereto, and the latter attached to the rear end of the main frame, or a projection thereon, for the purpose of lifting and tilting the cutting apparatus at one and the same operation, substantially as described.

2. The chain-guide *j*, with a free entrance for the chain at its front, and an opening at the other end, where the chain passes onto the rake-driving wheel, said opening corresponding in form to a cross-section of the chain, for the purpose of arranging the links of said chain in proper order to take the projections or recesses in the drive-wheel, as described and represented.

3. In combination with the automatic tripping mechanism *s t u v*, for holding and releasing the switch *o*, the locking mechanism *w*, under the control of the driver, for the purpose of holding the switch in one position when desirable to do so, without regard to the automatic tripper, as and for the purpose described.

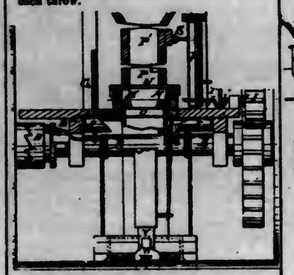


4. The cord *y*, when attached to the tripping mechanism *s*, in combination with the switch *o* and rollers *p* on the rake-arms, for the purpose of changing the rake-operating or shifting mechanism from automatic to one entirely under the control of the driver, as described.

168,709. MOWING-MACHINES. Cyrenus Wheeler, Jr., and Henry J. Case, Auburn, N. Y.; said Case assignor to said Wheeler, Jr. [Filed Dec. 16, 1873.]

The combination of the two levers E G, and crank-arm *g*, with the links connecting them with each other, and with the main frame and cutting apparatus, substantially as described, so that by the operation of the lever G the cutting apparatus may be raised and tilted at one and the same time.

168,710.



168,710. HELICAL-CONE SUCTION-FANS. Jas. White, Cleveland, Ohio. [Filed Mar. 6, 1875.]

Brief.—The hub of the fan-wheel is cone-shaped, with the apex toward the induction-pipe. The edges of the fans upon the same side of the machine are curved, also, to facilitate the passage of shavings, to discharge which is the purpose of the machine.

In a suction-fan, the combination of the cone C, curved edge wings B B, with the revolving shaft D and fan-case A, substantially as described.

168,711. POTATO AND SEED PLANTERS. W. H. Whitman, Scranton, Pa. [Filed Mar. 13, 1875.]

Brief.—The hopper is made in sections, the lower one being slotted to allow the slide to be reciprocated beneath. The edges of the sections are rounded off to allow the two upper sections to rock upon each other and upon the stationary section. Motion is imparted to the hopper by connecting-rods, one extending from the vertical pivoted shaft to the hopper, and the other from a crank-shaft that receives its motion by a cog-wheel gearing with a similar wheel on the axle of the bearing-wheel. The seed-slide is reciprocated by crank and a pitman, having a spring in its end, that causes it to stand still for a brief time at the end of each throw.

1. In a seed-planter, a hopper made in three parts, P P' P", the middle one forming a vibratory throat, as and for the purpose set forth.

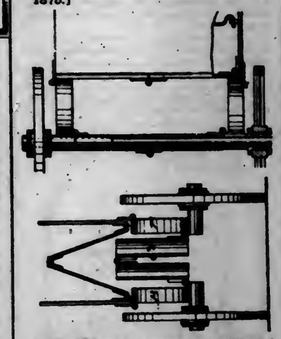
2. The combination, with the seed-slide and driving-crank, of an intermediate pitman, K, provided with springs *k'* that cause it to stand still for a brief time at the end of each throw, as and for the purpose specified.

3. The combination of the shaft R and its arms and connecting-rods S T, with the frame Q, the pivoted jointed hopper P, and the crank *f'* formed upon the shaft J, that gives motion to the pitman K, of the dropping-slide L, substantially as herein shown and described.

168,712. TRILL-COUPLINGS. S. J. Wiser, Bowmansville, N.Y. [Filed Apr. 20, 1875.]

1. In a thill-coupling, the combination, with a stationary jaw, E, of a movable jaw, F, and a journal-pin, T, substantially as and for the purpose set forth.

2. The combination, with the stationary jaws E and movable jaw F, of the spring K and the catch L, substantially as and for the purpose set forth.

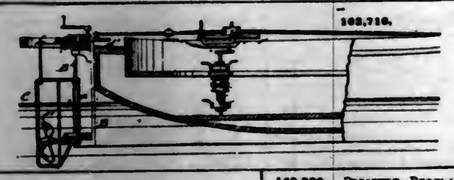


3. The combination, with the clip B, of the plate D, having the jaw E, lug H, and shaft E', with the catch L of the loose jaw F, projection F', and shaft F", journal-pin J, and spring K, as and for the purpose set forth.

168,714. BED-BOTTOMS. William Wood, Canton, Ohio. [Filed Mar. 20, 1875.]

In a bed-bottom the combination of the frame A, cross-bars *c*, springs *b*, slats *c*, end pieces *d*, springs *f g*, and slats *h*, substantially as shown and described.

168,715. CHILDREN'S CARRIAGES. William Wuers, New York, N. Y. [Filed Feb. 6, 1875.]



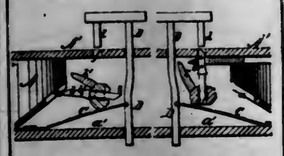
1. A child's carriage constructed of hinged sectional body and axles folding up symmetrically toward the central longitudinal axis, substantially as and for the purpose set forth.

2. In folding child's carriages, a body having centrally-hinged bottom sections, hinged sides, and detachable end parts, substantially as shown and described.

3. In folding child's carriages, the combination of the hollow exterior axle sections, hinged together and to the end sections, with an interior solid axle forming one strong axle, and admitting folding up on being withdrawn, substantially as specified.

168,716. STEERING-PROPELLERS. Wilhelm F. Eschs, Brooklyn, N. Y. [Filed Mar. 6, 1875.]

The combination of the rudder and screw-frame C, propelling-screw C', tube *a*, vertical driving-shaft B', driving-gearing *d d' d"*, guide-wheel *i*, arm *l*, rod *l'*, and steering-ropes *i i*, as and for the purpose set forth.

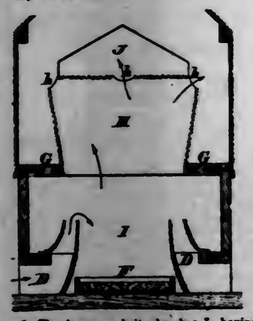


162,716.

162,717. FAUCET ATTACHMENTS FOR BARRELS. Albt. Zoller, Hoboken, N. J. [Filed Oct. 10, 1874.]

The key E, provided with the prongs *d*, thread *f*, and flange *e*, for opening and closing the valve C of a barrel, as specified.

162,718. CAR-COUPLINGS. Wm. H. Adams, Mount Gilead, Va. [Filed Apr. 23, 1875.]



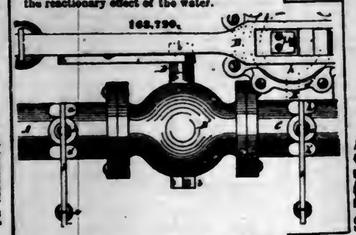
1. In an automatic coupling, the combination of draw-head A, having slot *e*, top-bolted case A' *e'*, rock-shaft having loose pin *b* and rigid wing *b'*, spring C, and a link-rod, substantially as set forth.

3. The combination of spring C, rod D, treadle E, and loose pin *b*, to drop the latter, all substantially as set forth.

3. The combination, with loose pin *b*, of a treadle, E, having the subjacent stud *d*, substantially as and for the purpose set forth.

4. The combination with a loose pin, *b*, of rock-shaft, spring, and cross-pin *b'*, to allow a car to detach itself when it runs off the track, all substantially as set forth.

162,719. FLY-TRAPS. Chas. Arendall and Wm. C. Runyan, Marathon, Ohio. [Filed Apr. 13, 1874.]



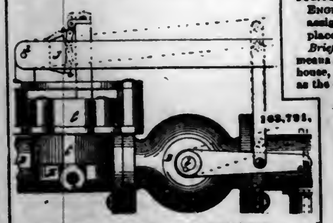
1. The lever or bait chamber I, having tubular entrances D D leading to the upwardly-projecting curved grooves or spouts E E, and the bait-tray F, in combination with the upper or light chamber K, the platform G, having apertures *g*, and the condensers H, having orifices *h*, as and for the purpose set forth.

2. A fly-trap, having longitudinal-ascending entrances, formed of wire-gauze, projecting at an angle into the cage, the lower sheet of gauze being stretched upon beveled blocks forming part of the base of the trap, as and for the purpose set forth.

162,720. PRESSURE-REGULATORS WITH SAFETY-VALVES. Phinehas Ball and Benaiah Fitts, Worcester, Mass., assignors to the Union Water-Meter Company, same place. [Filed Mar. 15, 1875.]

Brief.—A safety-valve is placed in the low service-main to relieve the regulator from the force of the reactionary blow of the "water-hammer" incident upon the closing of hydrant or other large valves, and a safety-valve in the high-pressure main gives vent to the excess of pressure upon the sudden closing of the governor-valve, and thus neutralizes the reactionary effect of the water.

162,720.



1. The combination of a pressure-regulator, governor-valve B, and safety-valve *c*, with a water-main, in which the safety-valve is applied to the low-service end C of the main, so as to operate in the manner substantially as and for the purposes set forth.

2. The combination of a pressure-regulator, governor-valve B, and safety-valve *d*, with a water-main, in which the safety-valve is independently attached to the high-service end A of the main, so as to operate in the manner substantially as and for the purposes set forth.

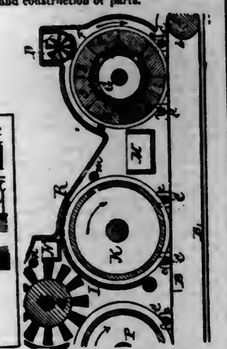
3. The combination of a water-main, governor-valve, and pressure-regulator, with a safety-valve, *d*, applied to the high-service end A, and a safety-valve, *c*, to the low-service end C, in the manner substantially as and for the purposes set forth.

162,721. PRESSURE-REGULATORS WITH DASH-POTS. Phinehas Ball and Benaiah Fitts, Worcester, Mass., assignors to the Union Water-Meter Company, same place. [Filed Mar. 15, 1875.]

Brief.—To secure a gradual and uniform motion of the regulator upon the governor-valve, a "dash-pot" is attached to the lever of the regulator.

162,721.

1. The combination of a pressure-regulator, C, and dash-pot K with a water-main and its governor-valve D, substantially as and for the purpose set forth.



2. The combination of a pressure-regulator, C, dash-pot K, and safety-valve *n*, with a water-main and its governor-valve D, safety-valve *n* being applied to the low-service end B of said main, substantially as and for the purpose set forth.

3. The combination of a pressure-regulator, governor-valve B, and safety-valve *n*, with a water-main and its governor valve, safety valve *n* being applied to the high service end A of said main, substantially as and for the purposes set forth.

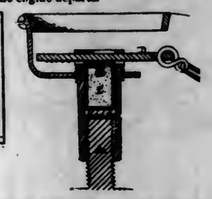
4. The combination of a pressure-regulator, dash-pot, and two safety-valves, *m* and *n*, with a water-main and its governor-valve, the whole being arranged in the manner and for the purposes substantially as set forth.

162,722. BRONZING-MACHINES. Willard J. Barber, Willimantic, Conn. [Filed Mar. 27, 1875.]

Brief.—Relates to the particular arrangement and construction of parts.

1. The combination, with the bronze-hopper D, constructed with a perforated bottom, of the perforated slide or slides F, substantially as and for the purpose described.

2. A revolving bronzing-roller having its surface composed of a series of movable bronzing-pads, to each of which a horizontal reciprocating motion is imparted during the revolution of the bronzing-roller, for the object specified.

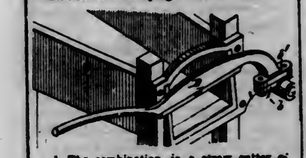


3. The bronzing-roller having the bronzing-pads attached to horizontal sliding plates H, in combination with cams I and J, for moving said plates, substantially as described, whereby the surface of the bronzing-roller has a reciprocating motion imparted to it in a direction parallel with its axis, for the object specified.

4. The combination of the cleaning-brush or roller K, the curved jacket L, partly surrounding the same, and the clearing-bar *n*, the whole being constructed and arranged substantially as and for the purpose described.

5. The combination of the cleaning-roller P, the revolving clearing-brush O, arranged above the same, the clearing-bar *n*, and the jacket R, inclosing the whole, all constructed and arranged substantially as herein shown and described.

162,723. FIRE-KINDLERS FOR STEAM FIRE-ENGINES. Frank Benedict, Detroit, Mich., assignor to himself and James Bittle, same place. [Filed Dec. 11, 1874.]

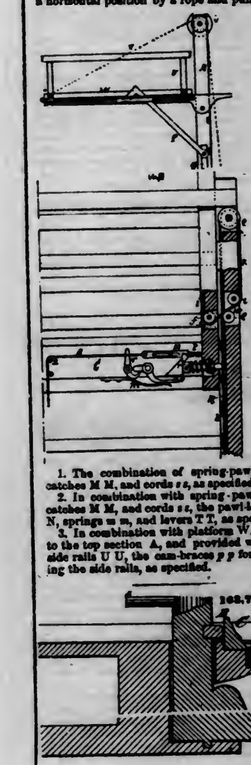


Brief.—The friction-plate is attached by means of a chain to the floor of the engine-house, to secure the withdrawal of the same as the engine departs.

The combination, with a fire-grate, of the match-tube, the friction-plate, and the screw, the same being adapted to receive and ignite a friction port-fire, as specified.

162,724. STRAW-CUTTERS. Benj. Belcher, Chicopee Falls, Mass., assignor of one-half his right to John W. Belcher, same place. [Filed May 6, 1875.]

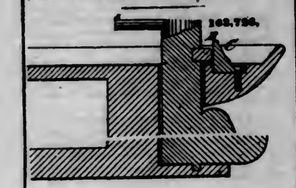
Brief.—The knife is adjustable with respect to the throat of the machine. The point of adjustment is independent of the pivot upon which the lever carrying the knife works.



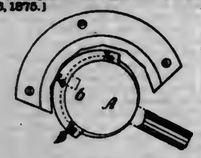
1. The combination, in a straw-cutter, of the stationary pivot and the knife, adjustably independent of the pivot, either at an angle or on a straight line, at a point away from said pivot with respect to the throat of the box, as set forth.

2. The combination, in a lever feed-cutter, of the stationary pivot *a*, sleeve C, with slotted flange *b*, and the lever D, with flange *b'*, connected to the flange *b* with screws, substantially as and for the purposes herein set forth.

162,725. EXTENSIBLE FIRE-LADDERS. Jos. M. Birchler, Chicago, Ill. [Filed Mar. 15, 1875.]



Brief.—Each section is provided with spring-catches, which engage in notches on the sides of the ladder. The sections are operated by ropes and pulleys. A platform is pivoted to the upper section, and is raised to a horizontal position by a rope and pulley.

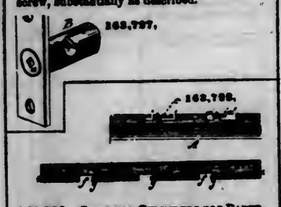


1. The combination of spring-pawls L L, catches M M, and cords *s s*, as specified.

2. In combination with spring-pawls L L, catches M M, and cords *s s*, the pawl-levers N N, springs *n n*, and levers T T, as specified.

3. In combination with platform W, hinged to the top section A, and provided with the side rails U U, the cam-braces *p p* for adjusting the side rails, as specified.

162,726. RUDDER-POST BEARINGS. Joseph N. Bitting, Jr., Camden, N. J. [Filed Mar. 26, 1875.]



1. The bearing B, made eccentric or wider at the middle than at the ends, substantially as shown and described.

2. In combination with a rudder post, A, an eccentric segment, B, and polygonal bearing, C, substantially as shown and described.

162,727. SASH-HOLDERS. W. B. Blackmer, Anconia, Conn. [Filed Apr. 20, 1875.]

Brief.—A suitable case attached to the window-frame carries an endless screw, which passes through and is combined with a transverse bolt, in such manner that the turning of the screw in one direction draws the bolt hard against the sash as a friction-holder, while turning it in the opposite direction releases the same.

The herein-described sash-lock, consisting of the screw C, supported in its case B, combined with the bolt E, projecting through a slot in the case, and worked by the said screw, substantially as described.

162,727.

162,728.

162,728. GRINDING-CYLINDERS FOR PAPER-PULP ENGINES. Chas. J. Bradbury, Lawrence, Mass., assignor to himself and Geo. W. Russell, same place. [Filed Apr. 26, 1875.]

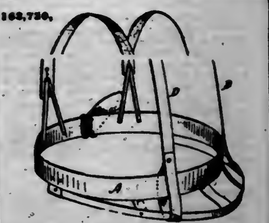
Brief.—Knives secured in cylinder by sliding bayonet-catch.

1. The blades C, formed with the notches *f* and shelves *g*, substantially as and for purposes stated.

2. The roll A, formed with the longitudinal grooves *a'*, annular grooves *a'*, and lips *a'*, substantially as and for purposes stated.

3. The combination, with the roll A, provided with longitudinal grooves, as described, of the blades C, entering said longitudinal grooves, and provided with shelves or projections which engage in the undercut grooves, as shown and set forth.

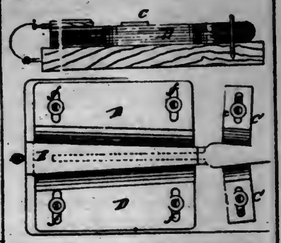
4. The combination of the roll A, removable blades C, and hoops *e e*, substantially as and for purposes stated.



162,729. TREATING WOOL, &c., TO FREE THEM FROM IMPURITIES. Otto Braun, Berlin, Prussia. [Filed Apr. 12, 1875.]

The process of treating wool, &c., to free them from impurities by first immersing them in water to remove impurities soluble in water, then displacing the water by an intermediate liquid capable of dissolving the impurities insoluble in water, and, finally, displacing the intermediate liquid by means of other, which will dissolve the impurities insoluble in alcohol and water, substantially as and for the purposes set forth.

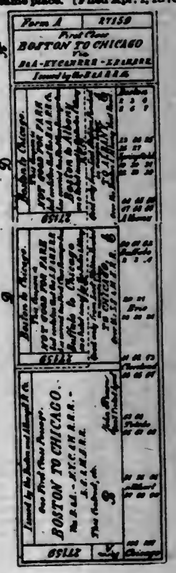
162,730. SKIRT-SUPPORTERS. M. P. Bray, Birmingham, Conn. [Filed Feb. 5, 1875.]



The herein-described skirt-supporter, consisting of the waistband A, supporting-spring B, and straps D D, attached to both the said spring and band, substantially as described, so as to support each independently of the other, as specified.

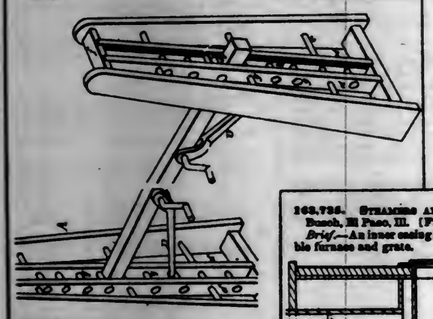
162,730.

162,731. APPARATUS FOR MOUNTING FANS. Gustav Brueck, New York, N. Y. [Filed May 7, 1875.]



Brief.—The leaves and folded covering of the fan are held in position while being joined together.

1. In an implement for mounting fans, the combination of leaf-guides C C and guides D D, for the folded covering of a fan, substantially as shown and described.

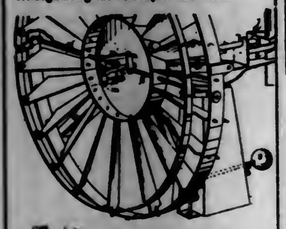


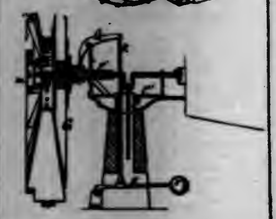
2. The combination of a follower, E, with the guides D D, for the folded covering, and with the leaf-guides C C, substantially as set forth.

162,732. TICKETS. Louis Brush, Buffalo, N. Y., assignor of one-half his right to T. A. Jebb, same place. [Filed Apr. 1, 1875.]

A passage-ticket extending over two or more lines of railroad, or divisions thereof, consisting of a contract-stub and passenger-strip, containing a continuous list of the stations on the entire route, permanently connected, and a series of coupons for the different roads or divisions, not good for fare, but forming a voucher for each road, or division, adapted to be detached from the other portions of the ticket by the conductor, while the passenger portions forms a continuous ticket and stop-over check, substantially as and for the purposes hereinbefore set forth.

163,732. SCAFFOLDS. Wm. Burge, Manmee, assignee of one-half his right to T. W. Ryan, South Toledo, Ohio. [Filed Apr. 24, 1875.]

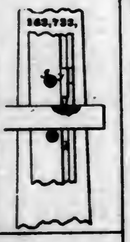




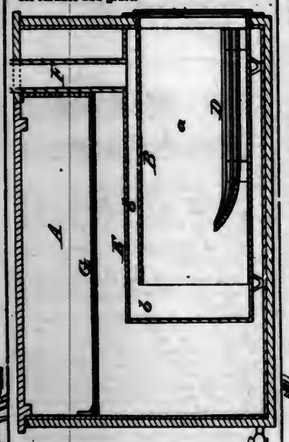
1. The frames A, constructed with central posts *d d'*, and removable bolts *g*, substantially as and for the purposes specified.

2. The combination of the slides *y*, having spurs *v*, and working in grooves *k*, with the removable braces D, substantially as and for the purposes specified.

163,734. WINDMILLS. Wm. T. Burrows, Nashua, Iowa, assignor of one-half his right to M. B. Ridgeway and M. Rosenbaum, same place. [Filed Nov. 6, 1874.]



Brief.—A wind-wheel provided with pivoted blades, a sliding hub or sleeve moving endwise bodily on the main shaft, and with crank-rods operated by said movement of the wheel, whereby the position of the blades is determined and regulated by the position of the wheel on its shaft, and thus, in turn, by the force or backward thrust of the wind thereon, for regulating the velocity of the wheel.

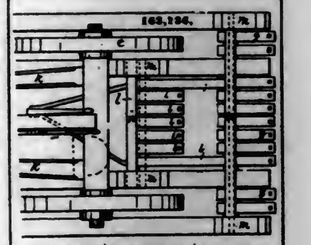


1. The wind wheel having the fixed and movable rings and pivoted slats, all connected with the sliding hub or sleeve, and adapted to slide endwise bodily on its main central shaft, as described, in combination with the arm or cross-head m on the end of said shaft, and the crank-rods N connected therewith, and operating as described.

2. The wind wheel provided with the fixed and movable rings, pivoted slats, and crank-rods, as described, and adapted to move endwise bodily on its shaft, in combination with the forked lever Q, rod R, and weighted lever S, for moving the wheel and pivoted slats, as described.

163,736. STEAMERS AND BOILERS. Carl Busch, El Paso, Ill. [Filed Mar. 27, 1875.]

Brief.—An inner casing incloses the removable furnace and grate.



1. The chest A, having the casing E and escape-pipe F, in combination with the removable furnace B and grate D, substantially as and for the purpose set forth.

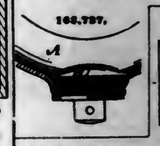
2. In an agricultural boiler, the chest A, having supporting-flanges, in combination with the perforated shelf G, casing E, and furnace B, substantially as and for the purpose set forth.

163,735. HARROWS. Columbus Burwell, Etna, Me. [Filed Mar. 31, 1875.]

Brief.—A rectangular frame is suspended from the axle-tree of bearing-wheels, from near its middle, by links. The forward end is also attached to the shafts by a lever and link. Two sets of pivoted arms, each carrying a tooth, are attached to the frame, one at the rear and the other near the middle, the latter sliding in ways by means of a lever. When the forward frame is shoved back it locks down the rear pivoted arms, and if at the same time the forward end of the main frame is drawn up to the shafts, the weight of the machine is thrown upon the rear teeth; thus forcing them into hard or impacted soil.

1. In a harrow, the combination of a balanced or nearly balanced frame, *c*, provided with one or more rods, *f f*, with independently-acting toothed finger-bars, hinged on said rods, as and for the purposes set forth.

2. In a harrow, the combination of a balanced frame, *c*, provided with one or more rods, *f f*, having toothed finger-bars hinged thereto with links, whereby said frame is suspended from its supporting-wheels, as herein set forth.



3. The combination of the frame *c*, provided with hinged tooth-carrying finger-bars, with the frame *l* sliding thereon, and operating as set forth, for the purposes described.

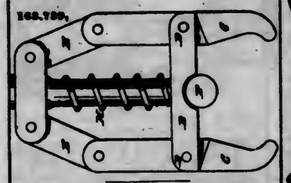
4. The combination of the frame *c*, with its hinged tooth-carrying finger-bars, and frame *l*, with a lever *p* and link or chain *q*, for changing the point of suspension of said frame *c* from its middle to its front end, whereby the weight of said frame is thrown upon the teeth, as and for the purposes specified.

163,737. DRAIN-SCREW ATTACHMENTS FOR STENCH-TRAPS. William A. Butler, New York, N. Y. [Filed Apr. 19, 1875.]

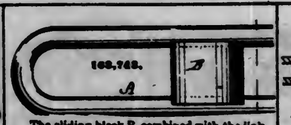
Brief.—A stench-trap made of ductile metal, and in two longitudinal half-sections. The lower half has a drain-screw socket struck up by stamping or otherwise, and having its lower edge turned in to form an annular flange, which forms a seat for a lead-metal screw-box within the socket, and serves to receive a drain-screw, the head of which bears on the outer edge of the soft metal of the internal flange of the socket to make a close joint.

In a sheet-metal trap composed of longitudinal half-sections, as described, the combination, with the lower half-section A, of the socket *b*, for reception and retention of the screw-box of the drain-screw, said socket being struck up from the metal of said half-section A, and being formed with an interior flange, *c*, at its lower end, substantially as and for the purposes herein set forth.

163,738. CYLINDER-CAMS. M. J. Carney, Toledo, Ohio. [Filed Apr. 23, 1875.]



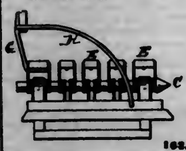
The combination of the part A, formed with the elongated cylindrical hub C, having slot *i*, and the movable part B, having slot *a*, the bolt *b*, nut *d*, and set-screw *b'*, which pass through the two parts B and C, for connecting both of the same directly to the shaft, all constructed as and for the purposes herein set forth.



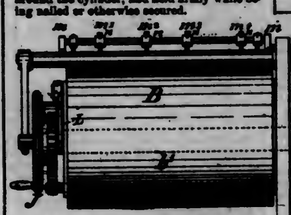
163,739. CLOTHES-POUNDERS. William H. Castle, Geneva, Ohio, assignor of one-half his right to R. O. Rote, same place. [Filed Sept. 7, 1874.]

Brief.—The handle has a cross-head at the lower end. Jaws are pivoted to cross-bars, through which the handle moves, and is actuated by a spiral spring.

1. A clothes-pounder having jaws fulcrumed to a slide on its handle, and listed or jointed at their upper ends to the latter, whereby their lower ends are caused to simultaneously pound and squeeze the clothes as they strike the same, substantially as shown and described.



2. The handle A, with its lower end provided with a cross-head, F, in combination with the jaws C C, slide B, and links E, with or without the spring H, substantially as and for the purpose set forth.



The sliding block B, combined with the link A, and having one side longer than the other, substantially as and for the purposes set forth.

163,744. VEHICLE-SEATS. Wm. H. Cloud and David D. Craig, Fremont, Ohio. [Filed Apr. 13, 1875.]

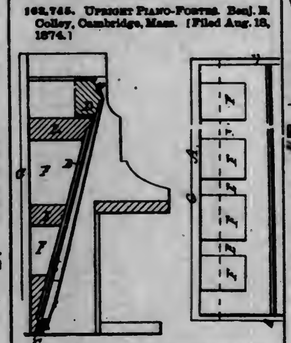
The combination of the seat-body A, arms B B, bars C C, the looped coil-springs D D, slats E E, back F, the bars G G and H H, all substantially as and for the purposes set forth.

163,741. BELL-PULLS. Clemens Clay, Philadelphia, Pa. [Filed Dec. 28, 1874.]

1. A bell-pull face-plate, A, having ways or lugs *a' a'* on each side of the opening *a* for holding the loop B, substantially as shown and described.

2. In combination with the plate A, having the ways *a' a'*, the removable adjustable loop B, substantially as shown and set forth.

163,742. SPOOL-HOLDERS. Caleb T. Cheverland, Old Town, Me. [Filed Feb. 19, 1875.]



A spool-holder consisting of the cylinder *a*, provided with the thread-opening *b*, pin *c*, and hole *f*, as and for the purpose set forth

---

163,743. CAR-COUPLING LINKS. James M. Glass, Opelika, Ala., assignor of part of his right to W. B. Shepard, Geo. A. and A. P. Bush, and W. H. Groom, same place. [Filed Apr. 1, 1875.]

Brief.—One side of the block is longer than the other, that it may be placed in the mouth of the draw-head to hold the link up. To give the link a downward inclination the shorter side is made to rest in the bottom of the draw-head.

163,745. UPRIGHT PIANO-FORTES. Benj. R. Colley, Cambridge, Mass. [Filed Aug. 18, 1874.]

The combination, in an upright piano, of the inclined sounding-board B and a series of passages, F, leading from the lower end to the upper end of the piano-case, substantially as herein shown and described.

163,746. CAR-COUPLINGS. John D. Conner and Louis Fritz, Philadelphia, Pa. [Filed Feb. 20, 1875.]

1. In combination with the swivel C and draw-head B, the swiveled post D to permit the lateral movement of said draw-head, as set forth.

2. The draw-head B, swiveled vertically and laterally, as and for the purposes set forth.

3. The combination of the draw-head B, having the chamber *b*, holding-springs *b' b'*, with the rod *c*, having a head, *c'*, working in said chamber, as set forth.

a. The draw-head B, having a hook, F, in combination with link E', pin *c*, and link E, substantially as set forth.

5. In combination with a draw-head, B, and link E, an auxiliary holding-pin, *c'*, of india-rubber, substantially as and for the purpose set forth.

6. In combination with the draw-head B, holding the hook F, the lever G, engaging with the stud *f* on said hook, substantially as and for the purpose set forth.

163,747. COPPER BOTTOMS FOR KETTLES. Allan Cunningham, New York, N. Y. [Filed Jan. 30, 1875.]

In a seamless extension copper bottom for tea-kettles, the combination of the central recess A, with corrugations *c c c* and one or more shoulders or flanges, B and C, with the inclined extension D, provided with the flanged lip *b*, arranged for forming one-half of a double seam when attached to a kettle-body, the whole bottom being struck out of sheet metal in a finished state for use, substantially as and for the purposes as herein shown and described.

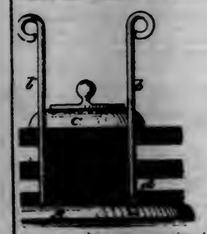
163,748. COTTON-SEED PLANTERS. Joseph Deane, Mitchell, Ind., assignor of one-half his right to E. P. Hamilton, Louisville, Ky. [Filed Apr. 6, 1875.]

Brief.—Oscillating agitator, regulating-slide, series of saws, brush-cylinder for cleaning saws, all mounted on wheels carrying opening and covering devices.

In a cotton-seed planter, the combination of the agitators J, regulator R, brush-cylinder L, and saw-cylinder K, constructed and arranged substantially as shown and described.

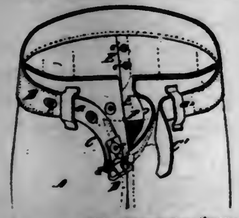
163,749. DRIVEN-WELL POINTS. Delos A. Danforth, Hobart, Ind. [Filed Apr. 8, 1875.]

Brief.—A well-tube provided with a number of holes, countersunk on the outside. In the holes are inserted filters of a button shape, consisting of a piece of wire-gauze, doubled, and in suitable shape. A piece of sheet metal is fastened around the edges of the gauze to hold the same, and on one side the metal is formed into a collar or hollow shank, thus completing the button, the collar being of the same size as the hole in the well-tube.



1. A well-point filter made in the form of a button, of wire-gauze *b*, sheet-metal rim *d*, and collar or hollow shank *c*, substantially as and for the purpose herein set forth.

2. The combination of the well-tube A, provided with countersunk apertures *a a*, and the filters B B, made in the form of buttons, and riveted in the countersinks, substantially in the manner and for the purposes herein set forth.

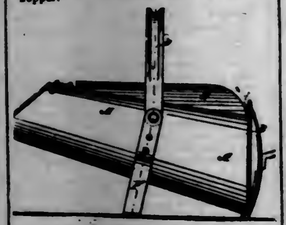


162,750. BILL-FILES. Charles Davis, Jr., Portland, Me. [Filed Mar. 31, 1875.]

Brief.—Files of bills are crossed in the standards and held down by the weight.

A bank-bill holder, consisting of a base, A, upright standards *b b' b''*, with a cover or weight, C, substantially as described.

162,751. OVERALLS. Sigmund Pentsch, Philadelphia, Pa. [Filed Apr. 26, 1875.]



1. As a new article of manufacture the overalls A, provided with the elastic gusset F at the fly, and the buckle-straps C C' formed in one piece with the waist-band strap C having the button-hole *c'*, and buttons *c c*, substantially as and for the purpose set forth.

2. In combination with a fly, E, an elastic gusset, F, to prevent tearing, substantially as shown and described.

3. In combination with the buckle-strap C, attached to the overalls A, the loose sliding-buckle D, substantially as described for the purpose set forth.

162,752. COAL-HODS. John B. Driscole, New-York, N. Y. [Filed Apr. 13, 1875.]

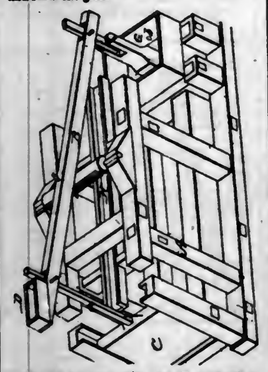
Brief.—The body of the hod or scuttle may be made of various sizes by varying the size of the base. The flanges form an elongated hopper.

1. A coal-hod the body A of which is composed of one piece bent partially round into a frustrumical shape, and held in shape by a base, B, secured to it at one end, and some suitable means of connection at the other end, substantially as set forth.

2. In combination with the body A, composed of one piece bent partially round, as described, the lips or flanges G G, the whole constructed to operate substantially as and for the purposes described.

3. In combination with the body A, the legs F F, ears *h h*, and arched brace *i*, made all in one piece, substantially as described.

162,753. ELECTRICAL CIRCUIT-CLOSERS. L. L. Duerden, Brooklyn, N. Y. [Filed May 6, 1875.]

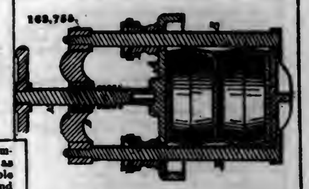


1. A telegraph-key, the moving part of which (for making and breaking contact) consists of a flexible and elastic diaphragm or disk, secured at its edges to a suitable base, and operating substantially as herein shown and described.

2. The combination of the flexible and elastic metallic diaphragm or disk, the recessed base, to which said diaphragm is secured at its edges, and the contact-points, inclosed in a chamber formed by and between the disk and base, substantially as set forth.

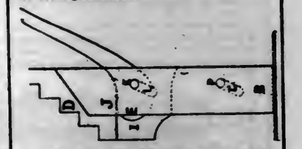
3. A telegraph-key, in which the contact-points are contained in a chamber hermetically sealed, or practically so, to the atmosphere, substantially as set forth.

162,754. WATER-WHEEL GATES. George W. Dunn, Texas Creek, Colo. [Filed Mar. 6, 1875.]



Brief.—The gate is connected by a rod with the inner end of the lever, which is provided with a box for the reception of weights to bear down the end of the lever and gate. From the other end of the lever is suspended a box. A trough is arranged in such a manner that when the water rises in the reservoir above the gate it will pass through this trough and fill the box, so that the box will overbalance the weighted end of the lever and raise the gate.

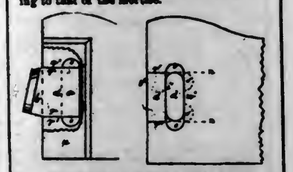
The combination of the gate C, connecting-rod *c*, lever or walking-beam B, with weight-box D, the box G, with outlet *h*, and the trough H, all constructed and arranged substantially as and for the purposes herein set forth.



162,755. VULCANIZING APPARATUS FOR DENTISTS. Horace M. Bisco, Toledo, Ohio. [Filed June 3, 1874.]

The combination, with the cover A, of the boiler and steaming-boxes G G, the rods B B, base C, cross-bar D, and screw E, whereby the flasks on the base are drawn upward against the under side of the cover, substantially as set forth.

162,756. CARRIAGE-JACKS. R. Eldridge, Harwich, Mass. [Filed Jan. 18, 1875.]



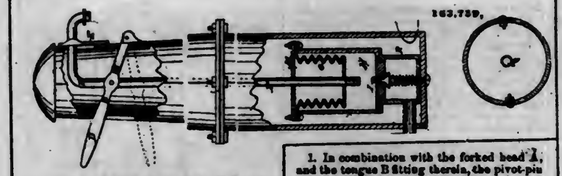
Brief.—Between two posts a cam-lever raises diagonally, by pins working in an upper and a lower slot, a block with a stepping series of bearing-shoulders.

As an article of manufacture, a carriage-jack composed of base A, standards B B', rack-head D, having body C, provided with two slots, L L', and sliding obliquely upon guide-bolt F and fulcrum-bolt K, when raised by hand-lever H, moving cam B under the shoulder of the body C, past the vertical center of fulcrum-bolt K, so as to be self-sustaining, all being constructed, combined, and arranged substantially as shown and described, as and for the purposes set forth.

162,757. RIVETED-FASTENINGS. William H. Elliot, New York, N. Y. [Filed Aug. 1, 1874.]

Brief.—The recesses are formed in the manner shown, to permit the inner corners of the tenon to enter the mortise without binding, the tenon being made of a form corresponding to that of the mortise.

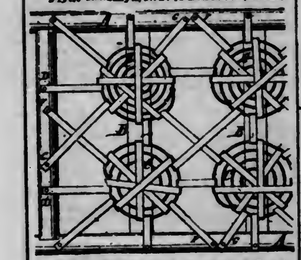
A bedstead-rail, provided with a mortise having the flat depressions *d d'*, shoulders *f*, and recesses *e e*, formed therein, as described.



162,758. WOOD-PAVEMENTS. Lewis S. Filbert, Philadelphia, Pa., and L. M. Hoffman, Washington, D. C. [Filed Apr. 6, 1875.]

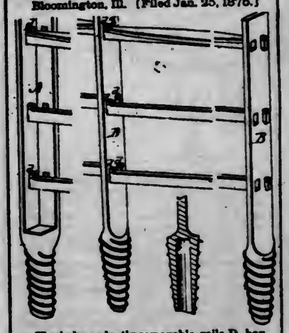
A round-block pavement provided with a vulcanite plastic filling and covering, substantially as herein set forth.

162,759. HYDRANTS. James W. R. Fisher and Wm. H. Fiske, Martinsburg, W. Va., assignors of one-third their right to C. J. Faulkner, Jr., and H. B. Faulkner. [Filed Apr. 9, 1875.]



Brief.—The hydrant has a vertical moving water-way operated by a pivoted lever. The two lower chambers are connected by a screw-joint. The upper chamber has an elastic cup of suitable material to hold the water-way centrally over the valve-seats, and for other purposes. All the internal parts may be removed together except the lower chamber.

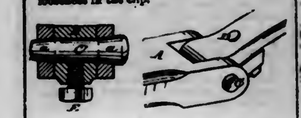
1. The combination of chambers H E, connected by screw-joint, cap G, tube F, lever D, and tube-section B, as shown and described, so that all the internal parts may be removed together except the bottom chamber.



2. The elastic cup G, fastened between the top of chamber H and its cover M, as and for the purpose specified.

162,760. BOTTOMS FOR CHAIRS, &c. C. D. Flynt Brooklyn, N. Y. [Filed Jan. 2, 1875.]

The combination, with the springs C and frame A, of the flat longitudinal transverse and diagonal flexible metal strips D E F G, connected with the top coils of the springs by wrapping, and their ends fastened to the surrounding supporting-frame, substantially as herein shown and described.



162,761. IRON FENCES. M. G. Freeman, Bloomington, Ill. [Filed Jan. 25, 1875.]

The independently-removable rails D, having notches *a* at their ends, and secured by wedges *d* alternately in the posts B, having a double series of openings for receiving the same, substantially as set forth.

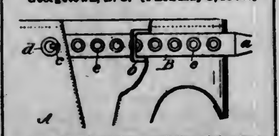
162,762. THILL-COUPLINGS. C. O. Gardiner, Springfield, Ohio. [Filed Mar. 27, 1875.]

Brief.—Peculiar form of bolt avoids friction on thill-iron, while providing against looseness in the clip.

1. In combination with the forked head A, and the tongue B fitting therein, the pivot-pin C, with a cylindrical waist and tapered ends, and secured to the tongue, so as to turn therewith, substantially as set forth.

2. The combination of forked head A, the split tongue B, screw D, and the coupling-pin C, with tapered ends and a cylindrical waist, and clamped fast in the end of the tongue, substantially as set forth.

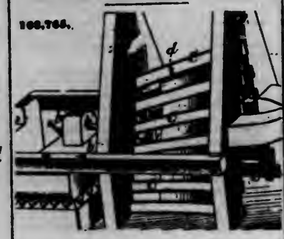
162,763. STEAM-RADIATORS. Stephen J. Geoghegan, New York, N. Y. [Filed May 14, 1875.]



Brief.—Incoming steam drives air out of the perforated screw-plug. The valve, which is placed in the last pipe of the radiator, when expanded by heat of steam, closes the perforation.

1. The pipe C' of a steam-radiator, in combination with a valve, *c*, substantially as and for the purpose specified.

2. The pipe C', having orifice and perforated screw-plug *c*, in combination with the valve *a* and screws *d d*, substantially as and for the purpose set forth.



162,764. GLOVE-FASTENINGS. S. W. Glenn, Georgetown, D. C. [Filed May 3, 1875.]

1. A glove-fastening, consisting of the strap B, provided with one or more eyelets, *e*, in combination with a loop, *c*, and hook *c*, all constructed to operate substantially as herein described.

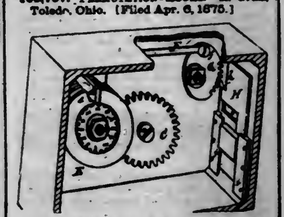
2. The strap B, composed of two layers or thicknesses, and having the eyelets *e* inserted through one layer or thickness only, substantially as shown and described.

162,765. [illegible]

162,766. VEGETABLE-CUTTERS. John N. Goolsbee, Woodville, Tex., assignor of two-thirds his right to J. W. Stewart and J. K. Durham, same place. [Filed Apr. 13, 1875.]

Brief.—Two converging tiers of knives fastened in swinging frame, so arranged as to have each knife have the same shear-cut.

The herein-described vegetable-cutter in which the knives C, arranged in two converging tiers, are attached to a swinging frame or handle at varying angles to operate with an even shear-cut, substantially as specified.



162,766. PUMPS. Daniel J. Gorton, Quincy, Ill. [Filed Apr. 10, 1875.]

Brief.—Convex faces above the valves deflect the water, so that it shall strike and bear at once upon the back of the valves. The waste-water hole is placed so that the stream shall flow into the forcing-cylinder, and maintain a priming therein.

1. The protuberances *e e*, in combination with the valves D D', substantially as described.

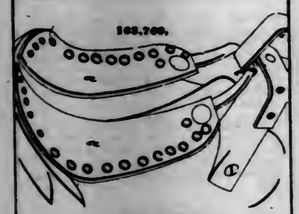
2. The barrel A, having the orifice G, as and for the purpose specified.

162,767. PERMUTATION-LOCKS. R. Grah, Toledo, Ohio. [Filed Apr. 6, 1875.]

1. The combination of the toothed disk B' with the rim E, provided with the single tooth *i*, notch *e*, and screws *h*, substantially as and for the purpose set forth.

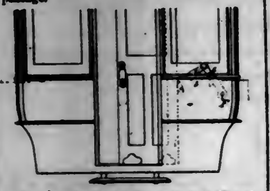
2. The combination, with the dial-knob B and gear-wheel C, of the spindle D, carrying the tumblers E, provided with the notches *e*, and gear-wheel C', bar F, dog *d*, geared sector G, and rock-bolt H, all constructed and arranged substantially as described and shown.

162,768. VEHICLE-POLE TIPS. Ellwood Grimshaw and Warren F. Osgood, Minneapolis, Minn. [Filed Jan. 23, 1875.]



The slotted metallic tip C', with the slanting annular stop D and rear fastening device, in combination with the catch E, with the stop *b*, and the spring C, held by a stud, substantially as set forth.

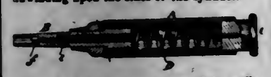
162,769. SPRING-SADDLES. C. H. Harris, Cedartown, Ga. [Filed May 15, 1875.]



In a riding-saddle, the spring C, constructed as described, and having the portion from *c* to *c'* rigid and straight, in combination with the pieces *a a*, and metal bar *m*, substantially as and for the purpose described.

163,769.

163,770. DEVICE FOR OPERATING STREET-CAR DOORS. Daml. B. Hart, St. Louis, Mo. [Filed May 1, 1875.]

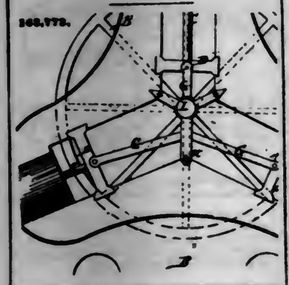


Brief.—When the crank and rock-shaft are turned one way, the toggle forces the door forward, closing it. When turned the other way, the toggle draws the door back, opening the passage.

The combination of the rock-shaft F and its operating lever or handle with the toggle-levers *e* and *f* and the sliding entrance-door of a street-car, substantially as and for the purpose set forth.

163,771. WATCH-KEYS. Addison Hathaway, Chicopee Falls, and F. Hathaway, Springfield, Mass. [Filed Apr. 15, 1875.]

Brief.—A watch-key having a revolving cylinder, the ratchet-connection between the parts being formed by the friction of the spring in unwinding upon the sides of the cylinder.



The combination, with the revolving cylinder A and barrel B, of the plunger *f*, rod *e*, spring D, and plug C, substantially as shown and described.

163,772. MATS FOR BIRD-CAGES. Andrew B. Hendryx, Ansonia, Conn., assignor to Hendryx & Bartholomew, same place. [Filed Apr. 19, 1875.]

As an article of manufacture, the herein-described mat for bird-cages, consisting of a wood body inclosed by a metal edge, as described.

163,773.

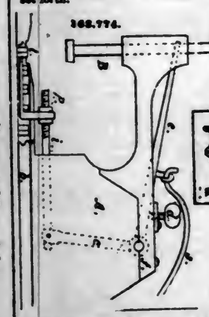
163,774. ADDRESSING-MACHINES. Henry S. Herr, Indianapolis, Ind. [Filed Apr. 2, 1874.]

Brief.—A printing machine constructed to move over the type held in columns in chases or galleys. The vertically-reciprocating plunger is connected by a beat lever to a rod bearing a doubly-adjustable pawl, having a branch extending to each side of the type-column, and acting against the vertical sides of both ends of the type-lines forming the address, which are separated by low slugs, leaving spaces for the action of the pawl-points.

1. In combination with the plunger B, beat lever C, rod *f*, spring *s*, adjusting-nuts *n n*, and casting or frame A, in an addressing-machine, the pawl *p*, provided with the two spring-points *a a*, constructed and arranged to operate, as shown and described, along the perpendicular sides of a column of type forming a series of names or addresses, and for the purpose set forth.

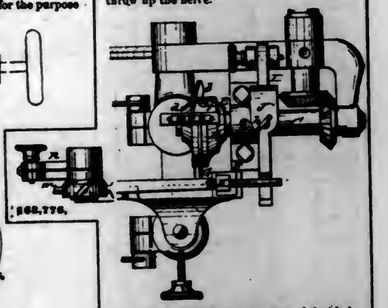
2. In combination with the set-screw *d*, beat-lever C, rod *f*, and pawl *p* in an addressing-machine, the adjusting-nuts *n n*, for the purpose of adjusting the pawl *p* upon the rod *f*, as shown and described, and for the purpose set forth.

163,775. STOVES. George W. Herrick, Detroit, Mich., assignor to the Detroit Stove-Works, same place. [Filed Mar. 23, 1875.]



Brief.—Air is received through perforations in the top of the stove, and, passing down between the magazine and the casing, is supplied to the combustion-chamber in front of the pendent diaphragm.

1. The combination, with a magazine-stove, of a combustion-chamber located at the plane of the fire-pot and ash-pit, and outside thereof, said combustion-chamber being provided with a pendent diaphragm, and the apertures *g* and *h* in the cover and magazine for delivering air thereto in front of said diaphragm, substantially as described and shown.



2. The illuminated combustion-chamber D D^1 D^2, and pendent diaphragm M, in combination with a magazine-stove having a throat to pass the gaseous products of combustion into said combustion-chamber, and a flue between the magazine and its casing for delivering air to the gases of combustion as they enter the said chamber, substantially as described.

3. The flanged division-plate *f* and flue-strips *k k*, in combination with the magazine J J^1, casing K, and perforated cap-chamber L, for supplying a current of heated air to the combustion-chamber D, substantially as set forth.

163,776.

163,775.

163,776. MACHINES FOR SETTING SAWS. B. Heunsch and Louis Beyer, Washington, D. C., assignors to Robert C. Hewett and Geo. Follansbee, same place. [Filed May 11, 1875.]

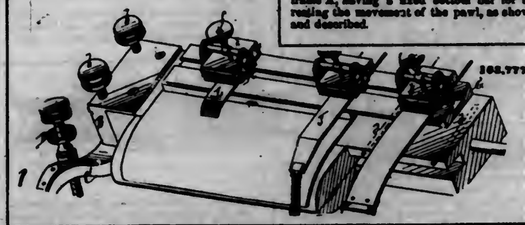
Brief.—A hub fastened to the shaft by a set-screw is provided with a clamp, in which a portion of the feeling-blade is secured. A lip on the end of the spring portion of the feeling-blade is placed between the legs of a bar, which slides in a groove in the hub, in virtue of which the blade can be set to feel the saw either to the right or to the left. One of the parts of the lever which raises the hammer-helve may be adjusted by a set-screw, so as to cause said lever to raise the helve to a greater or less extent, as required. The helve is secured in a piece which is pivoted to the overhanging bracket of the frame. When it is not desirable to have the hammer strike, the pin which secures said piece to the bracket is removed, and the piece allowed to turn and throw up the helve.

1. The feeling-gage, consisting of the blade G, held in a clamp, E, on the hub D, and formed with the spring part *b*, movable to the right or left by means of the slide *d*, substantially as and for the purposes herein set forth.

2. The lifting-lever, made in two parts, I and J, hinged one upon the other, and their relative position adjusted by means of a set-screw, in combination with the spring-helve L and hammer K, substantially as and for the purposes herein set forth.

3. The combination, with the spring-arm L, carrying the setting-die K, of the pivoted stud P, bracket R, arms *m n*, and pin *p*, substantially as and for the purposes herein set forth.

163,777. PAPER-RULING MACHINES. Wm. O. Hickok, Harrisburg, Pa. [Filed Apr. 17, 1875.]



1. The combination, with the beam A, of the curved pen-rest C, having ears, as shown, and pivoted to one end of the beam below the journal thereof, and adjusted by the set-screws *b b*, which pass through the beam, all substantially as set forth.

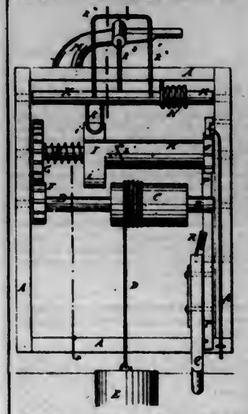
2. In combination with the pen-beam A and longitudinally-grooved bar G thereon the movable chairs E, having blocks I, plates *h*, and set-screws *f*, passing through a cross bar in the chair for holding and adjusting the ex tensible pen-bars, all constructed substantially as set forth.

3. In combination with the beam A and the bar G thereon the flat metal strip or rail *h*, secured upon the latter bar, and projecting in front thereof, forming a groove for wedging the flannel on the beam, as set forth.

2. The pivoted lever-pawl and its sliding, slotted, extension piece or arm Q, and the spring R, in combination with the ratchet-wheel O of the alarm mechanism, and the frame A, having a fixed bottom bar for arresting the movement of the pawl, as shown and described.

163,777.

163,778. CLASPS FOR STOCKING-SUPPORTERS. Elijah L. Howard, Boston, Mass., assignor to John A. S. Graves, same place. [Filed Feb. 23, 1875.]



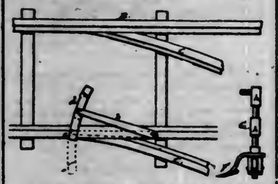
1. The improved clasp consisting of the two plates A and B, pivoted together, as described, and provided with the beat lever E, by which they are pressed powerfully and securely together, substantially as and for the purposes stated.

2. The two plates A and B, pivoted together, as explained, formed with the lips or ribs *c d e*, and combined with a suitable clamping device, substantially as and for the purposes stated.

3. In combination with the two plates A B, the beat lever E, so constructed and arranged that its longer arm serves both as a handle to operate the cam *f* and to stiffen or truss the plate B, substantially as and for the purposes stated.

163,779. BURGLAR-ALARMS. F. H. Hunter, Haltonville, Ind. [Filed Apr. 3, 1875.]

Brief.—The device is secured above the door, and a pawl-lever, which engages with a ratchet on the main shaft, is thrown out of gear to free the mechanism and sound an alarm. The pawl-lever is made in two parts—the lower end tapered, so that in closing the door the lower part slides upon the other, and the pawl is not disengaged.



1. The combination of the frame A, shaft B, drum C, cord and weight D E, gear-wheels F G, armed collar I *c*, clutch *P P'*, spring J, and the shaft K, provided with the arms b^1 b^2, and spring N, to enable a pistol to be discharged, a drum to be sounded, and a bell rung by the descent of a weight, E, substantially as herein shown and described.

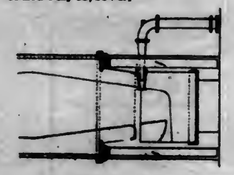
2. The pivoted lever-pawl and its sliding, slotted, extension piece or arm Q, and the spring R, in combination with the ratchet-wheel O of the alarm mechanism, and the frame A, having a fixed bottom bar for arresting the movement of the pawl, as shown and described.

163,780. STREET-RAILWAY SWITCHES. Geo. T. Jacobs, Washington, D. C., assignor of one-half his right to Thomas A. Mitchell, same place. [Filed Apr. 1, 1875.]

Brief.—An improved device for operating street-railway switches, consisting of an adjustable and reversible cam carried on the lower end of the operating-shaft; said shaft being provided with a steadying-wheel, which traverses the track-rail when the device is in operation. The cam strikes projecting lugs on the switch-point to properly shift it.

1. Combined with the switch *b*, provided with the studs *c e*, an adjustable and reversible cam, F, substantially for the purpose set forth.

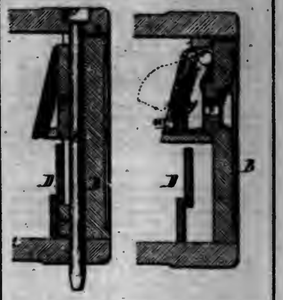
2. The cam F, combined with the shaft G, constructed with the rectangular portions *h h* and cylindrical portions *i i*, and moving in the bearings *g g*, substantially as described.



3. Combined with the cam F and shaft G, the gage-wheel J, substantially as set forth.

163,781. THILL-COUPLINGS FOR SLEIGHS. C. H. Johnson, Southington, Conn. [Filed Apr. 6, 1875.]

As a new article of manufacture, the sleigh-shackle having upon the rear end of its eye A a bolt, A', which extends horizontally rearward, substantially as and for the purpose specified.



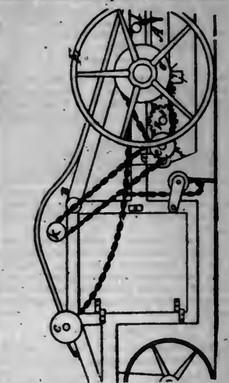
163,782. MANUFACTURE OF FERRO-MANGANESE. Alexandre Jullien, Paris, France. [Filed July 16, 1874.]

The process herein described of producing definite alloys of iron and manganese by combining the iron, in a state of fine division, with the comminuted ores of manganese, moistening the mass with ammoniacal solutions, and forming into bricks and reducing the same by heat, substantially as described.

163,783. AXLE-BOXES. Florens Keiser, Pottstown, Pa. [Filed Apr. 24, 1875.]

Brief.—Self-closing valve for admission of oil. Pin passing through projections of cover and box-front, to hold them together.

1. The combination of the cover B, its packing-strip *s*, and ribs *f f*, with the open front end of the axle-box adapted to the said cover, all substantially as set forth.



2. The combination of the cover B and the front end of the axle-box, with the retaining-pin E, passing through the box and through projections on the cover, substantially as set forth.

3. The combination of the cover B, having opening *t*, with the pocket *w* and self-closing valve *y*, all substantially as and for the purpose set forth.

4. The combination of the pocket *w* on the cover and its self-closing valve, with the partition D, substantially as and for the purpose set forth.

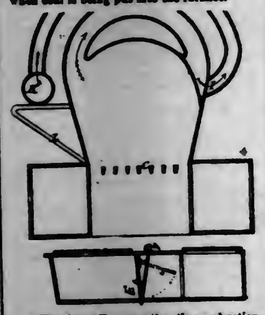
163,784. STREET-SWEEPERS. Orson W. Kellogg, Fond du Lac, Wis., assignor of one-half his right to Milford Van Dresar, same place. [Filed Apr. 16, 1875.]

Brief.—A street-sweeper in which the frame which carries the broom is attached to the sides of the machine by straps secured to the front end of the frame, and capable of vertical adjustment, the frame being raised or lowered by a chain attached to its rear end, which passes forward and up to the driver's seat.

The combination of the broom-frame A, straps *a*, chains *b*, pulleys B, and windlass *c*, as and for the purpose described.

162,785. VALVE-MOVEMENTS FOR ROCK-DRILLS. Daniel Kennedy, New York, N. Y. [Filed Apr. 7, 1875.]

Brief.—The valve is operated by the piston striking the tappets.



162,786.

The levers L M L M mounted on the centers *h h*, in combination with the slide-valve C *e e' e'*, piston B, and cylinder A, and with the ports *b' b'* and *b' b'*, operating together as herein specified.

162,786. AIR-HEATING AND VENTILATING FURNACES. Smith W. Kimble, Springfield, Ill., assignor of three-fourths his right to A. Leggett, S. W. Elsbree, and A. Rafter, same place. [Filed Apr. 14, 1875.]

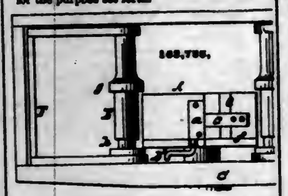
Brief.—The pipe which receives the fines rests loosely on brackets, and is moved by expansion and contraction. When the drop-door is down, ashes can be drawn from the fire-bed into the ash-pit. The door is raised when coal is being put into the furnace.

1. The throat T, connecting the combustion-chamber and ash-pit, provided with drop-door *a*, as and for the purpose described.

2. The fines I, connecting on one side of furnace with combustion-chamber, passing over it, and on the other side attached to a pipe, K, resting loosely on brackets L, as and for the purpose described.

162,787. MANUFACTURE OF GLASSWARE. William G. King, Union Township, Allegheny County, assignor to King, Son & Co., Pittsburg, Pa. [Filed Apr. 19, 1875.]

1. As a new article of manufacture, a pressed fabric or seamless hollow article of glassware having claw-feet pressed thereon, substantially as set forth



2. The combination of hollow mold B, having a cavity of any desired form for pressing the body of the article to be made, a base, *b*, in which are the foot-cavities *a*, and movable sections D, having re-entrant faces *d*, and moving in horizontal planes, substantially as set forth.

162,788. MACHINES FOR MAKING BOXES. John Kline, Nevada, Ohio. [Filed Apr. 10, 1875.]

Brief.—The material from which the box is formed is wound upon a cylindrical former, being retained in contact therewith by two pressure-rolls held in oscillating frames.

1. In combination with the cylinder A, having the clamps *a*, *b'*, *b'*, *c*, and head D, the plate *d*, cylinders or rollers E E, and frames G, F F, substantially as and for the purpose set forth.

2. In combination with the cylinder or or block A, the rollers or cylinders E E, having the annular flanges *g g*, and grooves *h h*, pivoted frames F F, and frame G, or other support for the latter, substantially as and for the purpose set forth.

162,789.

162,789. MAIL-BAG FASTENERS. ROCHLOS, Cincinnati, Ohio. [Filed May 5, 1875.]

Brief.—A girth or strap completely encircles the top of the bag. The staples are passed through slots from the side next the mouth of the bag, and the free end of the strap is heard through the staples on the opposite side.

1. A bag-fastener consisting of a girth, M *m*, secured by one end to the bag at K, and having a series of rearwardly-projecting staples, N, arranged to pass from the side next the mouth or opening through appropriate slots in the bag's mouth, so as to allow the back strap P to be wove through them, said strap being a continuation of the girth M, and adapted to be coupled to the staple K, or its equivalent, substantially as herein described, and for the purpose set forth.

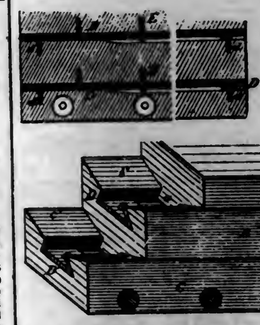
2. The stab or loop *p'* at the junction of the girth M with the back strap P, as and for the object stated.

3. The combination of shanked and riveted staples N *n n'*, girth M, and guard-plates O O', for the purpose designated.

162,790. PIVOT-CHAINS. John Lemmon, Cincinnati, Ohio. [Filed Jan. 27, 1875.]

1. A pivoted tilting-chair, consisting of the base B, spindle C, having the cross-bar E, and stop-arms *a a'* at its upper end, combined with the helical springs D D', attached at one end to the extremities of said cross-bar, and at the other to the seat-frame A, substantially as specified.

2. In combination with the helical springs D D' and screws *d*, the slotted seat-frame A *s*, substantially as and for the purpose specified.

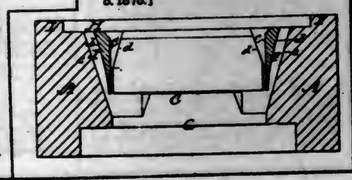


162,791.

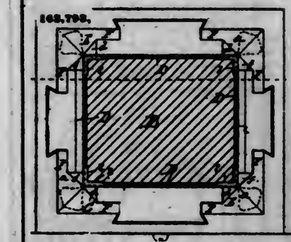
162,791. LIFTING-JACKS. William Livingstone, Valley Stream, assignor to himself and E. A. Rogers, New York, N. Y. [Filed Apr. 26, 1875.]

Brief.—Wheel-segments, forming bearings at the ends of the right and left hand screws, provided with sleeve-nut, are for the purpose, when the article has been raised, to roll a greater distance than heretofore usual in lifting-jacks.

The combination, with the right and left hand screws and tubular nut, of the wheel-segments, forming bearings at the ends of the screws, for the purpose set forth.



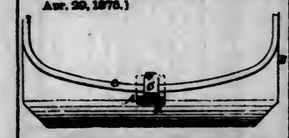
162,792. EXTENSION-TABLE SLIDES. Geo. B. Lyman, Dayton, Ohio [Filed May 12, 1875.]



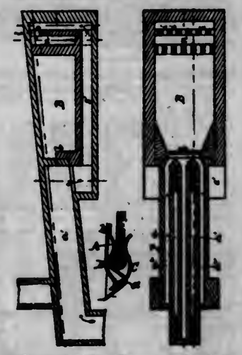
1. An extension-table slide, having a dovetail tenon with bearing-surfaces at each side, adapted to slide in a mortise in the adjacent block with corresponding bearing-surfaces, said mortise being enlarged considerably beyond the size of the tenon, while at each end it is provided with a metallic plate closely fitting said tenon, the latter being also embraced by a similar plate, which serves as a stop, and also to guide the tenon in the enlarged mortise, substantially as and for the purpose set forth.

2. The slide A B, having the dovetail tenon *a* and mortises *c*, respectively, the latter being enlarged, as described, and provided with the plates D and pins E, all constructed substantially as and for the purposes set forth.

162,793. DIES FOR FORMING SHEET METAL. Henry Martyn, Boston, Mass. [Filed Apr. 5, 1875.]



162,793.



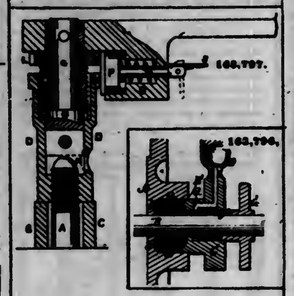
The female die A, constructed at its corners with the openings *e*, and spaces or openings *F* back of the working-faces of the die, said openings or spaces F having inclined walls *d* and *f*, substantially as described, whereby, when the plunger forces the sheet metal into the female die to form the box, the corners of said metal are forced through the openings F, and by the inclined walls *d* and *f* the metal is folded against the sides and ends of the box, as set forth.

162,794. FASTENINGS FOR POCKET-BOOKS. Louis Mamer, New York, N. Y. [Filed Apr. 29, 1875.]

In a fastening for pocket-books and other similar articles, the combination of the hook C, case A, the spring D, and the abutment *a*, all constructed and adapted to operate substantially as described.

162,795. METALLURGIC FURNACES. T. D. Morgan, Pittsburg, assignor to himself, D. Morgan, same place, and Hugh McDonald, Allegheny, Pa. [Filed Mar. 6, 1875.]

1. The neck of the ordinary metallurgic furnace, divided into alternately-arranged air, gas, and smoke flues *a a' a'*, the air and gas flues taking air and gas at the stack end of the neck, substantially as set forth.



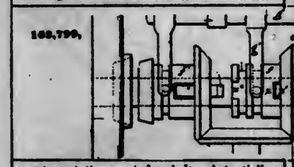
2. The air and gas flues *a a'*, arranged in the neck, alternately with the smoke-flues, and taking air and gas at the stack end of the neck, in combination with the flues *c c'* under the bed of the furnace, and up-take flues *m n*, with their discharge-ports alternately arranged, substantially as set forth.

3. A system of gas and air flues, *a a' c c'*, in combination with the up-take flues *m n* and operating-chamber B, whereby the air and gas are heated, mixed, and ignited, substantially in the manner and for the purposes set forth.

162,796. STUFFING-BOXES. A. G. Myers, Dayton, Ohio. [Filed May 6, 1875.]

1. The combination of the packing-box A, having concave bottom *h*, the packing-box C, having concave front *a*, and provided with the oil-cup D, and the packing-box G, having concave front *f*, all substantially as and for the purposes herein set forth.

2. The flanged and perforated chamber-ring *d*, inserted in the middle packing-box C, in combination with the packing-boxes A, C, and G, and the packings *a a'*, all substantially as and for the purposes herein set forth.



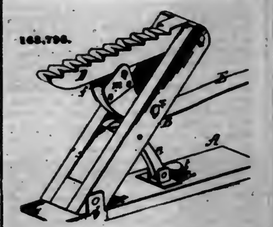
162,797.

162,796.

162,797. DEVICES FOR ROUNDING THE ENDS OF BOLTS. Jas. Nelson, Sunderland, England. [Filed Dec. 12, 1874.]

Brief.—A recess in the flange formed around the upper portion of the stationary cylindrical guide-body allows the spring-pawl carried on the under side of the handle to enter between two of the teeth of the feed-screw, and to move the said screw the distance of one tooth (before the flange again compels the pawl to recede) upon every revolution of the handle. Holes F are formed in the guide-body, to allow lubricants to be injected and the chips to be removed.

1. In a device for trimming studs and bolts, a rotary spindle, G, provided with a cutter, H, affixed removably to its lower extremity, and a rotating crank or handle, I, at the top, in combination with a stationary cylindrical guide-body, D, and an intermittent and arrestable feeding mechanism for feeding the said cutter



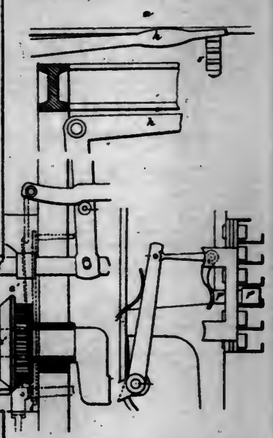
162,799.

up to a stationary stud or bolt, substantially in the manner shown, and for the purposes specified.

2. In a device for trimming studs and bolts, the combination of the rotating spindle G, provided with a cutter, H, and handle I; the stationary guide-body D, with a threaded opening, E, and an intermittent feeding mechanism, consisting of the threaded gland K, bearing a toothed flange, L; the stationary flange M, with beveled recess N; the spring detent or pawl R on the piston P, actuated by a spring, Q, and cam-lever S, all arranged to operate in the manner and for the purposes substantially as set forth.

3. In a device for trimming studs and bolts, in combination with the rotating cutter H on the spindle G, the stationary cylindrical guide-body D, provided with a threaded opening, E, in the bottom of the same, by means of which the said stationary body may be securely attached to the stud or bolt to be operated upon, in the manner substantially as shown, and for the purposes specified.

162,798. CARRIAGE-JACKS. HENRY B. Mitzinger, Philadelphia, Pa., assignor of one-half his right to S. Mitzinger, same place. [Filed Apr. 15, 1875.]



162,798.

1. A carriage-jack in which are combined the frame B, hinged to the lever A, the operating-lever E, notched arm D, and a device for retaining and releasing the said frame, all substantially as set forth.

2. The retaining-arm *a*, adapted to the central opening of the hinged frame B, having notches for the reception of a transverse pin in said opening, and provided at its lower end with a treadle, *t*.

3. The combination of the notched arm D with the operating-lever E, the short arm of which carries an anti-friction roller, *c*, and has a straight portion, *f*, as and for the purpose set forth.

162,799. LOOMS. Jas. Lee Norton, London, assignor to Gerald Hopper, Denmark Road, Camberwell, England. [Filed Mar. 29, 1875.]

1. The combination of a belt-pulley and a clutch, adapted to be disconnected from the crank-shaft, with a shaft in gear with the clutch-box, whereby, through the belt-pulley and shaft, the shedding and shuttle-box mechanisms may be reversed while the lay is at rest.

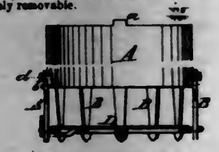
2. The combination of a clutch-box, belt-pulley, bed gearing, by which the shedding movement may be reversed, substantially as described, with a clutch-box adapted to disengage the crank-shaft, that the lathe may be at rest.

3. The combination of the hand-lever and connections with the clutch-box *f f*, the belt-pulley, and gearing, adapted to give movement to shedding mechanism, either backward or forward, substantially as set forth.

4. The combination of two pulleys actuated by power and their connections or gearing, whereby one of the pulleys, practically a fast pulley, is adapted to move the operative parts of the loom in the regular forward order, and the other pulley, through a belt, to operate other parts of the loom, as described, in a reverse order while the lay is at rest.

5. In a loom adapted for fancy weaving, the combination of the belt-pulley, clutches, and gearing, whereby, when the lay and picking motion are at rest, the other parts of the loom may be operated, substantially as described.

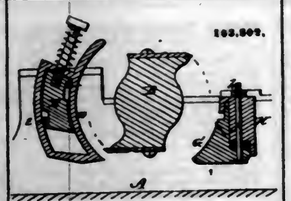
6. In a loom provided with a shaft, *c'*, or a pinion, *c'*, for imparting movement to shedding and shuttle-box-operating mechanisms, a clutch-box adapted to be disconnected from the crank-shaft and combined with gearing, substantially as described, to change the movement of the parts operating the shuttle-box and harness or shedding mechanisms while the crank-shaft and batten operate, substantially as described.



7. In a loom provided with a clutch-box and gearing for operating the parts which operate the shedding or shuttle-box mechanisms, substantially as described, a picking-shaft and a movable arm, *n*, adapted to be thrown out from the path of the actuating-tappet, for operating the picking-shaft when the loom is being reversed or operated to find a last pick or true shed, substantially as described.

8. The fast and loose parts *f' f'* of the clutch-box, forks *g' g'*, bar *g*, lever *h*, and holder or plate *n*, for moving the clutch-box and confining the lever in adjusted position, all substantially as described.

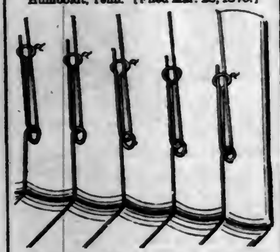
9. The combination of the crank-shaft and the clutch, adapted to be disengaged from the crank-shaft, with a belt-pulley and gearing, to impart movement to shedding and shuttle-box mechanisms, substantially as described.



162,800. STOVE-GRATES. Henry P. Ohm, Baltimore, Md., assignor of one-half his right to Alva Hubbard, same place. [Filed May 5, 1875.]

Brief.—The vertical bars are attached loosely at both top and bottom, and are separately removable.

1. The combination of the parts A, B, C, and D, constructed and put together substantially as described.

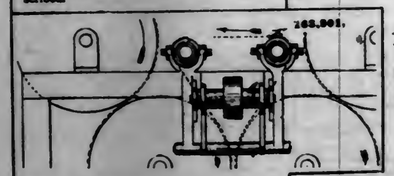


2. Bars B, having enlargements *c* on their lower ends, and oblong slots *e* through their upper ends, combined with buttons *b* and loops *f* on a base-ring, C, substantially as described.

162,802.

The combination of the frame A of a planing-machine and a revolving cutter-head, having cutters, the curved guide E, with rollers *e*, independent pressure-blocks D D, springs *c*, bolt *d*, and nuts *d'*, and the guide H, with independent spring-pressure blocks G secured by the bolts *b*, all constructed to operate substantially as set forth.

162,803. COTTON-BALE TIES. J. W. Philp, Humboldt, Tenn. [Filed Mar. 29, 1875.]



The wire bale-tie having the coil *c* near one end, and passing the other end through it before it is brought into the clasp *d* at the end of the coiled end of the wire for final fastening, as shown and described.

162,804. LACED BOOTS AND SHOES. Pascal Plant, Washington, D. C., assignor of one-half his right to Peter Hanney, same place. [Filed May 6, 1875.]

162,804.

162,801.

162,801. MECHANISMS FOR DRYING SHEET FABRICS. William H. Palmer, Jr., Middletown, Conn., assignor to Horst. F. Palmer, New York, N. Y. [Filed Apr. 3, 1875.]

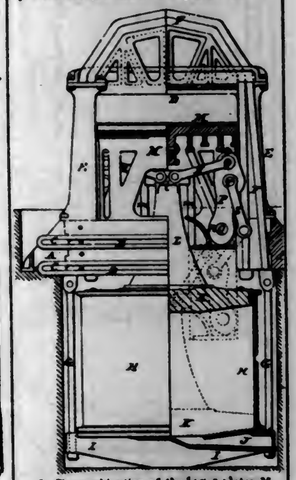
The combination, in a machine for drying sized or dressed fabrics, of rotary drying-cylinders and one or more rotary cylinders having a longitudinal reciprocating motion, the whole being constructed to operate substantially as and for the purpose herein described.

162,805. PLANING-MACHINES. C. B. Patterson, Pittston, Pa. [Filed Mar. 20, 1875.]

Brief.—Two boards of different thickness can be fed at the same time, and both held alike, or one board can be placed on one side of the machine, held alike at both edges, and uniform thickness and even surface secured in wood-planing machines, by means of a series of independently-operating chip-breaker or pressure-blocks arranged upon an inverted cross-bar or guide, and operated by spiral springs and friction-rollers. The inner sides of the blocks and cross-bar are curved on a circle concentric with the circle described by the cutters in their revolution.

1. The upper of a boot or shoe, having two exposed lacing-edges, said edges being provided with lacing-loops *a*, having elongated openings *c*, adapted to receive a flat lace, *g*, substantially in the manner and for the purpose specified.

2. A supplementary strip, *m*, provided with lacing-loops *c*, having elongated openings *c*, substantially as set forth.



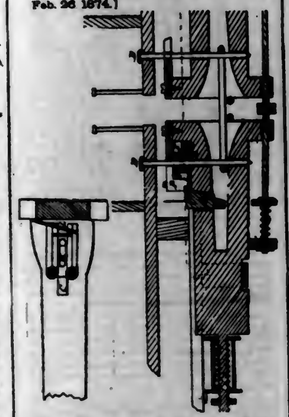
3. The combination of a supplementary strip, *m*, provided with lacing-loops *c*, having an elongated opening, *c*, with the upper of a lace-gaiter, boot, or shoe, substantially as set forth.

4. A gaiter provided on its front edge *b* with two rows of lacing-loops, *c*, having an elongated opening, *c*, and with a flat lace, *g*, or laces *g g'*, the loops *a* being so arranged with respect to each other that when laced up the lace will practically cover the openings of the shoe, substantially as shown and described.

5. A lace-gaiter, provided with at its lacing-edges *b* with two half tongues, *e e*, formed by projecting the edges of lining *f* beyond the edges of the upper, substantially as set forth.

162,806. COTTON-PRESSES. T. D. Powers, St. Louis, Mo. [Filed Apr. 6, 1875.]

Brief.—The plates, when commencing to rise, travels at a greater, but at a constantly-decreasing, speed relatively to that of the piston, until, when near the top of the stroke, the movement of the plates is so slow that a powerful compression is had upon the bale.



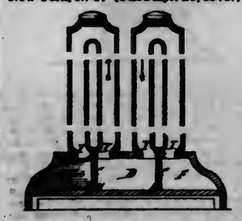
1. The combination of the lower platen M, lever-links P, arms N and S, post or column L, piston K, and cylinder H, substantially as set forth.

2. The lower platen M, having guides *m* for the column L of the piston K, in combination with the link-levers P, struts N, arms S, and open-topped steam-cylinder H, substantially as set forth.

3. The combination of stationary platen D, columns E, ties F, moving platen M, link-levers P, arms S, secured to the frame, and struts N, connected to the column L of the piston K, substantially as set forth.

162,808. CAR-COUPLINGS. Levi W. Powis, Valparaiso, Ind., assignor of one-half his right to F. W. Hunt, same place. [Filed Feb. 26 1874.]

In combination with the coupling-pin D, the slide M, spring L, and pivoted centred post C, all substantially as and for the purpose set forth.

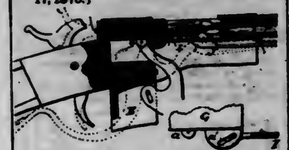


162,807. LIGHTNING-ROD STANDARDS. W. S. Rayburn and Frederick J. Martin, Philadelphia, Pa. [Filed Apr. 6, 1875.]

162,810.

The within-described lightning-rod standard, consisting of the legs *a*, plate *b*, which may or may not form part of a bracket for an insulator, the stem B, and insulator-bracket D, all being constructed and combined substantially as and for the purpose set forth.

162,809. STEAM-RADIATORS. G. B. Riggins, New York, N. Y. [Filed Apr. 23, 1875.]



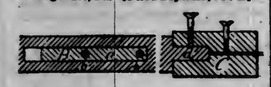
1. The base A, provided with a central induction-compartment, D, and lateral eduction-compartments F F, communicating with each other by means of a passage, H, in combination with the pipes B, substantially as described.

2. The partitions C C of the base, arranged across the pipe-openings I, in combination with the diaphragms K of the divided ends of the pipes B, substantially as described.

162,809. STARCH LUBRICANTS. Mary E. Robinson, Jackson, Miss. [Filed Mar. 27, 1875.]

A starch lubricant composed of starch and soap mixed together in about the proportions set forth, the soap being of the same color as the fabric to be ironed, as and for the purpose specified.

162,810. BREECH-LOADING FIRE-ARMS. O. M. Robinson, Upper Jay, N. Y. [Filed Apr. 17, 1875.]



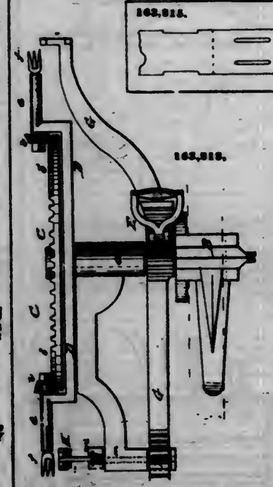
1. The extractor-bar *I*, connected and combined with the breech-block by an inclined slot, so that its working end is raised up behind the rim of the cartridge, substantially as specified.

2. In combination with the extractor-bar I, constructed and arranged to operate by means of the inclined slot, as specified, the spring J attached to the under side of the barrel, and provided with a projection upon its end adapted to enter a slot in the bar I for the purpose of throwing out the cartridge, substantially as specified.

3. The sliding block G, constructed with projections *e e'*, whereby connection is made with the extractor-bar I and with the guard-lever D, operating said block, together with the sliding block E, all constructed and combined, substantially as and for the purpose set forth.

162,811. MACHINES FOR DRESSING MILLSTONES. David Savage and H. Coleman, Orangeville, Pa. [Filed Sept. 28, 1874.]

1. A mill-pick bar made in two parts, A and B, and adjustably connected together by means of a slot, *a*, and set-screws, *b*, substantially as and for the purposes herein set forth.



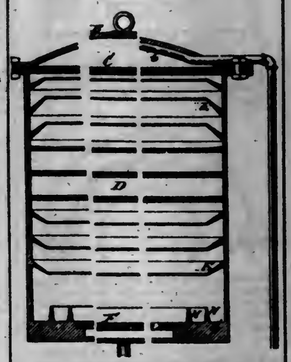
2. The swiveled holder C, introduced between the pick D and pick-bar A B, substantially as and for the purposes herein set forth.

162,812. VEHICLE-TOPS. Leonard Sawyer, Amesbury, Mass. [Filed May 6, 1875.]

In a carriage-prop, the combination of the body A B, having screw C and slot G, with the nut H and the washer E, having point F, all substantially as and for the purpose set forth.

162,813. APPLE-PARERS. R. L. Schenck, Pleasant Mount, Mo. [Filed Apr. 22, 1875.]

162,813.

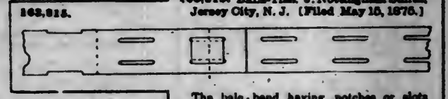


1. The combination of the wheel C, having notched semicircle *b*, the bar D, with tubular bearings *c*, fork *f*, and pinions *i*, as and for the purpose set forth.

2. The combination, with the wheel C and bar D, of the latches *t* and *v*, substantially as and for the purposes herein set forth.

3. The cogged slide G, operated by lever E and segment *h*, in combination with the segment *h* and vertical shaft *m*, provided with knife-paring lever H, substantially as and for the purpose specified.

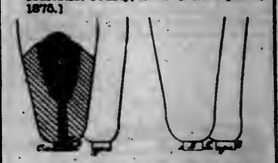
162,814. APPARATUS FOR FILTERING LIQUIDS. Thos. R. Sinclaire, New York, N. Y. [Filed July 29, 1874.]



Brief.—Combines ledges upon the sides and marginal bottom of the vessel with perforated diaphragms above and below, and a forcing apparatus.

1. The combination, with the filtering-vessel A, constructed with the impervious surface G, of the false bottom F and the side or bottom ledges E H, either or both, substantially as herein specified.

2. The combination of the vessel A, ledges E H, false bottom F, diaphragm C, cover B, pipe *b*, orifice or pipe K, and forcing apparatus L, substantially as and for the purposes specified.



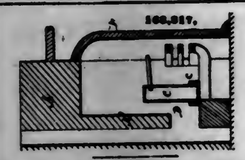
162,815. BALE-TIES. J. Nottingham Smith, Jersey City, N. J. [Filed May 10, 1875.]

162,815.

The bale-band having notches or slots formed in it, as described, in combination with the clip or clasp, applied as set forth, to form a bale-tie, substantially as and for the purpose set forth.

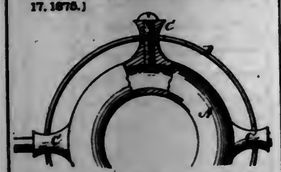
162,816. MILKING-TUBES. S. A. Smith, Muscatine County, Iowa. [Filed Apr. 27, 1875.]

As an article of manufacture, the milking-tube A, having grooved head B and slide-valve C, arranged substantially as and for the purpose specified.



162,817. GAS APPARATUS. R. H. Smith and Joshua Goldthorp, Pittsburg, Pa. [Filed Apr. 13, 1875.]

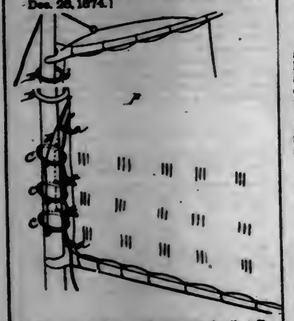
Brief.—A diving-flue back of the retort. An asbestus-lined shield to retain the heat in the fire-place.



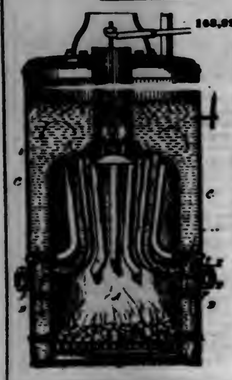
1. The combination of the retort C and the rear wall A', forming the intermediate diving-flue D, to economize the heat of the fire and the escaping products of combustion, all substantially as set forth.

2. In combination with the retort in the fire-place, as described, the shield H, covering the front of the fire-place to prevent inconveniently heating the apartment in which it is situated, substantially as set forth.

No. 163,017.



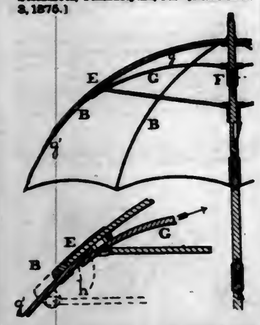
No. 163,018. GAS-RETORTS. William Smith, Pittsburg, Pa., assignor to R. H. Smith and Joshua Goldthorp, same place. [Filed Mar. 17, 1875.]



In combination with a fire-box, D, having notches at its top, the circular retort A, having two or more hollow projecting bosses, C, resting in the notches in the stove or fire-box, as set forth.

No. 163,019. MEANS FOR REEFING SAILS. Isaac Solomon, Solomon's Island, Md. [Filed Dec. 26, 1874.]

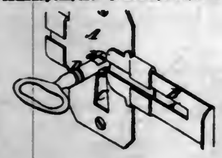
The combination, with a mast and sail, A B, of the upper hoops D, connected directly to the sail by the clamps b, and the lower loose hoops C, connected to the lacings a, and connected together and to the sail by the guide-ropes d, substantially as and for the purposes herein set forth.



No. 163,020.

No. 163,020. SECTIONAL STEAM-GENERATORS. George H. Starbuck, Troy, N. Y. [Filed Mar. 18, 1875.]

A steam-boiler composed of a cast-iron inner shell, A, and water-leg B, with strengthening-braces F and flange D, all cast in one piece, and an upper shell, C, of boiler-iron, provided with a flange, E, secured to the flange D of the water-leg by means of screw-bolts and nuts e, substantially as herein set forth.

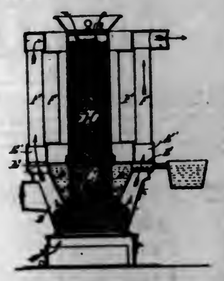


No. 163,021. FOLDING UMBRELLAS. Uriah G. Steinmetz, Philadelphia, Pa. [Filed Mar. 3, 1875.]

1. The combination, with the stocks E, fixed sections f, and hinged sections f', having overlapping ends h, of the arms G, sliding in the stocks and overlapping the overlapping ends of the stretchers f', substantially as and for the purpose set forth.

2. The combination, with the sectional ribs B, stocks E, and sliding arms G, of the auxiliary runner F and fastening J, substantially as and for the purpose set forth.

No. 163,022. KEY-FASTENERS. H. Stretcher, Indianapolis, Ind. [Filed Apr. 10, 1875.]



The improvement in key-fasteners, consisting of the key-hole escutcheon A, having lateral flanges or ears, with their upper and lower edges bent over to form guides, and the locking-slides B, having the studs c c and bent thumb-piece, substantially as shown and described.

No. 163,023. PORTABLE STEAM-ENGINES. L. Sweet, Wellsville, N. Y. [Filed Apr. 23, 1875.]

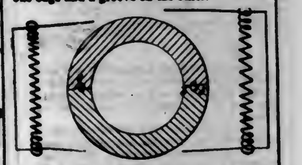
The cast-iron stove A having fire-brick lining D its entire length and mounted upon wheels, in combination with the boiler and engine supported thereon, all substantially as set forth.

No. 163,024. MAGAZINE HEATING-STOVES. G. H. Timmerman, St. Louis, Mo. [Filed Apr. 1, 1875.]

1. The stove part, consisting of the lower extension part C, water-chamber D, having outward-flaring bottom d', its partition d, pipes d' d', and top plate E, in combination with the stove-body B, flue-chamber B', and feed-pipe H, all constructed as herein shown and described, and for the purpose set forth.

2. The stove part consisting of the lower part C, water-chamber D, top plate E, flue-chamber E', pipes F, feed-pipe H, and stove-body B, all combined and congruated to operate substantially as herein shown and set forth.

No. 163,025. APPARATUS FOR ENAMELING MOLDINGS. Washington Wallick, Philadelphia, Pa. [Filed Oct. 16, 1874.]

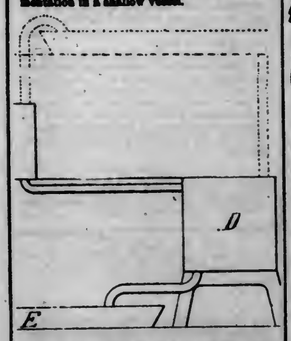


Brief.—A box having troughs for holding the enameling composition is provided with a longitudinal strip, which, in connection with the molding, divides the box into two distinct compartments.

An enameling-box divided into two compartments by a slotted partition, and having openings at the ends in a line with the slot in the partition, all substantially as and for the purpose set forth.

No. 163,026. LAMP-CHIMNEYS. Oliver D. Warfield, Chicopee Falls, Mass., assignor of one-half his right to John Anderton, same place. [Filed May 9, 1874.]

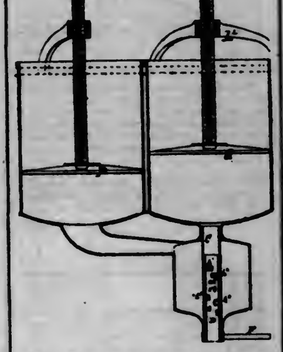
Brief.—Each section provided with a rib on one edge and a groove on the other.



A lamp-chimney section having straight vertical edges, one of which is provided with a rounded rib or bead, centrally arranged on the edge, and the other of which is provided with a correspondingly-rounded channel, as herein shown and described.

No. 163,027.

No. 163,027. PROCESSES OF BREWING. Emil H. Wiegand, Philadelphia, Pa., assignor to Jos. Fleischmeyer, same place. [Filed Sept. 30, 1874.]

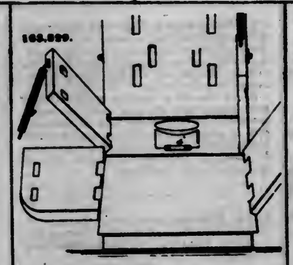


Brief.—After the first stages are completed in the process of brewing malt liquor, the partly-fermented liquor is conveyed from one deep vessel to another, and then to final fermentation in a shallow vessel.

The process described of subjecting the liquor obtained directly from the hop-vat A to primary fermentation in a comparatively deep vessel, D, and then to final fermentation in a shallow vessel or vessels, E, as and for the purpose set forth.

No. 163,028. APPARATUS FOR VARIEGATING SOAP. George C. Wenzel, Newburg, N. Y. [Filed Mar. 23, 1875.]

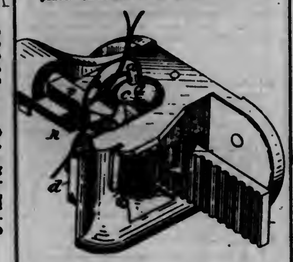
Brief.—Two or more vessels for containing soaps of different colors are fitted with pistons. The soaps are driven through pipes, and are intermixed by means of the perforated pipes contained in the separate mixing-chamber. The inner mixing-pipe turns within the outer one by means of a handle.



The adjustable gate, consisting of the annular perforated tubes C and D, with handle F, in combination with the tubes b' b^2 b^3 on the inside of the tube D, for the purpose of mixing colored soaps in different streams, and to regulate the relative quantity of the different kinds of colored soap, substantially as specified.

No. 163,029. FRACTURE-BOXES. Christn. Westerkamp, Cincinnati, Ohio. [Filed Aug. 6, 1874.]

Brief.—A hinged piece adjusts by means of a set-screw and nut in the bottom of a box, having hinged sides and foot-rests. The hinged foot-board is secured by two coil-springs, and is furnished with both rectangular and circular openings, through which cords and bandages may be passed.



No. 163,029.

1. In combination with the hinged sides and foot-rest, the hinged piece i, adjustable by means of the set-screw and nut, as and for the purposes set forth.

2. The hinged foot-board, held by the springs e e, and furnished with rectangular and circular holes, as and for the purposes set forth.

No. 163,030. GRAIN-BINDERS. John H. Whitney, St. Louis, Mo., assignor to Sumner & Whitney Manufacturing Company, same place. [Filed Nov. 18, 1874.]

1. A twister for grain-binders, consisting of the rotating shaft C, having attached rigidly thereto the eccentric spindle a, provided with a laterally-projecting finger or lip, b, the whole being constructed to operate substantially as described.

2. The clamping device, consisting of the stationary pin c and the spring lever or jaw d, the latter being pivoted eccentrically to the pin c, whereby the wire is held tight when drawn in one direction, and released when drawn in the opposite direction, as set forth.

3. The finger b, pin c, and conical headed roller a, all constructed and arranged to operate as described.

4. The shaft C, provided with the rigidly-attached spindle a, finger b, incline f, and cutting-lip e, in combination with the stationary lip c and the clamping device c d, all constructed to operate substantially as described.

No. 163,031. HARVESTER-RAKES. John H. Whitney, St. Louis, Mo., assignor to Sumner & Whitney Manufacturing Company, same place. [Filed Nov. 17, 1874.]

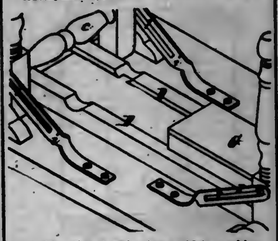
1. The series of rods c, each having a series of teeth, e, rigidly attached, with a guiding-arm, a, said rods c being attached to an endless canvas, A, arranged to carry the same, and cause the arm a to travel in the groove b, substantially as and for the purpose set forth.

2. The canvas A, provided with the slots f, in combination with the grooved roll C and the tilting or pivoted teeth e, all constructed to operate as set forth.

3. In combination with the canvas A, provided with the pivoted rods c and their teeth, the rods B arranged to support the grain and deliver it from the platform while the teeth are being drawn down out of the grain, in the manner shown and described.

4. The adjustable bearings or blocks I, provided with the projections e, in combination with the tilting rake-teeth e, substantially as set forth.

No. 163,032.



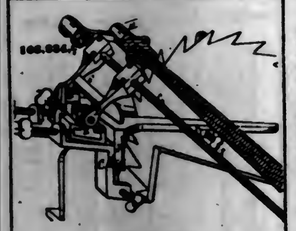
No. 163,032. CHAINS AND WHEELS FOR TRANSMITTING POWER. John H. Whitney, St. Louis, Mo., assignor to Sumner & Whitney Manufacturing Company, same place. [Filed Nov. 20, 1874.]

Brief.—A chain composed of a series of flat bar-links, one of which has oblong holes in its ends, the next provided with studs projecting from its sides, which fit into the holes of the first. The wheel is composed of two disks, each provided with polygonal solid hub, having radial projections equal to the length of the links.

1. A chain composed of the links H and I, constructed to operate substantially as described.

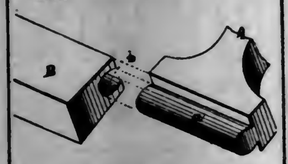
2. The wheel A, provided with the projections C, arranged alternately on opposite sides, substantially as shown and described, whereby it is adapted for use in combination with the links H and I, as set forth.

No. 163,033. FOLDING TABLES. Geo. H. Williams, Albany, N. Y. [Filed Apr. 7, 1875.]



1. The slotted spring-braces f h in combination with the pivoted legs of a table, constructed to operate substantially as described.

2. The pivoted legs B C, with their cross-bars c d, in combination with the longitudinally-sliding drawer G, the cross-bars being arranged so as to confine it in place when the legs are folded, substantially as set forth.



No. 163,034. SAW-FILING MACHINES. James A. Wilcox and Edmund D. Noble, Spring Lake, Mich. [Filed Oct. 21, 1874.]

1. The combination, with the angle-plate C, of the adjustable plate D, having dovetailed ways, in which the reversible tool-carrier H is secured, said tool-carrier having pivoted to it the frame F, carrying the filing attachment, as and for the purpose set forth.

2. The combination, with the angle-plate C, of the pivoted plate J, having arms J' J', bearings i, and adjusting-screws h h, as and for the purpose set forth.

163,995. RAILWAY-RAMMER HEADS. M. A. J. Wimpee, Rome, Ga. [Filed Mar. 10, 1875.]

In combination with the rammer A, provided with the dovetail tongue *a*, the removable head B, having a groove, *b*, which corresponds to and embraces said tongue, substantially as and for the purpose specified.

REISSUES.

6,441. HEATING-STOVES. Albert Brown, Troy, N. Y., assignor, by mesne assignments, to D. R. Paris and Sweet, Quimby & Parry, same place. Patent No. 84,943, dated May 21, 1867; reissue No. 5,906, dated Aug. 4, 1874. [Filed Jan. 9, 1875.]

Brief.—The magazine is attached to the bottom of the oven, which depends from the top of the stove.

1. In combination with the combustion-chamber of a base-burning stove, a fuel-reservoir or supply-chamber located directly under an oven depending within the stove, substantially as described.

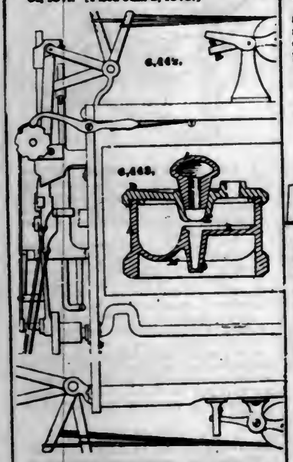
2. The combination of a fuel-reservoir or fuel-supplying chamber with the combustion-chamber of a base-burning stove, its fire-pot, and an oven suspended from the top of the stove in direct communication with the combustion-chamber.

3. The combination of an oven and a fuel-reservoir or fuel-supplying chamber with the combustion-chamber of a base-burning stove and a fire-pot, the fuel-reservoir or fuel-supplying chamber being removable and suspended within the stove in contact with the products of combustion.

4. An oven of a heater or stove provided with an opening or aperture to receive a boiler, in combination with an open-mouthed fuel-supplying reservoir or supply-chamber intervening between the oven and fire-pot, and disconnected therefrom.

5. The combination of an oven constructed to receive and support a rack or slide with the fuel supply reservoir, arranged within a heating stove, and interposed between the oven and the fire-pot, the reservoir being disconnected from the fire-pot.

6. An oven of a heater or stove provided with an opening or aperture to receive a boiler, and a rack for supporting pans or other articles, in combination with an open-mouthed fuel supplying reservoir or supply-chamber interposed between the oven and the fire-pot, and disconnected therefrom.



6,442. HARNESS-MOTIONS FOR LOOMS. G. Crompton, Worcester, Mass. Patent No. 99,972, dated Nov. 27, 1866. [Filed May 10, 1875.]

1. The combination, with the frame of the loom, and with cords for moving the harness-frames, of adjustable sheaves at the bottom and at the top of the loom, over which the cords pass, to permit the adjustment of the harness-frames and cording, substantially as described.

2. In combination, the sheaves, the pivoted frame, and mechanism for adjusting the position of the sheaves and frames, substantially as described.

3. In combination, a lifter and depressor, jacks, and elbow or angular levers connected with the jacks, and notched for adjustment of the harness or heddle cords, the latter extending from the elbow or angular levers to the harness-frames, substantially as described.

6,443. INKSTANDS. Samuel Darling, Providence, R. I. Patent No. 111,435, dated Jan. 31, 1871. [Filed Jan. 9, 1875.]

1. The combination, in an inkstand, of an ink-reservoir, an elevated dipping-cup within the reservoir, and an ink-receiving recess in the upper part, substantially as described.

2. The combination, in an inkstand, of an ink-reservoir and a pen-gage, such gage consisting of a cup or chamber and a deep narrow cavity leading downward from the bottom of this cup or chamber, the upper end of said cavity, which opens into the cup, being made smaller than the width of an ordinary writing-pen, when the height of the walls surrounding the cup or chamber regulates the amount of ink to be taken upon the pen, substantially as described.

3. The combination, in an ink-stand, of an ink-reservoir, a central dipping-orifice or tube, an ink-receiving recess in the upper part surrounding the dipping-orifice, and a cork-hole, the lower opening of the dipping-orifice being larger than an ordinary writing-pen, and above the ink when in use, substantially as described, and for the purpose herein set forth.

4. The combination, in an ink-stand, of an ink-reservoir, a central dipping-orifice, an ink-receiving recess in the upper part, and a deep narrow cavity in the lower part, substantially as described and herein set forth.

5. The combination, in an inkstand, of an ink-reservoir, a central dipping-orifice, a deep narrow cavity in the lower part, and an external recess under the bottom surrounding a central leg, which leg contains said deep cavity, substantially as described, and for the purpose herein set forth.

6. The combination, in an inkstand, of an ink-reservoir and an elastic stopper, such stopper having an air-chamber in its upper part or head, and a small air-duct through the lower part, which is inserted into the inkstand, thus providing a free passage for air from the chamber in the head of the stopper to the interior of the reservoir, substantially as described.

6,444. IRON BRIDGES. James B. Eads, St. Louis, Mo. Patent No. 142,361, dated Sept. 2, 1873. [Filed May 10, 1875.]

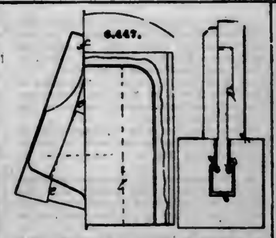
1. The combination of two arches joined together end to end, so that each constitutes one-half of a single span or complete rib of a roof or bridge, when each of said arches is combined with a system of bracing under or on the concave side of the arch.

2. The bracing C C, when used beneath an arch jointed at the center, and to the abutments, in combination with the longitudinal members B B, for the purpose set forth.

3. The longitudinal member or counter-arch B, when combined with the half-span arch A and bracing C, constituting one-half of a jointed arch or rib of a bridge, for the purpose set forth.

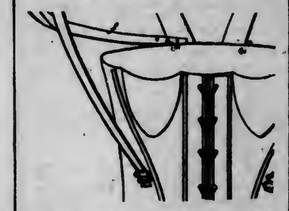
6,445. IRON BRIDGES. James B. Eads, St. Louis, Mo. Patent No. 142,361, dated Sept. 2, 1873. [Filed May 10, 1875.]

The within-described method of bracing the arches of a bow-string girder, the bracing being secured under each half-arch of the span, as described, and performing its functions independently of the chords or ties which resist the thrust or spread of said arches.



6,446. IRON BRIDGES. James B. Eads, St. Louis, Mo. Patent No. 142,361, dated Sept. 2, 1873. [Filed May 10, 1875.]

The bridge-pier, composed of columns C C, inclined and joined together in pairs, the planes of said pairs being located in the line of, or parallel with, the thrust of the arch.

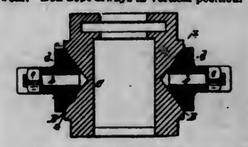


6,447. BEDSTEAD-FASTENINGS. William H. Elliot, New York, N. Y. Patent No. 93,193, dated Aug. 3, 1869. [Filed Aug. 17, 1874.]

1. In a bedstead-fastening, a tenon provided with shoulders at each end, the shoulders on the post end of the tenon being diagonal, in combination with a side rail having a shouldered mortise, and a post having a mortise with diagonal shoulders, the shoulders of the mortises in both post and rail being formed out of the material of the said parts, substantially as and for the purpose set forth.

2. A side rail having a tenon attached thereto, provided with diagonal shoulders *c'*, in combination with a post having diagonal shoulders *c* forming a component part of said post, the surfaces of the diagonal shoulders of the post and tenon being tangential to each other, substantially as and for the purpose set forth.

6,448. CORSETS. Lavinia H. Fuy, New Haven, Conn. Patent No. 30,906, dated Sept. 18, 1860. [Filed May 6, 1874.]



1. The combination, with the body or waist part A, having its lower part A' cut out, as described, and as seen in Fig. 4 at *a a*, of a semicircular piece, C, Fig. 5, substantially as and for the purposes set forth.

2. The combination, with the lower edge of the waist or body part A, of a semicircular dress and skirt supporting rim C, the parts of which are cut separately from the body part and in semicircular form, as described, and as shown or indicated in Fig. 5, substantially as and for the purposes stated.

3. The combination, with the waist A and straps E E, of detachable shoulder-braces F.

6,449. CAR-AXLE BOXES. A. A. Freeman, Philadelphia, Pa. Patent No. 63,379, dated Apr. 2, 1867. [Filed Apr. 20, 1875.]

Brief.—Easily-detachable guides, creating only minimum of friction, and provided with extension-pads, separating them from the hangers. Successive layers compensate for wear. Box kept always in vertical position.

1. The combination of V-shaped guides B B with the hanger A and box C, substantially as and for the purpose set forth.

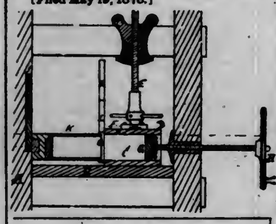
2. The bolts *b b*, in combination with the rib *c* on each leg of the hanger, and recess or channel *d* in the guides, substantially as and for the purpose set forth.

3. The combination, with the legs of the hanger A, of the V-shaped guides B B, bolts *b b*, nuts *c c*, and strips *e*, substantially as and for the purpose set forth.

6,450. THILL-COUPLINGS. Geo. G. Larkin, Exeter, N. H. Patent No. 62,430, dated Sept. 22, 1866. [Filed Apr. 3, 1875.]

Brief.—Head of screw presented toward eye of thill-iron and recessed for holding anti-rattling pad.

1. The combination, with a carriage-shackle, of the disk *c*, formed with a screw threaded shank, *g*, working in the front of the clip *a*, and against the rear of the eye of the shaft-iron, or other intervening substance, substantially as and for the purposes described



2. The combination, with a carriage-shackle, of the disk *c*, having the shank *g*, arranged and operating as described, and a pad or cushion, *n*, as herein set forth.

6,451. PROCESSES FOR PRESERVING MEATS. William C. Marshall, New York, N. Y., assignor to Arthur A. Libby, Chicago, Ill. Patent No. 43,516, dated July 12, 1864. [Filed May 19, 1875.]

1. The process herein described for packing and preserving meats, the same consisting in subjecting the meat, after it has been exposed to preserving processes, as described, to a heavy pressure and packing, and hermetically sealing the so compressed meat in packages or boxes, substantially as and for the purpose herein set forth.

2. As a new article of manufacture, the above-described compressed meat, preserved in solid form, without disintegration or desiccation, in hermetically-sealed packages, substantially as herein set forth.

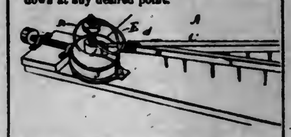
6,452. APPARATUS FOR PRESERVING MEAT. William C. Marshall, New York, N. Y., assignor to Arthur A. Libby, Chicago, Ill. Patent No. 43,516, dated July 12, 1864. [Filed May 19, 1875.]

1. The press-box C, with the movable screw-top D, follower G, and hinged end I, in combination, constructed and operating substantially as and for the purpose herein shown.

2. The frame I, in combination with the package K and press-box C, in the manner and for the purpose substantially as herein set forth.

6,453. ARGAND GAS-BURNERS. Edwin R. Walker, New York, N. Y., assignor to E. P. Gleason, same place. Patent No. 72,344, dated Dec. 17, 1867. [Filed Apr. 2, 1873.]

Brief.—The disk or plate prevents the hissing sound.



1. In an argand gas burner, the combination of the plate or valve and the inlet, as and for the purpose described

2. In an argand gas burner, the combination of the screw, the plate, and the inlet, as and for the purpose described.

3. In an argand gas burner, the combination and arrangement of the plate or valve with the inlet by means of ribs, projections, or devices, by which the inlet is left slightly open when the valve is shut, for a small supply of gas to pass, as and for the purpose described

6,454. RAKES FOR HARVESTERS. John H Mears, Oshkosh, Wis., assignor, by mesne assignments, to Reuben Hoffheins. Patent No. 94,594, dated Mar. 4, 1863. [Filed Feb. 16, 1875.]

Brief.—The rake-arm is hinged to the bevel-wheel, by which it is revolved. It is held down to the platform by a cam-guide supported upon the vertical axis, and is guided during the non-raking part of the revolution by a second guide, in a nearly vertical position. The vertical axis is adjustable to make the rake come down at any desired point.

1. A a continuously-revolving rake, combined with a controlling guideway, which is adjustable around the center of revolution, to cause said rake to come down upon the platform at any point desired.

2. The standard B around which the rake-driving gearing revolves, in combination with the guideway E affixed to and supported by said standard.

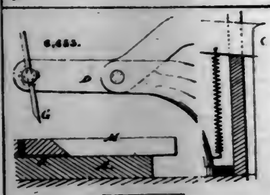
3. In combination with the rake-driving mechanism, the shield J, to cover and protect the same, as set forth.

4. In combination with a rake rotating on a stationary vertical axis, an upper stationary guideway or cam, E, for the purpose of guiding or controlling the rake in its rotation, to cause said rake to be forced down from an upright or vertical position to a horizontal position on the platform of a harvester, and retain said rake in that position until, in its movement, it has swept the grain from the said platform.

5. The combination of an upper guideway or cam, E, with a lower guideway or cam, D, and a rake continously revolving on a vertical stationary axis.

6. In combination with a continuously-revolving rake hinged to its driving mechanism, the cam-guide D around the outer side of the axis of rotation, and formed so that, after the rake has passed over the platform in a horizontal position, it will be adjusted successively to a vertical position, and again to a horizontal position, as set forth.

7. Combined with the rake C the detachable rake I, substantially as set forth.



8. The combination with the wheel F having the rake-arm hinged thereto, the stationary standard or spindle B, which forms a center for the rake's rotation, and the guideway D E, arranged for joint operation, substantially as shown and described.

6,455. MACHINES FOR TUNING KEYS OF MUSICAL INSTRUMENTS. Milon Pratt, Deep River, Conn., assignor to himself and Pratt, Read & Co., same place. Patent No. 159,498, dated Nov. 3, 1874. [Filed Mar. 20, 1875.]

Brief.—The wood remaining upon piano or organ keys, after the pieces known as "sharps" have been removed, is trimmed off by means of a chisel or cutting-tool adjustably attached to the end of a lever pivoted on a curved slotted standard, and operating in connection with a subjacently-recessed guide, upon which the key-board is placed.

1. The combination, with platform A and guide N, of a beveling cutter, G, as and for the purpose specified.

2. The lever D fulcrumed in a post, C, holding the cutter G at one end, and connected at the other with a treadle, as and for the purpose set forth.

6,455. SPINDLES FOR SPINNING-MACHINES. Francis J. Rabbeth, Pawtucket, R. I., and John B. Atwood, Willimantic, Conn., assignors, by mesne assignments, to Francis J. Rabbeth and Paine, Jenks & Sons. Patent No. 63,561, dated Apr. 2, 1867. [Filed Jan. 26, 1875.]

Brief.—The spindle is provided with a tubular whirl, which extends down around the bolster, which extends some distance above the rail, and supports the spindle, and also extends below the rail, and is provided with a step for the spindle. The top of the whirl is provided with pins, which engage and assist in driving the bobbin. Passages through the whirl-tube allow oil to be supplied to the oil-cup for lubricating the spindle.

1. In combination, the tube B' and bolster B, projecting upward, as described, the live spindle A, which extends above the bolster for receiving the bobbin, and the sleeve D', which encircles the bolster, is connected with the spindle above the bolster, and sustains and drives the bobbin.

2. The combination, with a tube having a step and a bolster for a spindle, of the flanged bracket provided with bolt-holes, substantially as described, whereby the tube and the several parts sustained by it may be readily adjusted on a spindle-rail.

3. The bolster B and the oil-box B', closed at its lower end, and surrounding the spindle, in combination with the spindle A, and annular oil-reservoir C surrounding it at the top of the bolster, and provided with the return-passage *a*, substantially as described.

4. The combination of the oil-chamber, the spindle, and the sleeved whirl, having the lateral oiling-passage *d*, substantially as described, whereby, without lifting the whirl or spindle, oil may be readily supplied.

5. The combination of the sleeved whirl, having the lateral oiling-passage, with a movable guard for closing said oil-passage.

6. In combination with the spindle and tube, the set-screw F and packing K, substantially as described.

7. The spindle A and oil-box B', in combination with the bolster B, provided with the oil-passage *a*, and the oil-cup C, provided with the slot *a*, substantially as described.

8. The combination of the oil-box B', surrounding the spindle, and closed at the bottom, the bolster B, the spindle A, and the oil cup C, provided with the slot *a*, substantially as described.

6,457. PACKING-MACHINES. Alex. Ralph, Philadelphia, Pa. Patent No. 142,601, dated Sept. 9, 1873. [Filed Apr. 8, 1875.]

1. In a packing-machine, the combination of a hopper, A, a feed-screw, F, a feed-spout, I, and a yielding package-carrier, J, as shown and described.

2. The shaft C, in combination with the cone friction-pulleys D E, for the purpose shown and described.

3. The shaft C, pulleys D E, gear-wheels G H, and the screw F, as shown and described.

4. The combination of the hopper A, shaft C, cone-pulleys D E, agitators C', screw F, and the gear-wheels G H, as and for the purpose shown and described.

5. The follower J, when constructed as shown and described.

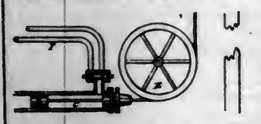
6. The screw F, carrier J, and the weighted lever P, as shown.

7. The shifting bar S, in combination with the clutch-lever T and the trip-rod V, as shown.

8. The shifting bar S, in combination with the clutch-lever T, trip-rod V, weighted lever P, and the friction-cones D E, as shown.

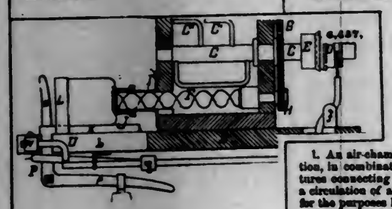
9. The shifting-bar S, in combination with the clutch-lever T, friction-cones D E, and the weighted lever U, as shown.

10. The former X, in combination with the form retainer Y, as shown



6,458. CIGAR-BOXES. Charles A. Stecke, New York, N. Y., assignor to himself and Augustus Wannack, same place. Patent No. 156,127, dated Dec. 22, 1874. [Filed Apr. 24, 1875.]

A metal cigar-box that is provided with a supplemental branding surface of wood, pasteboard, or other suitable material, to receive the manufacturer's brand, substantially as specified.



6,459. HYDRAULIC ELEVATORS. Timothy Stebbins, San Francisco, Cal. Patent No. 139,624, dated June 3, 1873. [Filed May 14, 1875.]

Brief.—The cylinder is placed in a horizontal position. To economize space and avoid the liability of the rigid rod to bend, substitutes for it a flexible piston-rod, made of steel wire, of a size adapted to the load.

The horizontal cylinder A, in combination with the flexible piston-rod C, attached directly to the piston B, and the large pulleys E and platform, arranged and operated as shown and described.

6,460. PLATFORMS FOR STOVES. Newark Tea-Tray Company, Newark, N. J., assignees, by mesne assignments, of Clark Brownell. Patent No. 106,773, dated July 26, 1870. [Filed Feb. 1, 1875.]

6,457.

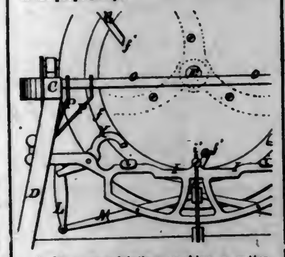
6,460.

1. An air-chamber beneath the central portion, in combination with one or more apertures connecting therewith, adapted to allow a circulation of air in such chamber, as and for the purposes herein specified.

2. In connection with an air space or chamber, the combination of one or more apertures in or near the base, and one or more apertures in or near the top, to cause the air to circulate through the space by reason of its heat, substantially as specified.

3. A flat surface, upon which the stove-legs rest, in combination with a higher central portion, affording a deeper space for defending against heat, substantially as herein specified.

4. In combination with a stove-platform, a dome or elevated central part, constructed as described, so as to be capable of attachment or removal at will, substantially as and for the purposes described.



5. In combination with a stove-platform, a lining of sheet metal, cement, or any analogous non-conducting material, substantially as described.

6. The combination of a metallic upper surface, having an air-space beneath, with a flanged molded edge extending downward from such upper surface or body, substantially as specified.

7. A metallic body or upper surface, and a flange or edge extending downward therefrom, inclosing an air-space under the central portion, in combination with internal supports beneath the body, upon which the weight of the stove rests, substantially as described.

6,461. STAVE-JOINTERS. John J. Relyea, Cleveland, Ohio. Patent No. 126,702, dated May 13, 1873. [Filed Feb. 17, 1873.]

Brief.—A revolving wheel having a slightly concave face is provided with suitable cutting-bits. The stave is secured upon an oscillating table, and pressed against the face of the wheel until the cutters have reduced it to the proper shape.

1. In a stave-jointing machine, a cutter-wheel having its sides made smooth and uniform by means of sheet-metal covering-plates, substantially as and for the purpose shown.

2. In a stave-jointing machine, a cutter-wheel made concave, and provided upon its outer face with a ridge, which intersects the cutter-openings, substantially as and for the purpose set forth.

3. In combination with the frame I, suspended from or by means of the link-bars P and P, the arms I' and I', shaft R, and arms Q and Q, all constructed to operate in the manner and for the purpose substantially as shown and described.

4. In combination with the frame I, provided with the bearings *i i* and *i'*, the clamps K and K, bars L and L, levers M and M, and treadle N, substantially as and for the purpose specified.

6,462. PLANE-IRONS. John J. Relya, Cleveland, Ohio. Patent No. 126,703, dated May 13, 1873. [Filed Feb. 17, 1875.]

Brief.—Wood can be smoothly dressed, regardless of the irregularity of its grain, by means of a plane-iron provided upon its front side with a longitudinally-adjustable cap, which at its forward end has an angle of ninety degrees with relation to the outer face of the iron.

In combination with a cutting-blade or plane-iron, a cap, which, at its forward end, has an angle of ninety degrees with relation to the outer face of said blade, substantially as and for the purpose specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 22. TUESDAY, JUNE 1, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DECISIONS OF THE COURTS.

SUPREME COURT OF THE UNITED STATES.

THE UNION PAPER-COLLAR COMPANY, APPELLANTS, *vs.* ISAAC VAN DEUSEN, JOHN VAN DEUSEN, AND HENRY BOEHMER, PARTNERS, AS VAN DEUSEN, BOEHMER & CO.

[*Appeal from the Circuit Court of the United States for the Southern District of New York.—Decided at the October term*, 1874.]

The purpose of a reissue is to render effectual the actual invention for which the original patent should have been granted—not to introduce new features.

Therefore, in an application for reissue, parol testimony is not admissible to enlarge the scope of the invention beyond what was described, suggested, or substantially indicated in the original specification, drawings, or Patent-Office model.

Whether a reissued patent is for the same invention as the original depends upon whether the specification and drawings of the reissued patent are substantially the same as those of the original; and, if not, whether the omissions or additions are or are not greater than the law allows to cure the defect of the original.

Where the original patent for improvement in paper shirt-collars, granted to Andrew A. Evans, May 26, 1863, stated the invention to consist, first, in making the collars of parchment-paper, or paper prepared with animal-sizing; and, second, in coating one or both sides of the collar with a thin varnish of bleached shellac to give smoothness, strength, and stiffness, and to repel moisture, the claim being for "a shirt-collar made of parchment-paper, and coated with varnish of bleached shellac, substantially as described, and for the objects specified:" *Held*, that a reissue thereof which describes a paper other than parchment-paper, or one prepared with animal-sizing, and which does not require either side of the collars to be coated with a varnish of bleached shellac for any purpose, the claim being for "a collar made of long-fiber paper, substantially such as is above described," is for a different invention from that embodied in the original patent.

Articles of manufacture may be new in the commercial sense when they are not new in the sense of the patent law.

New articles of commerce are not patentable as new manufactures unless it appears in the given case that the production of the new article involved the exercise of invention or discovery beyond what was necessary to construct the apparatus for its manufacture.

It appearing that the collars made by Evans, apart from the paper composing them, were identical in form, structure, and arrangement with collars previously made of linen, paper of different quality, and of other fabrics, and that Evans did not invent the special paper used by him, nor the process by which it was obtained: *Held*, that he was not entitled to a patent for the collars as a new manufacture.

The relations of employer and employé, in regard to the origin of inventions, stated.

The object in turning down a collar on a curved line instead of a straight line is precisely the same, whether the collar be all paper, paper and linen, or all linen. Hence, where it appeared that linen collars had been turned over on a curved line to prevent wrinkling, and to afford space for the cravat: *Held*, that it was not patentable to apply the same mode of turning down to collars of paper or paper and linen.

Reissued patent of Andrew A. Evans for "Improvement in Paper Shirt-Collars," July 10, 1866, (original May 26, 1863,) and of Solomon S. Gray, March 29, 1864, (original June 23, 1863,) pronounced invalid.

[The opinion of the circuit court, embodying the reasons for the decision from which this cause was appealed to the Supreme Court, will be found reported in the OFFICIAL GAZETTE, vol. II, 361; in 10 Blatchf., 109; and in 5 Fisher, 597.]

[*O. A. Seward*, for appellant.
J. J. Coombe and *E. Wetmore*, for appellees.]

Mr. Justice CLIFFORD delivered the opinion of the court.

Patents may be granted for a new manufacture, as well as for a new and useful art, machine, or composition of matter, if it appears that the manufacture is both new and useful, and that the applicant who desires to obtain the exclusive property therein is the original and first inventor or discoverer of the improvement. Such a patent also, if inoperative or invalid for either of the reasons stated in the thirteenth section of the patent act, may, if the error arose from inadvertence, accident, or mistake, and without any fraudulent or deceptive intention, be surrendered; and, in that event, the Commissioner may cause a new patent to be issued

for the same invention for the residue of the period then unexpired for which the original patent was granted. (5 Stat. at Large, 122.)

Matters embraced in the pleadings not in controversy will be passed over without comment. Seven of the patents described in the bill of complaint are of that character, which leaves but two for re-examination. Certain of the patents were adjudged invalid, in respect of which there is no assignment of error by the complainants, and certain other patents were adjudged valid, and, the respondents not having appealed from the decree, the question of their validity is not open to re examination. Two other patents were surrendered by the complainants and reissued during the litigation, for the infringement of which no profits or damages can be recovered in this suit. Stripped of all such matters the case presents two principal questions for decision: First, whether the reissued patent granted to Andrew A. Evans for improvement in paper shirt-collars is a valid patent. Second, whether the reissued patent originally granted to Solomon S. Gray for improvements in turn-over shirt-collars is a valid patent.

Usually the question of infringement also arises in such controversies; but that question is closed in this case in favor of complainants by the admission of the respondents.

Proofs were taken on both sides, and the circuit court entered a decree that the two patents in issue here are invalid, and the complainants appealed to this court. Since the appeal was entered here the complainants have filed the following assignment of errors:

1. That the circuit court erred in its decision that Evans was not the inventor of his patented product, and in its decree that the reissued patent therefor "is not a valid patent."

2. That the circuit court erred in its decision that Gray's invention was anticipated by prior inventions, and in its decree that the reissued patent therefor "is not a valid patent."

Two answers are made to the first assignment of errors:

I. That the reissued patent of Evans is not for the same invention as the original, which, if true, is sufficient to show that the patent is invalid, even if the patentee was the original and first inventor of the improvement described in the original patent.

Power to surrender patents for the purpose suggested in the act of Congress implies that the specification may be corrected to the extent necessary to cure the defects and to supply deficiencies to render the patent operative and valid; but the interpolation of new features, ingredients, or devices which were neither described, suggested, nor substantially indicated in the specification, drawings, or Patent Office model were never allowed; and by a recent act of Congress it is provided that no new matter shall be introduced into the specification, nor, in the case of a machine patent, shall the model or drawings be amended, except each by the other. (16 Stat. at Large, 206.)

Repeated decisions also have established the rule that parol testimony is not admissible, in an application for a reissued patent, to enlarge the scope and effect of the invention beyond what was described, suggested, or substantially indicated in the original specification, drawings, or Patent-Office model, as the purpose of a surrender and reissue is not to introduce new features, ingredients, or devices, but to render effectual the actual invention for which the original patent should have been granted.

Unless, however, it is apparent upon the face of the new patent that the Commissioner has exceeded his authority, his decision is final and conclusive, as the jurisdiction to reissue patents is vested in him, subject to a single exception, that if there is such repugnancy between the old and the new patent that it must be held, as a matter of legal construction, that the reissued patent is not for the same invention as that embraced and secured in the original patent, then the reissued patent is invalid.

Whether a reissued patent is for the same invention as the surrendered original, or for a different one, must very largely be determined by a comparison of the two instruments, as the decision must necessarily depend upon the question whether the specifications and drawings of the reissued patent are not substantially the same as those of the original; and if not, whether the omissions or additions are or are not greater than the law allows to cure the defects of the original specification.

Before describing the nature of his invention, the patentee in this case admits that he is aware that shirt-collars have been made of a fabric composed of paper and woven cloth prepared in a peculiar manner, and that collars of an indifferent character have been made of the ordinary kinds of paper; but the former, as he states, are expensive, and have a coarse appearance, and that the latter are too fragile to admit of a suitable button-hole, or to be of much utility as a shirt-collar.

His invention, as he states, consists of two features: First, in making shirt-collars of a fabric known to the trade as parchment-paper, or paper prepared with animal-sizing, which may be manufactured cheaper than a fabric composed of paper and cloth, and is sufficiently tough and strong to form tenacious button-holes, and is susceptible of a smoother surface and polish than cloth-paper, and may be turned over without cracking or forming a roughened edge. Second, in coating one or both sides of paper shirt-collars with a thin varnish of bleached shellac, which not only adds smoothness, strength, and stiffness to the fabric, but, being a repellent of water, it also prevents perspiration or other moisture from entering the fabric of the collar, and renders the surface of the paper so hard and smooth that it wears much longer without being soiled by being exposed to dust or dampness.

Specific directions are then given by the patentee as to the manner of dressing the described fabric before it is manufactured into shirt-collars, as follows: First take the parchment-paper, or paper prepared with animal-sizing, and cover one or both sides of it with thin varnish of bleached shellac, and allow it to dry. Then pass the paper through the polishing rollers, such as are in general use for polishing paper or cloth, and then the fabric is ready to be cut into collars; and the button-holes may be punched by dies with great rapidity.

Instead of that, the representation of *the reissued patent* is that the alleged inventor discovered, as the result of his experiments, that, in order to produce a really good collar, the paper used for the fabric must possess sufficient strength, without excessive thickness, to destroy the resemblance to linen, and sufficient tenacity, toughness, and pliability to allow the collar to be folded upon itself without cracking at the fold, with the pureness of color and necessary polish to resemble starched linen.

Shirt-collars of the kind described he made, as represented in the specification of the reissued patent, out of a paper which he produced or caused to be produced, in which he combined those qualities, which paper was made of a long fiber, substantially, in that respect, like bank-note paper, and of about the same thickness as an ordinary shirt-collar, and of a pure shade or color, such as to resemble starched linen. By means of the length of the fiber of the material he was enabled, as the representation is, to obtain from the specified degree of thickness the requisite degree of strength, tenacity, and pliability to make a collar practically useful for wear without interfering with the resemblance in appearance to a linen collar, and the representation is that he found a sample of the paper which was suitable, and that he used it, and filed it with his original application for a patent.

Particular description is also given of the means the inventor employs to produce paper possessing the requisite qualities for such a manufacture, as follows: What is known as hard stock, it is said, must be used in larger proportion than is required for other descriptions of paper, except for that which is known as bank-note paper, and in the process of pulping the stock that dull knives should be used, and that the knives or beaters and the mode of their striking the knife-bar should be so arranged as to draw out the pulp, instead of chopping it short, constituting what is known as the long-beating process, which should be continued for a great length of time, so that the fiber shall be not only long but fine, the effect of which will be to make the paper stronger and smoother, and to bed the fiber in the thickness of the paper, so as not to mar the surface.

Two modes of manufacturing the pulped stock into paper are then described, as follows:

1. If worked upon a cylinder machine, the representation is that the paper may be run off in two or more sheets of pulp, which may be united as they run from the machines—and pass together one over and the other under the pressure-rolls—into one sheet of the required thickness; or one sheet may be first run off upon a reel, and then united in the same manner with another sheet running from the cylinder, and both passing under the rolls together. Preference, however, is given by the patentee to the former mode, for the reason that the several sheets are, in that case, of equal degrees of moisture, and therefore form, in that state, a more perfect union; and he adds that great care must be taken to expel the moisture from the pulp in case a single sheet is used in that mode of manufacture, as the thickness and length of fiber tend to retain the dampness.

2. Such paper, it is said, may also be made of the required thickness from a single sheet of pulp in case a Fourdrinier machine is used; but the representation is that the wire on which the pulp is formed should be supplied with extra suction-boxes to remove the water, and that its forward motion should be much slower than in the manufacture of the ordinary paper; but the lateral or vibratory motion of the wire should be even more rapid than usual, in order to afford greater time and motion for extracting the moisture from the pulp. Care should also be used to give to the paper in the pulp the slight bluish tinge which is found in starched linen, and to prevent its having a dead or yellowish-white color.

Instruments so widely different can hardly be compared within the usual meaning and ordinary application of that word, as they really have substantially nothing in common, so far as respects the description of the invention which they respectively profess to secure. Examples where the difference between the original and reissued patents is as manifest as in this case may, perhaps, arise, but none such were referred to in the argument of such a striking character, nor are any such within the recollection of the court where the difference between the reissued and original patents is so pervading as in the case in decision.

Wide differences in that regard were exhibited in a case recently decided by this court; but they were by no means as striking and unmistakable as those disclosed in this record. (*Gill* vs. *Wells*, 6 OFFICIAL GAZETTE, 836.) Here the dissimilarity extends to every part of the description of the invention. There it had respect only to one of the elements of the patented combination. Attempt was made in that case to emasculate the combination described in the original patent by leaving out one of the material elements in order to give the exclusive right a more comprehensive effect in prosecuting suits for infringement; but in the case before the court the reissued patent is different throughout from the invention embodied in the original patent.

Proof of that proposition is found also in the respective claims of the patents, as well as in the respective specifications. "What I claim as new and desire to secure by letters patent," says the original patentee, "is a shirt collar made of parchment-paper and coated with varnish of bleached shellac;" but the patentee of the reissued patent claims as an article of new manufacture a collar made of long-fiber paper, without referring to a coating of any kind; nor is the question affected in the least by the fact that the claim of the respective patents concludes with the phrase "substantially as described," because the description of what is claimed, as given in the respective specifications, is even more widely different than the claims of the respective patents.

Instead of the phrase employed in the claim of the original patent, the specification to which it refers states that the nature of the invention consists, first, in making shirt-collars of a fabric known to the trade as parchment paper, or paper prepared with animal-sizing; and, second, in coating one or both sides of paper shirt-collars with a thin varnish of bleached shellac, which, as there represented, not only adds smoothness, strength, and stiffness to the fabric, but also, being a repellent of water, prevents perspiration or other moisture from entering the collar.

Nor will any attempt to construe the claim of the reissued patent by the specification have any tendency to remove the difficulty in the way of the complainants, as the specification is to the same effect as the claim, and shows conclusively that the manufacture there described is a collar made of long-fiber paper, manufactured in the manner and by the means therein minutely

described; that the paper there described is not the parchment-paper described in the specification of the original patent; nor is it paper prepared with animal-sizing; nor does the specification or claim of the reissued patent contemplate or require that either side of the collars shall be coated with varnish of bleached shellac for any purpose. Animal-sizing, according to that patent, may be *used* or it may be *omitted*, and one or both sides of the paper may be covered with a thin varnish of bleached shellac, or such a coating may be *omitted* altogether, which shows that those two requirements of the original patent are not a material part of the invention embodied in the reissued patent.

Authorities to support the proposition that a reissued patent is invalid if not for the same invention as the surrendered original is scarcely necessary, as the rule is universally acknowledged. (*Gill* vs. *Wells*, 6 OFFICIAL GAZETTE, 886.)

II. Suppose, however, the two may be so construed as to obviate that objection to the reissued patent, still the second defence of the respondents remains to be considered, that the patentee in the original patent is not the original and first inventor of the alleged improvement.

Usually the patent, when introduced, is *prima facie* evidence to support the affirmative of that issue; but the representations of the specification may be such as to afford satisfactory proof that the alleged invention is neither new nor useful. Equivalent views were expressed by the circuit court in disposing of the question involved in the present issue, and in those views the court here entirely concurs. (*Same case*, 10 Blatch., 119.)

Nothing was known to the supposed inventor respecting paper made of long fiber when he obtained his original patent, except that he previously found, as he states in his reissued patent, a sample of it ready made, suitable for such a purpose, and that he used it and filed it with his original application for a patent. Where he found it does not appear, nor does it appear for what purpose he used it, except that he filed it in the Patent Office. He does not even state that the original patentee knew who made it, nor that he had any knowledge of the process by which it was made. Viewed in any reasonable light, the narration shows that the sample was made by another, and not by the supposed inventor, and it affords a strong ground of presumption that he knew nothing respecting the process of manufacturing such paper, or of the constituents of the manufacture, except what is a matter of common knowledge.

Hard stock, it is now said, must be used in larger proportions than is required for other descriptions of paper, and that the pulp must be subjected for a greater length of time to the long-beating process, so that the fiber shall be not only long but fine, in order that the paper may be strong, smooth, and even, and that the fiber shall become bedded in the thickness of the paper, so as not to mar the surface. Neither of such requirements or conditions was contained in the original specification, from which it may be inferred that the original invention did not include the discovery of the constituents of the paper to be used for the purpose, nor the process by which the paper was to be manufactured. Conclusive support to that proposition is found in the specification of the original patent, in which the patentee states that he takes the parchment-paper known to the trade, or paper prepared with animal-sizing, and covers one or both sides of it with thin varnish of bleached shellac, and having allowed it to dry, the paper is then passed between polishing-rollers, such as are in general use for polishing paper or cloth, which operation finishes the fabric, ready to be made into collars.

Enough appears in these suggestions to show that the specification of the original patent does not describe the process of making paper possessing the qualities of long fiber paper, but the making of collars out of parchment-paper, showing that the discovery that for a good paper collar the manufacturer must have paper which possesses the qualities of long-fiber paper is a subsequent discovery. Nor does the statement in the reissued specification that he produced such a paper, or caused it to be produced, strengthen the case for the complainants, because the same specification states, in effect, that he found a sample of such paper suitable for the purpose, and that he used it and filed it with his original application, showing conclusively that the paper existed prior to his supposed invention.

Improvements in the manufacture of paper have often been made, and it may be that the discovery at that period of the constituents for making such paper, or of the process by which paper possessing the described properties could be produced, would have been the proper subject of a patent. Sufficient appears to show that the patentee learned from his experiments that he wanted paper of the qualities described in the reissued patent, and the evidence proves that he said so to the paper-manufacturer; but it is clear that he did not communicate any information to the manufacturer respecting the process by which such paper could be produced, nor did he give the manufacturer any directions upon the subject. Information of the kind he could not communicate for the best possible reason, which is that he was utterly destitute of any knowledge as to the constituents of such paper or the process by which it could be manufactured. Such paper was eventually produced by the manufacturer, to whom the patentee applied to make the attempt, after many experiments as to the character of the materials suited to the end, and as to the mode of operation best adapted to effect the desired result, without any assistance whatever from the patentee.

Good paper collars may unquestionably be manufactured from that product; but it is nevertheless true that the patentee is not entitled to a patent for the collars as a new manufacture for several reasons:

1. Because he did not invent either the product or the process by which the product is obtained.

2. Because the collars, apart from the paper of which they are made, are identical in form, structure, and arrangement with the collars previously made of linen, paper of different quality, and other fabrics.

3. Because it appears that the patentee is not the original and first inventor either of the paper or the process by which the paper is made, or of the collar which is denominated a new manufacture.

Articles of manufacture may be new in the commercial sense when they are not new in the sense of the patent law. New articles of commerce are not patentable as new manufactures, unless it appears in the given case that the production of the new article involved the exercise of invention or discovery beyond what was necessary to construct the apparatus for its manufacture or production. (*Glue Co.* vs. *Upton*, 6 OFFICIAL GAZETTE, 840.)

Nothing short of invention or discovery will support a patent for a manufacture any more than for an art, machine, or composition of matter, for which proposition there is abundant authority in the decisions of this court. *Hotchkiss* vs. *Greenwood*, 11 How., 265. *Philips* vs. *Page*, 24 How., 167. *Jones* vs. *Morehead*, 1 Wall., 162. *Simpson* vs. *Woodman*, 10 Wall, 121.)

Suffice it to say that it is not pretended that the original patentee invented either the paper or the process; but the claim in argument is that he was the first person to conceive the idea that paper possessing the described qualities was desirable for the purpose of making such collars, and that, inasmuch as he was not a paper-manufacturer, he had a right to employ trained skill to produce the desired product, and that he, under the circumstances, should be regarded as the actual inventor because he made known to the manufacturer that paper of such qualities would be useful, and because he employed the manufacturer to engage in the effort to produce the desired article; but the patentee communicated no information to the manufacturer as to the constituents or ingredients to be used, or as to the mode of operation by which they were to be compounded in order to produce the desired result.

Where a person has discovered a new and useful principle in a machine, manufacture, or composition of matter, he may employ other persons to assist in carrying out that principle, and if they, in the course of experiments arising from that employment, make discoveries ancillary to the plan and preconceived design of the employer, such suggested improvements are, in general, to be regarded as the property of the party who discovered the original principle, and they may be embodied in his patent as part of his invention.

Doubt upon that subject cannot be entertained; but persons employed as much as employers are entitled to their own independent inventions; and, if the suggestions communicated constitute the whole substance of the improvement, the rule is otherwise, and the patent, if granted to the employer, is invalid, because the real invention or discovery belongs to the person who made the suggestions. (*Agawam Co.* vs. *Jordan*, 7 Wall., 602.)

Apply that rule to the present case, and it is clear that the original patentee was not entitled to a patent either for the paper or the process, as he never made any invention or discovery upon the subject.

Remark respecting the other patent granted to the same party is quite unnecessary, as it is admitted that it falls within the same rule as the preceding patent, and for the additional reason that the decision of the circuit court in that regard is not assigned for error.

III. Two principal defenses are set up by the respondents to the charge made against them that they have infringed the reissued patent of Solomon S. Gray, as set forth in the bill of complaint: First, that the patentee is not the original and first inventor of the improvement. Second, that the alleged invention had been in open and public use, and on sale in this country, for more than two years, with the consent and allowance of the supposed inventor, before he filed his application for a patent.

Three claims are contained in the reissued patent, substantially as follows:

1. The turning over of a paper or a paper-and-cloth collar by a defined line, whether pressed into the material by a die or pointed instrument, or by bending it over the edge of a pattern or block of the proper curve or line, substantially as described.
2. So turning the part B of a paper or paper-and-cloth collar over toward the part A in a curved or angular line instead of a straight line, substantially as and for the purpose described.
3. So turning the part B onto or toward the part A, in the manner described, as that a space shall be left between the two parts;

which, it is admitted, is substantially the same as the second claim, in consequence of which those two claims will be considered together.

Collars of paper or paper and cloth, if turned over on a defined line, are covered by the first claim, whether the line is curved, angular, or straight, and whether the line is made or pressed into the fabric by a die or any pointed instrument, or marked or effected by bending the material over the edge of a pattern or block of the proper or preferred line or curve. Evidently, therefore, it is intended to cover collars turned over on a defined line, effected in any possible manner or by any practicable means, if made of paper or paper and cloth. Shirt-collars are turned over or down on a curved line, in order to prevent the collars from puckering or wrinkling when bent in a circle, and in order to cause the part turned over or down to set out a little from the band portion of the same, so as to admit a neck-tie between the band and the part of the collar which is turned over.

Manifestly these objects are precisely the same, whether the collar be all paper, paper and cloth, or all linen. Hence it is difficult to perceive upon what ground it can be held that any change in the manner of turning down a collar on a curved line, if made of any one of these fabrics, is patentable, if collars of either of the other fabrics have been turned down before in the same manner and precisely for the same purpose.

Evidence is exhibited which shows that many years before the patent was granted in this case paper envelopes and the tops and bottoms of paper boxes were produced by shapers of steel pressed on the material so as to produce defined lines by which the material could be folded. Satisfactory proof is also exhibited that collars made of paper and cloth were, several years earlier than the date of this invention, folded over a piece of metal in a straight line, which is the same process as that described in the specification of this patent, as it appears that the material was bent over a pattern or block to give the proposed curve or line.

Plenary evidence is also exhibited showing that linen collars were ironed on blocks, with a groove in the block, by which the collar received a defined line for the folding, which accomplished the same purpose as the pattern or block.

Proofs were also exhibited showing that paper collars, long before the alleged invention under consideration, were folded by laying upon the unfinished side of the same a piece of tin, having at one edge the required curve, which enabled the manipulator to accomplish the same object by pressing upward over such a curve a part of the collar, so as to mark the line of the curve and crease the paper preparatory to turning the collar over, which enabled the laundress to accomplish the

same object as the means described in the specification of the patent.

Support to the answer is also derived from the proofs that linen collars had for years been turned over in a curved line, and for the very purpose described, which is to prevent wrinkling and to afford space for the cravat.

Taken as a whole, the proofs in this regard are conclusive that the patentee is not the original and first inventor of the patented improvement described in either of the claims of his patent.

Decree affirmed.

SUPREME COURT OF THE UNITED STATES.

JAMES F. DANE, WILLIAM WESTLAKE, AND JOHN P. COVERT, APPELLANTS, *vs.* THE CHICAGO MANUFACTURING COMPANY.

[*In equity.—On appeal from the Circuit Court of the United States for the Northern District of Illinois.—October term, 1874.*]

The invention claimed in the reissue (November 23, 1869,) of the letters patent for an improvement in lanterns, granted to William Westlake, April 26, 1864, is the adaptation to a globe-lantern of a wire guard, removable at pleasure, the top of which is a band or ring sufficiently large for the globe to be passed through it, and which is separated from the top of the globe by a disk, to which it is connected by fastenings that allow the said parts (the disk and guard) to be detached at pleasure, so as to permit the removal of the globe.

The combination of old devices, which constitutes the invention set forth in the Westlake patent, is anticipated by the English patent to Isaac Evans in 1861.

[*L. L. Bond*, for appellants.
No appearance for appellee.]

Mr. Justice BRADLEY delivered the opinion of the court.

This case comes before us under peculiar circumstances. The appellants were complainants below, and filed a bill as assignees of William Westlake of certain letters patent granted to him April 26, 1864, for an improvement in lanterns, for which they obtained a reissued patent November 23, 1869. The bill was dismissed, on what ground does not appear. The defendants have not appeared to contest this appeal. We are left to ascertain as best we can, with such aid as the appellants' counsel has given us, the real merits of the controversy.

The nature and objects of the alleged invention are described by the patentee as follows:

> The nature and objects of my invention consist in the construction of lantern-guards without hooks, projections, or catches sticking out and interfering with the safe and convenient use of the lanterns, and so that the same can be readily attached or detached; in the employment of band or disk to fill or cover the space between the enlarged band or ring at the upper end of the guard and the top of the globe; and in the application of suitable fastenings to secure the dome to the guard.

In other words, the improvement claimed is the adaptation to a globe-lantern of a wire guard, removable at pleasure, the top of which is a band or ring sufficiently large for the globe to be passed through it, and which is separated from the top of the globe by a disk, to which it is connected by fastenings that allow the said parts (the disk and guard) to be detached at pleasure, so as to permit the removal of the globe. The object of the disk is said to be to cover the space between the top of the guard and the top of the globe, and to hold the latter, which it is important should be contracted at the top. It is stated that the fastenings referred to may be any suitable fastenings to secure the dome or disk to the guard; spring-catches being specifically described for the purpose, but any proper fastenings being admissible.

The reissued patent originally contained three claims, as follows:

> 1. The lantern-guard *a*, constructed entire without hinge or joint, so that, as a whole, it can be readily attached to or removed from the lantern, as set forth.
> 2. The disk *g*, in combination with the ring or band *b* of the guard and fastenings *e*, substantially as and for the purposes specified.
> 3. The guard *a*, in combination with the disk *g*, fastenings *e*, and removable globe *d*, substantially as specified.

The letters in these claims refer to the drawings, but the parts designated will be really understood from the foregoing description.

The first claim, which was for the removable guard alone, was afterward surrendered by a formal disclaimer filed in the Patent Office April 12, 1871.

The other two claims are for combinations; but the disk, designated in the drawings by the letter *g*, and being the disk before mentioned as being used to fill or cover the space between the circular top of the guard and the contracted top of the globe, and to hold the latter in place, is the central and important element in each combination. In the second claim it is combined with the top ring or band of the guard and the fastenings that connect them; in the third it is combined with the guard, the fastenings, and the removable globe. But in both all these elements are pre-supposed and implied. The idea of the guard is never dissevered from the circular ring or band which forms its top, and the guard and disk are never dissociated from the globe with its contracted top and capacity of removal. It is a globe-lantern with the globe removable and contracted at top, to which the improved guard, with its enlarged and circular top, and the attendant intervening disk, are adapted, and for which they are constructed. This is what the patentee in substance says, and what, indeed, is essential to make his claim to invention even plausible.

From the evidence before us it appears that when Westlake applied for his patent in March, 1864, all the elements of his improvement were well known. Butterfield's lantern, patented in 1855, and Lamport's, presented to the Patent Office for a patent in 1858, both had removable guards with bands at the top, and contracted-topped globes, the guards being so constructed, however, as to open like a jacket, and thus to be removed from the lantern. But the top of the guard, when in place, fitted closely around the top of the globe, and, therefore, there was no place or occasion for a disk between the guard and the globe, as in Westlake's lantern.

In Canning's lantern and in Max Miller's, both presented for patents, and the latter patented in 1858, there was a nearer approach to Westlake's. They had a guard with an enlarged top, consisting of a circular ring, large enough to allow the globe to be removed through the same; and this top was connected by fastenings (bayonet-fastenings are exhibited) with the dome, the bottom of which was spread out like a broad flat bell, and might have served the purpose of the disk in Westlake's lantern, had it been admissible or required. But in these lanterns, the top of the globe not being

contracted, as in Westlake's, it filled the top of the guard, and left no intervening space for a disk between them. With this exception—namely, that the top of the globe was not contracted—the difference between the lanterns of Canning and Max Miller, and that of Westlake, was very slight. And as globes with contracted tops were not new, it may be deemed somewhat doubtful whether the application of such globes to these lanterns (Westlake's being little more than this) was entitled to the merit of invention, and therefore patentable.

In Waters' lantern, patented in 1855, there was a globe with a contracted top, such as is employed by Westlake; and said top was inserted for support in the lower part of the dome, around which a narrow flange spread outwardly (somewhat like Westlake's disk) far enough to receive, in small apertures, the wires of the guard, the tops of which (not being connected by a ring or band) were inserted therein directly. But although the dome could be detached from the wires by pressing them inwardly, and lifting the dome off from them, and thus give room for removing the globe, yet, as the parts were arranged, this could not be done conveniently; and, in fact, the globe was not removed from the top of the guard, but the latter was detached at the bottom, and lifted off from the globe, when it was desired to have access to the latter.

In none of the lanterns thus far adverted to was there fully exhibited and applied a disk described in Westlake's patent, used for the same purpose as in his, although the germ of it was seen in Waters' lantern, and an adaptable equivalent for it in Canning's and Max Miller's. But Westlake, in his testimony, admits that the disk was old at the time he made his invention, when used as a reflector in a conductor's lantern; and two English patents were put into the case, which exhibit it as used substantially in the same manner, and for the same purpose, that it is used in Westlake's lantern. The first was a patent granted to Graham Chappell in 1812, and the other to Isaac Evans in 1861. The use of the disk was somewhat similar in both of the lamps or lanterns described in these patents. That of Evans' will be more particularly adverted to.

Evans' lantern had an inner chimney, contracted at the top, an outer globe, and a guard, having a circular rim or band at the top. The disk was called in the patent a *crown-plate*, and filled and covered the space between the contracted top of the inner chimney and the outer globe, and between the latter and the top rim of the guard. It has some perforations to allow the air to pass upward between the chimney and globe. The specification says:

> Above the top of the outer glass cylinder *a*. (the globe,) and inside the upper ring, is placed a crown-plate, *l*, provided with a number of projecting flanges, which serve to keep the upper part of the outer and inner glass cylinders *a* and *b* in their places.

As this lantern was intended to be used in mines, the crown-plate was fastened to the top or rim of the guard by a screw, so as to obviate the danger of its being accidentally detached; but when it was detached and removed the globe and cylinder could also be removed through the top of the guard, or the latter could be removed from the lamp by detaching it from below. This crown-plate, therefore, seems to have served the precise office of Westlake's disk. Stetson, the complainants' expert, testifies as follows: "In Evans' patent, Exhibit No. 1, the equivalency of the guard is somewhat doubtful, but I think it is substantially the same as the guard claimed in the first claim of Westlake's patent. It has a glass chimney contracted at the top, within the globe, which is held in place by a disk supporting it at the top, and extending out to the ring at the top of the guard." This is a precise description of Westlake's disk. It is true the witness adds, "but the disk has holes for the circulation of air; the disk practically only fills the space between the small top of the lamp-chimney and the globe." But the fact that the disk had holes in it does not deteriorate from its importance as a disk to fill and cover the space between the chimney and the guard, and to hold the former as well as the globe in place. The witness admits that "if the small holes were made in the defendant's disk their lanterns would still infringe the second claim of the patent;" thus implying that the holes do not destroy the identity of the disk.

Smith, the defendant's expert, says: "This lantern, Exhibit 1, representing Evans' patent, has a guard so made that it may be separated from the top and from base of the lantern, all in one piece. The parts are screwed together instead of being held by catches, but it admits the entire removal of the dome from the guard just the same. There is a plate inside of the upper band of the guard which has flanges upon it to maintain the top of the globe and chimney, and this plate fills the entire space except so far as it is perforated. The globe can be raised through the top band of the guard. The guard in this Exhibit 1 is whole, and can be removed, not from the entire lantern any more than the guard in Exhibit B, (Westlake's,) but from the other parts of the lantern the same as the guard of Exhibit B. It cannot be removed from the other parts of the lantern as readily as the guard of Exhibit B, because it is screwed to the other parts, and cannot be unscrewed as readily as spring-catches can be worked.

"The lantern Exhibit 1 comes as completely within the first claim of the complainant's patent No. 3,747, marked complainants' Exhibit A, as the defendants lanterns do.

"The disk *g* is stated in the patent to be for filling and covering the space between the band and the top of the globe. There is such a disk in Exhibit 1, and it is the equivalent of disk *g*. The fastenings in the lantern Exhibit 1 for securing the disk to the guard, or the guard to the disk, are not like the fastenings *e* shown in the Patent No. 3,747, but they are equivalents for each other, because both specifications say that other fastenings may be used, and they both produce the same result and admit of the complete separation of the guard and disk, and in Evans' Exhibit 1 the globe can be removed.

"The combination claimed in the second claim of the Patent No. 3,747, Exhibit A, is substantially embodied in the lantern Exhibit 1, unless the claim embraces the guard *a*, removable, leaving an entire lantern.

"There is a loose globe in Exhibit 1, and it therefore substantially embodies the third claim; but there is a difference in construction between the lantern-guards."

This testimony seems to us to be corroborated by the patents and other exhibits; and from this it sufficiently appears that both the second and third claims of Westlake's patent are exemplified in Evans' lantern. It has

the combination of the disk, the band, and the fastenings specified in the second claim; and that of the guard, the disk, the fastenings, and the globe, specified in the third claim. While, therefore, it may be true that none of the lanterns referred to are equal to Westlake's in beauty of form or convenience of adaptation to the purpose for which it is intended, yet every part has been anticipated and used in some form or other for the very purposes and uses to which it is applied in Westlake's; and in Evans' lantern all the essential parts are brought together and used in the combinations claimed by the patentee. Of course, the combination might be new, and, if productive of new and useful results, and not a mere aggregation of results, might be the subject of a patent, though all the parts were used before. But here the combinations patented, as well as their separate elements, had been anticipated.

The decree is, therefore, affirmed.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date June 1, 1875.]

8,358.—Silk Fabrics.—JOSEPH COIGNET, New York, N. Y., assignor to HAMIL & BOOTH, same place. Application filed April 30, 1875. Term of patent 3½ years.

8,359 to 8,363, inclusive.—Inkstand-Supports.—CHARLES KITSCHELT, New York, N. Y., assignor to NICHOLAS MULLER'S SONS, same place.—Cases A, B, C, D, and E. Applications filed May 14, 1875. Term of patents 7 years.

8,364.—Fan.—NATHAN METZ, New York, N. Y. Application filed May 19, 1875. Term of patent 3½ years.

8,365.—Medal.—JOHN H. SCHREINER, Philadelphia, Pa. Application filed May 26, 1875. Term of patent 3½ years.

8,366.—Medal.—ISAAC TOWNSEND, Philadelphia, Pa. Application filed May 8, 1875. Term of patent 7 years.

8,367.—Cooking-Range.—NICHOLAS S. VEDDER and FRANCIS RITCHIE, Troy, N. Y., assignors to SWETT, QUIMBY & PERRY, same place. Application filed May 21, 1875. Term of patent 7 years.

8,368.—Vase.—JOSEPH W. FISKE, New York, N. Y. Application filed May 4, 1875. Term of patent 7 years.

8,369.—Fork-Handle.—JOSEPH F. FRADLEY, Brooklyn, N. Y. Case A. Application filed April 17, 1875. Term of patent 7 years.

8,370.—Spoon-Handle.—JOSEPH F. FRADLEY, Brooklyn, N. Y.—Case C. Application filed April 17, 1875. Term of patent 7 years.

8,371.—Lawyer's Badge.—SIMPSON L. HARMON, Batesville, Miss. Application filed February 12, 1875. Term of patent 7 years.

8,372.—Tea and Coffee Pots.—JAMES D. RICE, Philadelphia, Pa. Application filed April 28, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date June 1, 1875.]

2,601.—Blacking.—JOSEPH ANDREWS, New York, N. Y. Application filed May 18, 1875.
"word 'CENTENNIAL.'"

2,602.—Chisels, Plane-Irons, and other Light Edge-Tools.—BUCK BROTHERS, Millbury, Mass. Application filed May 24, 1875.
"representation of a buck's head."

2,603.—Crackers, Biscuits, Cakes, &c.—DAVID CARRICK & CO., Philadelphia, Pa. Application filed May 19, 1875.
"picture of a bell draped with the United States flag, the word 'Centennial,' and the figures '1776' and '1876.'"

2,604.—Flour.—LEONARD DAY & CO., Minneapolis, Minn.—Case A. Application filed May 8, 1875.
"word 'PALISADE.'"

2,605.—Flour.—LEONARD DAY & CO., Minneapolis, Minn.—Case B. Application filed May 8, 1875.
"words ROYAL ROSE."

2,606.—Flour.—LEONARD DAY & CO., Minneapolis, Minn.—Case C. Application filed May 8, 1875.
"word 'BISMARCK.'"

2,607.—Flour.—DAY, ROLLINS & CO., Minneapolis, Minn.—Case A. Application filed April 17, 1875.
"word 'Hercules.'"

2,608.—Flour.—DAY, ROLLINS & CO., Minneapolis, Minn.—Case B. Application filed April 5, 1875.
"words 'GOLD LEAF.'"

2,609.—Flour.—DAY, ROLLINS & CO., Minneapolis, Minn. Application filed April 17, 1875.
"word 'ORIENT.'"

2,610.—Flour.—DAY, ROLLINS & CO., Minneapolis, Minn.—Case D. Application filed April 17, 1875.
"words 'White Spray.'"

2,611.—Glass Lamp-Chimneys.—EXCELSIOR FLINT GLASS COMPANY, Pittsburg, Pa.—Case A. Application filed April 19, 1875.
"the star-symbol."

2,612.—Glass Lamp-Chimneys.—EXCELSIOR FLINT GLASS COMPANY, Pittsburg, Pa.—Case B. Application filed April 19, 1875.
"letters 'X L C R.'"

2,613.—Bitters.—THEODORE FILLETTE, New York, N. Y. Application filed May 22, 1875.
"the monogram 'F. S. W. T.,' in connection with the words 'Sherry Wine Tonic.'"

2,614.—Clay Pipes.—HOPKINS & ROBINSON MANUFACTURING COMPANY, Akron, Ohio. Application filed May 5, 1875.
"words 'Cream Pipes.'"

2,615.—Bolting-Cloths.—HUNTLEY, HOLCOMB & HEINE, Silver Creek, N. Y. Application filed May 10, 1875.
"words 'EXCELSIOR ANCHOR BOLTING-CLOTH.'"

2,616.—Composition for Printers' Inking-Rollers.—ISAAC L. JACKSON, New York, N. Y. Application filed May 21, 1875.
"words 'Eureka' and 'Isaac L. Jackson's transparent.'"

2,617.—Cigars, Cheroots, and Cigarettes.—FRANCIS S. KINNEY, New York, N. Y.—Case A. Application filed May 22, 1875.
"word 'CAPORAL.'"

2,618.—Cigars, Cheroots, Cigarettes, and Smoking-Tobacco.—FRANCIS S. KINNEY, New York, N. Y.—Case C. Application filed May 22, 1875.
"word 'DRAGOON.'"

2,619.—Ale, Porter, and Beer.—KOHLER & GEISKEN, Philadelphia, Pa. Application filed April 13, 1875.
"word 'CRYSTAL.'"

2,620.—Lager-Beer.—JOHN EMIL KUBELY, New York, N. Y. Application filed March 24, 1875.
"letters 'U' and 'S' and the words 'Centennial Lager-Bier.'"

2,621.—Medicine.—LAWSON CHEMICAL COMPANY, Cleveland, Ohio. Application filed January 25, 1875.
"a bottle having thereon the words 'Lawson's Curative,' the streams of lightning bearing the words 'Quick and Certain Relief,' and a human skeleton."

2,622.—Collars and Cuffs.—MEDBERY & MANN, Ballston Spa, N. Y. Application filed May 24, 1875.
"word-symbol 'JOHN HANCOCK.'"

2,623.—Collars and Cuffs.—MEDBERY & MANN, Ballston Spa, N. Y. Application filed May 24, 1875.
"word-symbol 'Seventy-Six.'"

2,624.—Steam-Heating Apparatus, Steam-Fittings, &c.—PANCOAST & MAULE, Philadelphia, Pa. Application filed April 24, 1875.
"a capital letter, A, having the central cross-bar V-shaped. Within the apex of the A is the smaller Gothic letter M, and on the left hand of the letter A, and a little above the line of M, is the letter O, and on the right hand of A is the letter E in a corresponding position. The three letters O M E are similar in size."

2,625.—Medicine.—RADWAY & CO., New York, N. Y. Application filed May 24, 1875.
"two oval devices used in conjunction and constituting a whole, one being attached to the top of a box containing our pills, and the other to the bottom."

2,626.—Medicinal Fluid Preparation.—RADWAY & CO., New York, N. Y. Application filed May 24, 1875.
"a combination of certain devices, words, and letters."

2,627.—Medicine.—RADWAY & CO., New York, N. Y. Application filed May 24, 1875.
"the devices, words, letters, and figures shown."

2,628.—Watches.—LOUIS STRASBURGER & CO., New York, N. Y.—Case B. Application filed April 30, 1875.
"words 'R. Lanier, Geneva,' with the figures of an arrow and two stars."

2,629.—Watches.—LOUIS STRASBURGER & CO., New York, N. Y.—Case C. Application filed April 30, 1875.
"letters and words 'James Picard, Geneva,' and the figure of a five-pointed star."

2,630.—Watches.—LOUIS STRASBURGER & CO., New York, N. Y.—Case D. Application filed April 30, 1875.
"letters and words 'P. H. Doret, Locle,' with the figure of a Maltese cross."

2,631.—Watches.—LOUIS STRASBURGER & CO., New York, N. Y.—Case E. Application filed April 30, 1875.
"letters and words 'Ph Doret, Locle,' with the figure of a crescent."

2,632.—Watches.—JOHN W. TUCKER, San Francisco, Cal.—Application filed May 22, 1875.
"words 'The Ladies' Friend' and the figure of a greyhound."

2,633.—Corsets.—UNITED STATES CORSET COMPANY, New York, N. Y. Application filed May 3, 1875.
"word 'CHARM.'"

2,634.—Soap.—ALBERT E. WHYLAND, New York, N. Y. Application filed May 15, 1875.
"words 'Big Bonanza.'"

2,635.—Tobacco, Cigars, and Snuff.—JESSE LAZEAR & CO., Baltimore, Md. Application filed May 24, 1875.
"words 'Amazon Brand' and the pictorial representation of a female warrior on a rearing horse defending herself with a javelin from the attack of a tiger."

LABELS REGISTERED DURING THE WEEK.

[Each Certificate bearing date June 3, 1875.]

253.—Title: **"Caution."**—BENJAMIN F. BADGER, Charlestown, Mass. Application filed May 28, 1875.

254.—Title: **"Donovan's Rheumatic Liniment."**—MICHAEL HENRY DONOVAN and WILLIAM FRANCIS DONOVAN, Weymouth, Mass.

[Certificate bearing date June 7, 1875.]

255.—Title: **"Stringer's Pulmonic Syrup."**—Mrs. JOHN STRINGER, New York, N. Y. Application filed June 1, 1875.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

BOUND VOLUMES OF PATENTS.

The bound volumes of patents, containing the specifications and drawings of patents in full from May 30, 1871, to within a few months of date, may be consulted at the following places:

Astor Library, New York city.
American Society Civil Engineers, New York city.
Bronson Library, Waterbury, Ct.
Court of Appeals, Syracuse, N. Y.
Cooper Union Library, New York city.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., May 19, 1875.

On the petition of ANN JENNETTE HATHAWAY, of Milwaukee, Wis., executrix of JOSHUA HATHAWAY, deceased, authorized by act of Congress approved February 18, 1875, praying for the extension of a patent granted to the said JOSHUA HATHAWAY, on the 3d day of April, 1860, for an Improvement in Devices for Converting Reciprocating into Rotary Motion,

It is ordered that the testimony in the case be closed on the 20th day of July next; that the time for filing arguments and the Examiner's report be limited to the 30th day of July next; and that said petition be heard on the 4th day of August next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

INDEX OF INVENTIONS PATENTED JUNE 1, 1875.

	Class No.	No. of Patent.
Alarm, burglar, J. Andrews	24	163,960
Amalgamator, W. H. Carson	3	163,847
Anchor, J. S. Williams	138	164,065
Bale tie, J. S. Carson, (reissue)	7	6,462
Balnster, P. J. Hardy	4	163,993
Battery, flume, D. F. Hawkes	3	163,887
Bed bottom, spring, J. Wagner	62	163,902
Bedstead fastening, W. H. Elliot	62	163,982
Belting, machine, C. A. Jewell	81	164,002
Billiard table, H. W. Collender, (reissue)	143	6,469
Binder, temporary, Pelroe and Foye	15	164,030
Bird cage hook, extension, V. Balcom	24	163,909
Bit stock, D. F. Sutton	29	163,896
Boat propelling mechanism, T. W. Pratt	139	164,033
Boiler, wash, W. P. Casperson	91	163,916
Boot and shoe heels and soles, manufacture of, J. J. Sawin	16	163,948
Bridge, metallic arch, J. B. Eads	21	163,854
Buckle for suspenders, A. Shenfield, (reissue)	23	6,474
Burner, gas, W. J. Herriott	64	163,929
Burner, lamp, A. Kimber	90	164,006
Butter package, J. C. Tilton	45	163,899
Button holes in cloth, leather, &c., machine for cutting, J. D. Westgate	38	163,904
Car brake, F. L. Kirtley	122	164,007
Car brake, F. L. Kirtley	122	164,009
Car coupling, B. S. Kearney	122	163,931
Car coupling, J. McNabb	122	164,017
Car coupling, O. L. Taylor	122	163,897
Car coupling, automatic, J. Miller	122	164,020
Car heater and ventilator, J. Amory	154	163,908
Car, refrigerating, R. Armiger	58	163,961
Car starter, A. H. Smith	122	164,049
Car starter, F. Stafford	122	163,895
Carpet stretcher and tack driver, combined, G. A. Alger	62	163,907
Carriage tops, slat iron for, F. B. Plumb	34	163,885
Casting hollow articles of cement, apparatus for, L. A. Tartière	20	164,057
Cement, apparatus for casting hollow articles of, L. A. Tartière	20	164,057
Chain links, device for welding, P. H. Standish	60	163 949
Chair, adjustable and reversible, Voth and Hyatt	62	163,953
Chair, folding, J. E. Wakefield	62	164,060
Chair, folding, J. A. Ware	62	164,061
Chronometers, watches, &c., regulating, L. Eaton	36	163,981
Chuck for metal drills, G. M. Pratt	100	164,032
Churn, reciprocating, Price and Hoover	45	164,034
Clock, pendulum, V. Himmer	86	163 868
Clothes drier, W. Bloomer	91	163,972
Clothes drier, E. S. Heath	91	163,918
Coat patterns, apparatus for laying out, Z. Bauer	38	163,911
Cocoanut for domestic use, preparing, A. P. Ashbourne	38	163,962
Columns and pilasters, construction of, P. J. Hardy	4	163,994
Columns, construction of marble, P. J. Hardy	4	163,995
Compass, mariner's, D. Baker	50	163,836
Compass, mariner's, D. Baker	50	163,837
Compass, mariner's, D. Baker	50	163,838
Compass, mariner's, D. Baker	50	163,839
Compass, mariner's, D. Baker	50	163,840
Cooler, beer, A. Roos	19	164,040
Cooler, milk, R. Smith	45	164,048
Corset, H. G. Emery	60	163,983
Culinary steamer, H. M. Welch	154	164,063
Cultivator, A. Dart	43	163,921
Doll, paper, W. H. Hart, Jr.	143	163 866
Drills, chuck for metal, G. M. Pratt	100	164 032
Elevator, water, Hoag and Junkerman	118	163,999
Emery to metal surfaces, applying, S. G. Morrison	70	163 880
Engines, injector or ejector for steam, G. H. Little	150	163,876
Exercising apparatus, G. W. Wood	143	163,957
Exhaust, variable, Leseur and Michel	148	163 934
Fabrics, machine for tentering, W. H. Palmer, Jr.	37	164,026
Feather renovator, H. E. Rowe	62	163,889
Fence, barbed wire, Watkins and Scutt	52	163,955
Fence, farm, W. E. Cary	52	163,848
Fence post, J. E. Warren	52	163,954
Fifth-wheel, C. B. Wood	31	164,067
Fire kindler, W. C. Philbrick, (reissue)	154	6,472
Fish hook, E. L. Dunlap	143	163,980
Flour dressing machine, G. Smith	57	164,050
Fruit drier, H. E. Bidwell	48	163,968
Furnace, air heating, S. W. Davenport	154	163,978
Furnace grate bar, J. Clark	149	163,975
Fuses, slow match for lighting, A. S. Wall	124	163,903
Game apparatus, C. L. Browne	143	163 945
Gas regulator, D. P. Mayhew	64	163,937
Gas retort, J. C. Tiffany	66	164,058
Grading apparatus, E. Church	51	163,849
Graining roller, A. J. Taplin	54	164,056
Guns, feed case for machine, D. C. Farrington	105	163,922
Hame and horse collar, combined, E. Stroud	72	163,950
Hand rail, P. J. Hardy	4	163 996
Harrow, A. Ross	73	164,042
Harrow, corn, J. McCormick	73	164,013
Harvester, S. S. Stults	74	164,055
Hat, A. A. Richardson	76	164,036
Hat fastening, C. R. Blackwood	76	163 913
Heater and condenser, J. E. Coughlin	147	163,917
Hoe, H. D. Mills	141	164,021
Hoe, D. and E. Moore	141	164,023
Hold-back, J. V. Phillips	31	163,884
Horseshoe, C. Hartmann	60	163,997
Horseshoe bars, roll for rolling and creasing, H. H. Gilmore	60	163,864
Horseshoe calks, die for forming spurs on, J. Palmer	60	163 892
Horseshoes, die for creasing, W. Russell	60	164,044
Horseshoes, machine for bending, A. Barton	60	163,841
House, wooden, M. Rogers	30	163,898
Ice, storing and removing, A. Hunt	79	164,001
Index, C. H. Bradley	15	163,973
Indicator, station, C. A. Blomquist	120	163,844
Indicator, station, S. P. Littlefield	120	163,936
Injector, W. P. Patton	148	164,037
Insect powder injector, A. Meyer	63	163,877
Iron and steel, apparatus for manufacturing, J. B. Pearse	85	164,029
Jack, lifting, J. C. Bird	79	163,969
Journal, stud, or crank pin, O. E. Seymour	87	163,892
Knitted trimming, G. M. Gernshym	89	163,985
Ladder, extensible, W. B. Elliott	30	163 856
Lamp, C. McKinnon	90	164,016
Lathes, cutter holder for metal, J. R. Mitchell	100	163,878
Laundry polish, C. L. Holland	91	163,669
Leather work, machine for forming and driving staples for, T. K. Reed	92	164,010
Letter and picture block, D. Birmeli	143	163,912
Letter box, A. Rosenstjerna	146	164,041
Locomotives, &c., cylinder cock for, C. H. Hopkins (reissue)	94	6,464
Loom for weaving tubular fabrics, J. E. Gillespie	95	163,925
Loom heddle frame, H. Parsons, (reissue)	95	6,466
Marble, manufacture of artificial, Cowman and Barber	153	163,977
Marble to building purposes, application of, F. J. Hardy	153	163,990
Mats, making wooden, J. M. Hall	56	163,926
Match box, E. S. Burchett	90	163 846
Measure and funnel, J. D. Humphrey	133	164 000
Mirror, A. Huber	62	163,930
Motor, electric, C. J. B. Gaume	50	163,924
Mucilage holder, H. T. Cushman	146	163,919
Music holder, sheet, B. J. Beck	102	163,966
Music recorder, automatic, G. Landrien	102	163,932
Music stand, folding, E. A. White	62	163,905
Package holder, G. Lewinson	146	163,935
Painting with soluble silicates, base for colors in, Thielepape and Kroeschell	107	163,898
Paper box, L. A. Kettle	109	164,005
Paper, machine for planishing, W. E. Lockwood, (reissue)	108	6,470
Paper pulp, wood grinder for, J. O. Gregg	108	163,926
Paper pulp, wood grinder for, A. M. Zimmer	104	163,958
Pencil attachment, slate, J. Poznanski	146	163,886
Pessary, J. Kean	156	163,871
Piano attachment, A. Steinway	112	164,052
Piano attachment, A. Steinway	112	164,053
Piano attachment, A. Steinway	112	164,054
Pictures, apparatus for viewing, E. S. Ritchie	54	163,946
Pipes, device or clamp for stopping leaks in water and other, J. B. Peake	167	164,028
Planter, hand corn, J. Beers	133	163 967
Plow, H. Olson	114	164,025
Plow iron, Moore and Curkendall	114	164 022
Plow, reversible, J. McCabe	114	164,014
Pot scraper, U. Cramer	88	163,918
Poultry coop, F. M. Blanc	116	163,971
Press, cider, H. Sells	19	164,045
Press, cotton, E. Van Winkle	7	163,900
Printers' leads, machine for cutting, Hawkins and Dodge	117	163,998
Pump, chain, C. Fishbaugh	118	163,859
Pump, chain, G. Fishbaugh	118	163,860
Pump for deep wells, J. T. Whipple, (reissue)	118	6,477
Railroad crossing signal, King and Nunn	120	163 875
Railroad rail joint, W. M. Spacht	120	164,051
Railroad signaling apparatus, circuit and circuit closer for, H. W. Spang, (reissue)	120	6,476
Rake, horse, J. Pennypacker, (reissue)	77	6,471
Roof, cement, I. Mills, Jr.	126	163,938
Rope traction way, endless, A. S. Hallidie	127	163,865
Sash balance, T. I. Dale	24	163,920
Sash balance, E. Johnson	24	164,003
Sash balance, T. J. W. Robertson	24	164,038
Saw filing machine, W. B. Bissell	131	163,970
Saw for sawing stone, S. G. Morrison	131	163,879
Saw sharpening machine, P. D. Burgher	131	163,974
Saw sharpening machine, P. D. Burgher	131	164,068
Sawing machine, scroll, H. L. Beach	130	163 843
Scraper, road, E. A. Beach	51	163,842
Seeds, machine for moistening oleaginous, A. B. Lawther	26	163,933
Sewer trap, J. Naughton	8	164,024
Sewing machine, C. F. Bosworth, (reissue)	134	6,463
Sewing machine, C. F. Bosworth, (reissue)	134	6,467
Sewing machine cover, G. Rehfuss	134	164,043
Sewing machine embroidering attachment, L. M. Rose, (reissue)	134	6,473

	Class No.	No. of Patent.
Sewing machine for stitching straw, Smith and Ricker	134	164,047
Sewing machine thread tension device, J. Reece	134	164,035
Sheet iron, manufacture of, J. Ella	136	163,857

Stereotype plate holder, A. N. Kellogg	164	163,872
Stone-cutter's gage, E. R. Batcheider	153	163,910
Stone to building purposes, application of, P. J. Hardy	153	163,992
Stone to walls of buildings, application of, P. J. Hardy	153	163 989
Stove, J. Spear	154	164 046
Stove attachment, cooking, F. Enos	154	163,858
Stove, cooking, D. E. Paris, (reissue)	154	6,465
Stove, heating, P. J. Hardy	154	163,987
Stove, heating, P. J. Hardy	154	163,988
Stove, heating, L. B. Stuart	154	163,951
Stove, magazine fire-place, J. J. McCormick	154	164,015
Stove pipes, lid holding attachment to, Denman and Barfoot	88	163,852
Stove, reservoir cooking, D. E. Paris	154	163 883
Street mains, laying, A. O'Neill	167	163,942
Table and desk, combined, T. W. Moore	62	163,939
Table, extension, T. White	62	164,064
Table, ladies' work, C. R. Snyder, (reissue)	62	6,475
Tar, treating, T. H. Dunham	47	163,979
Telegraph, duplex, M. Gally	50	163,923
Telegraphs, station for submarine, R. F. Bradley	50	163,915
Thrashing machine band cutter, E. L. Beard	159	163,964
Tide power, T. Beche	82	163,965
Torpedo for oil wells, J. Taylor	124	163,952
Toy, cartesian, A. Demuth	143	163,851
Track clearer, S. G. Smith	120	163,893
Track scraper, S. A. Otis	120	163,943
Trunks, spring buffer for, E. N. Geer	162	163,863
Tubing, device for drawing and welding, G. Matheson	163	164,011
Type setting machine, A. C. Richards	117	164,037
Vessels, construction of, J. W. Norcross	137	163,941
Vessels, mast and sail for, J. W. Norcross	138	163,940
Vessels, steering gear for, D. Scattergood	137	163,890
Wagon axle, E. Balkema	31	163,963
Wagon bodies, stud for, C. Spencer	31	163,894
Wagon, side bar, M. Donnelly	31	163,853
Walls of buildings, covering for, P. J. Hardy	4	163,991
Wash bench and wringer, C. F. Hornbeck	91	163,870
Washing machine, Addison and Yates	91	163,906
Washing machine, Jones and Kidd	91	164,004
Washing machine, J. W. Melick	91	164,018
Washing machine, E. J. Robinson	91	163 947
Washing machine, J. Seaman	91	163,891
Water wheel, O. J. Bolliuger	168	163,914
Water wheel, J. P. Collins	168	163,850
Water wheel gate, J. M. Hart	168	163,927
Weed turner, Mowry and Chance	114	163,881
Wells, torpedo for oil, J. Taylor	124	163,952
Whiffletree, T. T. Furlong	31	163,862
Whiffletree hook and clip, I. N. Pyle	31	163,945
Whiffletree trace fastening, J. L. Wingate	31	163,956

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JUNE 1, 1875.

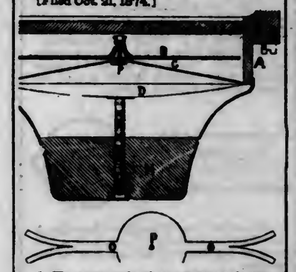
	Patent No.
Addison, T., and J. T. Yates, Washing machine	163,906
Alger, G. A., Combined carpet stretcher and tack driver	163,907
Allen, N. I., Spool	163,959
Alliger, R. D., assignee	164,023
American Button Hole Overseaming and Sewing Machine Company, assignee	164,043
Amory, J., Car heater and ventilator	163,908
Andrews, J., Burglar alarm	163 960
Armiger, R., Refrigerating car	163,961
Ashbourne, A. P., Preparing cocoa-nut for domestic use	163,962
Baker, D., Mariner's compass	163,836
Baker, D., Mariner's compass	163,837
Baker, D., Mariner's compass	163,838
Baker, D., Mariner's compass	163,839
Baker, D., Mariner's compass	163,840
Balcom, V., Extension bird cage hook	163,909
Balkema, E., Wagon axle	163,963
Barber and Cowman	163,977
Barfoot and Denman	163,852
Barton, A., Machine for bending horseshoes	163,841
Batcheider, E. R., Stone cutter's gage	163,910
Bauer, Z., Apparatus for laying out coat patterns	163,911
Beach, E. A., Road scraper	163,842
Beach, H. E., assignee	163,853
Beach, H. L., Scroll sawing machine	163,843
Beard, E. L., Band cutter for thrashing machines	163,964
Beche, P., Tide power	163,965
Beck, B. J., Sheet music holder	163,966
Beers, J., Hand corn planter	163 967
Bibb, R. C., assignee	164 015
Bidwell, H. E., Fruit drier	163,968
Bird, J. C., Lifting jack	163,969
Birmeli, D., Letter and picture block	163,912
Bizzell, W. B., Saw filing machine	163,970
Blanc, F. M., Poultry coop	163,971
Blomquist, C. A., Station indicator	163,844
Bloomer, W., Clothes drier	163,972
Bodwell, A. E., assignee	163,904
Bolliuger, O. J., Water wheel	163,914
Bosworth, C. F., Sewing machine, (reissue)	6,463
Bosworth, C. F., Sewing machine, (reissue)	6,467
Bradley, C. H., Index	163,973
Bradley, R. F., Station for submarine telegraphs	163 915
Brear, A., assignee	163,975
Brewster, J. B., & Co., assignees	163,885
Brown, F. H., assignee	163,892
Browne, C. L., Game apparatus	163,845
Burchett, E. S., Match box	163,846
Burgher, P. D., Saw sharpening machine	163,974
Burgher, P. D., Saw sharpening machine	164,068
Carson, J. S., Bale-tie, (reissue)	6,468
Carson, W. H., Amalgamator	163 847
Cary, W. E., Farm fence	163,848
Casperson, W. P., Wash boiler	163,916
Chance and Mowry	163,881
Child, S. S., assignee	164,027
Church, E., Grading apparatus	163,849
Clark, E., assignee	164,050
Clark, J., Furnace grate bar	163,975
Collender, H. W., Billiard table, (reissue)	6,469
Collins, J. P., Water wheel	163,850
Cook, J. C., Smoking tube	163,976
Coombs, R. T., assignee	163,901
Cornell, S., assignee	164,017
Coughlin, J. E., Heater and condenser	163,917
Cowman, J., and S. B. Barber, Manufacture of artificial marble	163,977
Cramer, U., Pot scraper	163,918
Crompton, G., assignee, (reissue)	6,466
Curkendall and Moore	164,022
Cushman, H. T., Mucilage holder	163,919
Dale, T. I., Sash balance	163,920
Dart, A., Cultivator	163,921
Davenport, S. W., Air heating furnace	163,978
Deere & Co., assignees	164 023
Demuth, A., Cartesian toy	163,851
Denman, W. S., and M. E. Barfoot, Lid for holding attachment to stove pipes	163 852
Dick, T. S., assignee	163,861
Dodge, T. A., assignee	163,925
Dodge and Hawkins	163,998
Donnelly, M., Side bar wagon	163,853
Downs, W. W., assignee	163,972
Draper, G., & Son, assignees	163,959
Dunham, T. H., Treating tar	163,979
Dunlap, E. L., Fish hook	163,980
Durand, F., assignee	163 951
Eads, J. B., Metallic arch bridge	163,854
Eastman, J. I., Shoe dressing	163,855
Eaton, L., Regulating chronometers, watches, &c	163,981
Elliot, W. H., Bedstead fastening	163,982
Elliott, W. B., Extensible ladder	163,856
Ella, J., Manufacture of sheet iron	163,857
Emery, H. G., Corset	163,983
Enos, F., Cooking stove attachment	163,858
Farrar, J. M., assignee	163 907
Farrington, D. C., Machine gun feed case	163,922
Fishbaugh, C., Chain pump	163,859
Fishbaugh, G., Chain pump	163,860
Fist, G. W., assignee	164,066
Fleishman, S. S., Shirt bosom	163,984
Ford, T. P., Swinging ship's berth	163,861
Foye and Pelroe	164 030
Furlong, T. T., Whiffletree	163,862
Gally, M., Duplex telegraph	163 923
Gaume, C. J. B., Electric motor	163,924
Geer, E. N., Spring buffer for trunks	163,863
Gernshym, G. M., Knitted trimming	163,985
Gillespie, J. E., Loom for weaving tubular fabrics	163,925
Gilmore, H. H., Roll for rolling and creasing horseshoe bars	163,864
Gregg, J. O., Wood grinder for paper pulp	163 926
Hall, J. M., Making wooden mats	163 986
Hallidie, A. S., Endless rope traction way	163,865
Hardee, W. H., assignee	163 970
Hardy, P. J., Heating stove	163 987
Hardy, P. J., Heating stove	163,988

	Patent No.
Hardy, P. J., Application of stones to walls of buildings	163,989
Hardy, P. J., Application of marble to building purposes	163,990
Hardy, P. J., Covering for walls of buildings	163,991
Hardy, P. J., Application of stone to building purposes	163,992
Hardy, P. J., Baluster	163,993
Hardy, P. J., Construction of columns and pilasters	163,994
Hardy, P. J., Construction of marble columns	163,995
Hardy, P. J., Hand rail	163,996
Hart, J. M., Water wheel gate	163,997
Hart, W. H., Jr., Paper doll	163,866
Hartmann, C., Horseshoe	163,997
Hawks, D. F., Flume battery	163,867
Hawkins, W., and W. F. Dodge, Machine for cutting printers' leads	163,998
Heath, E. S., Clothes drier	163,998
Herriott, W. J., Gas burner	163,999
Himmer, V., Pendulum clock	163,868
Hoag, P., and O. Junkerman, Water elevator	163,999
Holland, C. L., Laundry polish	163,869
Hoover and Price	164,034
Hopkins, C. H., Cylinder clock for locomotives, &c., (reissue)	6,464
Hornbeck, C. F., Wash bench and wringer	163,870
Huber, A., Mirror	163,930
Humphrey, J. D., Measure and funnel	164,000
Humphrey, W. L., assignee, 163,836, 163,837, 163,838, 163,839,	163,840
Hunt, A., Storing and removing ice	164 001
Husbands, J. D., Jr., assignee, (reissue)	6,472
Hyatt and Voth	163,953
Jewell, C. A., Machine belting	164,002
Johnson, E., Sash balance	164,003
Jones, G. S., and B. F. Kidd, Washing machine	164,004
Junkerman and Hoag	163,999
Kean, J., Pessary	163,871
Kearney, B. S., Car coupling	163,931
Keith, A. B, administrator	164,010
Kellogg, A. N., Stereotype plate holder	163,872
Kellogg, A. N., Stereotype block	163,873
Kellogg, A. N., Stereotype plate	163,874
Kettle, L. A., Paper box	164 005
Kidd and Jones	164,004
Kimber, A., Lamp burner	164,006
King, J. T., and L. L. Nunn, Railroad crossing signal	163,875
Kirkpatrick, C. B., Stair builder's adjustable square	164,008
Kirtley, F. L., Car brake	164,007
Kirtley, F. L., Car brake	164,009
Knickerbocker Ice Company, assignee	164,001
Kroeschell and Thielepape	163,898
Landrieu, G., Automatic music recorder	163,932
Lawther, A. B., Machine for moistening oleaginous seeds	163,933
Leseur, W. F., and C. Michel, Variable exhaust	163,934
Lewinson, G., Package holder	163,935
Little, G. H., Injector or ejector for steam engines	163,876
Littlefield, S. P., Station indicator	163,936
Lockwood, W. E., assignee, (reissue)	6 470
Martin, E , assignee	163,969
Matheson, G., Device for drawing and welding tubing	164,011
Mayfield, W. D., Smoothing and fluting iron	164 012
Mayhew, D. P., Gas regulator	163,937
McCabe, J., Reversible plow	164,014
McCormick, J., Corn harrow	164,013
McCormick, J. J., Magazine fire place stove	164 015
McKinnon, C., Lamp	164,016
McLeod, C., assignee	163,910
McMinn, W. G., assignee	164,006
McNabb, J., Car coupling	164,017
Melick, J. W., Washing machine	164,018
Metallic Seam Company, assignee	164,010
Meyer, A., Insect powder injector	163,877
Michel and Lesenr	163,934
Miller, J., Automatic car coupling	164 020
Miller, W. A., Slate frame	164,019
Mills, H. D, Hoe	164 021
Mills, I., Jr., Cement roof	163,938
Mitchell, J. R., Cutter holder for metal lathes	163 878
Moore, C. F., assignee	163,882
Moore, D. and E., Hoe	164,023
Moore, G., and G. Curkendall, Plow iron	164,022
Moore, T. W., Combined table and desk	163,939
Morrill, O., assignee	164,035
Morrison, S. G., Saw for sawing stone	163,879
Morrison, S. G., Applying emery to metal surfaces	163,880
Mowry, A. J., and H. Chance, Weed turner	163,881
Murch, T. H., assignee	163,910
National Tube Works Company, assignee	164,011
Naughten, J., Sewer trap	164,024
Norcross, J. W., Mast and sail for vessels	163,940
Norcross, J. W., Construction of vessels	163,941
Nunn and King	163,875
Olson, H., Plow	164,025
O'Neill, A., Laying street mains	163,942
Otis, S. A., Track scraper	163 943
Palmer, J., Die for forming spurs on horseshoe calks	163,882
Palmer, W. H., Jr., Machine for tentering fabrics	163,026
Paris, D. E., Cooking stove, (reissue)	6,465
Paris, D E., Reservoir cooking stove	163,883
Parker, S. G., assignee	163,907
Parry, T. W., Slate cutting machine	163 944
Parsons, H., Loom heddle frame, (reissue)	6,466
Pattou, W. P., Injector	164,027
Peake, J. B., Device or clamp for stopping leaks in water pipes, &c	164,028
Pearse, J. B., Apparatus for manufacturing iron and steel	164,029
Peirce, R. O., and W. H. Foye, Temporary binder	164,030
Pennypacker, J., Horse rake, (reissue)	6,471
Philbrick, W. C., Fire kindler, (reissue)	6,472
Philips, W. J., Electric signaling and recording apparatus	164,031
Phillips, J. V., Holdback	163,884
Plumb, F. B., Slat iron for carriage tops	163,885
Poznanski, J., Slate pencil attachment	163 886
Pratt, G. M., Chuck for metal drills	164,032
Pratt, T. W., Mechanism for propelling boats	164,033
Price, W. H., and R. Hoover, Reciprocating churn	154,034
Purcell, T. V., assignee	163,971
Pyle, I. N., Whiffletree hook and clip	163,945
Randolph, E. F., assignee	163,952
Reece, J., Sewing machine thread tension device	164,033
Reed, T. K., Machine for forming and driving staples for leather work	164,010
Rehfuss, G., Sewing machine cover	164 043
Richards, A. C., Type setting machine	164,037
Richardson, A. A., Hat	164,036
Richardson, G., Spinning ring and ring rail	163,887
Ricker and Smith	164,047
Ritchie, E S., Apparatus for viewing pictures	163,946
Robertson, T. J. W., Sash balance	164,038
Robinson, E. J., Washing machine	163,947
Rodier, P., Skate	164,039
Roe, W. H., assignee	163,976
Rogers, M., Wooden house	163,888
Roos, A., Beer cooler	164,040
Rose, I. M., Sewing machine embroidering attachment, (reissue)	6,473
Rosenstjerna, A., Letter box	164,041
Ross, A., Harrow	164,042
Rowe, H. E , Feather renovator	163,889
Russell, W., Die for creasing horseshoes	164,044
Sawin, J. J., Manufacture of boot and shoe heels and soles	163,948
Scattergood, D., Steering gear for vessels	163,890
Schuyler, J. F., Machine for planishing paper, (reissue)	6,470
Scutt and Watkins	163,955
Seaman, J., Washing machine	163 891
Sells, H., Cider press	164 045
Seymour, O. E., Journal stud or crank pin	163,892
Shenfield, A., Suspender buckle, (reissue)	6,474
Smith, A. H., Car starter	164,049
Smith, F. S., assignee	163,975
Smith, G., Flour dressing machine	164,050
Smith, J. P., and S. W. Ricker, Sewing machine for stitching straw	164 047
Smith, R., Milk cooler	164,048
Smith, S. G., Track clearer	163,893
Snow, H. J., assignee	163,910
Snyder, C. R., Ladies' work table, (reissue)	6 475
Spacht, W. M., Railway rail joint	164,051
Spang, H. W., Circuit and circuit closer for railway signaling apparatus, (reissue)	6,476
Spear, J., Stove	164,046
Spencer, C., Stud for wagon bodies	163,894
Stafford, F., Car starter	163,895
Standish, P. H., Device for welding chain links	163,949
Steinway, A., Piano attachment	164,052
Steinway, A., Piano attachment	164,053
Steinway, A., Piano attachment	164,054
Straw Sewing Machine Company, assignee, (reissue)	6,467
Stroud, E., Combined hame and horse collar	163,950
Stuart, L. B., Heating stove	163,951
Stultz, S. S., Harvester	164,055
Sutton, D. F., Bit stock	163,896
Taplin, A. J., Graining roller	164,056
Tartière, L. A., Apparatus for casting hollow articles of cement	164,057
Taylor, J., Torpedo for oil wells	163,952
Taylor, O. L., Car coupling	163,897
Thielepape, W. C. A., and H. Kroeschell, Base for colors in painting with soluble silicates	163,898
Tiffany, J. C., Gas retort	164,058
Tilton, J. C , Butter package	163,899
Vaill, E. W., assignee 164,060,	164,061
Van Dyke, T., assignee	163,972
Van Winkle, E , Cotton press	163,900
Von Auer, W., Swinging ship's berth	163,901
Voth, H., and C. J. Hyatt, Adjustable and reversible chair	163,953
Wade, A. M., Spinning machine spindle	164,059
Wagner, J., Spring bed bottom	163,902
Wakefield, J. E., Folding chair	164,060
Wall, A. S., Slow match for lighting fuses	163,903
Walton Brothers, assignees	164,028
Ware, J. A., Folding chair	164 061
Warren, J. E., Fence post	163,954
Watkins, W., and H. B. Scutt, Barbed wire fence	164,955
Wattles, T. B., Spinning frame bobbin	164,062
Welch, H. M., Culinary steamer	164,063
West, J. J., assignee, (reissue)	6,473
Westgate, J. D., Machine for cutting button holes in cloth, leather, &c	163 904
Whipple, J. T., Pump for deep wells, (reissue)	6,477
White, E. A., Folding music stand	163,905
White, T., Extension table	164,064
Williams, J. S., Anchor	164,065
Wilson, T., Steam brake	164,066
Wingate, J. L., Trace fastening for whiffletrees	163,956
Wood, C. B., Fifth wheel	164,067
Wood, G. W., Exercising apparatus	163,957
Yates and Addison	163 906
Zimmer, A. M., Wood grinder for paper pulp	163,958

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED JUNE 1, 1875.



163,836. MARINERS' COMPASSES. David Baker, Boston, Mass., assignor of one-half his right to W. I. Humphrey, same place. [Filed Oct. 27, 1874.]

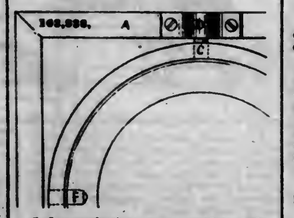
1. In a mariner's compass, a line, F, in connection with a vertical mark, G, upon the inside of a compass-bowl, for the purpose of observing the magnetic bearing or azimuth of a heavenly body by a shadow cast from said line or mark F directly upon the compass-card, and down upon the inside of the compass-bowl, to coincide with the said vertical mark G, substantially as and for the purpose set forth.

2. The combination of the weight L with the line F and vertical mark G, substantially in the manner described, as and for the purpose set forth.

163,837. MARINERS' COMPASSES. David Baker, Boston, Mass., assignor of one-half his right to W. I. Humphrey, same place. [Filed Oct. 21, 1874.]

1. The compass-bowl as constructed, consisting of two parts, the sides A and flexible bottom D, united together, substantially as and for the purposes set forth.

2. The conical disk C, for confining the liquid within a compass-bowl to a shallow space, substantially as and for the purposes set forth.

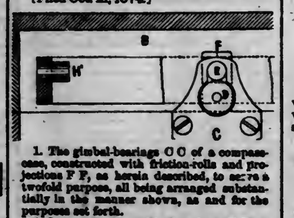


3. The glass plate E, with conical under surface I, substantially as and for the purpose set forth.

4. The combination of a compass-bowl with the cone C or an arm, O, provided with a short pivot, P, substantially as and for the purpose set forth.

5. The combination of the top, the frame, and suitable intermediate packing, secured together by screws S S passing upwardly from the under side of a ledge or lugs upon the frame, substantially as and for the purpose set forth

163,838. MARINERS' COMPASSES. David Baker, Boston, Mass., assignor of one-half his right to W. I. Humphrey, same place. [Filed Oct. 21, 1874.]



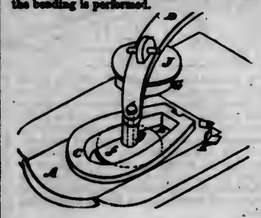
Brief.—Prevents "lubber-line" from moving out of line with ship's course, however much the ship may be "heeled."

1. In a mariner's compass, a mark or marks or other means of indicating a point or line in the direction of the axis of the outer gimbal-ring, as and for the purposes set forth.

2. A mariner's compass provided with means for indicating the lubber-point, placed in the vertical pane of the axis of the outer gimbal-ring, substantially as and for the purpose set forth.

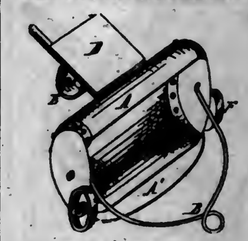
163,839. MARINERS' COMPASSES. David Baker, Boston, Mass., assignor of one-half his right to W. I. Humphrey, same place. [Filed Oct. 21, 1874.]

1. The gimbal-bearings C C of a compass-case, constructed with friction-rolls and projections F F, as herein described, to serve a twofold purpose, all being arranged substantially in the manner above, as and for the purpose set forth.



2. In combination with the pivots E E' or H H' of the gimbal-ring G, the friction-pulleys D D' and the self-adjusting spring-washers L L, for steadying a compass or chronometer suspended within said gimbal-ring, substantially in the manner described, as and for the purposes set forth.

163,840. MARINERS' COMPASSES. David Baker, Boston, Mass., assignor of one-half his right to W. I. Humphrey, same place. [Filed Oct. 21, 1874.]

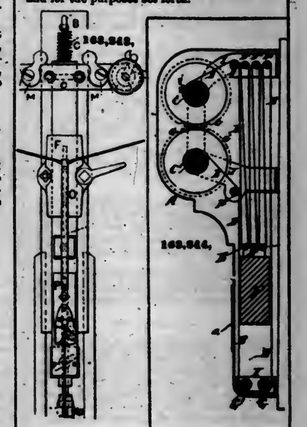


A liquid compass in which the liquid that comes in direct contact with the pivot, card, and needle is oil, or a liquid in which oil predominates sufficiently to prevent oxidization, substantially as specified, and for the purpose set forth.

163,841. MACHINES FOR BENDING HORSESHOES. Arthur Barton, Nevada City, Cal. [Filed Apr. 27, 1875.]

Brief.—A hollow former, to which the blank is fixed by a stop, and a bending-roller, (two parts), whose pivot, provided with a friction-roll, follows the inner side of the former while the bending is performed.

163,842. ROAD-SCRAPERS. H. A. Beach, Battle Creek, Mich. [Filed Jan. 15, 1875.]



The scraper A, of the form shown, provided with the bale B, bars C C, platform D, caster-wheel E, and wheels F F, substantially as described.

163,843. SCROLL-SAWING MACHINES. H. L. Beach, Montrose, Pa. [Filed Aug. 26, 1874.]

Brief.—The saw is strained by a system of springs, and its reciprocation operates a blower, which drives away the sawdust from its path.

1. The slotted tubular support E, in combination with the spiral spring C, hook B, bolt D, box F, cap O, and cam-lever N, substantially as and for the purposes set forth.

2. The slotted tubular support E, in combination with the cross-head F, the beads K and R, the helical springs I, levers J, and geared wheels L, and eccentrics M, substantially as and for the purposes set forth.

163,844. STATION-INDICATORS. C. August Blomquist, La Porte, Ind. [Filed Apr. 14, 1875.]

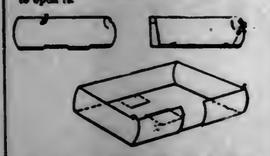
Brief.—The winding-drums at each end of same belt are geared together, and slack is taken up by a compound pulley and weight.

1. The indicator herein described, consisting of an endless belt, B, the length of which is taken up between a set of fixed pulleys, D D' D'' D''', and a set of movable pulleys, E E' E'', the said belt or ribbon being printed with the names of stations or other information, which printing or advertisement is disclosed to the passenger through the window *a*, as shown described.

2. The combination of the belt B, pulleys D D' D'' D''', weighted pulleys E E' E'', the rollers G G', and the drums C C', with the case A, substantially as described.

163,845. GAME APPARATUS. C. M. Browne, Brooklyn, N. Y. [Filed Oct. 10, 1874.]

Brief.—The quoit has a dead inelastic fall, and, with the board, is especially adapted for use either indoors or out.

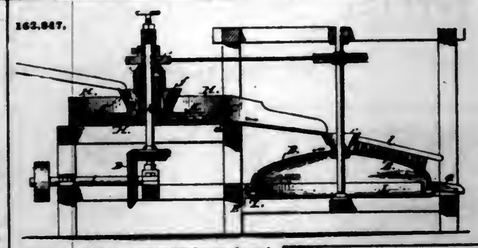


1. The penetrated shield or hub A, in combination with the adjustable pegs D D' and rods F, substantially as described.

2. The quoits E, composed of hollow rings of leather or equivalent material, and filled with sand or other stuffing, as and for the purpose set forth.

163,846. MATCH-BOXES. Ebenezer Stanley Burchett, 20 Brompton Square, England. [Filed May 11, 1875.]

Brief.—The spring, or the tray actuated thereby, presses against a flange upon the lid to open it.

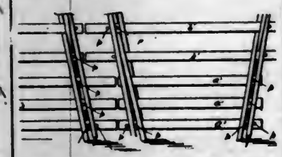


1. The combination, substantially as set forth, of the box-body, the hinged lid, and the spring bearing against the back of the lid, whereby the box is opened by the pressure of the finger and automatically closed, as set forth.

2. The combination of the box-body, the lid, the tray, and the spring *g*, these members being constructed and operating substantially as set forth.

163,847. AMALGAMATORS. W. H. Carson, San Jose, Cal. [Filed Sept. 10, 1874.]

Brief.—After amalgamation in the pan, the pasty pulp passes to the revolving amalgamated copper dome-shaped distributor. The amalgam is retained in the trough I, while the exhausted pulp passes off through the spout.

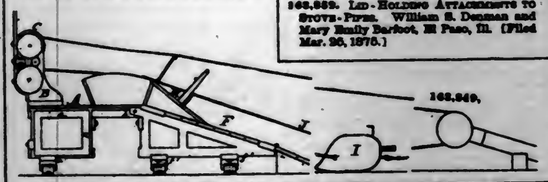


1. The pan H, provided with a bottom formed of amalgamated copper plates or dies forming alternate elevations and depressions, and the spout C, in combination with the muller A, also provided with amalgamated copper shoes and the funnel *f*, substantially as and for the purpose set forth.

2. The rotating copper-surfaced dome-shaped separator B, provided with distributing-funnel *s*, in combination with the stationary brush I and trough I, provided with the spout *o* and siphon P, constructed to operate substantially as and for the purpose set forth.

163,848. FARM-FENCES. Waltsell B. Cary, Bloomfield, Iowa. [Filed Apr. 7, 1875.]

Brief.—The reversely-inclined panel-posts serve to prevent endwise sway of the panels. The lap-joints prevent a continuous opening being formed between the panels in case of their slight separation.

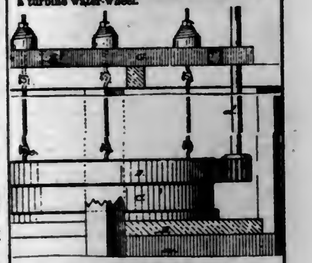


1. The combination, in a portable fence, of two adjacent detached panels, composed of boards *a a'* and *b b'* of different lengths, projecting beyond the fence-posts and forming lap-joints, substantially as shown and described.

2. The posts C C at opposite ends of a fence-panel, inclined toward each other, and held in position by pins *p* passing through holes in the boards *a b* on opposite sides of said posts, substantially as described.

163,849. GRADING APPARATUS. E. Church, Cleveland, Ohio. [Filed Dec. 19, 1874.]

Brief.—An excavating apparatus consisting of a bridge with space for teams under it, windlasses with clutches, and trap-doors secured by latch mechanism. An inclined platform is provided with a flap and bail, against which the scoops strike, when the trap-doors are opened and the load dumped into the carts.



1. The bridge A, constructed with a space for teams to pass under, and having combined therewith the frames B B, drums C C, shafts and clutches D D, and the trap-doors H H, provided with the latch and closing device, substantially as and for the purpose set forth.

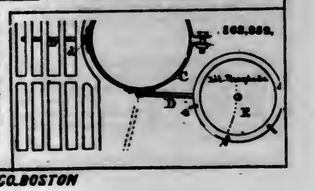
2. The inclined platform F, provided with the flap M, having a bail, *m*, by means of which the scoop I is made to tilt and deposit its loads onto the trap-doors, substantially as shown and described, and for the purpose set forth.

163,850. WATER-WHEELS. Jas. P. Collins, Norwich, Conn. [Filed Apr. 20, 1875.]

Brief.—Springs are applied in combination with a suspended water-wheel gate having a bearing-surface in a horizontal plane, for the purpose of diminishing the friction between the bearing-surfaces of the gate and guide of a turbine water-wheel.

In combination with a suspended water-wheel gate, having a bearing-surface in a horizontal plane, springs, applied substantially as and for the purpose set forth.

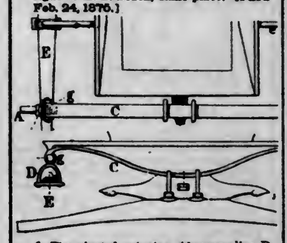
163,851. CARTESIAN TOYS. A. Demuth, New York, N. Y. [Filed Apr. 20, 1875.]



Brief.—The lower bulb is held in the palm of the hand. The heat of the hand expands the air, which, rising in bubbles through the liquid, sets the figure in motion.

The cartesian toy composed of the bulbs A B, which are connected by the neck *a*, and contain the figure C, for operation as described.

163,852. LID-HOLDING ATTACHMENTS TO STOVE-FUEL. William S. Denman and Mary Emily Barfoot, El Paso, Ill. [Filed Mar. 26, 1875.]

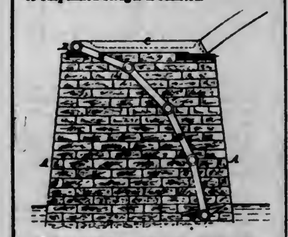


163,853.

1. In combination, with the adjustable collar C and brackets D D, the basin-shaped stove-lid holders E E.

2. The combination, with the collar C and brackets D D, of the hollow stove-lid, basins E E, provided with pendent hooks *e e* on their rims, as described.

163,854. SIDE-BAR WAGONS. Martin Donnelly, Peoria, Ill., assignor of one-half his right to H. E. Beach, same place. [Filed Feb. 24, 1875.]



1. The pivoted swinging side-spar clips D D, having an eye at its apex, and in combination with the supporting-spring C to sustain the ends of their respective side spars below the spring-heads, substantially as set forth.

2. The half-elliptic spring, having pendent ends *g g*, in combination with the fastening and pendent clip D, to avoid the torsion of the side spars, substantially as set forth.

3. The combination of the side spars E E and their clips D D below the spring-heads *g g*, the pivot-bolt *d*, and recurved spring-heads *g g*, substantially as described.

163,855. METALLIC-ARCH BRIDGES. Jas. B. Eads, St. Louis, Mo. [Filed May 11, 1875.]

Brief.—A skew-back for metallic bridge-arches is combined with a metallic chain-tie extending downward through the masonry of the abutment, and anchored in the lower portion thereof, so as to utilize the weight of the abutment in resisting the thrust of the arch, in a manner similar to that in which the strain of suspension-bridges is resisted.

The combination of the abutment A, skew-back C, chain or tension member E, and anchor-block F, substantially as described.

163,856. SHOE-DRESSINGS. J. I. Eastman, Philadelphia, Pa. [Filed Mar. 6, 1875.]

Brief.—Composed of Brazil wood, caustic soda, soluble Prussian blue, gum-shellac, and water.

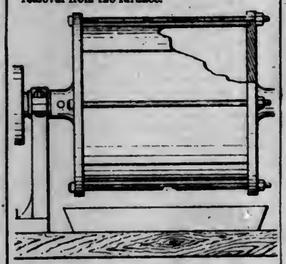
The within-described ingredients, mixed or compounded in about the proportions and for the purpose specified.

163,864. EXTENSIBLE LADDERS. William S. Elliott, Corning, N. Y. [Filed Oct. 31, 1874.]

Brief.—A ladder composed of an upper section with two or more rectangular frames, the ladder and its frames telescoping into the frame next below, and extended by means of ropes, a pulley, and a crank. The rectangular frames are each provided with a rope ladder, which, as the ladder is extended, travels from the rear part of each frame into grooves in the sides of the frames, thus forming a continuous ladder.

163,850.

1. The combination, with the ladder A, of the frames A' A', substantially as specified.



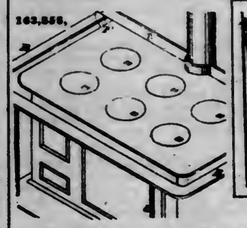
2. The combination, with the grooves *a' a'* in the sections A' A', respectively, the rounds F F and the ropes E E', substantially as specified.

3. The combination, with the shafts C C', having pulleys *f f'*, and the winches D D', having rag-wheels *g g'*, of the ropes E E', having ladder-rounds F F', substantially as specified.

4. The combination of the ropes E E', having rounds F F', with the rag-wheels *g g'*, ratchet-wheel I, pawls *p*, and retaining-springs S, as specified, and for the purpose set forth.

163,857. MANUFACTURE OF SHEET-IRON. J. Ellis, Pittsburg, Pa. [Filed Nov. 16, 1874.]

Brief.—The sheets to be polished are clamped, lapping one another, endwise between two circular heads on a shaft, forming thus a hollow cylinder, in which polishing material is placed and the cylinder revolved. The mottling is done by a plain roll on a level table closely studded, and the lining is accomplished by alternating the sheets with layers of wood-ashes in a close iron box placed on wheels, to facilitate its introduction into and removal from the furnace.



1. The mode or method of scouring and polishing sheet-iron—that is to say, causing the loose scouring and polishing material or substance to slide over the inner surface of the sheets, in the manner shown and described.

2. A table studded over with small hemispherical protuberances, in combination with a roll, the surface of which is plain and smooth, as and for the purposes set forth.

3. The mode or method of lining sheets of iron by arranging them in open order within a close cast-iron box, and alternated with an interlayer of wood-ashes, in the manner shown and described.

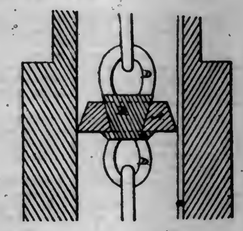
163,858. ATTACHMENTS FOR COOKING-STOVES. Frank Enos, Mineral City, Nev. [Filed Apr. 2, 1875.]

163,858.

In a cooking-stove, the detachable rim B and B', in combination with the hooks F and legs D D, constructed to operate substantially as described.

163,859. CHAIN-PUMPS. Chas. Fishbaugh, Tiffin, Ohio. [Filed Apr. 27, 1875.]

Brief.—The rubber is slitted inward from the edge, the slits terminating in round holes through the same.

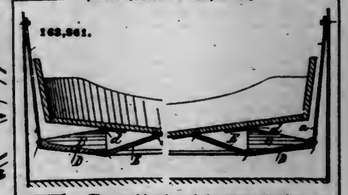


1. The bevel-edged rubber collar B, provided with one or more slits and holes, C C C C, substantially as described.

2. The combination of the bevel-edged rubber collar B, with one or more slits and holes, C C C C, with the cone and flange A, and the inner surface of the pump-stock F burned, substantially as described.

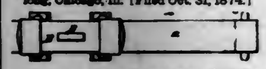
163,860. CHAIN-PUMPS. Geo. Fishbaugh, Tiffin, Ohio. [Filed Feb. 19, 1875.]

Brief.—The tubing is provided with a small groove running the whole length of it, by which the water standing in the tube draws down into the well.



1. A chain-pump stock provided with a groove, G, as and for the purposes set forth.

2. The combination of the chain-pump stock, provided with a groove, G, the cone-shaped cylinder B, with the flange G, the bevel-edged rubber collar A, and links D D, substantially as and for the purposes above described.



163,861. SWINGING SHIPS' BERTHS. Thos. P. Ford, Brooklyn, N. Y., assignor of one-half his right to Thomas Scott Dick, same place. [Filed Nov. 16, 1874.]

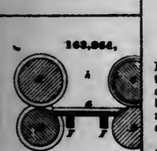
163,861.

The combination of the suspension bars or frames a with the carrier-frames B and their connecting-rods *c*, together with the fixed arms D and their connecting-rods E, attached to and in connection with the berth, substantially as described, and for the purpose set forth.

163,863. WHIFFLETREES. Thomas T. Furlong, Chicago, Ill. [Filed Oct. 31, 1874.]

As a new article of manufacture, a whiffletree consisting of a half elliptic spring, made of flexible leaves, differing from each other in length and bound together at or near their centers, one or more of the shorter leaves being within the curve of the longest one, and the said spring being provided with a drawbar or lug, and constructed at the ends to receive the traces, substantially as specified.

163,862. SPRING-BUFFERS FOR TRUNKS. E. N. Geer, Corry, Pa. [Filed Sept. 15, 1874.]



1. A spring-buffer for trunks composed of a metallic boss and a rubber or other spring, both held in a suitable socket, substantially as described, for the purpose specified.

2. The angular socket A, provided with an inwardly-projecting flange, *a*, at its mouth, in combination with the spring C and boss E, the latter having the flange *b*, all arranged and operating substantially as described.

3. The elongated metallic buffer B', having the roller E and the concave back, in combination with the elongated socket A' and spring C', substantially as described, for the purpose specified.

163,864.

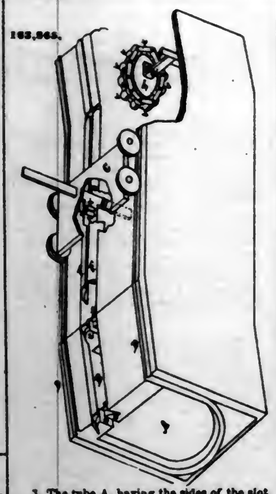
163,864. ROLLS FOR ROLLING AND CREASING HORSESHOE-BARS. H. H. Gilmore, Cambridgeport, Mass. [Filed Apr. 14, 1875.]

Brief.—Bar passed through grooves, the shafts of the creasing-rolls acting as discharging-rolls; then through another groove, guide trough, and creasing-rolls, emerging therefrom in a finished state.

1. In the horseshoe-bar-rolling machine, the rolls A B, constructed to reduce the bar with the tread slope *b b* and the edge slope *c f*, in combination with the rolls C D for creasing it, substantially as described.

2. The combination of the discharging rolls or cylinders *e e* with the creasing-rolls C D and the rolls A B, for reducing and sloping the bar on its upper surface and edge, as set forth.

3. The combination of the guide-rolls F F and the trough G with the frame, the reducing-rolls A B, the creasing-rolls C D, and the discharging rolls or cylinders *e e*, all being arranged and applied substantially in manner and to operate as and for the purpose explained.



163,865. ENDLESS-ROPE TRACTION-WATER. Andrew S. Hallidie, San Francisco, Cal. [Filed Mar. 8, 1875.]

Brief.—An improvement in endless-rope traction-railways, in which the slot through which the grapple from the car passes is kept closed by stripe or bars of semicircular cross-section, the outer ends of which rest in semicircular seats. The upper inner edges of the strips are thicker than the edges, and thereby close together by gravity after having been opened by a wedge-shaped separator provided with rollers, said wedge being on the grappling-arm. An improved supporting-pulley is employed where the angle of the road changes, consisting of a series of small travelers or pulleys arranged to rotate on and around an oval block, secured beneath or above the traveling cable, as the case may be, thereby giving a less abrupt bearing-surface to said cable than when the ordinary round pulley is used.

1. The slot-closing strips F F, constructed and applied, as described, so as to close together automatically by gravity, substantially as and for the purpose described.

2. The sheave E, with wedge attachment J and friction-rollers *h h*, in combination with the strips or bars F F, substantially as described, and for the purpose specified.

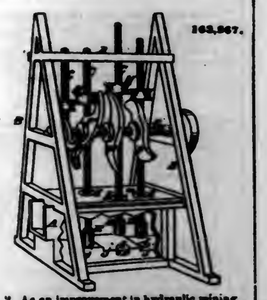
163,865.

3. The tube A, having the sides of the slot B beveled inward, as described, and having the projections *e e* with their rounded upper surfaces, in combination with the stripe or bars F F with their concave under sides and rounded upper outside corner, substantially as and for the purpose described.

4. The improved pulley, consisting of the oval form T, with its encircled series of connected rollers or pulleys *v v v*, connected by links *x x x*, substantially as and for the purpose described

163,866. PAPER DOLLS. Wm. H. Hart, Jr., Philadelphia, Pa. [Filed Apr. 14, 1875.]

1. The combination, with the upper portion A of a doll, of the tongue C, contained into legs D, substantially as and for the purpose set forth.

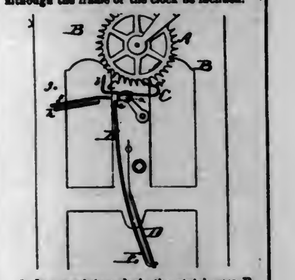


2. The prong or loop E, fixed to or a portion of the tongue C, and operating with the doll's dress, substantially as and for the purpose set forth.

163,867. FLUME-BATTERIES. D. F. Hawkes, Timbuctoo, Cal. [Filed Nov. 16, 1874.]

Brief.—Pulverized gold-holding material washing through the waste-flume of a hydraulic mine by a stamp-battery.

1. In combination with a main flume, A', provided with the grating *c'*, the turn-out flume A, provided with one or more battery-stamps, E, substantially as and for the purpose set forth.



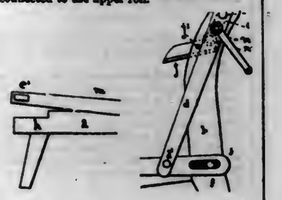
163,867.

2. As an improvement in hydraulic mining, the process of reducing the unbroken pieces of cement, earth, or other light material by passing the wash from the sluices through a flume which leads through a stamp-battery, whereby the lumps or pieces will be carried by the water underneath the stamps and subjected to a crushing action in their passage through the flume, substantially as and for the purpose set forth.

163,868. PENDULUM-CLOCKS. V. Himmer, New York, N. Y. [Filed Oct. 19, 1874.]

Brief.—A clock so constructed that the pendulum will adjust itself in vertical position, although the frame of the clock be inclined.

1. In a pendulum-clock, the crutch-wire E, connected by a flexible joint with the anchor C, or a projection thereof, substantially as described.



2. In combination with the anchor C and jointed crutch-wire E, the projecting pin *f* and the stop-pins *g* and A, arranged substantially as and for the purpose described.

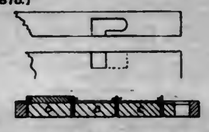
163,869. LAUNDRY-POLISHES. C. L. Holland, Ipswich, Mass. [Filed Dec. 8, 1874.]

The herein-described laundry-polish, composed of starch-flour, gum-arabic, and glycerine, in the proportions and in the manner herein set forth.

163,870. WASH-BENCHES AND WRINGERS. Cornelius F. Hornbeck, Slaterville, N. Y. [Filed Feb. 11, 1875.]

Brief.—The rolls are forced together by draw-rods pivoted to a lever-platform, upon which the tub stands, the weight of the latter being sustained by the draw-rods, which are connected to the upper roll.

The combination of the adjustable lever-platform *m e e'*, having a slot, *f*, with rods *d*, pivots *b f*, upper cross-bar *c*, bearing-rods *c'*, wriagar-rollers *n*, curved posts *b*, and bench *a*, as set forth.



163,871. PESSARIES. John Kean, Chicago, Ill. [Filed May 11, 1875.]

Brief.—Both the hinged wings of the pessary and a cup upon a perforated standard adjust together vertically, by turning nuts at the outer end of the cup-stem.

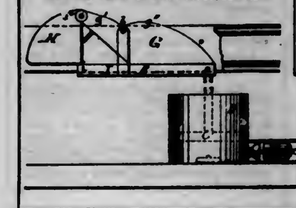
The adjustable and self-sustaining pessary composed of hollow curved standard *b'*, constructed at its end with screw-thread *b'*, adjustable jaws *a*, hinged together and to the standard, arms *d*, united at the lower end and hinged to the jaws at the top, perforated cup *f*, secured to a curved stem, *g*, constructed at its end with screw-thread *g'*, and operating-nuts *h i*, working on screw-threads *b' g'*, all constructed, arranged, and adapted to operate as and for the purpose described.

163,872. STEREOTYPE-PLATE HOLDERS. A. N. Kellogg, Chicago, Ill. [Filed Apr. 26, 1875.]

The combination of the column-plate, provided with the L-shaped cavities in its side edges, with the column-rules furnished with pins, substantially as specified.

163,873. STEREOTYPE-BLOCKS. A. N. Kellogg, Chicago, Ill. [Filed Apr. 26, 1875.]

1. The combination of the plain A and block B, provided with the fastening consisting of a button or flanged shank upon one and a lipped cavity in the other, whereby the two may be united, or separated when united, by a short sliding movement, substantially as specified.

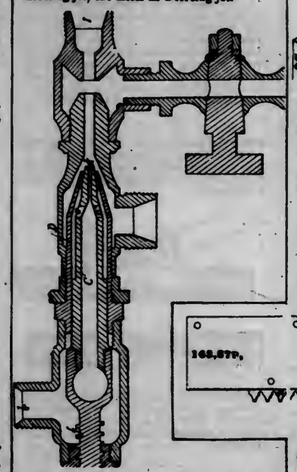


2. The plate A, provided with the headed short screws or buttons *a a*, in combination with the block B, made with the cavities *b b*, covered partly by the notched lip *c*, substantially as specified.

163,874. STEREOTYPE-PLATES. A. N. Kellogg, Chicago, Ill. [Filed Nov. 11, 1874.]

The whole page-plate cast with a groove on the back opposite the interval between the columns, substantially as specified.

163,875. RAILROAD-CROSSING SIGNALS. R. T. King, Cleveland, and Lucien L. Nunn, Oberlin, Ohio. [Filed Feb. 18, 1875.]



1. The railroad-crossing signal, consisting of the whistle, operated through the medium of a tilting lever, adapted to be operated by the wheels of a train passing in one direction only.

2. The combination, with the levers B and G, of the block H, substantially as and for the purpose described.

3. In combination with the leverage mechanism B G H, the rod C, cylinder D, sounder F, and pipe E, all arranged substantially as and for the purpose described.

163,876. INJECTORS OR EJECTORS FOR STEAM-ENGINES. George H. Little, Peabody, Mass. [Filed Feb. 13, 1875.]

Brief.—An interior tube receives steam within itself, and delivers it in the first instance in a small central jet. By drawing the said tube back, its tapering point is unseated from a surrounding nozzle and tube, and steam passing through side outlets in the inner tube is delivered in an annular jet around the other—the former acting as a drafting-jet, the latter as a forcing-jet.

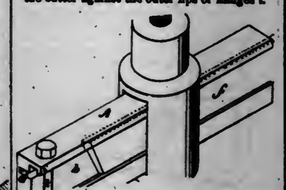
1. The described construction, consisting of the inner steam-tube C having the small outlet *h* and the side outlets *c' c'*, in combination with the outer tube D, the one tube being adjustable relatively to the other, as set forth, and whereby, when the tubes are seated together, the letting on of steam will draft water without moving any of the parts, and the unseating of these tubes from each other will force the drafted water into the boiler.

2. In combination, the inner steam-tube C, the outer tube D, the regulating nut or nuts, overflow-neck having a full-sized opening; the overflow-chamber, straight or tapering; and the outlet I, straight or of increasing size, the parts being arranged and operating substantially as shown and described.

163,877. INSECT-POWDER INJECTORS. A. Meyer, New-York, N. Y. [Filed Mar. 26, 1875.]

Brief.—A cup similar in form to an ordinary oil-cup has a free bottom attached to a diaphragm, which joins the outer case at its largest diameter. The diaphragm is kept distended by a spiral spring within. The nozzle is held in place by a screw-cap, and can be removed to charge the instrument.

163,875.



163,877.

The double-bottom disks I J of the vessel A, in combination with the flexible diaphragm K and spring N, as specified.

163,878. CUTTER-HOLDERS FOR METAL-LATHES. Jos. R. Mitchell, Haywood, Cal. [Filed Apr. 2, 1875.]

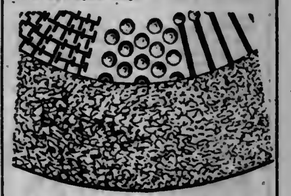
Brief.—A longitudinal groove, extending nearly through the upper part of the holder, permits the top to be sprung down by the screw in the tool-post, and thus clamp the cutter between the top and bottom of the grooved way in which it rests. The pin *k* passes transversely across the back of the recess in which the tool is held, and projects slightly, to hold the cutter against the outer lips or flanges *i*.

1. The tool-holder A, with its way or recess *b* and lips *i i*, in combination with the tool or bit, *f* and the clamping or pinching screw *c*, substantially as and for the purpose described.

2. In combination with the tool-holder A, with its recess or way *b*, and bit or cutter, the bolt or pin *k*, with its projecting faces, arranged and operated substantially as and for the purpose described.

163,879. SAWS FOR SAWING STONE. Samuel G. Morrison, Williamsport, Pa. [Filed Oct. 8, 1874.]

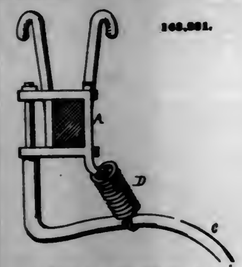
Brief.—The cutting portion of the saw consists of emery-paste or other similar abrasive material, which is attached to a metal back.



163,879.

The saw-plate herein described, composed of two metal plates united together at the upper edge by rivets, in combination with the corrugated metal blades *c*, provided with an edge of emery-paste, substantially as specified.

163,880. MODES OF APPLYING EMERY TO METAL SURFACES. Samuel G. Morrison, Williamsport, Pa. [Filed Sept. 1, 1874.]

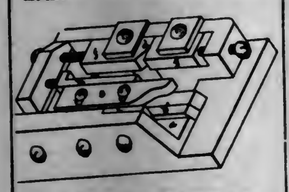


Brief.—The metal plate or tool is roughened, heated, and coated with flour of sulphur, which melts and spreads upon the surface. A thick paste, composed of dissolved gum-shellac, pulverized sulphur, and emery, is applied, pressed, and baked sufficiently to melt the sulphur only.

The process or mode of applying emery to metal surfaces for mechanical purposes, substantially as described.

163,881. WIRE-TUBERING. Aaron J. Mowry and Henry Chance, Burgoon, Ohio. [Filed Apr. 15, 1875.]

Brief.—A gripe embraces the plow-beam, the upper and lower bars of which project upon the land-side of the plow, and in which is swiveled a bent or curved arm, which reaches over into the furrow upon the mold-board side of the plow, to sweep down the stubble, weeds, and grass upon the edge of the land forward of the mold-board, in order that these may be covered in by the turning furrow. The arm is held to its work by a spiral spring, which allows it to pass over immovable obstructions.



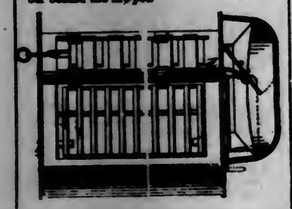
163,891.

The clevis A, in combination with the hook C, of the shape shown, operating upon the swivel B, and attached to the clevis by the coiled spring D, substantially as shown and described

---

163,892. DIES FOR FORMING SPURS ON HORSESHOE-CALKS. Joseph Palmer, Concord, N. H., assignor to himself and C. P. Moore, same place. [Filed Dec. 12, 1874.]

Brief.—A rough blank, with a lateral and projection, is first pierced (with its projection resting upon the steel slide *b'*) in the recess *a* of the die. A cverge then descends and compresses the projecting portion of the blank into a partially-formed spur. The blank is taken from the die *a*, and pierced, with its spur portion over the die *d*, in a recess on the other side of the die. A punch, of the same configuration as the die *d*, then descends, forces the blank through the die and recess, thereby shearing off the surplus metal, and finishes the calk



1. The dies described, being the recess *d* and the adjustable parts *f*, *b*, *g*, as set forth.

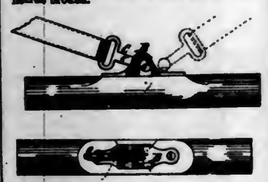
2. The combination of the die *d* and punch *d'*, as described.

3. The combination of the punch *c b* with the die *a b'*, as described.

163,893. RESERVOIR COOKING-STOVES. D. B. Paris, Troy, N. Y. [Filed Oct. 16, 1874.]

Brief.—From the fire-pot the draft may be either direct to the exit-flues, or indirect through the reservoir-chamber and the opening at its rear, which leads into the fire-chamber behind the fire-pot.

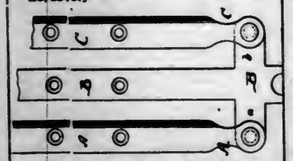
1. In a cooking stove or range, having its exit-flue opening on its rear side, or longitudinally opposite the fire-box, a reservoir-chamber located on one end of the stove, horizontally and laterally opposite the fire-box, in combination with an ash-pit below said chamber.



2. In a cooking range or stove having its exit-flue opening on its rear side, a reservoir-chamber and ash-pit, located the one above the other on one end of the stove, and a baking-oven and flue-space on the other end, in combination with a fire-box intervening, constructed as described, so that the smoke and heat may pass around the oven or through the reservoir-casing, at the will of the operator.

3. A smoke-flue leading to the exit-pipe located on the back side, and in rear of the back plate of an oblong or square shaped cooking-range, in combination with a reservoir casing or chamber, located at right angles thereto on one end of the range, and connected therewith by an aperture made through the end or rear wall of said casing, to allow the smoke to pass through it on its way to the exit-pipe.

4. In an oblong or square shaped cooking-range, having its exit-flue opening on its rear side, connected with a reservoir casing or chamber located on one end at right angles therewith, the combination of the fire-box and reservoir casing or chamber, separated by a plate or wall, provided with a protecting damper, that may either prevent or allow the direct action of the heat upon the reservoir.



163,894. HOLDBACKS. J. V. Phillips, New Buffalo, Mich. [Filed Apr. 16, 1875.]

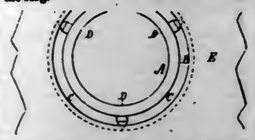
Brief.—Ordinarily holds firmly, but is detached whenever tugs are unhitched or whiffletrees broken.

In a holdback attachment, the combination of tongue C, having notched cross-head *c* and socket B, provided at its entrance with a shoulder, substantially as and for the purpose set forth.

163,895. SLAT-IRONS FOR CARRIAGE-TOPS. Freeman B. Plumb, New York, N. Y., assignor to J. B. Brewster & Co. [Filed Feb. 26, 1875.]

The cross-shaped slat-iron B, made in one piece with the rigid arms *a b*, that project from opposite sides of said slat-iron, in combination with the slat-irons A and C, that are respectively pivoted to the arms *a* and *b*, so that the pivot *d* of the beak bow will, in folding, come beneath the pivot *d* of the slat-iron, substantially as shown and described

---

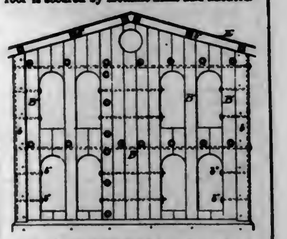


163,896. SLATE-PENCIL ATTACHMENTS. J. Pomeroy, New York, N. Y. [Filed Oct. 16, 1874.]

The sponge-holder for slate-pencils herein described, consisting essentially of the tube *b*, provided with slits *c*, claws *c*, and ring *g*, all constructed and arranged to operate substantially as set forth.

163,897. SPINNING-RINGS AND RING-RAILS. George Richardson, Lowell, Mass. [Filed May 11, 1875.]

Brief.—The sockets in the ring-rail are larger in diameter than the ring, and the latter has no flange to rest on the top of the rail, and thereby a space is left entirely around the ring, through which waste may fall, the ring being supported by screws passing into its neck, the points of which enter a groove in the socket, and are adjustable to centralize the ring.



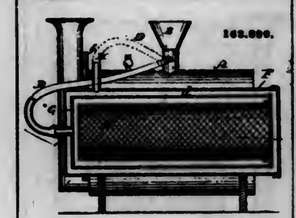
1. A spinning-frame ring, A, and its rail E, provided with a waste-discharging passage, C, encompassing the ring and open or uncovered both at top and bottom, to allow waste passing from the ring or the traveler, to fall down through such space and be discharged from the rail, as set forth.

2. The ring-socket B, provided with the peripheral groove *b*, arranged in it as explained, in combination with the ring A and its adjusting-screws D D D, applied together and arranged in such socket and groove, all substantially as specified.

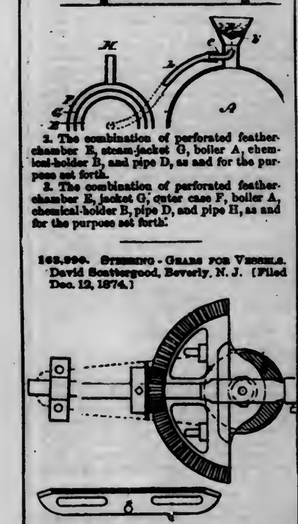
163,898. WOODEN HOUSES. M. Rogers, Phillipsport, N. Y. [Filed May 6, 1875.]

Brief.—A house made of grooved stripe of plank, without frame, lath, or plaster, having metal tongues inserted in the grooves, and held together by transverse bolts and nuts. The floors rest in grooves, and are held together by anchor-links and screw-rods. The roof is secured by metallic links and anchors.

1. In the construction of the walls, partitions, roofs, or floors of houses or buildings, the combination of the grooved stripe B', metal tongue *b'*, and screw-rods *b''*, substantially as and for the purpose described.



2. The combination of the floors *c*, *c'*, or *c''*, constructed as described, and resting in grooves *a* in the outer walls B, with the anchor-links 1, and screw-rods *b''*, in the manner substantially as and for the purposes described.



3. The combination of the screw-rods *b''*, in the outer walls B, and in the roof B, with the perpendicular link-anchor 5, and angle-link 6, constructed and arranged as described, to secure the roof to the walls of the building, as set forth.

163,899. FEATHER-RENOVATORS. Horace B. Rowe, Brockville, Canada. [Filed Feb. 19, 1875.]

1. The combination of boiler A, the chemical-holder B, connected thereto, and having the converging and perforated bottom *b'*, so as to permit the chemical to pass in small drops and impregnate the steam, the perforated feather-chamber E, and the pipe D, connecting said boiler and chemical-holder with the said feather-chamber, as and for the purpose set forth.

163,899.

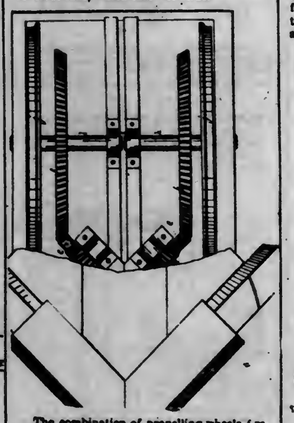
1. The beveled-wheel segment, provided with slotted apertures and combined with a strap-bolt and nuts for fastening the same, as set forth.

2. The beveled segment having a central bolt-hole and nut-pocket adapted to be held to a rudder-post by a central bolt and nut, as set forth.

163,900. STEERING-GEARS FOR VESSELS. David Scattergood, Beverly, N. J. [Filed Dec. 12, 1874.]

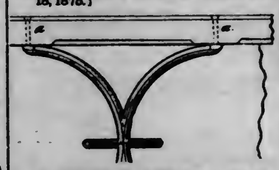
In a washing-machine, the combination of the standards *a*, provided with the sliding tongues *h*, springs *j*, adjusting-straps *i*, and pins or catches *n* on the top of the tongue, substantially as shown and described.

163,901. JOURNAL-STUDS OR CRANT-PINS. Oliver H. Seymour, Indianapolis, Ind., assignor to Franklin H. Brown, same place. [Filed Mar. 26, 1875.]



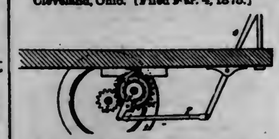
163,902.

The expansible pin A, made in one piece, and terminating at one end in a male screw, and at the other in a flaring, recessed, and split head terminating in a female screw, in combination with the headed screw-pin C, all substantially as shown and described, and for the purposes set forth.



163,903. TRACK-CLEARERS. S. G. Smith, Hollis, Me. [Filed Jan. 4, 1875.]

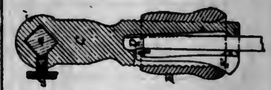
Brief.—Operated by friction of wheels on rails. Plow divides snow, and bevel-gearing revolves fans, which throw it aside.



The combination of propelling-wheels *j* revolved by contact with the track, short shafts *k*, driving-gears *f*, guars *e*, their shafts, snow-removing fans having radial fans, base *a*, and prow *b*, all as and for the purposes set forth.

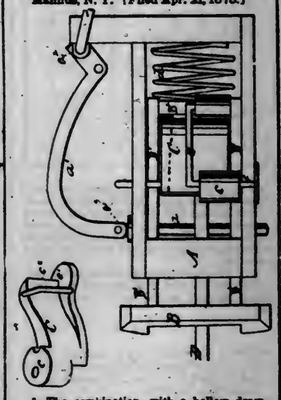
163,904. STUDS FOR WAGON-BODIES. Chas. Spencer, East Greenwich, R. I. [Filed Mar. 15, 1875.]

As a new article of manufacture, a stud for wagon-bodies, made of malleable metal, in one piece with the projecting pins *a a'*, substantially as set forth.



163,905. CAR-STARTERS. Frank Stafford, Cleveland, Ohio. [Filed Mar. 4, 1875.]

The shaft D, having upon it a cam, F, and a propelling spring, G, gear-wheel H, for imparting motion to the car, and a ratchet for winding up the spring, in combination with the gear-wheel I, bifurcated arm K, connecting-rod P, and lever O, substantially as and for the purpose set forth.



163,906. BIT-STOCKS. Delay F. Sutton, Philadelphia, Pa. [Filed Mar. 22, 1875.]

Brief.—The bit is secured to the stock by means of a tapering angularly recessed socket-piece provided with a single tapering dog, depending by a stud on the upper end of its shank from the socket-piece, in connection with a screw-sleeve having its lower end flaring outward.

The socket-piece C, having a groove, *a*, in combination with the single dog F, suspended from said piece C in an opening opposite to the groove *a*, and with the sleeve E, all constructed, arranged, and operating as set forth.

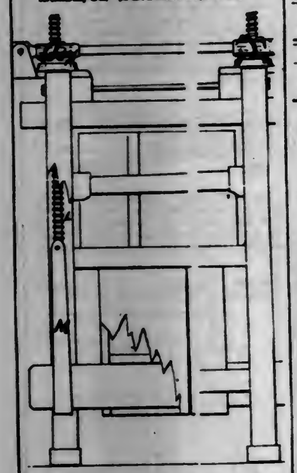
163,907. CAR-COUPLINGS. O. L. Taylor, Manlius, N. Y. [Filed Apr. 21, 1875.]

1. The combination, with a hollow draw-head, A, provided with parallel sides, and a buffer-head, B, having parallel bearing-plates B', of the connecting-link *c*, bent lever C, plate *c'*, pin *c''*, and link D, substantially as shown and described.

2. The combination, with a draw-head, A, buffer B B' B'', connecting-link *c*, lever C, plate *c'*, pin *c''*, and coupling-link D, of the coupling-pin *a*, lever *a'*, axle *a''*, and handle *a'''*, all constructed to operate substantially as set forth.

163,908. BASES FOR COLORS IN PRINTING WITH SOLUBLE SILICATES. Wilhelm C. A. Teichmann and Herman Kroeschell, Chicago, Ill. [Filed Sept. 9, 1874.]

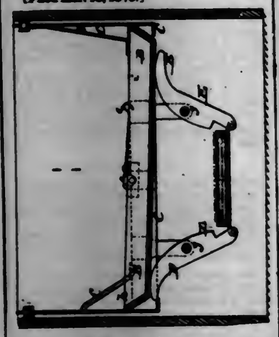
Brief.—Slakes quicklime in ammonia alum, and uses the precipitate as a "size" to fix colors in painting with soluble silicates.



The process herein described of obtaining a base for paints, consisting in slaking quicklime in a solution of ammonia alum, as set forth.

163,909. BUTTER-PACKAGES. J. C. Tilton, Pittsburg, Pa. [Filed Aug. 10, 1874.]

The herein-described butter-package, consisting of a metallic case, A, porcelain lining B, and notched flange G, in combination with cover C and spring-bar D, for fastening down the same, all constructed and arranged as and for the purpose set forth.

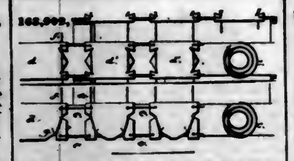


163,900. COTTON-PRESSES. E. Van Winkle, Atlanta, Ga. [Filed Mar. 23, 1875.]

1. In a cotton-press, the stationary draw-bails L, having right and left screw-threads, in combination with the pinion-wheels G and G', which form the nuts thereof, and a screw pinion-shaft, E, having right and left thread-worms, substantially as and for the purposes described.

2. A combined pinion-wheel and screw-nut, in combination with a friction-ball and oscillating trunnion, as and for the purposes set forth.

163,901. SWINGING SHIFT' RAILWAY. Wm. Van Aken, Flatbush, assignor to himself and Richard T. Coombs, Brooklyn, N. Y. [Filed Mar. 18, 1875.]

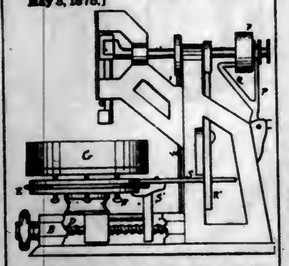


The vibrating berth B, hung, by transverse pivots a, in the vibrating frame D, and combined with the levers D and B, which are pivoted to the vibrating frame C and joined by the weighted connecting-bar B, so that their upper ends bear against the under side of the berth B, substantially as specified.

163,902. SPRING BED-BOTTOMS. J. Wagner, Utica, N. Y. [Filed Mar. 12, 1875.]

The combination of the notched blocks d d', longitudinal wire-links e, and transverse wire-threads f, as described, the blocks being woven and linked together to form the upper surface of the bed-bottom, substantially as set forth and described.

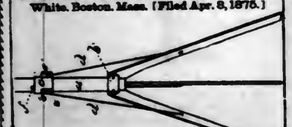
163,903.



163,904. SLOW-MATCHES FOR LIGHTING FUSES. Adam S. Wall, Graniteville, Cal. [Filed Mar. 24, 1875.]

A slow-match, B, for firing blasting-fuses, adapted to have one of its ends secured around the fuse at the point where it is to be fired, substantially as and for the purpose described.

163,905. MACHINES FOR CUTTING BUTTON-HOLES IN CLOTH, LEATHER, &c. Joseph D. Westgate, Lynn, Mass., assignor to himself and Asa H. Bodwell, same place. [Filed May 3, 1875.]

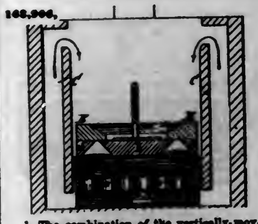


1. In a machine for cutting button-holes, the combination of the ways B and screw D with rotating disk E and table-block G, all substantially as and for the purpose described.

2. In combination, the rotating cam K, lever E', sliding-lever S, and flanged disk R, for turning the table-block G, as shown and described.

3. In combination with the loose pulley P, the shipper P', provided with an arm, Q, adapted to apply friction to the disk and stop further motion when the pulley is moved back.

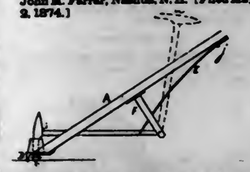
163,906. FOLDING MUSIC-STANDS. E. A. White, Boston, Mass. [Filed Apr. 6, 1875.]



The combination, with the tripod b and legs c, of the rods d, slide s s', having a slot, f, formed on its interior face, and the pin f, secured to the standard a, substantially as and for the purpose herein specified.

163,907. WASHING-MACHINES. Thomas Addison and James T. Yates, Ellicott City, Md. [Filed July 31, 1874.]

Brief.—The tub has a central chamber, formed by two partitions extending nearly to the bottom thereof. The chamber has a perforated bottom, and also has a vertically-moving plunger, provided with a large valve, opening downward. The vertical movement of the plunger forces the water down through the clothes and perforated bottom, on which the clothes are placed, and up through the side chambers, formed by the partitions, into the central chamber, and through the valve again to the clothes.

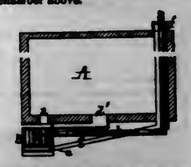


163,908.

1. The combination of the vertically-moving plunger E, the downward-opening valve I, the false bottom B, and side partitions C, substantially as and for the purpose specified.

2. The combination of the inclined pieces J with the edges of the plunger E, as described, for the purpose of tucking the clothes down and preventing the wear of the same between the edges of the plunger and sides of casings, substantially as specified.

163,907. COMBINED CARPET-STRETCHERS AND TACK-DRIVERS. Geo. A. Alger, Manchester, assignor to Samuel G. Parker and John M. Farrar, Nashua, N. H. [Filed May 2, 1874.]

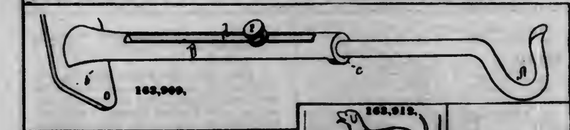


1. A stretching and tacking mechanism combined, consisting of the serrated plate D at the extremity of the staff, spring-jaws placed above said plate to hold the tack, and a hammer pivoted at the end of its handle to a support projecting from the under side of the staff, said hammer being actuated by a rod running in eyes upon the staff, all as and for the purpose set forth.

2. The combination of the slotted staff A, the hammer-support F, hammer s pivoted at the end of its handle to the end of the support F, and the actuating-rod R, joined to the hammer-handle at a point midway between its head and the pivoted end of the handle.

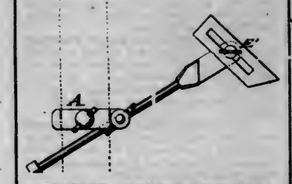
163,908. CAR HEATERS AND VENTILATORS. Jonathan Amory, Boston, Mass. [Filed June 2, 1874.]

Brief.—Air enters the box at the top of the car, and descends through a flue which surrounds the smoke-axis flue, and through two branch flues passes into the air-chamber below the fire-pot chamber, to supply both the fire and the hot-air chamber. The chamber below the fire-pot is connected by pipes with the hot-air chamber above.



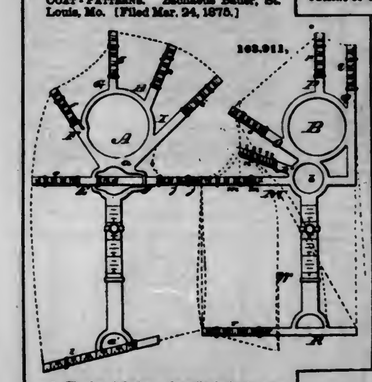
The combination of the air-box f and its two flaps, the casing B, and its flues d, d', g, and h, with car A, substantially as described.

163,909. REVERSIBLE BED-CASE HOOKS. Vernum Balcom, Boston, Mass. [Filed Apr. 17, 1875.]



Brief.—A balanced suspending-hook made conveniently adjustable.

The sliding hook A, in combination with the stationary slotted stock or holder B, provided with the attaching-plate b, ring or tube a, and tightening-screw c, substantially as and for the purpose set forth.



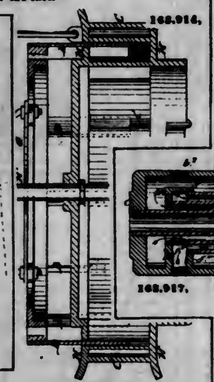
163,909.

163,910. STONE-CUTTERS' GAUGE. Edwin R. Batcheldor, Prospect, assignor to himself, Charles McLeod, South Thomaston, and T. H. Murch and Henry J. Snow, Dix Island, Me. [Filed Apr. 3, 1875.]

The adjustable gage for attachment to stone-cutters' squares, consisting of a clamping guide-piece, A, with a sliding rod, C, applied thereto by socket and clamp-screw, and provided with an adjustable slotted gage-piece and set-screw at the end, substantially in the manner and for the purpose set forth.

163,911. APPARATUS FOR LAYING OUT COAT-PATTERNS. Zacharie Bauer, St. Louis, Mo. [Filed Mar. 24, 1875.]

1. The herein-before-described device for laying out coat-patterns, consisting of the parts A, B, and D, combined and arranged to operate substantially as described.



2. The herein-described devices, consisting of the part A, having the frames s and s', and the arms E, F, G, H, I, J, and L, and the slides d, f, g, h, i, j, and l, and the part B, having the frames b and b', the arms M, N, O, P, Q, and R, and the slides m, n, o, p, q, and r, all combined and arranged to operate substantially as shown and described.

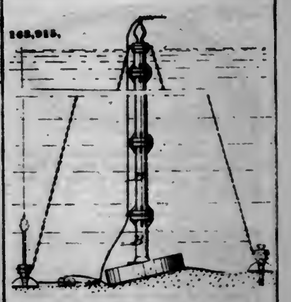
3. The part D, as and for the purpose set forth.

163,912. LETTER AND PICTURE BLOCKS. Daniel Birnell, Greenville, N. J. [Filed May 1, 1875.]

The picture-blocks A, in combination with the letter-blocks B, each of the latter having one of the letters forming the name of the pictured object, and fitting to the block A by means of grooves and projections, which vary in form for the different letters, substantially as and for the purpose set forth.

163,913.

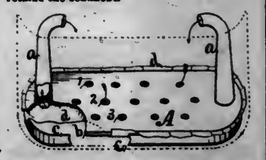
1. The gates B, arranged in the inner and narrowest position of the throats, substantially as specified.



2. The combination of the secondary guides D with the main guides C, substantially as specified.

3. The combination of the gates B, ring F, radial arms G, hub H', inclined rods J, guide-runner K, yoked lever M, and oscillating fulcrum-stand N, with the wheel and case of a turbine, as and for the purpose set forth.

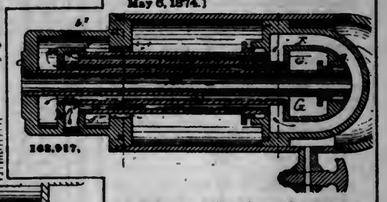
163,914. STATIONS FOR SUBMARINE TELEGRAPHS. Robert F. Bradley, Moffettsville, S. C. [Filed Mar. 20, 1875.]



In ocean-telegraphy, a station for placing intermediate points in communication with the land termini, constructed of a hollow sectional column, which is supported on a universally-jointed base-plate, and anchored, by stay-chains or cables, to bottom stay-plates secured by stakes, for carrying the branch cable from the main cable to the surface, substantially as and for the purpose set forth.

163,915.

163,916. WASH-BOILERS. W. P. Casperson, Monroe, Iowa. [Filed Dec. 19, 1874.]

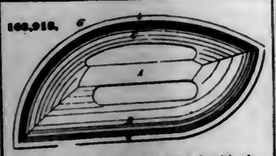


Brief.—A flexible strainer is arranged beneath the perforated plate, which acts as a valve to close the perforations and direct the ascending water to the upright tubes, and also retains the sediment.

1. In an automatic wash-boiler or boiler attachment, the flexible diaphragm d d, substantially as and for the purposes specified.

2. The combination of the perforated plate A, having conductors a a, a series of perforations, 1 2 3, and a narrow rim, b, the movable rim c c, and the movable and flexible diaphragm d d, substantially as and for the purposes shown and described.

163,917. HEATERS AND CONDENSERS. Joe. E. Coughlin, San Francisco, Cal. [Filed May 6, 1874.]



1. A heater and condenser for steam-engines, consisting of a series of pipes or tubes, telescoped one within another, so as to form alternate steam and water passages, and having a cap at each end, one of which is provided with a steam-induction, a water-induction opening, and a water-discharge orifice, and the other with a discharge and a condensed-steam discharge-orifice, all combined substantially as and for the purposes set forth.

2. The combination, in a heater and condenser, of the telescoped tubes 1, 2, 3, and 4, cap A, having the discharges b' and l, cap C, having steam-induction opening b', water-induction opening b', and water-discharge K, water-chamber B, having water-passage F, and enlarged steam-chamber G, all constructed and operating substantially as and for the purposes set forth.

163,918. POT-SCRAPERS. Urias Cramer, New Philadelphia, Ohio. [Filed Sept. 22, 1874.]

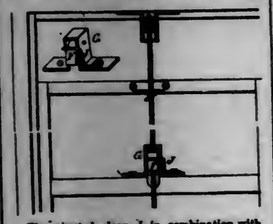
Brief.—The pot-scraper is made in the form of an elongated irregular cup, with a straight edge, a short curved edge, and a long curved edge, to adapt it for scraping the interior surfaces of vessels with different curves and angles.

163,918.

A pot-scraper, A, constructed with the straight edge D E, and curved edges E F and F G D, as described, and for the purpose specified.

163,919. MUCILAGE-HOLDERS. Henry T. Cushman, Bennington, Vt. (Filed Mar. 18, 1875.)

Brief.—The receptacle containing the liquid mucilage is united to the cap, thereby forming a base for the mucilage-reservoir, and a cover to the chamber of the base, in which chamber the mucilaginous matter to be dissolved is kept in dry lump form.

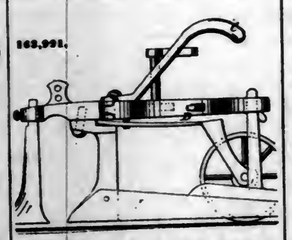


1. Mucilage-stands provided with a chamber for containing dry adhesive material, and a separate reservoir for dissolving such dry material, and containing the liquid adhesive product so formed, all combined in one case, in which that portion of the case which incloses or protects the glass fountain or reservoir also serves to cover or inclose the chamber containing the dry material aforesaid, substantially as described and set forth.

2. The combination of the base A, provided with the chamber H, with the cap B and reservoir J, for the purposes set forth.

163,920. SASH-BALANCES. Thos. I. Dale, Russellville, Ky. (Filed Apr. 10, 1875.)

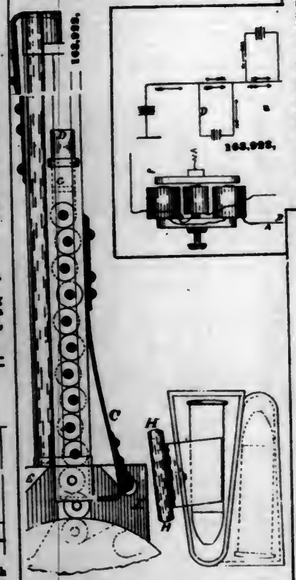
Brief.—A swinging pivoted clasp, serving to clasp either the upper or lower edge of a serrated dog, to release its bite upon the cord, or to hold it more securely in position.



The pivoted clasp J, in combination with the dog F, supported in bearings in the metallic case G, substantially as and for the purpose set forth.

163,921. CULTIVATORS. Albert Dart, Rockville, Conn. (Filed Apr. 17, 1875.)

Brief.—The frame consists of a central beam to the upper side of which the handles are attached. A cultivator-tooth is adjustably secured to the front end, and a wing-standard a little in the rear, to the upper end of which is secured a spring, extending rearwardly, terminating in a bifurcation, which supports a bearing-wheel. Stationary wings are attached to the wing-standard, and adjustable wings are attached to pivoted arms upon each side of the center beam.



163,921.

The combination, with spring-adjusting wheel, of stationary wings I I and adjustable wings J J, as and for the purpose specified.

163,922. FEED-CASES FOR MACHINE-GUNS. De Witt C. Farrington, Lowell, Mass. (Filed Nov. 27, 1874.)

Brief.—The case is placed vertically over the feed-opening in the gun, and is made in two compartments, which have their openings at opposite ends; said openings being closed by spring-hooks, which, when the case is put in position for use, are forced out by means of lugs on said springs taking into inclined grooves in the base which supports the case. When one compartment is exhausted the case is reversed, and the other compartment brought into position to be used.

1. The duplex feed-case herein described, the cartridge delivery of the compartments being arranged at opposite ends, and the case adapted for operation, as set forth.

2. In combination, a cartridge-magazine or feed-case and a spring-hook, C, provided with lugs H, the hook and lugs being above the end of the case, substantially as set forth.

3. The follower D, when provided with the slot G, adapted for operation, and to be secured in place by the spring-hook C, in the manner substantially as set forth.

4. The combination of the inclined planes E, with the spring-hook C, and the lugs H, operating with the inclined planes or slots E, for the purposes and in the manner substantially as set forth.

163,923. DUPLEX TELEGRAPH. M. Gally, Rochester, N. Y. (Filed Feb. 9, 1875.)

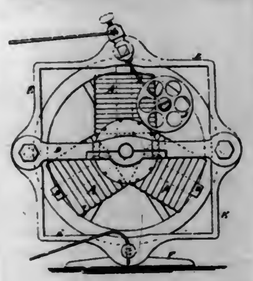
1. The combination, with a main line, of a branch containing both the receiving-instrument and a magnetic key or switch for connecting main line with battery, or for breaking its direct connection with ground, substantially as specified.

2. The combination, with circuit D, having a magnetic switch therein, of circuit A A', the one being open while the other is closed, and vice versa.

3. The combination, with the main line, of sub-line A' and switch *f*, for cutting out the main battery when not in use for transmitting, substantially as specified.

4. A receiving-magnet, provided with ordinary electro magnet or magnets, and an additional magnet or magnets, all acting upon the same armature-lever for equalizing its stroke under different conditions of currents, substantially as specified.

5. A compound electro-magnet, consisting of a number of cores and helices, a part of which are stationary, the armature being adjusted to them by means of a spring, the others being in themselves adjustable, to be moved to or from the armature, substantially as specified.



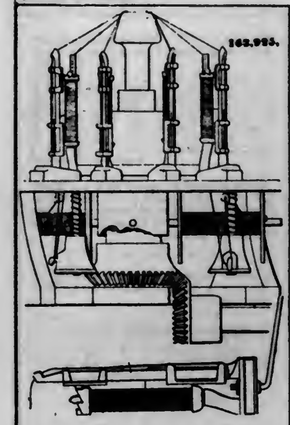
6. An armature having magnetic extremes and non-magnetic center, the extremes to be affected by electro-magnets as a polarized armature, and the center as a common armature, substantially as specified.

7. The combination, with the main line passing through one or more of the magnets of the receiver, of the compensating circuit passing through the same magnet or magnets, and also through another magnet or magnets not affected by the main-line current, but all acting upon the same armature-lever, substantially as specified.

8. The combination, with a main line and its battery, of one or more circuits, each having a section of union with the main line, and an independent battery maintaining intact its own circuit-current, the magnetic or neutral condition of each section of union changing with any change of the direction of the main current, substantially as specified.

9. The method of reducing the resistance of a wire or helix to a given current, by passing through it, in whole or in part, the current of another circuit or circuits.

163,924. ELECTRIC MOTORS. Charles J. B. Gaume, Williamsburg, N. Y. (Filed May 1, 1875.)



The frame or box armature E, made with four, more or less, plain or concaved sides, having half-round or square enlargements formed upon their outer or inner surfaces, substantially as herein shown and described.

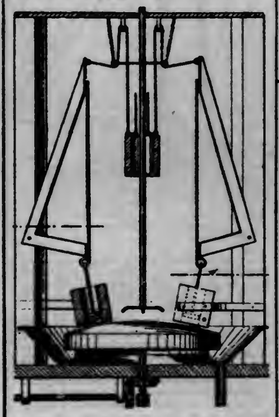
163,925. LOOMS FOR WEAVING TUBULAR FABRICS. Jas. B. Gillespie, Boston, Mass., assignor to Theodore A. Dodge, trustee, same place. (Filed Apr. 14, 1875.)

Brief.—The warp is carried on spools moving on radial lines, and the carriers are provided with pivoted inclined feed, adapted to run in deep grooves, and to cross each other. Combined with the loom is a mandrel and mechanism for introducing a water-proof lining as the tube is woven, and at the weaving-point.

163,925.

1. The combination, with the heads of the warp-carriers, of the pivoted inclined feet, adapted to cross each other, substantially as described.

2. The combination of a rotating grooved surface or plate, with warp-carriers having pivoted inclined feet adapted to cross each other at the intersection of the grooves, substantially as described.



3. The combination of the warp-carriers and their pivoted feet, with the grooved plate and the independent removable warp-carrier guides, substantially as described.

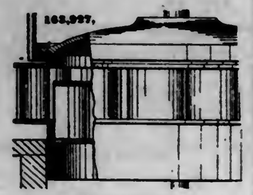
4. The combination of the mandrel, about which the tube is formed, with a shoulder, *s*, against which the warps rest at the weaving-point, substantially as described.

5. The combination, with a loom for weaving a tubular fabric, and the mandrel, of mechanism adapted to form and introduce a lining or water-proof material within the tube during the process of weaving, substantially as described.

163,926. WOOD-GRINDERS FOR PAPER-PULP. Jas. C. Gregg, Elkhart, Ind. (Filed Apr. 10, 1875.)

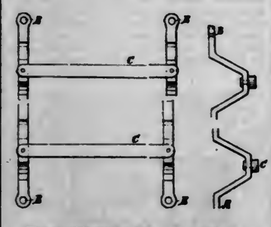
Brief.—Double bell-crank levers and a weight operate the pistons which feed the wood to the grinding-stone.

The combination, with a double elbow-lever fulcrumed on different frame-posts, of a single central hollow weight, attached to all the levers to prevent jarring, shaking, or quivering of the lever.



163,927. WATER-WHEEL GATES. Jas. M. Hart, Apple Grove, Va. (Filed Apr. 24, 1875.)

Brief.—The chutes and cylindrical gate are made in one piece, so that the vertical adjustment of the chutes and gate delivers the water at full or partial gate, while the hanging of the chutes admits their turning in case of obstruction.



1. As an improvement in water-wheels, the chutes and gate combined in one piece, to be adjusted for full or partial gate of wheel, substantially as specified.

2. The vertically-adjustable chutes and gate combined, hung by an annular top flange to a supporting-ring band, so as to revolve with the wheel in case of accidental obstruction, substantially as described.

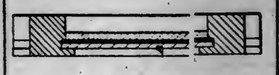
163,927.

163,928. CLOTHES-DRIERS. R. S. Heath, North Hope, Pa. (Filed May 1, 1875.)

The combination of the crooked bars A, having holes B, with the cross-bars C, pivoted to the bars A, substantially as specified.

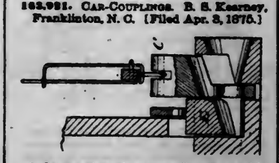
163,929. GAS-BURNERS. Wm. J. Herriott, Boston, Mass. (Filed Mar. 19, 1875.)

Brief.—The slotted plate arrests impurities, and divides the current of gas before entering the pebbles. The tip with crossed slits projects into an expansion-chamber.



163,929.

1. The combination, with the chambered burner *a a'* and its tip *l*, of the slotted plate *b*, fitted to a seat in the bottom of the burner, the pebbles, the plate *g*, securely fitted to the shell *a*, and the removable tip or gas-regulating piece *f*, all constructed and combined as described, to arrest the impure or other particles moving with the gas, and to deliver the gas in measured quantities into the chamber, from which it is consumed through an opening in the tip *l*, as set forth.

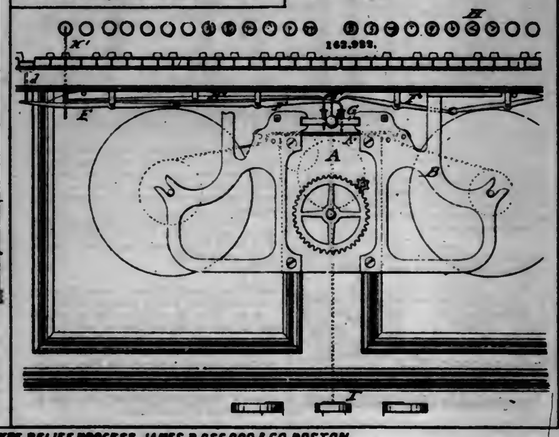


2. The combination of the burner *a a'*, regulating-tip and plate *f g*, tip *l*, and tube, provided with crossing-slots *i*, and fitted to the interior of the removable shell *a'*, and projecting within the chamber, all as shown and described.

163,930. MIRRORS. Allen Huber, Berlin, Canada. (Filed Dec. 19, 1874.)

As a new article of manufacture, a mirror having a water-proof rear face, and over this a cement back, as and for the purpose described.

163,931. CAR-COUPLINGS. B. S. Kearney, Frankinton, N. C. (Filed Apr. 3, 1875.)

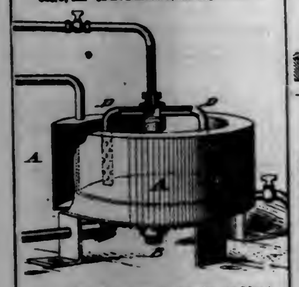


1. In an automatic car-coupling, the combination of a top-recessed draw-head, A, sliding socket-gate, C, governing rear block E, and straight or curved coupling-link having ball-shaped head, all substantially as and for the purpose set forth.

2. The combination of the coupling-link having ball-shaped head, with a curved and tapering governing-block, and top lever bearing thereon, for retaining the link at any required inclination for coupling, substantially as set forth.

163,932. AUTOMATIC MUSIC-RECORDERS. C. Landrien, Brussels, Belgium. (Filed Nov. 7, 1874.)

163,932.



1. In an apparatus for recording the musical compositions played on keyed instruments, the combination of a series of jointed transmitting key-levers, F F', the series of stops H, connecting-levers H', pedal I, and marking-lever I' with the guide-board, pencils, or marking devices, and the sheet of paper arranged to be moved by suitable clock-work mechanism, all constructed and relatively arranged substantially as herein shown and described.

2. The combination of the keys of a keyboard instrument by sliding pins d, fulcrumed and jointed transmitting-levers F and F', with spring acted marking devices, and the guide-board G, all constructed and arranged substantially as specified.

3. The spring-stops H, pivoted rods H', and fulcrumed levers H'', in combination with the corresponding marking devices for registering the musical expressions and other miscellaneous signs, as specified.

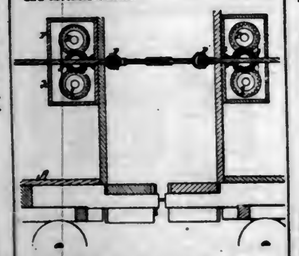
163,922. MACHINES FOR MOISTENING OLEAGINOUS SEEDS. Alfred B. Lawther, Chicago, Ill. [Filed Mar. 6, 1875.]

A machine for mixing, moistening, and heating oleaginous seeds, herein described, comprising a steam-jacketed reservoir or vessel, A, and hollow revolving perforated stirrer-arms D, as and for the purpose set forth.

163,924. VARIABLE EXHAUSTS. William F. Lesser and Charles Michel, College Point, N. Y. [Filed Apr. 24, 1875.]

The combination of the vertical screw-threaded rod D and adjustable conical plug F with the exhaust-nozzle, said rod being arranged in and projecting above the rim of the nozzle, as shown and described.

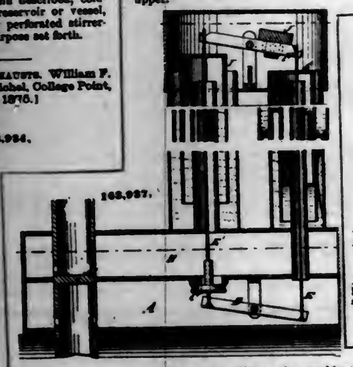
163,925. PACKAGE-HOLDERS. G. Lovinson, Boston, Mass. [Filed Jan. 6, 1875.]



1. The within-described holder composed of the two end pieces or caps *b b*, connected by a cord or band, *c*, substantially as and for the purpose set forth.

2. In combination with a package consisting of a number of pencils or pen-holders, the caps *b b*, united by one or more cords or bands, *c*, substantially as described.

163,926. STATION-INDICATORS. S. P. Littlefield, Lynn, Mass. [Filed Dec. 31, 1874.]

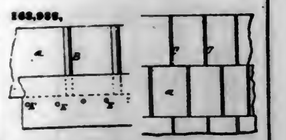


Brief.—Shaft runs through whole train, by which, through bevel-gearing, the indicator is in each car actuated. The connection of shafts between the cars is made by universal joints and extensible shaft.

The combination of the shafts C C', the extensible and contractile shaft E, and their connecting universal joints D D' with the two railway-carriages A B and their station-indicators F, all being arranged and applied substantially in manner and to operate as and for the purpose as hereinbefore specified.

163,927. GAS-REGULATORS. D. P. Mayhew, Detroit, Mich. [Filed Mar. 20, 1875.]

Brief.—One water-valve is operated from the lower chamber, and the other from the upper.



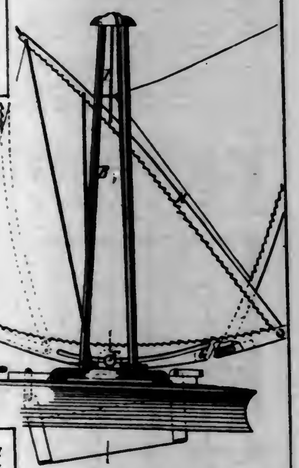
1. In a gas-regulator, the combination of the water-valves G I, communicating, respectively, with the receiving and exit chambers A H, and connected with the exit-valve C, substantially as herein described, for the purpose set forth.

2. The combination of the receiving-chamber A, exit-chamber H, exit-valve C, levers F D, rod E F, and water-valves G I, substantially as specified.

163,928. CEMENT ROOFS. Isaac Mills, Jr., Pittsburg, Pa. [Filed Mar. 25, 1875.]

Brief.—Tiles or shingles made of cement are molded on the roof-boards, nails having been previously driven partially into the roof-boards to secure said tiles. Spaces are left between the side edges of the tiles, to allow for thermal changes, and the spaces thus left are covered with a strip of bent metal, the edges of which are embedded in the tiles before they set or become hard.

163,929.



The application of cement while in a plastic state to roofs, in sections *a*, with the weather-space C, fluting B, and the fastening by means of nails E, substantially as and for the purpose hereinbefore set forth.

163,930. COMBINED TABLES AND DESKS. Thomas W. Moore, Plainfield, N. J. [Filed Nov. 14, 1874.]

The combination of the lid A, consisting of two sections hinged together, having triangular strips G, and the piece E, having the strip F hinged thereto, whereby the device may be converted from a table to an inclined closed desk, or vice versa, all substantially as specified.

163,940. MASTS AND SAILS OF VESSELS. Joseph W. Norcross, East Boston, Mass. [Filed Nov. 13, 1874.]

1. The combination of a mast composed of four timbers with a platform which revolves in or on the deck of the vessel, and with a cap which unites the tops of the four timbers, substantially as set forth.

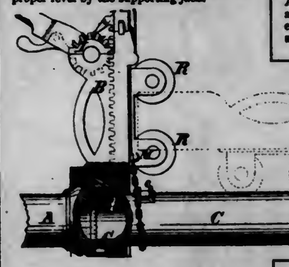
2. The combination of the boom of a sail with a guide secured on a platform revolving in or on the deck of the vessel, either the boom or the platform being movable fore and aft, substantially as described.

3. The combination of a curved boom and a suitable guide with a halyard suspended from the cap of the mast B, substantially as set forth.

4. The arrangement of a groove in the main-boom, for the reception of the boom of an outrigged sail, substantially as described.

5. The combination of a sheer-boom with the main-boom, constructed and operating substantially as set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



163,941. CONSTRUCTION OF VESSELS. Joe W. Norcross, East Boston, Mass. [Filed Aug. 20, 1874.]

A vessel the aft section of which forms an arc, *j k*, described from a center, *c*, while its forward section forms an arc, *j i*, described from a center, *c'*, the centers *c* and *c'* being obtained substantially in the manner described, and illustrated in Fig. 4, for the purpose specified.

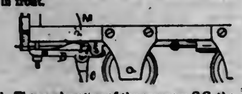
163,942. ART OF LAYING STREET-MAINS. Andrew O'Neill, Ansonia, Conn. [Filed Oct. 15, 1874.]

Brief.—The bayonet-joint coupling is used. The twisting-jack rests upon and holds in place one section of the pipe, while the twisting strain is applied to the succeeding section, the other end of the latter being kept at a proper level by the supporting-jack.

1. The mode of coupling or forming joints of gas or water mains, consisting in providing the sections of pipe with the respective members of a bayonet or screw joint, and with leaden gaskets or packing-rings, and with external lugs *a p*, or their equivalents, bringing the parts loosely together by hand, and forcibly rotating the entering section by means of a twisting-jack, substantially as herein specified, for the purposes set forth.

2. The twisting-jack B, constructed with a deep saddle, and with a notch or depression therein, in combination with a corresponding projection, *a*, on one section, A, which is thus held by this jack, while it supports the same during the application of the twisting strain to an adjoining section, C, as set forth.

3. The combination of the rack-bar H, chain N, and lug *c*, for the purpose described.



4. The wheel or wheels R, arranged on one of the vertical sides of the twisting-jack B, and constructed with concave peripheries, in combination with the laid pipe, forming a track therefor, as means for transporting the twisting-jack from point to point.

5. The combination of the adjusting and supporting jack F, having a swiveled stirrup, B, supported by a vertical screw, and the plug D, having a long cylindrical stem, D', with lugs or projections *a e* on the sections of pipe, and a twisting-jack, B, operating in connection therewith, as described, for laying street-mains by mechanical means, in the manner specified.

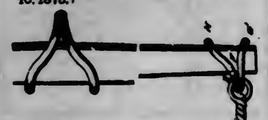
6. The improved dead-end P, having one member of a screw or bayonet coupling and an external lug, *p*, formed thereon, for use in combination with a twisting-jack, to temporarily stop or plug the outer end of a section or branch, substantially as herein described.

163,943. TRACK-SCRAPERS. Sabil A. Otis, Boston, Mass. [Filed Apr. 14, 1874.]

Brief.—The scraper may be elevated out of the way when not in use, and is pivoted, so as to yield to extraordinary pressure from below or in front.

1. The combination of the scrapers C C, the shaft D', the cam S, and the spring R, all to operate with the adjustable levers D D, substantially as set forth.

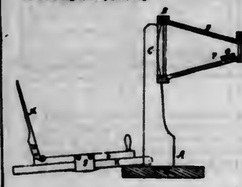
2. The combination of the scrapers C C, the springs M M, and stops M' M' with the swinging levers D D and shaft D', all to operate substantially as and for the purpose set forth.



163,944. SLATE-CUTTING MACHINES. Thos. W. Petty, Danielsville, Pa. [Filed Jan. 4, 1875.]

In a machine for cutting or dressing slate, the combination of the knife-lever G, adjustable weight K, slotted fulcrum-post I, stop-post m, guard L, treadles N O, with the frame A, notched bar E, flange D', cutter-plate E, and knife F, when all the parts are constructed and relatively arranged as herein shown and described.

163,945.



163,946. WHIFFLETREE HOOKS AND CLIPS. Isaac N. Fyle, Decatur, Ind. [Filed Apr. 10, 1875.]

1. A clip formed of two wire wrought-metal rings, spread apart at one end and welded together at the other, to adapt it to different sizes of single trees, substantially as set forth.

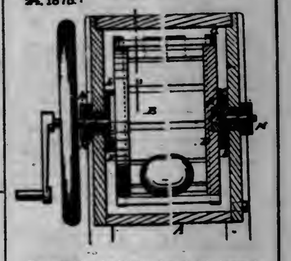
2. The end clip F, consisting of two rings, G H, in combination with a twisted and double wire hook, F, substantially as and for the purpose set forth.

163,946. APPARATUS FOR VIEWING PICTURES. Edwd. S. Ritchie, Brookline, Mass. [Filed Apr. 20, 1875.]

1. The combination of the eye guard D and the adjustable picture-supports K L M K L M, substantially as described, with the lens C and the supporting-frame A.

2. The combination of the head piece E with the eye-guard D, provided with the lens C, arranged at its larger end, as set forth.

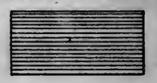
3. The lens-carrying frame B and the eye-guard D, made separate, and provided with means of connection, substantially as and for the purpose described.



4. The combination of the compensating-lens G and its movable frame F, as described, with the eye-guard D and the main lens C, all being arranged substantially as specified.

5. Each picture supporter and adjuster, composed of the arm M and the two bars K L, all arranged and combined as explained.

6. The combination of the supporting-frame A, with the lens-carrying frame B and the adjustable picture-supporters K L M K L M, pivoted to said frame, all as specified.

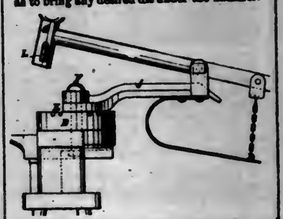


7. The combination of the frame A with the eye-guard D and lens C by side pivots, admitting the changes of position, substantially as specified.

163,947. WASHING-MACHINES. Edward J. Robinson, Schenectady, N. Y. [Filed Apr. 24, 1875.]

The combination of the detachable journals J, flanged plates K, journal-boxes L, and nuts M with the revolving washing-cylinder B and suds-box A, substantially as herein shown and described, for the purpose specified.

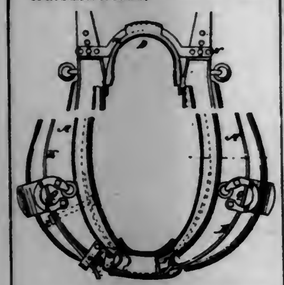
163,948. MANUFACTURE OF HEELS AND SOLES OF BOOTS AND SHOES. J. J. Sawin, Natick, Mass. [Filed Apr. 7, 1875.]



1. In the process of manufacturing heels from curried and oiled leather, the immersion of the oiled leather to form the lifts in naphtha or other volatile hydrocarbons, substantially as described.

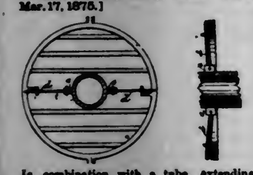
2. As a new article of manufacture, a heel-blank made from lifts or layers of scrap upper leather with the oil extracted, substantially as described.

163,949. DEVICES FOR WELDING CHAIN-LINKS. Philander H. Standish, Jefferson City, Mo. [Filed Sept. 20, 1874.]



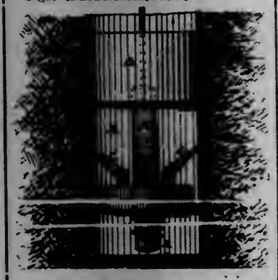
Brief.—The plate contains dies of different sizes, and can be swung around the pivot, so as to bring any desired die under the hammer.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



The combination, substantially as described, of rotary plate D, having open dies E near its edge, and hammer, having main die G and wing-dies L L, all arranged substantially as and for the purpose specified.

163,960. COMBINED HAMES AND HORSE-COLLAR. Ezra Stroud, Rockford, Minn. [Filed Aug. 3, 1875.]

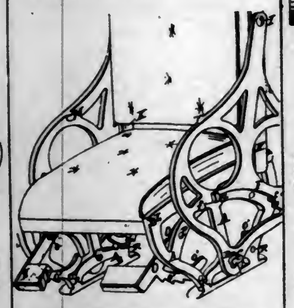


The hames A, having holes *a*, the bow-rods M M, having a series of holes, N, in their end portions, and supporting the neck-pad D, all combined as shown and described, for the purpose specified.

163,961. HEATING-STOVES. Levi B. Stuart, Seymour, assignor of one-half his right to Frederic Durand, Derby, Conn. [Filed Mar. 17, 1875.]

In combination with a tube, extending centrally entirely through the stove and grate, the ears *a a* on the tube, and the swinging bars *d d* on the grate, pivoted to the ears, all substantially as and for the purpose described.

163,962. TOOTHPICKS FOR OIL-WELLS. J. Taylor, Millerstown, Pa., assignor of one-half his right to H. F. Randolph, Ridgeway, N. Y. [Filed Nov. 21, 1874.]

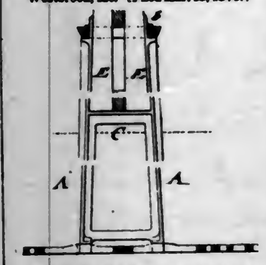


1. In combination with the magazine B, provided with the anchors O O and the discharging devices, the separate tamping-box D, adapted to be connected and suspended, substantially as and for the purpose set forth.

2. The movable rod or shaft R, passing through the magazine and operating the hammer H to fire the charge, in the manner set forth.

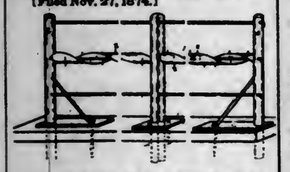
3. The combination, with the rod R and magazine B, of the spring T, in the manner and for the purpose stated.

163,963. ADJUSTABLE AND REVERSIBLE CHAIRS. Henry Voth, Moberly, and Chas. J. Hyatt, St. Louis, Mo. [Filed Sept. 20, 1874.]



Brief.—The back, at its mid-height, is pivoted to side frames, having at their lower ends slotted connection with pivot-studs on the seat-frames. Said side frames have also ratchets that engage studs on the seat-frames. The foot-rest has slotted connection with the seat-frames, and is adjusted to the desired position by means of ratchet-arms engaging studs on said frames

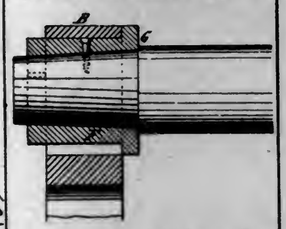
1. The arm-frame F, having slotted pivot-connection C D and racks *f f*, engaging stud G, in combination with the back, pivoted to the frames, and having downwardly-extending arms K, engaging studs L of the seat-frame A, all constructed and combined substantially as set forth.



2. The foot-rest having slotted pivot-connection *e* P with the base-frame A and ratchet-racks *e'*, engaging on studs E, all constructed and combined substantially as shown and described.

163,964. FENCE-POSTS. John H. Warren, Westbrook, Me. [Filed Mar. 13, 1875.]

A fence-post consisting of extension-standards A D, collar *b*, and studs E, all constructed substantially as and for the purpose specified.



163,965. BARBED-WIRE FENCES. William Watkins and Hiram B. Scott, Joliet, Ill. [Filed Nov. 27, 1874.]

The attachment of wire fences herein described, consisting of wire encircling strip *a*, formed of spiral metal, and having barbs *s* projecting through the sides thereof, constructed as and for the purpose described.

163,966. TRACE-FASTENINGS FOR WHIFFLE-TREES. John L. Wingate, Moores Forks, N. Y. [Filed Aug. 10, 1874.]

Brief.—Strain comes on whole whiffletree, instead of on metal attachment at end.

The combination, with thimble F, having leg H on its circumference, and collar G, of the trace-eye B, having slot E, as and for the purpose specified.

163,967. EXERCISING APPARATUS. George W. Wood, New York, N. Y. [Filed Mar. 6, 1875.]

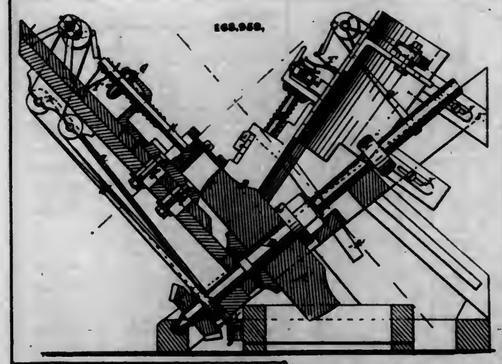
Brief.—The elasticity of the tube is overcome by the muscular contraction of the operator in any exercises desired.

1. The conical plugs or handles B, inclosed in the ends of a rubber or other elastic tube or rod, substantially as herein shown and described.

2. The combination of the cord C with the rubber tube A and the conical plugs or handles B, substantially as herein shown and described.

3. The combination of a cross or stirrup handle, D, with the rubber tube or rod A and the conical plugs or handles B, substantially as herein shown and described.

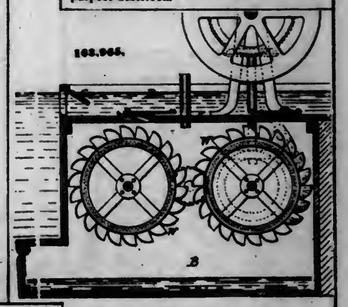
163,968. WOOD-GRINDERS FOR PAPER-PULP. Anna M. Hammer, Elkhart, Ind. [Filed Mar. 20, 1875.]



Brief.—The grinding-wheel is set at an angle of forty-five degrees, and has feed-boxes on face and edge. Each feed-box has a piston-plunger.

1. A stone for grinding wood, arranged to run in a plane oblique to the horizontal plane, in combination with feed-boxes for the face and for one side, substantially as specified.

2. The combination of feed-pawl lever Q and a crank-shaft with the feed-presser, having a ratchet-stem, substantially as specified.

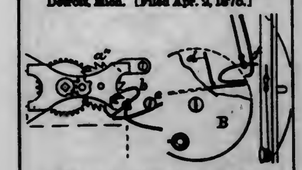


3. The combination of a spring T, with the feed-pawl and its connecting-rod and crank-shaft, substantially as specified.

163,959.

A series of curved band-cutting knives, C, secured upon a shaft, *c*, mounted in bearings *b*, free to play up and down in curved slots *a*, in uprights A, substantially as and for the purpose described.

163,965.

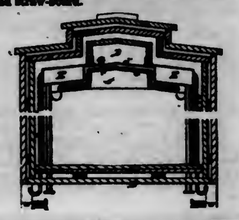


163,969. SPOOLS. Nicholas I. Allen, Hopedale, Mass., assignor to George Draper & Son, same place. [Filed May 11, 1875.]

Brief.—To enable a barrel-shaped yarn-load to be built by a uniform traverse of the yarn-guide.

The double-headed spool, having its body largest in diameter at its middle, and tapering each way from its middle to the two heads, all being substantially as shown and described.

163,970. BURGLAR-ALARMS. J. Andrews, Detroit, Mich. [Filed Apr. 2, 1875.]

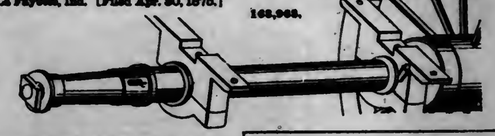


1. The lever *c*, having the bent cord and adapted to be attached directly to the thread-loop, and to allow the entrance of the pivoted wire *f* to lock said lever, in combination with the catch *d*, pallet *h*, gong-striker *b'*, gong B, and escape-wheel *a'*, all substantially as herein specified.

2. The combination of the pivoted locking-wire *f*, with the bent stop-lever *e*, the parts being constructed and adapted for operation, as shown and described.

163,971. REFRIGERATING-CARS. Richard Armiger, Baltimore, Md. [Filed May 1, 1875.]

Brief.—Water-chambers between ice-box retain the drip-water. Bottom of ice-box is a continuous metal floor. Water condensing on it conveyed away by troughs. Food-chamber air-tight; air-space around it lined with felt and straw-board.



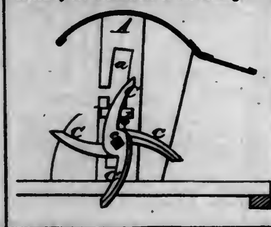
In refrigerator-cars, a median ice-chamber, D, and a water-chamber, E, on each side to receive the drippings thereof, the whole resting upon a metallic bottom, *f'*, that forms the roof of an air-tight provision-chamber, C, as shown and described, so that the ice-cold water, which absorbs caloric slowly on the journey, may form an important part of the cooling medium over the provision-chamber.

163,972. PROCESSES FOR PREPARING COCOA-NUT FOR DOMESTIC USE. Alexander P. Ashbourne, Oakland, Cal. [Filed Apr. 15, 1875.]

The process of preparing cocoa-nuts for domestic use, substantially as herein described, and consisting essentially of first grating or pulverizing the meat, and then cooking by the direct action of steam, drying and sweetening the same.

163,973. WAGON-AXLES. Edwd. Ballman, La Fayette, Ind. [Filed Apr. 20, 1875.]

163,973.

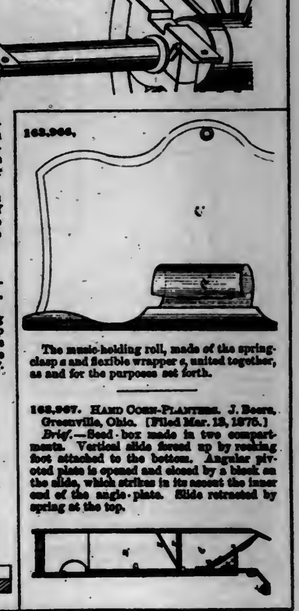


1. An axle adapted to turn in boxes, combined with a thimble-chain adapted to turn upon the thimble, so that there is an independent revolution of the axle and of the traction-wheels, all substantially as and for the purpose set forth.

2. In combination, an axle, a box in which it is to revolve, and thimble-chains capable of revolution upon a thimble rigidly attached to said axle, substantially as and for the purpose set forth.

163,974. BAND-CUTTERS FOR THRASHING-MACHINES. Byron L. Beard, Thorntown, Ind. [Filed Apr. 17, 1875.]

Brief.—The bearings of the shaft carrying the band-cutting knives are free to play up and down in slots curved in an arc concentric to the shaft, imparting motion to allow the tension of the driving-belt to remain unaffected by the rise and fall of the bearings.



163,975. TIDE-POWERS. Peter Boehs, Bath, Pa. [Filed Mar. 19, 1875.]

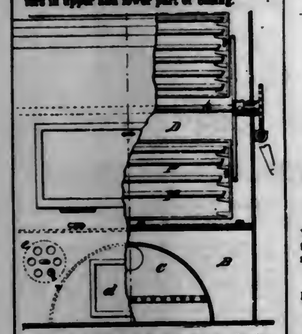
1. The method, substantially herein described, of utilizing the tides as a power by means of a flood and ebb gate, C A, communicating with an upper water-head dam, D, and a lower receiving and emptying dam, E, and a water-wheel, W, or wheels between these dams for joint operation, as herein set forth.

2. The combination, in a tide-power apparatus, of an ebb-gate, A, opening outward, and a flood-gate, C, opening inward, with the lower and upper dams D B, and the water wheel or wheels, combined for operation with these tide-gates, substantially as herein set forth.

163,976. SHEET-MUSIC HOLDERS. Bernard J. Beck, Brooklyn, N. Y. [Filed Jan. 29, 1875.]

163,976.

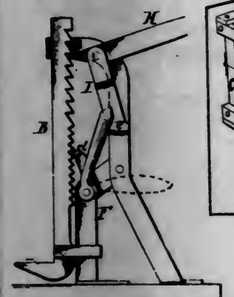
The music-holding roll, made of the spring-clasp *a* and flexible wrapper *c*, united together, as and for the purposes set forth.



163,977. HAND CORN-PLANTERS. J. Beers, Greenville, Ohio. [Filed Mar. 12, 1875.]

Brief.—Seed-box made in two compartments. Vertical slide forced up by rocking foot attached to the bottom. Angular pivoted plate is opened and closed by a block on the slide, which strikes in its nearest the inner end of the angle-plate. Slide retracted by spring at the top.

The notched seed-slide D, acted on by a spring, and having guard G, block K, and floor L, in combination with the pivoted plate H, carrying jaw F'', and the seed-box, having corresponding jaw F, and the chambers B C, separated by diaphragm F, all arranged as shown and described, to operate as specified.

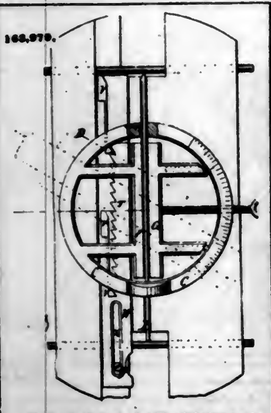


163,969. FRUIT-DRIER. Henry R. Bidwell, South Haven, Mich. [Filed Jan. 7, 1876.]

Brief.—A furnace, drying-chamber, and intermediate fire-chamber, receiving trays, and a regulator. Between the two latter are registers in upper and lower part of casing.

In the herein-described fruit-drier, having the furnace C, drying-chamber D, and intermediate fire-chamber B, the revolving shelves or trays, in combination with the regulator *f g*, registers *e*, and door *c*, whereby there is maintained a circulation of heated air of given temperature within said drying-chamber, substantially as specified.

163,970. LIFTING-JACKS. Joseph C. Bird, Bishop Gun, Md., assignor of one-half his right to Edwin Martin, same place. [Filed May 8, 1875.]



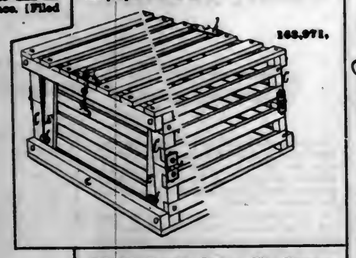
1. The combination, in a lifting-jack, of the toothed lifting-bar B with the operating-lever H, hung to the upper forked end of an arm, I, which is contained in the space between the opposite sides of the frame, and rests loosely at its lower end upon a bearing, *e*, on the frame, all substantially as set forth.

2. The combination of the arm *f* on the spindle of the pawl *d* with a movable weight or lever, by adjusting which the center of gravity of the said pawl can be changed, as set forth.

163,970. SAW-FILING MACHINES. Wm. B. Bissell, La Grange, N. C., assignor to himself and W. H. Hardee, same place. [Filed Dec. 20, 1875.]

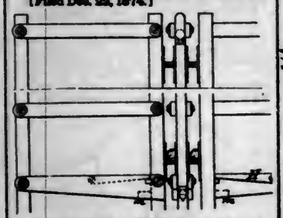
Brief.—The plate carrying the spring-pawls is provided with a slot and set-screw for setting the pawls to the ratchet-bar after the file is adjusted.

163,970.



The notched ratchet-bar T and spring-pawls V, arranged on a shifting-plate, combined with the feeding-frame C, as and for the purpose specified.

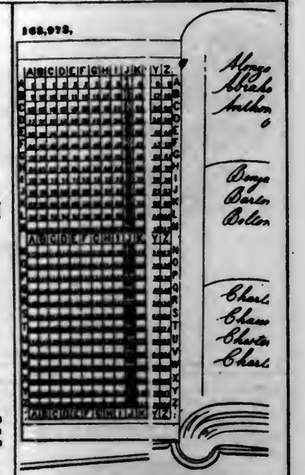
163,971. POULTRY-COOPS. Frederic M. Blanc, Winchester, Va., assignor of one-half his right to T. V. Purcell, same place. [Filed May 11, 1875.]



Brief.—The ends are hinged at top, and turn inward against the roof. The sides, with their pents, are centrally hinged to bend inward, and made to double upon themselves, and thus bring the top and bottom near each other.

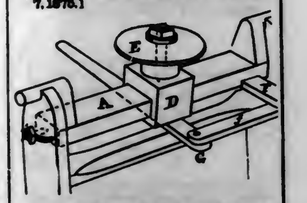
The combination, with the top and bottom frames A B, of the jointed and folding sides C D and the hinged folding ends E, all arranged and operating in the manner and for the purpose set forth.

163,971.



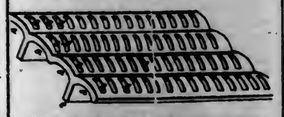
163,972. CLOTHES-DRIERS. Wm. Bloomer, New York, N. Y., assignor to Thomas Van Dyke and William W. Downs, same place. [Filed Dec. 23, 1874.]

In a clothes-drier with hinged sections and pivoted bars, the combination of the stop H with one of the said bars, and with the step *n*, as and for the purpose set forth.



163,973. INGRAIN. C. H. Bradley, Coatesville, Pa. [Filed Apr. 11, 1876.]

163,973.



Three horizontal alphabetical columns of letters, representing initial letters of christian names, and the two perpendicular alphabetical columns, representing the initial letters of surnames, and the figures horizontally arranged, representing the numbers of pages, in combination with two or more numerals in each square of one or more columns, by which I subdivide different christian names of the same initial, substantially as described.

163,974. SAW-SHARPENING MACHINES. P. D. Burgher, Deep Creek, Va. [Filed Apr. 7, 1876.]

The saw-swing A, resting in, and adapted to be secured horizontally or at an angle in, its frame, in combination with the traveler D, saw-rest E, bearing F, link *f*, and lever G, all combined and operating substantially as and for the purpose specified.

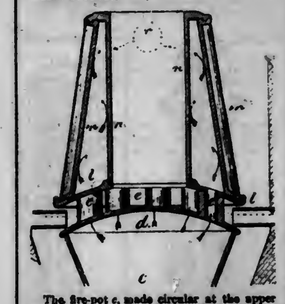
163,975. FURNACE GRATE-BARS. Joseph Clark, Green Point, N. Y., assignor of two-thirds his right to Abel Bruce, Saugatuck, Conn., and Frank S. Smith, Brooklyn, N. Y. [Filed May 20, 1875.]

The herein-described grate-bar or section, consisting of a series of longitudinal perforated arches, *a*, substantially as set forth.

163,976. SHOEING-TOOLS. Joseph C. Cook, New York, assignor to William H. Boe, Flushing, N. Y. [Filed Dec. 28, 1874.]

Brief.—The lining of the tube is held to the exterior part by a cement packing, whereby the heat is prevented from burning the wooden part, and permits the handling of the device.

163,976.



The combination of the tube A, non-porous lining B, non-conducting casing *a*, hollow plug C, with perforated partition *b*, and mouth-piece or holder D, all substantially as and for the purposes herein set forth.

163,977. MANUFACTURE OF ARTIFICIAL MARBLE. John Cowman and S. B. Barber, Rochester, N. Y. [Filed Mar. 6, 1875.]

1. The composition for making imitation stone, consisting of the combination, with gypsum, of glue, gum-tragacanth, and alum, compounded substantially as described, and for the purpose specified.

2. The process of forming artificial marbles and other facititious stones, by combining gypsum, glue, gum-tragacanth, and alum with mineral colors in separate vessels, and applying the colored cements by suitable instruments in building up a body or facing of the stone with the colors blended throughout, as described.

163,978. AIR-HEATING FURNACES. Saml. W. Davenport, Somerville, N. J. [Filed May 3, 1875.]

The fire-pot *c*, made circular at the upper end, and oblong contiguous to the grate-bars, in combination with the dome *d*, that covers the fire, the circular range of tubes *e*, the annular plate *f*, the central air-heating shaft *n*, and casing *m*, substantially as specified, whereby the air to be heated is drawn in between the dome *d* and plate *f* by the ascending current in the shaft *n*, substantially as set forth.

163,979. TREATING TAR. T. H. Dunham, Boston, Mass. [Filed May 15, 1875.]

Brief.—Treats tar and water by steam heat in vats communicating with other vats, where the goods are moved by machinery; allows tar to settle; draws off impurities; adds alkalies; boils again. Then bleach and render inodorous or less inflammable by sulphuric acid and chlorine; or may (instead of such bleaching) add resin, shun, glue, tallow, or oil, and boil again; adds crude sulphur, and color to suit, and finally a soluble salts of an alkali and earths.

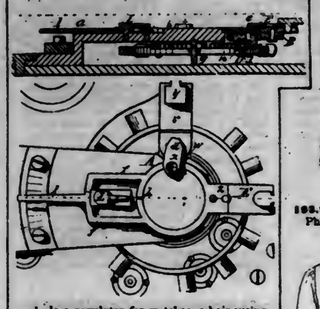
1. The prepared tar, being inodorous and bright-colored, as described.

2. The process described for treating tar to give it a brightre color and free it from odors, consisting in treating it with acids and alkalies, or with bleaching compounds, substantially as described.

3. The method herein described for rendering tar fire-proof, consisting in combining with it sulphate of ammonia or other salt of ammonia, or a soluble salt of an alkali, and other, chalk, infusorial earth, whiting, lime, baryta, or equivalent earthy material, substantially as set forth.

163,980. FISH-HOOKS. E. L. Dunlap, Bucksport, Me. [Filed May 1, 1876.]

Brief.—A snap-hook, the line being attached to a hinged or pivoted latch, securing the spring-striker in position.



163,980

The main hook *a*, secondary spring-hook, and spring *d g e f*, arranged and connected therewith, as shown, in combination with the swinging catch *b*, pivoted to the shank of the main hook *a*, all constructed and arranged substantially as shown and set forth.

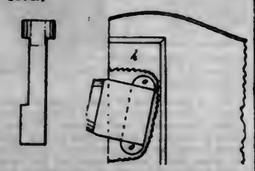
163,981. REGULATING CHRONOMETER, WATCHES, &c. Leander Eaton, Worcester, Mass. [Filed Mar. 8, 1875.]

Brief.—Adjusting parts of regulator held in position by locking levers

1. In a regulator for watches, a hair-spring lock for holding or locking the hair-spring to give it a single, permanent, and firm base of action, for the purposes herein set forth.

2. In a watch-regulator, the levers for fastening the movable or adjustable parts thereof, for the purposes herein set forth.

3. In a watch-regulator, the combination of a lock with the index of the regulator for the purposes herein set forth.



4. The regulator-frame A, constructed as described, with the arms *f f* and cut *h*, substantially as and for the purposes herein set forth.

5. The hair-spring lock consisting of the plate B with jaw *n*, bolt D, lever E with jaw *c*, and lever *c*, all constructed as described, and attached to the regulator-frame A, substantially as and for the purposes herein set forth.

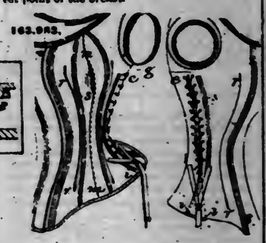
6. The adjustable hair-spring holder, consisting of the plate *e* with jaw *g*, movable jaw *b*, and levers *x y*, all constructed substantially as and for the purposes herein set forth.

7. The combination of the regulator-frame, hair-spring lock, adjustable hair-spring holder, and the sight *l*, all substantially as and for the purposes herein set forth.

163,982. BEDSTEAD-FASTENINGS. Wm B. Elliot, New York, N. Y. [Filed Nov 7, 1874.]

In a bedstead-fastening a wood-tenon having all its shoulders parallel to each other, and to the ends thereof, and united with the side rails of the bedstead by a mortise cut diagonally therein at an angle corresponding with the inclination of the post-mortise, said rail-mortise being covered by the cleat *h*, substantially as and for the purpose set forth.

163,983. CORSETS. Harriet G. Emery, Boston, Mass. [Filed Oct. 27, 1874.]



1. The elliptic side openings under the arm, closed at the top and enclosed at the bottom, and provided with a lacing for adjusting the same, substantially as shown and described.

2. In connection with the side openings under the arm, and with their adjusting-lacings, the flaring parts *i i*, arranged to overlap, as shown and described, or to meet without overlapping, as shown in Fig. 1, and for the purposes set forth.

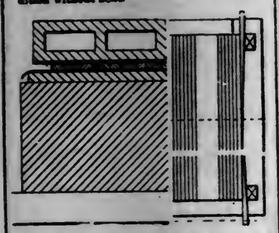
3. The combination of the seams *r r*, made as described, with the elliptic side openings and their lacings.

4. The combination of the contrasted seams *r r*, made as described, with the seams *n n*, extending vertically over the center and highest point of the breast.

163,983.

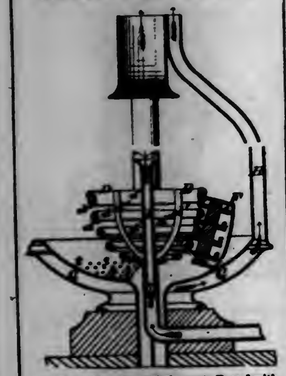
163,984. SHIRT-BOSOMS. S. S. Fleishman, Philadelphia, Pa. [Filed Mar. 10, 1876.]

The combination, in an open-back shirt, having a hinged flap, B, formed of continuations of the two sides *a b* of the fixed portion of the bosom, of plaits *a'' a'''*, one carried by the flap and the other arranged on one side of the fixed bosom, substantially as set forth.



163,985. KNITTED TRIMMINGS. Gabriel M. Gernsheym, Brooklyn, E. D., N. Y. [Filed Aug. 13, 1874.]

A knitted trimming, the back of which is composed of a series of plain stitches or loops, *a*, which lie close together, and each of which is longer than the stitches composing the face of the trimming, said face presenting a continuous undulated surface, each undulation being composed of a series of stitches, *b b' b²*, which are drawn tight, while the back stitches *a* are elongated to match, substantially as shown and described.



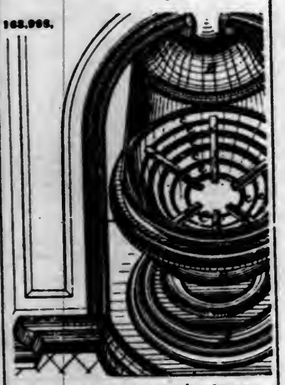
163,906. MAKING WOODEN MATS. James M. Hall, Worcester, Mass. [Filed Feb. 10, 1875.]

Brief.—After the slats have been glued to the cloth the mat is laid cloth downward upon a heated compressible bed, and a smooth platen is brought to bear upon the slats; it is subsequently permitted to "set" in this condition without heat.

The described improvement in the art of manufacturing wooden mats for table or other use, which consists in subjecting the prepared strips, preliminarily put together, glue-coated, and furnished with a cloth covering, as described, to pressure on a yielding heated bed, where the mat is evened, and the glue caused to bind the strips to the cloth, and subsequently pressing the mat in a cooling and setting apparatus, and smoothing off the wood faces of the mat, all substantially in the manner set forth.

163,907. HEATING-STOVES. P. J. Hardy, New York, N. Y. [Filed May 3, 1875.]

1. In combination with the grate D, and with the shaft E, provided with the disks *a* and *c*, that pass into the openings *d*" of said grate, the casing F, arranged to inclose said shaft at all points, except at its front side and lower end, substantially as and for the purpose specified.

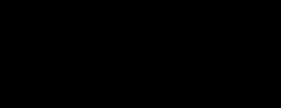


2. In combination with the basket-grate D, the concave hollow base A, having interiorly a correspondingly-shaped air-space, G, which communicates, through openings *p* and *p*, with the space surrounding said grate, and, by means of the pipes H, H, and H, is connected with the exit-flue, substantially as and for the purpose shown.

163,908. HEATING-STOVES. P. J. Hardy, New York, N. Y. [Filed Mar. 27, 1875.]

Brief.—The movable portion of the casing can be revolved entirely around its axis. The rotation of the cup-shaped grate raises it by means of the disks.

1. A heating-stove having the circular portion of its casing above its grate made sectional, centrally pivoted at its upper and lower ends, and capable of rotation around its axial center, substantially as and for the purpose described.



163,908.

2. In combination with the annular openings *c*" *c*", &c., of the horizontally-rotating grate C, the shaft F, provided with the toothed disks *f f*, &c., and arranged to cause one of said disks to be contained within each of said annular openings, substantially as and for the purpose shown.

163,909. APPLICATION OF STONES TO WALLS OF BUILDINGS. P. J. Hardy, New York, N. Y. [Filed Feb. 11, 1875.]

Brief.—A facing for walls consisting of thin slabs of marble or other stone, secured in place by a metal frame, and leaving an air-space between its inner face and the outer face of the wall.

In combination with the wall of a building, a facing or covering composed of slabs of marble, slate, or other like material, secured in place thereon by means of a metal frame, and having an air-space between its inner face and the outer face of said wall, substantially as and for the purpose specified.

163,910. APPLICATION OF MARBLE TO BUILDING PURPOSES. P. J. Hardy, New York, N. Y. [Filed Mar. 22, 1875.]

Brief.—An interior frame of metal with an exterior covering of stone, which conceals the same, for monuments and architectural purposes, allowing of the use of thin slabs, while giving the appearance of solidity.

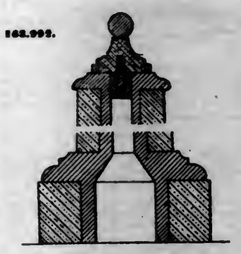
For architectural purposes, the combination of an interior frame or core, of metal, with an exterior covering of stone which conceals the same, substantially as and for the purpose specified.

163,911. COVERINGS FOR WALLS OF BUILDINGS. P. J. Hardy, New York, N. Y. [Filed Mar. 13, 1875.]

As a new article of manufacture, a covering for the exterior walls of building, composed of a sheet of lead or other soft metal, having impressed or otherwise formed upon its outer face the configuration of brick, stone, or other facing usually employed for walls, substantially as and for the purpose specified.

163,912. APPLICATION OF STONES TO BUILDING PURPOSES. P. J. Hardy, New York, N. Y. [Filed Mar. 31, 1875.]

Brief.—The marble is used in thin slabs, and is applied, by means of metal supporting-frames, to the construction of newel-posts, columns, and similar articles.



163,909.

163,911.

163,912.

In the construction of columns, newel-posts, and for other like architectural purposes, the combination of slabs of marble or other stone with metal supporting and inclosing frames, substantially as specified.

163,913. BALUSTERS. P. J. Hardy, New York, N. Y. [Filed Feb. 20, 1875.]

As a new article of manufacture, a metal baluster having the whole or a portion of its surface covered with wood veneer, substantially as and for the purpose specified.

163,913.

163,914.

163,914. CONSTRUCTION OF COLUMNS AND PILASTERS. P. J. Hardy, New York, N. Y., [Filed May 1, 1875.]

Brief.—A metal supporting-frame with base and frieze, between which a stone shaft or column is held.

The combination of the metal supporting-frame A, base B, and frieze C with the stone shaft E, substantially as and for the purpose specified.

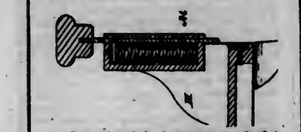
163,915. CONSTRUCTION OF MARBLE COLUMNS. P. J. Hardy, New York, N. Y. [Filed May 1, 1875.]

Brief.—An ornamental coin.on consisting of a metal center rod, longitudinally-divided stone base and shaft, and recessed metal plates at top, middle, and bottom, to contain the ends of base and shaft.

In a column for architectural purposes, the combination of a metal center, F, longitudinally-divided base and shaft A and B, and recessed metal plates C, D, and E, for containing the ends of said base and shaft, substantially as and for the purpose specified.

163,916. HAND-RAILS. P. J. Hardy, New York, N. Y. [Filed Feb. 11, 1875.]

Brief.—A hand-rail consisting of two metal sections united by bolts or screws, and provided with recessed edges, that embrace the edges of the stone or marble top piece.



In combination with the metal sections A and A, constructed and united as shown, the stone or marble section C fitted between and embraced by the edges *a* and *a* of the former, substantially as and for the purpose specified.

163,917. HORSESHOES. Christn. Hartmann, Hanover, Germany. [Filed Apr. 17, 1875.]

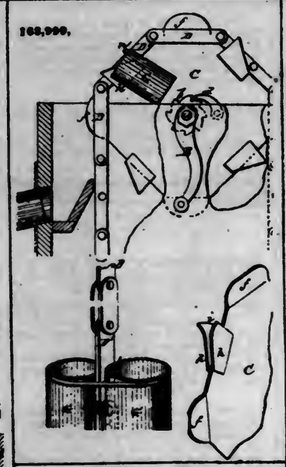
The combination of the buffer B, having slit *f*, with lining *g* of textile fabric, retaining-spring *h*, and shoe A, substantially as herein set forth.

163,918. MACHINES FOR CUTTING PRINTERS' LEADS. Wm. Hawkins and W. P. Dodge, Newark, N. J. [Filed June 30, 1873.]

1. In a printer's lead-cutter, a standard for carrying the knife, composed of the part H, adapted to be secured to the side of the table, a wing, J, turned transversely across and over the table, having a recess adapted to receive a spring and a removable face-plate, M, substantially as described and shown.

2. The printer's lead-cutter, substantially as described, wherein a knife, composed of a single piece, to which a striking-handle is secured, and reciprocating between a wing-standard and a removable face-plate, and a table having a side ledge, adapted to hold and guide a gage, are all constructed, combined, and arranged to operate substantially as set forth.

163,919. WATER-ELEVATORS. Peter Hoag and Otto Junkerman, Centralia, Ill. [Filed Nov. 21, 1874.]

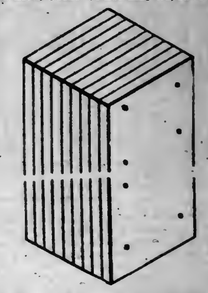


Brief.—A water-elevator with a wheel having alternate elongated projections and flanges, forming flaring mouths. The endless chain is formed of alternate double bars and single bars. The buckets are arranged in pairs, pivoted one on each side of the chain, and connected by a rod.

1. The wheel C, provided on its circumference with alternate elongated projections *f* and flanges *h h*, constructed as described, to form the flaring mouth *i*, substantially as and for the purposes herein set forth.

2. The buckets G G, arranged in pairs, pivoted one on each side of the chain D D', and connected by a rod or bail, *a*, substantially as and for the purposes herein set forth.

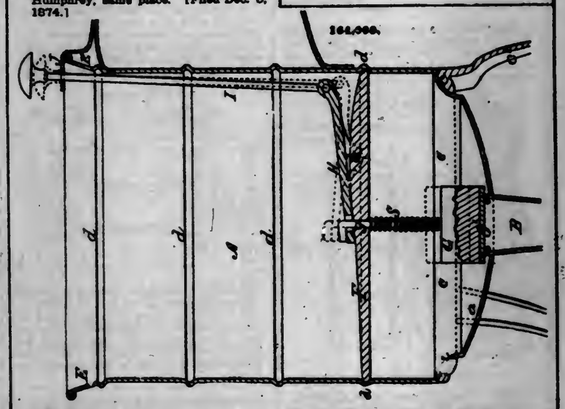
3. The combination, in a water-elevator, of the wheel C, having alternate elongated projections *f* and flanges *h*, forming flaring mouths *i*, the endless chain formed of alternate double bars D D and single bars D', and the buckets G G, arranged in pairs, pivoted one on each side of the chain, and connected by a rod or bail, *a*, all substantially as and for the purposes herein set forth.



163,920.

1. The combination of an ice-house and an adjoining platform, B, with an articulated and adjustable frame and endless chains, substantially as described, for the purpose specified.

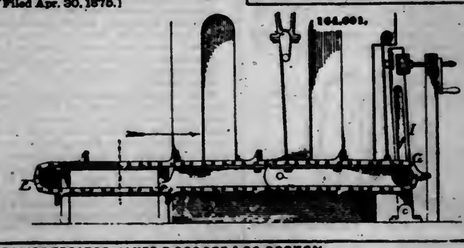
2. The combination of the articulated frame, the endless chains, chain drum or pulleys E on the driving-shaft, and chain drum or pulleys G with the adjustable frame I.



164,002. MACHINE-BELTINGS. C. A. Jewell, Hartford, Conn. [Filed May 24, 1875.]

As an improved manufacture of belting, an angular or nearly square belt, substantially as shown and set forth.

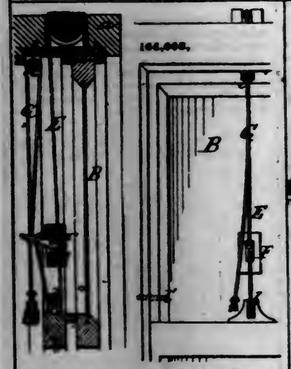
164,000. MEASURES AND FUNNELS. John Dudley Humphrey, New Britain, Conn., assignor of one-half his right to Wm. A. Humphrey, same place. [Filed Dec. 5, 1874.]



164,000.

The measuring-vessel A, having annular gradations *d d*, annular flange E, ejection-tube B, and shelf J, in combination with the rod F, valve C, spring S, lever H, and rod I, provided with catch *k*, substantially as described, and for the purpose set forth.

164,001. STORING AND REMOVING ICE. A. Hunt, Philadelphia, Pa., assignor to the Knickerbocker Ice Company, same place. [Filed Apr. 30, 1875.]



164,001.

164,003. SASH-BALANCES. Elias Johnson, Wesson, Ohio. [Filed May 6, 1875.]

Brief.—A traveling clamp is applied upon the balance-cord of a pair of sashes, moving up and down upon the same, in such manner that either sash can be raised or lowered independently of the other, and either one can be readily adjusted to any degree of elevation or depression relative to the other.

164,003.

The combination of a traveling clamp, F, with the snaps B C, balanced by means of a cord, B, passing over a pulley, D, at the top of the window-frame, substantially as specified.

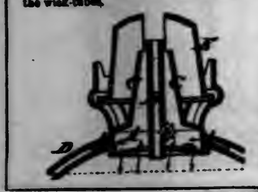
164,004. WASHING-MACHINES. George S. Jones and Benj. F. Kidd, Russellville, Ky. [Filed Apr. 21, 1875.]

Brief.—The rollers are formed of end plates, connected by small detachable metallic rods passed through sections of rubber tubing.

The washing-roller, consisting of the end plates E, the detachable rods C, and the sections of rubber tubing H, all combined and arranged substantially as and for the purpose described.

164,004.

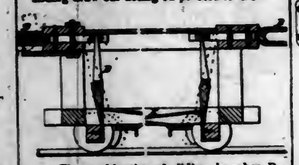
164,005.



164,005. PAPER BOXES. Louis A. Kettle, Philadelphia, Pa., assignor of one-half his right to Rupert Kettle, Merridale, England. [Filed Jan. 8, 1875.]

The paper lid C, formed of the outer pieces a c, with the interposed narrow piece b, in combination with the paper body A, formed with inwardly-projecting rims B, substantially as and for the purpose set forth.

164,006. LAMP-BURNERS. Abraham Kimber, Muncie, Ind., assignor of one-half his right to William O. McMillan, Wiley, Pa. [Filed Mar. 20, 1875.]



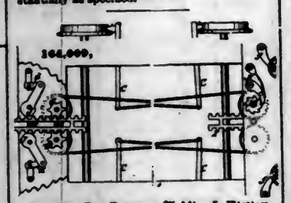
Brief.—Perforations in the bottom and sides of the burner and tubes, upon both sides of the wick-tubes.

In a lamp-burner for crude petroleum, having perforations a in its bottom and b through its sides, tubes C C, leading to the upper end of the wick-tube B, and annular skirting D, combined substantially as described, and for the purpose set forth.

164,007. CAR-BRAKES. Fielding L. Kirtley, Cleburne, Tex. [Filed Apr. 14, 1875.]

Brief.—Brakes automatically applied by sliding draw-bar acting on pivoted levers.

1. The combination of sliding draw-bar B, lever D, rods E E, and the brake-bars, as and for the purpose set forth.



2. In combination with a car-brake, the sliding draw-bar B, having the jointed turn-up end B', as and for the purpose set forth.

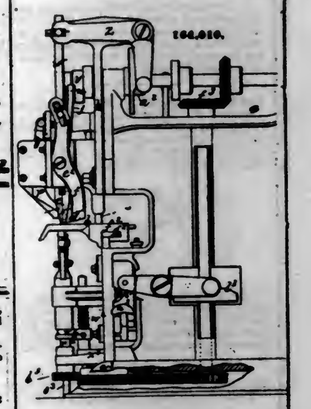
164,008. STAIR-BUILDERS' ADJUSTABLE SQUARES. Columbus B. Kirkpatrick, Parkersburg, W. Va. [Filed Mar. 27, 1875.]

The square herein described, having short branches a and long branches b, slotted longitudinally, and connected in pairs of short branches and of long branches by clamp-screws c, to form an adjustable rise and tread measuring instrument for stair-builders, substantially as specified.

164,009.

164,009. CAR-BRAKES. Fielding L. Kirtley, Cleburne, Tex. [Filed Apr. 14, 1875.]

Brief.—When speed of locomotive is decreased, cars, in crowding, make the sliding rack operate the windlass-shaft pinions, and thereby automatically apply the brakes. Apparatus may be locked by a cam operated by hand.



1. The slotted draw-bar H, having racks I, in combination with the windlass-shaft F, pinion G, the brake-lever C, and the connecting cord or chain, substantially as and for the purpose set forth.

2. The combination, with the draw-bar H, of the locking-cams J, the connecting-link d, the vertical shaft K provided with a hand-wheel, and the ratchet and pawl f, substantially as and for the purpose set forth.

164,010. MACHINES FOR FORMING AND DRIVING STAPLES FOR LEATHER-WORK. Asa B. Keith, Braintree, and Eunice S. Reed, administratrix of Timothy K. Reed, deceased, East Bridgewater, Mass., assignors, by mesne assignments, to Metallic-Seam Company, New Haven, Conn. [Filed May 17, 1875.]

Brief.—Improvements on Shorey's Patent No. 138,348. The wire is fed over a former, which serves as a rest for the center of the staple-forming length of wire, which is bent into staple form by the descent of the bender, when it is severed by the cutting device. As the device descends, the former is withdrawn, the staple driven through the parts to be united, and the projecting ends raised by rotating nippers and twisted, after which the twisted ends are embedded into the stock by a setting-rod.

164,010.

1. In combination with the wire feeding and bending mechanism, the severing-cutters, acting against the top and bottom surfaces of the wire, substantially as described.

2. In a machine for forming seams, a pair of twisting-nippers, actuated to have an upward motion during the twisting operation.

3. The combination of the rotary cam a^2, cam-rise a^3, shaft r^6, and sleeve q^2, for imparting the inward movements to the nippers, substantially as described.

4. In combination with the cam a^2, the spring w^2, for imparting the downward movement to the sleeve, substantially as described.

5. The continuously-rotating shaft r^6, in combination with the nippers, and for imparting to them their twist movement, substantially as described.

6. In combination with the driving-shaft, the shaft S^2 and gears b^2 b^3 b^4 b^5, for actuating the nipper-shaft r^6, substantially as described.

7. In combination with the twisting mechanism, the set s^3, for bending the twisted staple-points, substantially as described.

8. In combination with the set s^3, the cam q^2 and spring for imparting to it its respective movements, substantially as described.

9. In combination with and for operating the former d, the lever c^2, with its slot d^2 and the pin projecting from the driver-bar w, substantially as described.

10. The lever z, cam a^2, and spring b^2, for operating the driver-bar w, substantially as described.

11. The crank-pin u, link j, and bender-bar i, combined and operating substantially as described.

12. The cutter-lever p, operated by the incline o and a spring, substantially as described.

13. The swinging head h and vertically-moving work-support plate h, moving laterally together, substantially as described.

14. The cam F, lever k^2, and spring m^2, combined and operating to actuate the work-plate vertically, substantially as described.

15. The vertical slide-plate f^2 and horizontal slide-plate f^3, connected, and having relative movements and movements in common, substantially as described.

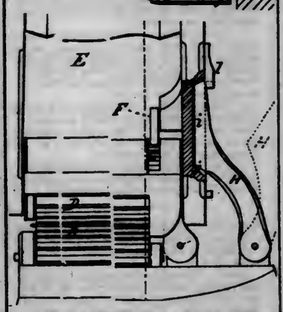
16. The method of making a staple-seam, by forming the staples with the parallel V-shaped points, and driving said staples in line, so that the edge of each staple-point stands at a right angle to the plane of the seam as it enters the work, substantially as described.

17. A staple having the wedge-shaped points, with the edges of the two points inclined, substantially as described.

164,011. DIVIDERS FOR DRAWING AND WELDING TUBULOS. Geo. Matheson, McKeesport, Pa., assignor to himself and the National Tube-Works Company, same place. [Filed Mar. 26, 1875.]

Brief.—The bell-mouthed die is intended to be slipped upon the rod that is welded to the skelp, and the die-support has a channel cut downward from the top into the die-space, to permit the rod to be passed down through it.

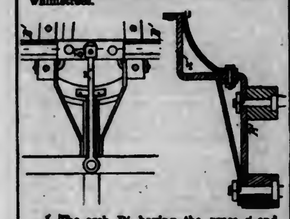
164,011.



The combination of the matrix B with the support or holder C, provided with the slot D, substantially as and for the purpose hereinbefore described and set forth.

164,012. SMOOTHING AND FLUTING IRONS. William D. Mayfield, Fort Worth, Tex. [Filed Feb. 20, 1875.]

Brief.—A smoothing-iron with a pair of fluting-rollers, operated by a vertically-vibrating handle with pawl and ratchet-wheel.

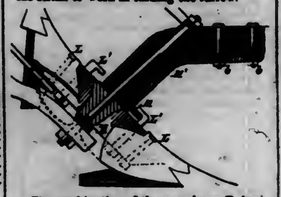


1. In a combined smoothing and fluting iron, the vertically-vibrating actuating-handle E O, having pawl F, in combination with the fluting-rollers D E, the former having a rack-wheel, G, substantially as specified.

2. The actuating-handle E G, having recess j and latch l, in combination with the pivoted lever H, provided with flattened end i, substantially as and for the purpose set forth.

164,013. CORN-HARROWS. J. McCormick, Peoria, Ill. [Filed Aug. 20, 1874.]

Brief.—To the lower part of the arched bars, bent at right angles, are secured sections of the harrow; the front arch of which is strengthened by the curvilinear brace, which also forms corners, into which the front end of the removable pivoted handle projects. The tongue is made rigid by a bar projecting from the front arch-bar to the bolt holding the whiffletree.



1. The arch B', having the brace c and openings s and s', in combination with the removable and adjustable plow-handle D, substantially as and for the purpose set forth.

2. In combination with the draft-pole e, the removable rod r, attached in the manner as described, and for the purpose set forth.

164,014. REVERSIBLE PLOWS. J. McCabe, Woodbury, Tenn. [Filed Apr. 14, 1875.]

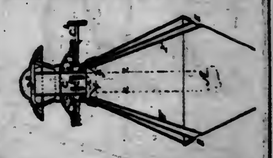
Brief.—The plow-beam has an angle of about forty-five degrees downward and backward, and through which a strong bolt passes, engaging with the lower end of a standard rising rearwardly therefrom, and at right angles thereto. The shares and mold-boards are both upon a short beam that is pivoted upon the inclined bolt. Both mold-boards look in the same direction, so as to turn the furrow in the same direction in the return furrow upon the same side of the land. To the lower side of the beam is secured an iron bar, terminating in a projection that engages with a hook on either end of the share-beam, so as to take the strain of work in turning the furrow.

The combination of the cross-beam B, journaled to the bolt b, extending longitudinally through the bent portion of the main beam A, and the projections l' l', adapted to engage over the projection M of the plate M', attached to the main beam A, for the purpose of receiving the strain upon the plowshares, substantially as described.

164,015. MAGAZINE FIRE-PLACE STOVES. Joseph J. McCormick, Baltimore, Md., assignor to E. C. Bibb, same place. [Filed Jan. 23, 1875.]

1. In a fire-place stove or heater, the combination of two vertical sections, adapted to be separated vertically, for access to the interior of the combustion-chamber, substantially as and for the purposes set forth.

2. In combination with a stove or heater, constructed in two vertical sections, adapted to be separated vertically, for access to the interior of the combustion-chamber, the fuel-magazine K, detachably secured to the front section of the stove, substantially as and for the purpose set forth.



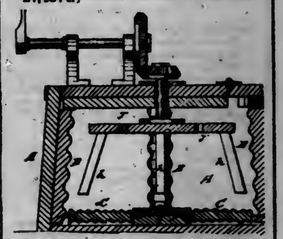
3. In combination with a stove or heater, constructed in two vertical sections, adapted to be separated vertically for access to the interior of the combustion-chamber, the pivoted grate W, supported in the removable stop-plate X, adapted to fit the guides Y, secured to the rear section of the stove, substantially as and for the purposes set forth.

4. In combination with a stove or heater, constructed in two vertical sections, adapted to be separated vertically, for access to the interior of the combustion-chamber, the reciprocating fire-pot front E, curved at its lower edge, connected with the peripheral teeth of the pivoted grate W, and located a short distance from the lower bank of mica J, substantially as and for the purpose set forth.

5. In combination, the horizontal base fire B, extended well to the front of the fire-chamber D, the base flues O O, diving-flues F F, and rising flue F', substantially as and for the purposes set forth.

164,016. LAMPS. Cameron McKinnon, Midway, Ala. [Filed May 6, 1875.]

Brief.—The tubes, diminishing toward the burner, throw a jet of air against the wick, which, commingling with gas in the lamp, carries the same to the flame.



The combination, with the lamp bowl or body A and wick-tube C, of the tubes F F, gradually decreasing in diameter and extending up from apertures E E on opposite sides of the interior of the bowl or body A to a point just below the under side of the tube C, in position that the jets or streams from the nozzles or openings f f shall impinge against the opposite edges of the wick a, in the manner and for the purpose set forth.

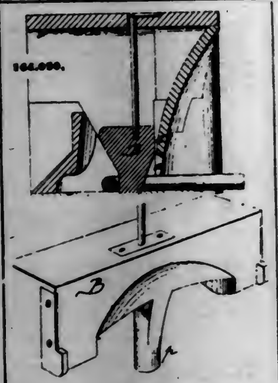
164,017. CAR-COUPLINGS. Jas. McNabb, Widder Station, Canada, assignor to himself and Sylvanus Cornell, same place. [Filed Aug. 22, 1873.]

The combination of the draw-bar A, capable of longitudinal movement under the car-bed, the hooked coupler E, pivoted within its socket, so as to have a lateral movement, and the wiper D, all substantially as and for the purpose set forth.

164,018. WASHING-MACHINES. James W. Malick, White Cottage, Ohio. [Filed Mar. 27, 1874.]

The tub A, provided with corrugated ribs B B, in combination with rollers C C and revolving disk J, provided with flaring arms h h, as described.

164,019. SLATE-FRAMES. Wm. A. Miller, Paterson, N. J. [Filed Apr. 17, 1875.]



The combination, with the groove a, having the long bevel or incline a', and counterbore d, of the recess d', spring c, and sleeve p, for the purposes specified.

164,020. AUTOMATIC CAR-COUPLINGS. J. Miller, Baltimore, Md. [Filed May 1, 1875.]

The combination of the sliding and locking block B, having the pin p, and the draw-head, substantially in the manner and for the purposes set forth.

164,020.

164,021. HOES. Henry D. Mills, Otsego, Mich. [Filed Apr. 6, 1875.]

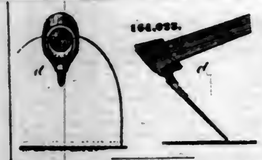
Brief.—The hoe-blade is made of plate-steel cut into the desired form. A hole is made for a bolt, for securing it to the socket of the handle, by punching, leaving a circular lip on the face of the hoe around the hole. The socket of the handle is formed with a recess, into which the lip fits, and the parts are secured by a bolt, which screws into the socket.

The hoe-blade A A', having the projection *c*, in combination with the socket B, having the recess *c'*, and screw C, when the several parts are constructed and arranged substantially as described and shown.

164,022. PLOW-IRONS. Gilpin Moore and George Ourkendall, Moline, Ill., assignors to Deere & Co., same place. [Filed Jan. 6, 1874.]

Brief.—To facilitate welding and to strengthen the combined land-side and share at their point of junction, the land-side is constructed with a lateral flange along its upper edge.

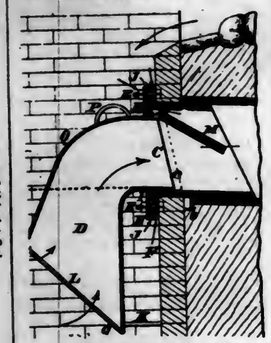
1. A forward land-side bar, B, for plows, having a lateral flange, *b*, along its upper edge, substantially as described, and for the purpose specified.



2. A slip-plowshare, when constructed of the ordinary share and a flanged land-side bar, substantially as described, and for the purpose specified.

164,023. HOES. Daniel Moore and Edwin Moore, Brooklyn, N. D., assignors to themselves and Richard D. Alliger, New York, N. Y. [Filed May 3, 1875.]

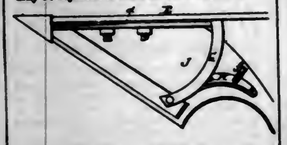
Brief.—The blade of the hoe is made of sheet-metal, with a tongue rising from the middle of the upper edge. This tongue is curved into a semicylinder form, and bent forward, having a lip that turns downward, and fits within and over the lower section of the eye, which is made of a single piece, and receives the tongue of the blade. The wooden handle, being driven in, holds the parts firmly together.



The hoe-blade, made with a trough-shaped tongue, in combination with the eye receiving such tongue, and the projection *f*, to prevent the tongue and eye separating after the handle has been inserted in place, as set forth.

164,024.

164,024. SEWER-TRAPS. James Naughtee, Cincinnati, Ohio. [Filed Apr. 28, 1875.]



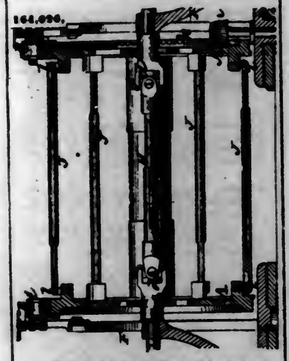
Brief.—The tube or body has a flanged discharging neck, terminating with an oblique seat for flap-valve at discharge-orifice. It also has a downturned flaring inlet, whose oblique inlet is protected by a strainer.

The trunk, tube, or body D, having the flanged discharging-neck C, terminating with oblique seat *o* for flap-valve M, and having the down-turned flaring inlet Q, whose oblique inlet *g* is protected by strainer L, as and for the purpose set forth.

164,025. PLOWS. Holcom Olson, Mount Pleasant, Iowa. [Filed Apr. 1, 1875.]

Brief.—A flange upon the front edge of the mold-board is clamped between the standard and the land-side. The flexible mold-board may be adjusted to different curves by a screw.

1. A mold-board and point or share made in one piece and provided with a flange, *d*, as shown, to be clamped between the plow-standard B and land-side bar E, all combined substantially as and for the purposes herein set forth.



2. The frame of a plow, consisting of the standard B, bar G, arm H, supporting-plate I, and land-side bar E, all substantially as and for the purposes herein set forth.

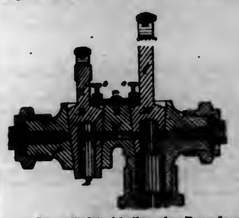
3. The combination of the mold-board J, frame B G H, and set-screw *f*, for regulating the curve of the mold-board, substantially as herein set forth.

164,026. MACHINES FOR TWISTING FABRICS. William H. Palmer, Jr., Middletown, Conn., assignor to Herbert P. Palmer, New York, N. Y. [Filed Apr. 8, 1875.]

1. The combination, with the revolving selvage-carriers A A, of the endless bolts, bands, or chains B B, in the relation as regards both their lines or courses of travel with said carriers, the delivery-roll R, around which the bands pass, and the guide-pulleys C C, in parallel axial relation, or thereabout, with the revolving carriers, substantially as shown and described.

164,026.

2. The combination, with the adjustable revolving selvage-carriers A A, of the longitudinally and universally adjustable shaft H, connecting said carriers in a positive manner, essentially as described.



3. The combination of driving mechanism, applied to the one revolving selvage-carrier on the one side of the machine, with the connected and adjustable revolving selvage-carriers on the opposite side of the machine, substantially as herein set forth.

4. The longitudinally-adjustable bars or ribs J, connected with the revolving selvage-carriers, and adapted to serve as a traveling frame for the support of the body of the fabric, essentially as described.

5. The adjustable telescopic delivery-roll, provided at its ends with sheaves, substantially as and for the purpose herein described.

164,027. INJECTORS. William P. Patton, Harrisburg, Pa., assignor to himself and Sullivan S. Child, same place. [Filed Apr. 27, 1875.]

Brief.—Water-chamber consists of a hollow cock, having conical perforations of varying size in its sides, which serve as steam and delivery nozzles. The overflow-chamber is similar, the cock having a perforation to register with the delivery for overflow, and a transverse tube, similarly registering, to convey water through to the boiler. A cross-bar binds the cocks to their seats, or, being turned a quarter, admits of their ready removal.

1. The cylindrical hollow plug B, perforated as described, in combination with the steam-pipe *a*, exit-pipe *a'*, and inlet or supply pipe C, constructed to operate substantially as and for the purpose set forth.

2. The cylindrical hollow plug D, provided with the transverse tube *d*, orifice *e*, and escape-pipe E, in combination with the pipe or bore *a'* and exit-pipe *a'*, all constructed to operate substantially as and for the purpose set forth.

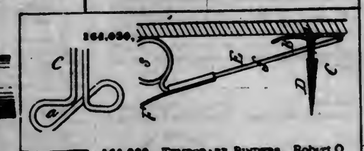
3. The plug B, provided with the perforations or nozzles of different sizes, in combination with the steam-pipe *a*, inlet or supply pipe C, the pipe or bore *a'*, plug D, provided with the transverse tube *d*, orifice *e*, and escape-pipe E, and the exit-pipe *a*, all constructed to operate substantially as and for the purpose set forth.

4. The clamping-bar *a*, provided with the screws *o o*, in combination with the plugs B and D, substantially as and for the purpose set forth.

164,028. DEVICES OR CLAMPS FOR STOPPING LEAKS IN WATER AND OTHER PIPES. Jas. B. Peake, Washington, D. C., assignor to himself and Walton Brothers, New York city. [Filed Apr. 5, 1875.]

Brief.—A metal clamp of two equal parts, each having a longitudinal semicircular groove, so as to fit over the pipe. One part of the clamp has a longitudinal dovetail flange, fitting in a correspondingly-shaped groove of the other. The packing between the clamp and the bursted pipe may be of sheet-lead or other suitable material.

1. The clamps A and B, provided with tapering dovetailed flanges or ribs *a a*, and with correspondingly-shaped grooves, substantially as and for the purposes herein set forth.



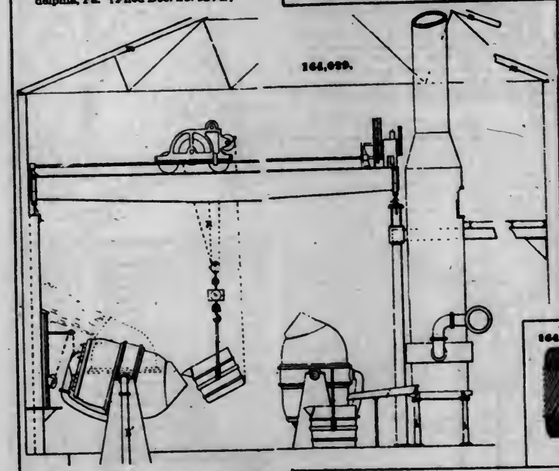
2. The combination, with a pipe, C, of the packing *b* and the clamps A B, having tapering dovetailed joints, substantially as and for the purposes herein set forth.

164,029. APPARATUS FOR MANUFACTURING IRON AND STEEL. John B. Pearce, Philadelphia, Pa. [Filed Dec. 26, 1874.]

6. In a Bessemer plant, the elevated parallel tracks extending the length of the works, the transverse traveling track or crane, and crab, combined and arranged to command the cupola-ladles, converters, steel ladles, and ingot molds, substantially as described.

7. The combination, with the cupola-ladles, converting vessels, steel ladles, and ingot-molds, of a single crane and its tracks, arranged to command all said articles in a Bessemer plant, substantially as specified.

164,030.



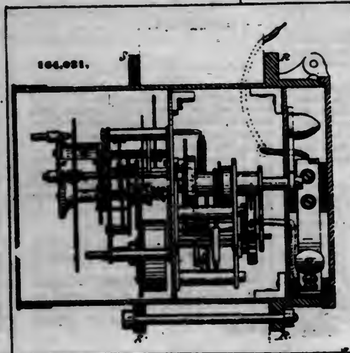
164,030. TEMPORARY BINDERS. Robert O. Peirce and Wm. H. Foye, Portland, Me., said Peirce assignor to said Foye. [Filed Apr. 10, 1876.]

1. The detached thumb plate F, in combination with a paper-fastener and a wire clamp, E, substantially as described.

2. The paper-fastener C, formed of a single piece of wire by bending the same in figure-8 form, to construct the base, and approximating the ends and extending them up to form penetrating-points, substantially as specified.

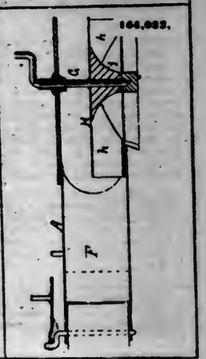
164,029.

1. The process of feeding converters, which consists in carrying the molten metal from the cupola to the converting-vessel in detachable cupola-ladles by means of a crane, whereby the usual runners are dispensed with, substantially as described.



2. The combination, with the traveling crane and crab, of the second chain-drum *r* on said crab, the tilting-chain E', and the converting-ladle L', substantially as and for the purpose specified.

3. In a Bessemer plant, the combination, with a counterbalanced post for handling the tuyere-plate, of the elevated tracks extending the length of works, and arranged in relation to the cupola-ladles, converters, and molds, the transverse traveling crane, and the crab or hoisting-carriage, substantially as described.



4. The trunnion-band section of a converting-vessel, interchangeable with every converting-vessel in the plant, substantially as specified.

5. The combination of a tuyere-plate, having no depending flanges and a nearly hemispherical sheet-metal chamber, with a projecting extension or pipe, for easy handling and free access to the interior of the tuyere-box, substantially as described.

164,031.

164,032.

164,031. ELECTRIC SIGNALING AND RECORDING APPARATUS. William J. Phillips, Philadelphia, Pa. [Filed Apr. 26, 1876.]

Brief.—Arranged so that a watchman may send in a signal to central office, announcing his visit to any post, and at the same time register by suitable devices the time of the visit upon a dial in the box, all as an ordinary district alarm system.

1. The combination, with an electric signaling or alarm mechanism, of a recording mechanism for registering at the transmitting station the time of transmittal of a signal therefrom, substantially as set forth.

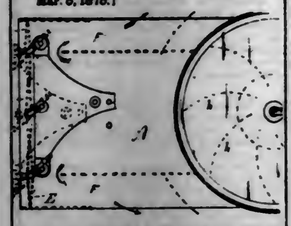
2. The double-faced signal-box, provided with the signaling mechanism and the clock-work register, substantially as set forth.

3. The combination, with the circuit-breaking wheel and motor-train thereof, of a pencil or other marking-point of a registering mechanism and suitable connecting devices, substantially as set forth.

4. A double-faced signal-box, provided with the flanges R S and bolts U, substantially as and for the purposes set forth.

5. In the registering mechanism, the pencil-arm M, composed of the rigid parts *m m'*, united by a spring slip or piece, *n*, substantially as and for the purposes set forth.

6. The combination, with the arm M, provided with projection *c*, of the standard Q, provided with beveled upper edge or end, substantially as and for the purposes set forth.



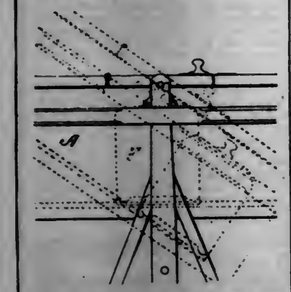
164,032. CHUCKS FOR METAL DRILLS. Geo. M. Pratt, Middletown, Conn. [Filed Mar. 20, 1876.]

Brief.—The rear ends of the clutch-actuating levers rest upon the inclined bottoms of the longitudinal recesses cut in the swiveled follower, and are, when the follower is advanced, forced apart, pressing the clutches with which they are connected together. In order that the clutches may be opened upon the retreat of the follower, the levers are provided with pivots, which work in inclined grooves cut in the side walls of the longitudinal recesses.

1. In combination with the chuck-head and levers, the cylindrical follower, with longitudinal recesses, having inclined bottoms, for the purpose of operating said levers without straining the same, substantially as set forth.

2. In combination with the cylindrical follower, having longitudinal recesses, and the levers for actuating the clutches, the inclined grooves in the side walls of said recesses for returning the levers and clutches, as and for the purposes set forth.

164,032. MECHANISMS FOR PROPELLING BOATS. T. W. Pratt, Boston, Mass. [Filed Mar. 6, 1875.]

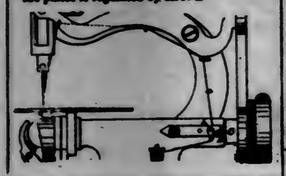


1. In a mechanism for propelling vessels, the case B, provided with the horizontal wheel H, having the blades h h, curving backward from the direction of motion, in combination with the curved abutments j j and the deflector I, all constructed and arranged substantially as and for the purpose set forth.

2. In a mechanism for propelling vessels, the case B, constructed substantially as described, and provided with the horizontal wheel H, in combination with the eduction-pipe A, valves E E E, and supplemental orifices F F, all constructed and arranged substantially as and for the purpose set forth.

164,033. RECIPROCATING CHURNS. William H. Price and Rudolph Hoover, Schellsburg, Pa. [Filed Mar. 13, 1875.]

Brief.—A rocking churn-box with a perforated gravitating dasher-block. The ends of the churn-box are provided with strips, to prevent the block and the box from coming in contact.

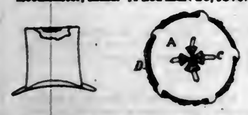


1. In a churn, the gravitating dash-block F, having perforations d, in combination with an oscillating or rocking cream-box, substantially as specified.

2. The strips e in a rocking cream-box, A, in combination with a gravitating dash-block, substantially as specified.

164,034. THREAD-TENSION DEVICES FOR SEWING-MACHINES. John Rosen, Stanstead, Canada, assignor to Orro Merrill, same place. [Filed Feb. 1, 1875.]

Brief.—The needle-thread is clamped between two spring-plates secured on the frame of the machine. The main shaft has a cam, the projections of which force a pin against the outer plate, releasing the thread, and the plate forces the pin back and clamps the thread, as the cam revolves. The tension of the plates is regulated by screws.

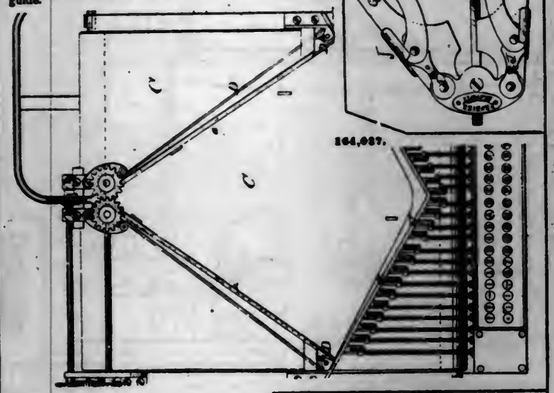


164,035

1. The cam-grooved driving-shaft C and sliding pin G, in combination with the combined spring and clamping plates A and B, all constructed and arranged as shown and described, to operate as specified.

2. In a tension device, the combination of a spring clamping-plate, A, and a sliding pin, G, with the shaft C, having a cam formed with an acute angle for acting on said plate and releasing the thread, in the manner described.

3. The combination of the plates A B and the adjusting-screw i, substantially as set forth.

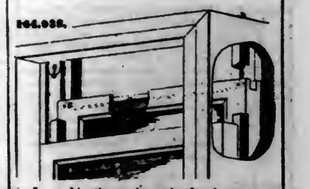


164,036. HATS. Arthur A. Richardson, Leominster, Mass. [Filed Mar. 20, 1875.]

As a new article of manufacture, the holder A, provided with the points b c, and carrying the sponge D, substantially as and for the purpose specified.

164,037. TYPE-SETTING MACHINES. A. C. Richards, New York, N. Y. [Filed Apr. 12, 1875.]

Brief.—Types are dropped from inclined cases upon a broad band. Two converging belts at an angle with the broad band, and moving at a different rate of speed, carry the types into a type-channel. The converging belts are held down to the broad band by a guide.



1. The combination of an endless carrying-apron, C, with converging belts D D, and with a series of type channels or cases, from which the desired types are discharged successively, substantially in the manner herein shown and described.

2. In combination with the endless carrying-apron and the converging belts, the flanged rails e, overlapping the inner strands of the converging belts, substantially as and for the purpose set forth.

164,038. SASH-BALANCES. Thomas J. W. Robertson, Washington, D. C. [Filed Apr. 27, 1875.]

Brief.—Differential movement of the sashes, and a working indicator, of one toward the other, resulting from peculiarities of the hanging, and methods of attaching the suspending-cords.

164,038.

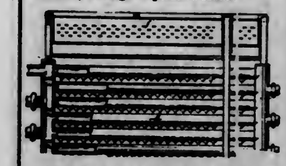
In combination with a pair of sashes, a suspending cord or cords, connected therewith, and with the window-frame, one end of the cord being attached to the side of the lower sash, and another portion connected with the center or both sides of the upper sash, whereby one of the sashes is nearly suspended and the other hung from one side, thus producing a differential movement of the two, and rendering them self-balancing, substantially as shown and described, for the purposes set forth.

164,039. SKATES. Peter Rodier, Detroit, Mich. [Filed Apr. 17, 1875.]

164,039.

1. The combination of the plates C C' C', the two latter provided with the spurs f f, with the heel-pedestal of a skate, substantially as and for the purposes set forth.

2. The ratchet heel-plate D and bolt S, in combination with the plates D C', as and for the purposes set forth.

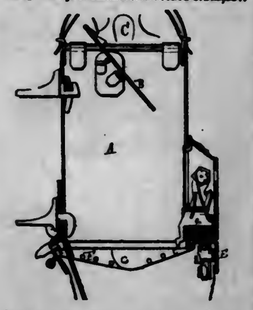


3. The toe-plate E, foot-plate F, side plates G G', plates H H', adjustable clamps J J', and a locking device, in combination with the pedestal B' B' of a skate, substantially as and for the purposes set forth.

4. The block K, pivoted between the plates G' E', in combination with the notch o and projection p of the foot-plate F, substantially as described.

5. A skate having a stationary side plate provided with an adjustable sole-clamp, a swinging side plate provided with a similar clamp, which latter plate is pivoted to the stationary plate, or to an intermediate girt-plate, and a locking device, the several parts combined and operating substantially as described.

164,040. BEER-COOLERS. August Rose, New York, N. Y. [Filed May 12, 1875.]



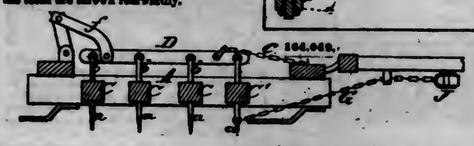
Brief.—Each vertical section, consisting of end pipes divided by partitions and flanges, with its connecting horizontal tubes, may be removed, leaving an operative cooler.

A sectional beer-cooler, consisting of the horizontal tubes A and sectional columns B, provided with flanges for the purpose of connecting a number of said sections together, substantially as and for the purposes herein set forth.

164,041. LETTER-BOXES. A. Rosenstjerna, Chicago, Ill. [Filed June 28, 1874.]

Brief.—Improvements on Patent No. 141,237.

1. The combination of the flap C, provided with small stud a, and the tilting diaphragm B, provided with the beveled stud a' and the aperture a', substantially as described, and operating in the manner set forth.



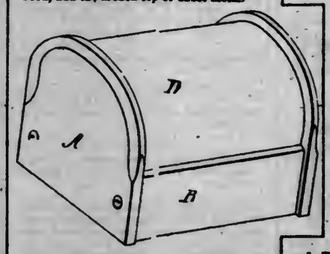
2. The combination, with the bag-jaw F and box A, of the locks E' F', the former being provided with the indicating-roller and operating-mechanism, and the latter with the indicating-device, both being operated when the locks are brought in contact, as set forth.

3. The bag-jaw, provided with the hook a', in combination with the box having the socket i upon the binding I, for the purpose of securing the front of the bag to the bottom of the box when the locks are in juxtaposition.

4. The combination of the flap C', provided with the cam b', the spring b, and the tilting diaphragm B, substantially as described and shown.

164,042. HARROWS. Ayres Ross, Victor, Iowa. [Filed Mar. 6, 1875.]

Brief.—The side beams of the harrow-frame are slightly diverging. The beams that carry the teeth are journaled in the side beams. The middle teeth in the forward beam have a hole below the beam, into which is hooked the draft-chain. The upper side of all the tooth-beams have standards, which are pivoted to the longitudinal connecting-bar, the forward end of which is connected to the frame by a chain, which limits the forward motion of the teeth. The rear end of this connecting-bar is connected to a lever, by which the points of the teeth are thrown rearwardly.



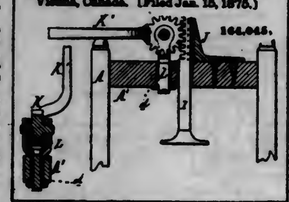
164,042.

The rocking bar C, armed with teeth c, and connected with the whiffletree J by the chain G, in combination with the connecting-bar D, chain c, and rocking bars C, substantially as described.

164,043. SEWING-MACHINE COVERS. Geo. Rehfuss, Philadelphia, Pa., assignor to the American Button-Hole, Overseaming, and Sewing Machine Company, same place. [Filed Mar. 13, 1875.]

Brief.—The sides and ends are made of wood, and the arched top of sheet metal.

The within-described sewing-machine cover, consisting of the end pieces A and A', side pieces B and B', all of wood, and the arched top D, of sheet metal, set within grooves in the end pieces, all being combined and secured for ready detachability, as set forth.

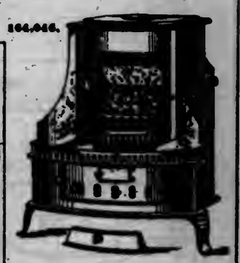


164,044. DIES FOR CHEMISETTE HORNS. William Russell, Cincinnati, Ohio. [Filed May 26, 1875.]

Brief.—The creaser is made out of one piece of metal, and, when placed in the groove in the die, springs outward against the walls of the groove with sufficient force to retain it in the die when the shoe is withdrawn. Below the creaser-groove are holes, through which an implement can be inserted to knock out the creaser when it is necessary, to either adjust, sharpen, or change it.

In combination with the grooved and rimmed die A a a, the creaser D, constructed and operating substantially as and for the purpose specified.

164,045. CIDER-PRESSES. Hugh Sells, Vienna, Canada. [Filed Jan. 15, 1875.]



164,045.

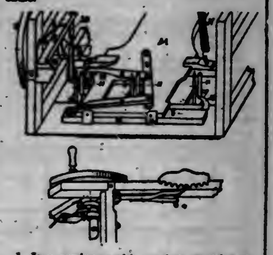
164,042.

The combination of the pinion and lever K K', the standards L L, plate d, and wedge e with the press-bar I, provided with the rack h, and the guide J on the cross-piece A', substantially as described.

164,046. STOVES. James Spear, Philadelphia, Pa. [Filed Mar. 27, 1875.]

164,046.

1. The combination, with an open-front stove, of a pivoted radector, substantially as set forth.



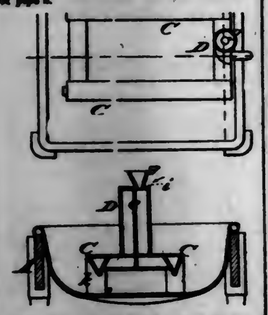
2. The combination, in an open-front stove, of a fire-chamber, a pivoted radector, and sliding doors, substantially as set forth.

3. The combination, in an open-front stove, of a fire-chamber, pivoted radector, a reverse-draft damper, and revertible-draft flues, substantially as set forth.

4. The combination, in an open-front stove, of a fire-chamber and front doors sliding upon a front plate, which is separated by an air-space from the vertical front grate, substantially as set forth.

164,047. SEWING-MACHINES FOR SETTING STRAW. John F. Smith and H. W. Bisbee, Exeter, N. H. [Filed Feb. 20, 1875.]

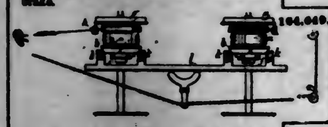
Brief.—The crown-head, operated by the main shaft through the connecting-pitman, imparts to the needles the proper reciprocating movement, and also operates the trimming-shears arranged on either side of the machine. The feeding-hands are moved forward by a ratchet on one of their supporting-drums, and a pawl actuated by a cam on the main driving-shaft, which, in connection with two other cams arranged thereon, and a series of slides and levers beneath the work-supporting bed, manipulate the thread-carriers in such a manner that the thread is carried completely around the needles at each descent of the same.



1. In a sewing-machine, substantially such as described, the slide M, provided with the spring N, and the slide 16, provided with the bent arms 19 and carriers 11, constructed and arranged to operate substantially as specified.

2. In a sewing-machine, substantially such as described, the rocker-shaft K, provided with the arms I J, the shaft 9, provided with the cams I 19, the slide M, carriers 11, slide 16, pitman 20, levers 5 6 7 15, spring 4, and needles c, combined and arranged to operate substantially as and for the purpose set forth and specified.

164,648. MILK-COOLERS. Russell Smith, (Nelson H. Smith, administrator,) Richford, Vt. [Filed Mar. 30, 1876.]

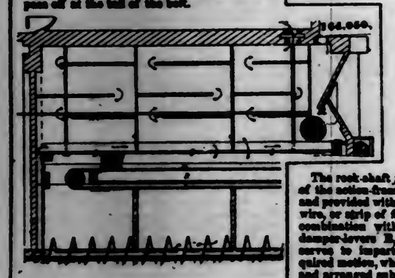


Brief.—The trunk D is divided into two compartments, the water passing in at the feed-funnel *g* of the division *f*, and carried around in the triangular pipes C, and discharged through the division *f'* into and out of pipe *h*.

The rectangular cooler C, formed of triangular pipes, in combination with the centrally-divided trunk D, having a feed-funnel, *g*, and air-hole *i*, and an angular discharge-pipe, *h*, substantially as described.

164,649. CAR-STARTERS. Andw. H. Smith, New York, N. Y. [Filed Nov. 16, 1874.]

Brief.—A spring attached to brake-wheel and to friction-wheel is wound by braking. Its unwinding force assists in starting the vehicle. If the motion of the latter be reversed, the apparatus acts only as an ordinary brake.



1. The friction-wheels *b* and *c* and the spring *a*, attached at its ends to said wheels, in combination with the pawls *e* and *h* and brake-blocks *k*, substantially as and for the purposes set forth.

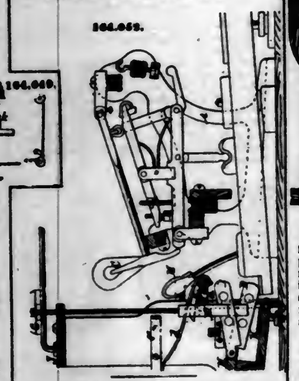
2. The bar *l*, carrying the brake-blocks *k*, and to be operated by a connection to the hand-brake, in combination with the brake-wheel *b*, ratchet-wheel *f*, and pawl *e*, for operating the wheel *b* as an ordinary brake when the motion of the car is reversed, as set forth.

164,650. FLOUR-DRESSING MACHINES. G. T. Smith, Minneapolis, Minn. [Filed July 12, 1871.]

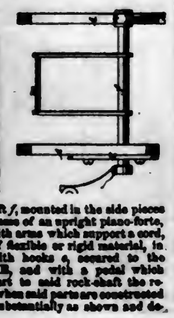
Brief.—The lighter particles of bran are taken up and carried off by the current of air passing upward through the bolting-cloth. The heavier particles are prevented from passing through the belt by the same current and pass off at the tail of the belt.

The combination, in a machine for dressing flour or middlings, of a bolting-surface through which an air-current passes in one direction, while the flour or middlings pass in the other, with a brush or a series of brushes, which traverse the under side of the bolting-cloth to remove the adhering particles of flour, substantially as set forth.

164,651. RAILWAY-RAIL JOINTS. Wm. M. Specht, Dunkirk, Ohio. [Filed Apr. 21, 1876.]



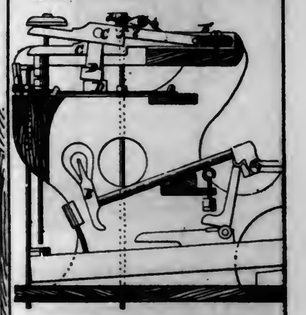
The reversely-arranged wedges I K, having the slots *c*, in combination with the double-headed bolts E and the rails, substantially as described.



164,652. PIANO ATTACHMENTS. A. Steinway, New York, N. Y. [Filed May 15, 1876.]

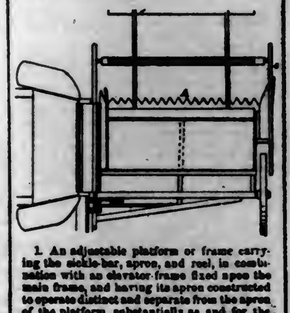
The rock-shaft O, mounted in brackets M, secured in blocks I, situated beneath the wrest-plank of a grand piano, said rock-shaft being provided with two or more arms, which support a wire, cord, or strip of flexible or rigid material, in combination with pins or shoulders formed on the foot or rods which connect the under damper-levers with the damper-heads, said rock-shaft O being subjected to the action of a pedal, when said parts are constructed and arranged substantially as and for the purpose shown and described.

164,653.



164,653. PIANO ATTACHMENTS. A. Steinway, New York, N. Y. [Filed May 15, 1876.]

The rock-shaft *f*, mounted in the side pieces of the action-frame of an upright piano-forte, and provided with arms which support a cord, wire, or strip of flexible or rigid material, in combination with hooks *e*, secured to the damper-levers E, and with a pedal which serves to impart to said rock-shaft the required motion, when said parts are constructed and arranged substantially as shown and described.



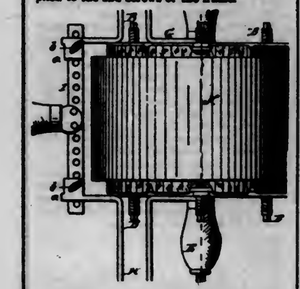
164,654. PIANO ATTACHMENTS. A. Steinway, New York, N. Y. [Filed May 15, 1876.]

The rock-shaft *c*, mounted on the damper-frame E, and provided with arms which support a cord, wire, or strip of flexible or rigid material, in combination with hooks *g*, secured in the damper-levers G, and with a pedal which serves to impart to said rock-shaft the required motion, when said parts are constructed and arranged substantially as shown and described.

164,655. HARVESTERS. Sidney S. Stults, Cedar Bluffs, Nebr. [Filed Sept. 15, 1874.]

Brief.—The platform upon which the cut grain falls is vertically adjustable independently of the elevator-apron.

1. An adjustable platform or frame carrying the sickle-bar, apron, and reel, in combination with an elevator-frame fixed upon the main frame, and having its apron constructed to operate distinct and separate from the apron of the platform, substantially as and for the purpose set forth.



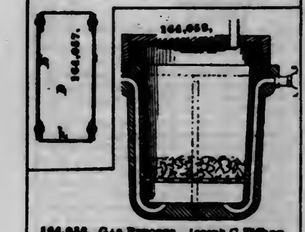
2. The frame of the sickle-bar, apron, and reel, rigidly attached by hinge-plates to a rod, *a*, swung in fulcrum-bearings under the axle, in combination with a crank-coupling, *i*, levers L M, brace-rod *n*, tongue F, and standards G' O, provided with slots *m*, substantially as set forth.

3. The combination of the detachable grain-carrier K, stationary elevator-frame, and pivotal supports P' P, substantially as and for the purposes set forth.

4. The sheet-metal pressure-rack, hinged or pivoted to the elevator, in combination with and overlapping a rack having a hinged connection with a wire support attached to the adjustable frame, substantially as and for the purpose set forth.

164,656. GRAINING-ROLLERS. A. J. Taplin, Bloomington, Ill. [Filed Mar. 6, 1875.]

Brief.—The construction of the frame-work allows the roller to be adjusted to any desired width, and is operated by means of a key applied to the end screws of the frame.



1. In a graining-machine, the combination of the adjustable wheels A A, right-and-left-hand adjusting-screws B B, center shaft D, and supporting-arms C C, substantially as and for the purposes herein set forth.

2. The combination of the adjustable frame, composed of wheels and screws A B, with center shaft D, levers G G with bands H H and sockets *a a*, the sliding bar I with handle J, and the set-screws *b b*, all substantially as and for the purposes herein set forth.

3. In a graining-machine, the outside bolting, consisting of the composition K, plate *d d*, and canvas or other belt L, arranged upon an adjustable frame, substantially as and for the purposes herein set forth.

164,657. APPARATUS FOR CASTING HOLLOW ARTICLES OF CEMENT. L. A. Tardieu, Elizabethport, N. J. [Filed Mar. 24, 1875.]

The core for forming the interior of hollow rectangular, or polygonal molded articles of clay, plaster, cement, and other similar materials, consisting of the polygonal or rectangular block, over which is fitted a sleeve, consisting of the strips E E of sheet metal, united at their ends by means of flexible strips F F, substantially as and for the purpose described.

164,658. GAS-RETORTS. Joseph C. Tiffany, Portsmouth, N. H. [Filed May 13, 1875.]

Brief.—Passages for the oil in the body of the retorts present it more nearly to the heat, and deliver it at various points on the bottom, whatever the inclination of the retorts.

A gas-retort provided with a series of passages, formed in its shell or body, extending from the the top thereof where they are connected with suitable supply-pipes, to the bottom where they terminate at various points around the same, for the purpose of feeding and distributing the oil evenly over the heating-surface of the retort, substantially as described.

164,659. SPINDLES FOR SPINNING-MACHINES. Asel M. Wade, Lawrence, Mass. [Filed May 11, 1875.]

Brief.—The dead spindle is a fixed hollow tube, having a neck and shoulder at its top to receive and support the live spindle, which is a wooden tube tapered at its upper end to form a bearing for the bobbin, and has a metal bushing driven in its lower end, which serves as a lower bearing for it against the dead spindle, and also to expand it, so that it is held securely between the bushing and tapering whirl-tube.

1. The live-spindle, composed of the wooden tube B, the tapering metallic bushing L, and the tapering bearing-tube I, provided with the whirl K, all being made and arranged substantially as described.

2. In combination with the said live-spindle, the single-tube dead-spindle A, provided with the bearing-neck *g*, shoulder *h*, and support B, all as described.

164,659.

164,660.

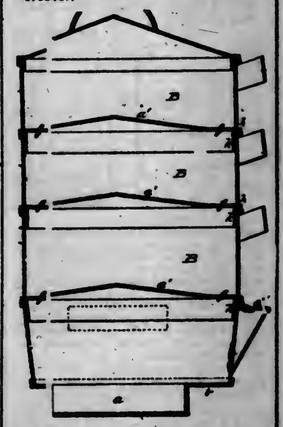
164,660. FOLDING CHAIRS. John R. Wakefield, Worcester, Mass., assignor to R. W. Valil, same place. [Filed Apr. 6, 1875.]

Brief.—When the chair is folded the outer ends of the arm-pieces move downward, and carry the frame forming the back legs with them until it rests against the back.

The frames *a*, *b*, *c*, and *d e f*, connected together by the arm-pieces *h*, links *l*, and flexible seat *s*, and swinging in the manner specified while the chair is being folded, as set forth.

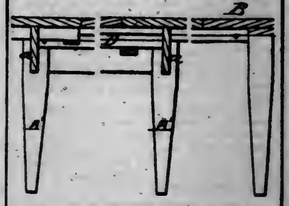
164,661. FOLDING CHAIRS. John A. Ware, Worcester, Mass., assignor to R. W. Valil, same place. [Filed Apr. 6, 1875.]

The combination, with the back frame *a c d* and the front frame *e*, of the seat-frame *b k* and links *m*, the parts being arranged so that the links *m* swing from a nearly vertical position, and by a toggle movement strain the flexible seat in folding and unfolding the chair, as set forth



164,662. BOBBINS FOR SPINNING-FRAMES. Thomas B. Wattles, Canton, Mass. [Filed Nov. 17, 1874.]

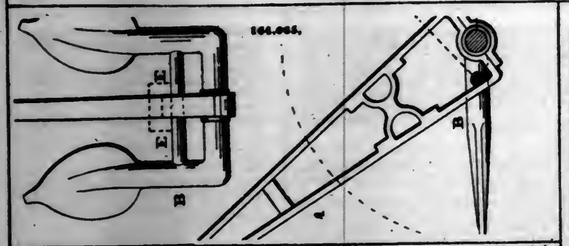
Brief.—To overcome the inequality of the drag of the traveler when guiding the yarn on different parts of the bobbin.



The improved bobbin or quill, having its body or barrel conical or tapering from end to end, and greater in diameter at the upper than at the lower end, substantially as and for the purpose specified.

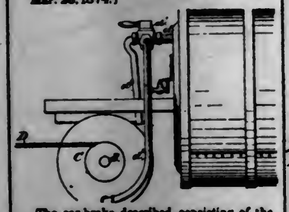
164,663. CULINARY STEAMERS. Harlow M. Welch, Cowansville, Canada. [Filed Apr. 3, 1876.]

In a steam cooking-utensil, the sections B B, each having a convex-convex bottom, *a'*, provided with a series of drip-holes, *p*, extending entirely around the outer edges of said bottom and flange *b*, whereby said sections may be interchangeably fitted into each other and the base-section, and the water of condensation be carried back into the boiler without coming in contact with the materials to be cooked, substantially as described.



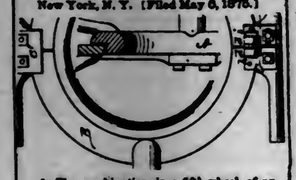
164,664. EXTENSION-TABLES. Thos. White, Waynetown, Ind. [Filed Mar. 13, 1875.]

In an extension-table, the transversal leg-supported central frame A, having the rigid T-shaped bars D D, connecting the end rails *a a*, and the movable leg-supported leaves B' B, provided with L-shaped slides F' E, respectively engaging with the inside and outside grooves of the bars D D, substantially as specified.



164,665. ANCHORS. Joseph S. Williams, Riverton, N. J. (Filed May 14, 1876.)

An anchor, the flukes B B of which are swiveled in the crown of the shank A, and have a transverse rigid connection, E, operating therewith, substantially as and for the purpose set forth.



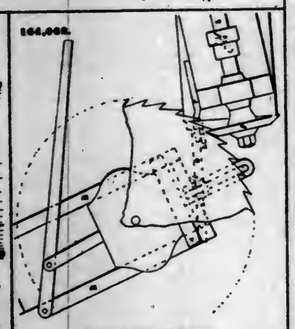
164,465.

164,466. STEAM-BRAKES. Thomas Wilson, Kalamazoo, Mich., assignor of one-half his right to Geo. W. Fist, same place. [Filed Mar. 26, 1874.]

The car-brake described, consisting of the piston B b', adapted to make a partial revolution in the cylinder C, the live-steam and exhaust pipes d d' d², the regulating-cock d³, adapted for operation by the engineer, and the intermediate devices O D, for communicating the movement of the piston to the brake mechanisms, the parts being relatively so arranged that the brakes are fully applied before the piston can make a complete movement, substantially as described.

164,467. PITH-WHEELS. Chas. B. Wood, New York, N. Y. [Filed May 6, 1875.]

1. The combination, in a fifth-wheel, of an interior upper annular plate, A, formed with an exterior circumferential groove, and the exterior annular plate B, made in two or more parts, and fitting in the groove in the plate A, substantially as herein set forth.



2. An adjustable fastener, in combination with the bisected plate B and interior plate A, for holding said bisected plate in the groove on the interior plate, and taking up all lost motion thereof, substantially as herein set forth.

3. The combination of the annular plate A, provided with a circumferential groove, a b, the exterior bisected annular plate B, fitting in said groove, and one or more adjustable fastenings, consisting of the plates C, with lugs d, bolt h, and nut i, all substantially as and for the purposes herein set forth.

164,468. SAW-SHARPENING MACHINES. P. D. Bangher, Deep Creek, Va. [Filed Sept. 8, 1874.]

1. The carriage D, having a recessed under face, plate G, having a corresponding upper face, and the projecting guide g, dividing the D, in combination with the adjusting-screws e and rollers ff, the whole resting upon a track, and forming a longitudinally-sliding and combinedly-adjustable support for the saw, substantially as herein set forth.

2. The vertically-adjustable arm h, and clamp i, in combination with the frame 2 and bracket B, substantially as set forth.

164,468.

REISSUES.

6,462. SEWING-MACHINES. C. F. Bosworth, Milford, Conn. Patent No. 68,836, dated Sept. 17, 1867. [Filed May 6, 1875.]

Brief.—Improvement on Letters Patent No. 33,297. A variable motion is imparted to the needle-bar by means of a series of grooves arranged at right angles to each other in disks secured to the forward end of the driving-shaft, and a connecting-rod attached at its lower end to the needle-bar, and provided at its upper end with studs, which operate in said grooves. A take-up, operated by means of a cam of peculiar shape on the driving-shaft, acts in connection with an eye formed in a projection on the needle-bar, to take up the thread at the proper time; and an adjustable guide pivoted to the cylindrical supporting-surface guides the bent to the stitching mechanism, whereby each successive braid is laid in proper position for stitching.

1. The combination of the rotating plates provided with crossing slots, substantially as described, with the needle-bar and its connecting-link, and the two bearings working in the two crossing slots, as and for the purpose set forth.

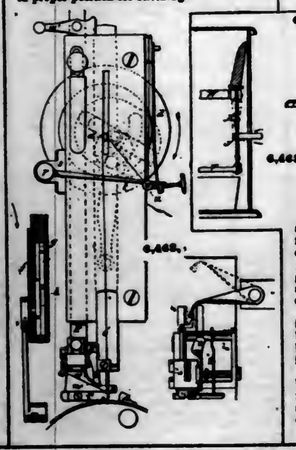
2. The combination of the thread-controlling eye, governed in its position by the needle-bar, with the take-up composed of two arms, a rock-shaft, and spring, and its actuating-cam, adapted to operate the take-up positively to slacken the thread and draw it taut, substantially as described.

3. The shuttle-carrier provided with the tongue g^1, arranged relatively to the return-tongue f^1, as described, whereby the shuttle is prevented from tilting when the thread is taken up, substantially as described.

4. The combination, with the roller for guiding and bending the braid, of the needle and the pivoted needle-guard e^1 and its spring, substantially as described.

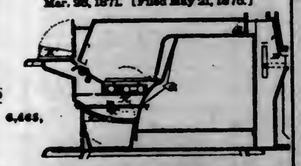
5. The combination of the roller over which the braid to be sewed is bent, and the gage s^1 for governing the edge of such bent braid, with a cylindrical supporting-surface, e, and gage r^1, substantially as described.

6. The combination of the roller h^1 and gage s^1, for binding and gaging the strip of bent braid being overlapped and stitched on an under braid, with the cylindrical supporting-surface, the gage for the lower strip, and the divided feed having different movements, substantially as described.



7. The combination, with the supporting-surface e, of the adjustable gage, pivoted outside the needle-hole and beyond the head of the machine, substantially as described.

6,464. CYLINDER-COCKS FOR LOCOMOTIVES. Geo. C. H. Hopkins, Lyndon, Vt. Patent No. 130,724, dated Mar. 11, 1873. [Filed Mar. 19, 1875.]



1. A cylinder-cock constructed with its plug A and reservoir B in an angular relation to each other, whereby the seat of the plunger-valve can be located within the reservoir B, and the plunger-valve permitted to move by the action of a tappet from said seat in a direction lengthwise of the steam-cylinder, to which the cock may be applied, and transverse to the steam-passage of the plug A, substantially as described.

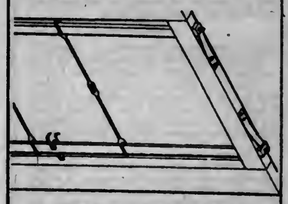
2. The plug A and reservoir B, in combination with the plunger-valve f, valve-rod E, finger a, and longitudinally-sliding rod g, arranged and operating substantially as described.

6,465.

6,465. COOKING-STOVES. Daniel B. Furs, Troy, N. Y. Patent No. 112,093, dated Mar. 28, 1871. [Filed May 21, 1875.]

1. A sifting-grate located in the body of a cooking-stove and below the fire-grate, the former arranged to dump and discharge its contents into the pit below.

2. In combination with an ash-pan and fire-grate, a dumping and sifting grate or coal-screen, intervening between the two and located within the body of a stove.



3. In combination with a fire-grate, a sifting-grate or coal-screen, located within the body of a cooking-stove, constructed to vibrate horizontally and to dump and discharge its contents.

4. For a stove, a sifting-grate or coal-screen hinged directly or perpendicularly below a fire-grate, and, in combination therewith, the sifting-grate, being arranged to dump and discharge its contents.

5. In combination with a fire-grate, a sifting-grate or coal-screen located lower down than the fire-grate, and resting upon vibrating supports, one end or one side of which moves with the screen as it vibrates, for the purpose of screening the coals that may fall upon it.

6. For a sifting grate, a support or supports, constructed to sustain the sifting-grate, one end or one side of which supports is attached to a stove, while the other end or side vibrates with the grate, the whole in combination with a fire-grate located in the stove over or above the sifting-grate.

6,466. LOOM HEDDLE-FRAMES. Henry Parsons, Waterloo, N. Y., assignor to George Crompton, Worcester, Mass. Patent No. 96,100, dated Aug. 12, 1862. [Filed Apr. 26, 1875.]

The combination, with the heddle-frame, of a heddle-bar holding-device, consisting of an arm and a pin adapted to be connected with the upright side or end piece of the heddle-frame, whereby the heddle-bar may be engaged or disengaged by the movement of the pin and its carrying-arm, substantially as and for the purpose described.

6,467. SEWING-MACHINES. C. F. Bosworth, Milford, Conn., assignor, by mesne assignments, to the Straw-Sewing-Machine Company. Patent No. 36,807, dated June 9, 1863. [Filed May 6, 1875.]

Brief.—The braid is passed over a roller journaled in a frame attached to the lower end of the presser-bar, and is thereby presented in a bent condition to the action of the needle, which is deflected toward the bend in said braid by a deflector attached to a spinning-arm secured to the presser-bar, the movement of such deflector being regulated by a cam operated by the needle-bar. Above and slightly in rear of the bending-roller is arranged a second roller, which acts in connection with a guide in the above-mentioned frame, to present the braid to the bending and stitching mechanism in proper position for stitching to the already stitched braid, which passes under the bending-roller, and is guided to the needle by an adjustable gage secured to the supporting-surface below. The feed is formed in two parts, each of which is adjustable independently of the other.

3. The combination of the movable roller, about which the braid is bent, and the supporting surface and feeding device arranged in opposition to the roller, with the needle arranged just in advance of the roller, where by the bent braid is united to the top of the other braid, supported on the supporting-surface by a series of stitches, substantially as described.

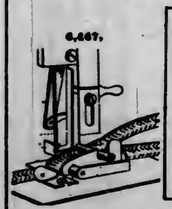
4. The combination, with the sewing mechanism, the presser, and the supporting surface, of the gages arranged at opposite sides of the needle-hole, and adjusted to guide the lapped edges of two pieces of fabric, substantially as described.

5. The combination, in a straw braid sewing-machine, of a roller, over which the braid is bent to be sewed, with a needle guard or deflector, substantially as described.

6. The improvement in the art of manufacturing hats from substantially a continuous braid, consisting in laying the braid in successive coils or rows, commencing at the edge of the brim, and overlapping each successive coil or row on the inner edge of the braid of a preceding coil or row, and uniting the same by stitches, substantially as described.

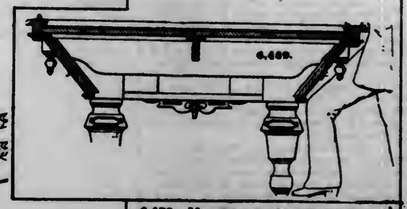
6,468. BALE-TIES. John S. Carson, Brookhaven, Miss., assignor to Warren L. Carson, Memphis, Tenn. Patent No. 97,541, dated Mar. 9, 1869. [Filed May 12, 1875.]

1. In a metallic tie for baling purposes, a hook attached to the tie for the purpose of completing the connection between the ends of the same, and thereby preventing the release of the bale.



2. The combination, in a metallic tie for baling purposes, of a band passing around the bale, a link to connect the two ends of the band, having an opening, through which the looped end of the band may be passed, and a hook secured to some portion of the tie, and so adjusted that it may engage the loop of the free end of the band after it has been passed through the opening in the link, and thereby prevent the withdrawal of the band.

6,469. BILLIARD-TABLES. F. W. Collender, New York, N. Y. Patent No. 145,767, dated Dec. 23, 1873. [Filed May 20, 1875.]



Brief.—Combining proper support for the table, even to its outside edges, with sufficient room below for the knee of the player.

In combination with the bed and projecting cushion-rails, the beveled sides or broad rails f, the whole constructed and arranged substantially in the manner and for the purpose described.

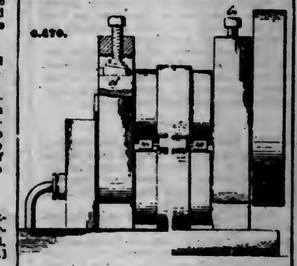
6,467.

6,469.

1. The combination, with sewing mechanism, of mechanism adapted to guide straw or other plaited braid, and present it in a bent or folded condition between the point of the needle and the braid to which it is to be sewed, supported on a supporting-surface against the thrust of the needle, substantially as described.

2. The combination of a roller or guide, over which the braid is bent, and the gage for the edge of the bent strip with a supporting-surface, and a gage for the edge of the braid, to which the bent braid is to be united, substantially as described.

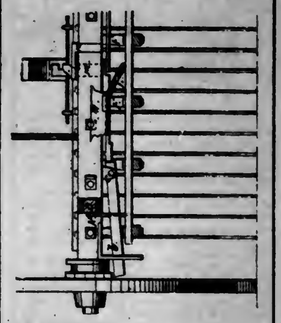
6,470. MACHINES FOR PLAINISHING PAPER. William B. Lockwood, Philadelphia, Pa., assignee of John F. Schuyler, deceased. Patent No. 37,700, dated Feb. 24, 1863. [Filed Mar. 4, 1875.]



Brief.—Two rolls, revolving in contrary directions at different speeds—the upper ribbed by draw-filing longitudinally, the lower smooth and steam-heated.

1. As an improvement in the art of plainishing paper, submitting the paper to friction under pressure between a roughened feed-roller and a plainisher, substantially as described.

2. The combination, in a paper-plainishing machine, of a plainisher with a draw-filed roller, for controlling the paper while it is under pressure between the said roller and plainisher, all substantially as set forth.



3. The auxiliary roller K, of the form described—that is to say, rounded longitudinally, and larger in diameter in the middle than at the ends—in combination with the upper and lower rollers D and E, for the purpose specified.

6,470.

6,471. HORSE-RAKES. John Pennypacker, Ridley Park, Pa. Patent No. 40,663, dated Feb. 23, 1863. [Filed July 2, 1874.]

Brief.—The lifting-bar is placed at some distance behind the axle, to give firm support to the teeth, which are supported against lateral strain by the walls of the slots in the lifting-bar, through which they pass. The pawl-levers, by reason of their spring ends, permit the pawls to slide over the ratchets in backing; or, if one wheel is stationary, in turning, the pawl and its ratchet on the other side operate the rake.

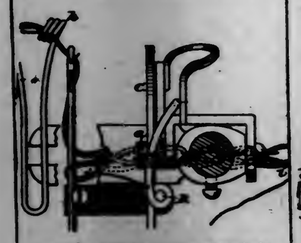
1. The combination, in a horse-rake, of a rocking axle operated by the forward motion of the wheels, rake-teeth separately hinged to the rake-head, and teeth-supports arranged behind the axle, and rigidly connected thereto, substantially as shown and described, so as to support the teeth when in action against lateral strain, and raise them in a body when the axle is rocked for discharging the load.

2. In combination with each of the supporting-wheels of a horse-rake, a ratchet and pawl constructed and arranged to operate substantially as described, so that the two wheels may act in concert to raise the rake when both wheels are advancing, or independently when the machine is turning corners or changing direction.

3. In combination with the notched plate J and the latch n, the lever I for depressing said plate.

6,472. FIRE-KINDLERS. W. O. Philbrick, Lynn, Mass., assignor to J. D. Husbands, Jr., St. Louis, Mo. Patent No. 73,922, dated Jan. 28, 1868. [Filed May 13, 1875.]

Brief.—The blocks are beveled and perforated to permit circulation of air.



6,472.

1. A fire-kindler constructed from a block of suitable material, with a series of air-passages or draft-flues for admitting the draft into and through the block, to intensify the heat and support combustion.

2. The combination, with a fire-kindler having beveled sides for affording a circulation of air around the kindler, of draft-flues or air-passages for permitting a draft into and through the kindler, substantially as described.

6,473. REGULATING ATTACHMENTS FOR SEWING-MACHINES. Israel M. Rose, Brooklyn, N. Y., assignor, by mesne assignments, to Joseph J. West, New York city. Patent No. 120,008, dated Feb. 18, 1873. [Filed Nov. 26, 1874.]

Brief.—A latch-needle on a rock-shaft carried in the vibrating plate, connected to the presser and actuated from the needle-carrier, takes a thread from the guide, draws it under the needle-thread, and forms it into a chain on the upper side of the fabric. A guide or loop on the presser-foot places the embroidery-thread in proper position to be taken by the latch-needle at each vibration of the same.

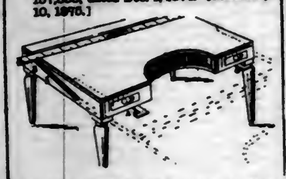
1. An embroidery-thread-embroining device, constructed substantially as described, whereby said thread, without passing through the fabric, is confined within itself, and laid in the form of a braid upon the surface of the fabric, for attachment thereto by sewing.

2. The embroidery-thread carrier consisting of the vibrating plate C, latch-needle E, and connecting mechanism, substantially as described, arranged as specified, for laying an embroidery-thread upon the surface of the fabric, as set forth.

3. The combination of the latch-needle E, the rock-shaft D, to which it is attached, and the vibrating plate C, on which the said rock-shaft has an independent axial motion, substantially as herein described.

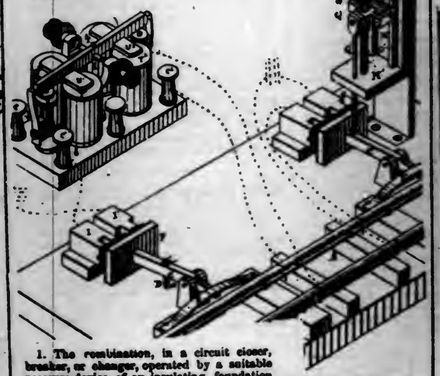
4. The combination of the latch-needle E and the guide h on the presser-foot, substantially as and for the purpose herein specified.

5. The embroidery-thread carrier of an embroidery attachment to a sewing-machine, arranged and operated substantially as herein described, whereby it is enabled to perform a longitudinal and a lateral motion, as and for the purpose herein specified.



6. The combination of a sewing-machine needle with a vibrating embroidery-thread carrier, E, as set forth.

6,474. BUCKLES FOR SUSPENDERS. Abraham Shonfeld, New York, N. Y. Patent No. 119,287, dated Mar. 28, 1871. [Filed Nov. 24, 1874.]



The suspender-buckle, having the body a, bar 3, and hook 5 for the ring or attachment of the suspender-ends, and the opening for the suspender, in combination with the swinging clasp c, that is in front of, and connected with, the body a, substantially as set forth.

6,475. LADIES' WORK-TABLES. Charles B. Snyder, Minneapolis, Minn. Patent No. 157,256, dated Dec. 1, 1874. [Filed May 10, 1875.]

A lady's work-table having a cover of such form and construction as to adapt it to use as a lap-board, attached to the table by links pivoted to the latter in front of a longitudinal median line, that the rear edge of the lap-board may be brought over and dropped, below the front edge of the table, upon the leg substantially as and for the purpose set forth.

6,476. CIRCUITS AND CIRCUIT-CLOSERS FOR RAILWAY-SIGNALING APPARATUS. H. W. Spang, Reading, Pa. Patent No. 142,121, dated Aug. 26, 1873. [Filed Nov. 10, 1873.]

1. The combination, in a circuit closer, breaker, or changer, operated by a suitable pressure device, of an insulating-foundation having metallic conducting-pieces arranged thereon, and a metallic roller or rollers for electrically connecting the same, substantially as set forth.

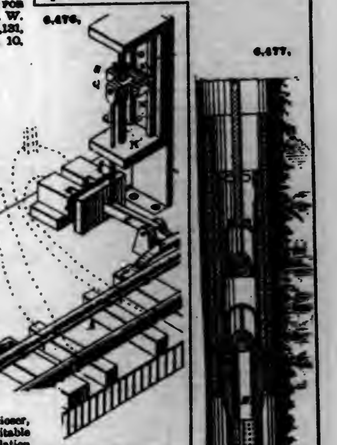
2. The metallic plates or rails O O' O' or O' O' O', or O' O' O' O', in combination with the insulating-plate N, guide-rod P, sleeve Q, roller-hand R, roller or rollers R', as and for the purpose set forth.

3. The combination of curved spring or yielding presser-bar B, detached lever C, and a circuit-closer having an insulated foundation with metallic roller or rollers, for electrically connecting the same for closing an electric railway-signal circuit, as set forth.

4. The combination of the electro-magnets T' T' T' T', armature-lever U, armatures U' U', and springs V' V', one or both, substantially as described.

5. The combination of the two lines of rails a a' of insulated section A of railway-track, electro or relay magnet T' T', controlling a secondary circuit and electric railway-signal apparatus, and connected with said lines of rails at one end of said section of track, and a circuit closer and breaker and battery located beyond the opposite end of said section of track, and connected with said lines of rails thereof at said opposite end, as and for the purpose set forth.

6. The combination of electro-magnet T' T', battery Y, and circuit closer and breaker B with electro-magnet T' T', connected with lines of rails a a' of insulated section A of railway-track at one end thereof, and battery Y' and circuit closer and breaker B', located beyond and connected with said lines of rails at the opposite end thereof, as and for the purpose set forth.



7. The combination of an insulated section of railway-track, the respective lines of rails of which are in continuous metallic connection, an electro-magnet having its terminals connected respectively to opposite lines of rails of said section at one end thereof, a galvanic battery having one of its poles connected to one line of rails of said section at the opposite end thereof, and its other pole connected with a circuit-closer, which is electrically connected with the other line of rails at said opposite end of the section, substantially as and for the purpose set forth.

6,477. PUMPS FOR DEEP WELLS. James T. Whipple, Oak Park, Ill. Patent No. 74,736, dated Feb. 18, 1868. [Filed Nov. 30, 1874.]

Brief.—The filter is attached to a valve-seat having an elongated conical base, which is screwed into a collar that is forced down the tube to the desired point. Valve-seat and filter may be removed without disturbing the tubing.

What

1. In combination with the filter extending below the main tube, the valve-seat D, when connected to the filter and arranged to admit of being withdrawn through the tube, as specified.

6,477.

2. In combination with valve-seat D, the adjustable ring or collar C, adapted to pass through the cavity of the tube, whereby the seat is secured in position, as specified.

3. The flexible packing G, arranged to close the space between the periphery of the base of the valve-seat and the inner surface of the tube below the seat, as and for the purpose set forth.

4. In combination with the valve-seat D, the cylinder F, arranged to receive the valves and compress the packing G between its end and the shoulder of the valve-seat, as specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 23. TUESDAY, JUNE 8, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

ANDREW MILLS.—*Appeal; Interlocutory.*

[*Appeal from the Primary Examiner in the matter of the application of Andrew Mills for Letters Patent for a* "FRUIT-PICKER," *filed March* 25, 1875.—*Decided June* 2, 1875.]

Where an applicant for patent had filed his application in 1855, and after its rejection had withdrawn it, and it afterward became abandoned by operation of the 2d proviso of the 35th section of the act of July 8, 1870, held that the applicant was barred from prosecuting a new application for patent for the same invention, an application being analogous to an action at law to establish a right of property, and the statute being in the nature of a statute of limitations upon the right of action.

The word "abandoned" in the body of the proviso referred to applies to the application alone; but in the last clause the word "abandonment" has a wider signification, referring both to the application and the invention.

Where applicants file new applications, such as have been before filed by them and abandoned under the 2d proviso of the 35th section of the act of 1870, the proper action for Examiners is not to reject them on reference to the former application, but to refuse to consider them on the ground that the right to file them no longer exists.

THACHER, *Commissioner:*

James Bailey, on January 2, 1875, filed an application for a patent for a fruit-picker, which was rejected on reference to an application of Andrew Mills, the present appellant, filed March 7, 1855, rejected April 5, 1855, and withdrawn June 12, 1855.

A reconsideration was then asked by Bailey on the ground that the reference was not a pertinent one, in view of the Commissioner's decision in the Rouse and Stoddard case, 7 OFFICIAL GAZETTE, 169. This was granted in accordance with the requirements established in the case cited, a letter of inquiry was dispatched to the applicant, Mills, and to his attorney of record, for the purpose of ascertaining whether the invention of the former had been brought into public use. March 11, 1875, Mills replied to the inquiry by filing an affidavit setting forth that his invention had not been in public use, and on March 25 filed the present new application for the same invention. At the same time he requested that an interference be declared between his and Bailey's applications.

April 3 the Primary Examiner, in a letter to Mills, referred to his former application of March 7, 1855, and stated that, "In view of section 35 of the act approved July 8, 1870, it cannot be seen that the present application can be entertained by the Office. The application is consequently rejected." Upon a reiteration of this objection Mills took the present appeal.

The 35th section of the act of 1870, cited by the Examiner, has the following proviso:

And provided further, That when an application for a patent has been rejected or withdrawn, prior to the passage of this act, the applicant shall have six months from the date of such passage to renew his application or to file a new one; and if he omit to do either, his application shall be held to have been abandoned. Upon the hearing of such renewed applications abandonment shall be considered as a question of fact.

It is urged by the appellant that the term "abandoned" relates to the *application* and not to the *invention* or right to a patent; that the object of the law was evidently to prevent parties from continuing an application for years, and repeatedly calling it up and getting action on it under one fee; that the law was not to prevent a party from obtaining a patent for his invention, but to require him to seek it upon a new application and fee, *provided* he had not renewed his application or filed a new one within six months from July 8, 1870; but if *subsequent* to that date the application should be renewed, then it should be held to have been abandoned—such abandonment to be considered as a question of fact. This reasoning, I think, must be regarded as more ingenious than sound.

It is no doubt true that the word "abandoned," in the body of the section referred to, applies to the application alone; but in the last clause, which provides that "Upon the hearing of such renewed applications, abandonment shall be considered as a question of fact,"

the word "abandonment" appears to have a wider signification, and to include within its scope both the abandonment of the application and the invention. At least such was the construction placed upon it by Judge Drummond in the case of *Marsh* vs. *Sayles et al.*, (5 Fisher, 610.)

The discussion of the point as to the abandonment of the invention is, however, not necessary in the decision of the precise question arising here. The single point to be now determined is whether the Office is not barred by statute from entertaining at all the present application. As regards those applications designated by the last proviso of the section under consideration—viz., those filed and then rejected or withdrawn prior to July 8, 1870—I believe the plain purport of the language of the proviso to be that there was a specified limitation of the time within which such applications could alone be renewed or new ones for the same invention filed in place thereof.

Regarding the filing of an application for a patent as analogous to an action at law to establish one's rights to a certain species of property, the section referred to is in the nature of a statute of limitations, which prescribes the time within which, after such action is commenced and then discontinued or dismissed, a new action may be commenced. Statutes and rules limiting the time for the recommencement of actions are common everywhere.

If, as alleged, the object of the law was to simply prevent an applicant from renewing his application without paying an additional fee, it would have been a very easy matter to have said so, and if such was the only limitation of the legislators, the limitation as to the time of renewing the old or filing the new application was an entirely meaningless and superfluous requirement.

The position taken that the statute, so far as the question of abandonment is concerned, had reference to applications filed after the expiration of the six months from July 8, 1870, is entirely opposed to the plain meaning of the language therein employed. That part of the section bearing on this point says: "The applicant shall have six months from the date of such passage to renew his application or to file a new one, and if he omits to do either his application shall be held to have been abandoned. Upon the hearing of *such* renewed applications abandoment shall be considered a question of fact."

Now, it is quite evident from this language that the question of abandonment is to be regarded with reference to two classes of applications: First, if the new or renewed application is *not* made within the six months, then the original application "shall be held to have been abandoned"—that is, absolutely abandoned, without redemption either by renewal or filing another application. Second, if the new or renewed application is made within the six months, then "upon the hearing of *such* new or renewed applications abandonment shall be considered as a question of fact"—that is to say, an opportunity is then afforded of showing that the application had not been abandoned. When the language of the statute is so plain and clear it is not necessary for its interpretation to inquire what the legislature intended. Here a limited period was prescribed, within which a certain thing could be done—to wit, the renewing of an old application for patent, or the filing of a new application for the same invention; and by the very fact of such limitation, after the expiration of the period named, the act contemplated cannot be done at all.

It is not for me to discuss the policy of the law which bars an applicant for a patent in his attempt to renew an application that may have been either wrongfully rejected or unwisely withdrawn. It is the duty of the Commissioner to execute the plain provisions of the statute without regard to their effect. I do not see how it is possible to put any other construction upon the statute bearing upon this case than that given above, and, in my opinion, therefore, the Commissioner has no authority whatever for entertaining the application of Mills.

In cases like this, the application ought not to be rejected on reference to the prior application; but the proper action is for the Examiner to refuse to consider the application on the ground that, under the 35th section of the old law of 1870 the right to file such an application no longer exists.

The application of Mills is remanded to the Examiner, who will refuse to give it further consideration in view of the decision above.

HART *vs.* LITTLE.

[*Appeal from the Examiners-in-Chief in the matter of the interference between the applications of Daniel R. Hart and Samuel H. Little for Letters Patent for an* "IMPROVEMENT IN STREET-CAR DOORS."—*Decided May* 27, 1875.]

Alleged sketches of an invention not preserved or accounted for, and not followed up by a reduction of the invention to practice, are not sufficient to establish priority of invention.

Where one is first to conceive an invention, but throws aside all evidence of the conception, makes no effort to complete or introduce the invention to the public, and delays making application for a patent for nearly four years after another has brought it into extensive use, he has no standing as an inventor.

THACHER, *Commissioner:*

In two previously-adjudicated interferences upon the same subject-matter, in which Little was a contestant with other parties, it was determined, on substantially the same proof as is now adduced by him, that he had conceived this invention as early as June 19, 1869; that on that day he made a drawing of the same; that during 1869 and 1870 he made models fully embodying the invention; and that he exercised due diligence in filing his application for a patent, which was done January 29, 1872. The original drawing and the model referred to were introduced in evidence, and clearly identified by several witnesses.

In the reproduction of his proof in this case, some discrepancies in the testimony of some of the witnesses are found; but they are not such as to vary the essential matters above set forth, or to materially weaken the credibility of those in whose testimony the discrepancies appear. Such being the state of the case in behalf of Little, it now remains to pass upon the claims of Hart to the title of first and original inventor.

Hart not only appeared as a witness in the two interferences already alluded to, but also in a third interference in which, although Little was not a party, the same subject-matter was more or less involved. The first interference was between Little and one John Stephenson, the decision of which by the Commissioner may be found in 3 OFFICIAL GAZETTE, page 379. At that time Hart was in the employ of Stephenson, and has been ever since; and in neither his testimony in that interference, nor in that of one or two other witnesses in that case who now appear in his behalf, was there the slightest claim set up in behalf of Hart that he was in any degree whatever the originator of this invention. On the contrary, Hart gave the entire credit to Stephenson, and that, too, in reply to questions directly upon this point. After that interference had been decided in favor of Little and against Stephenson, new opponents to Little's claims sprung up in the persons of Shaffer and Rider, of St. Louis, and upon an interference with them Hart was again produced as a witness against Little, when, for the first time, he testified substantially that he communicated the knowledge of this invention to Little. Smith and Rider having also been defeated finally, Hart himself now comes forward as a competitor.

The close pecuniary relations between Hart and Little's first opponent, John Stephenson, which relations still exist, justify a very close and careful scrutiny of his present claim.

In his preliminary statement he alleges that he conceived the device in controversy on the 15th of April, 1869, while employed at Wight's omnibus and car shop, in the city of St. Louis, Missouri; that on the following day he made a drawing of the improvement, fully showing the same; that on the same day he showed and explained this drawing, and described the improvement to his son, to Mr. Herman G. Bohn, and to his employer, Mr. Wight, and shortly thereafter to other parties, all of whom, he alleges, fully understood the invention and its mode of operation; that on the 19th of June, 1869, he described this improvement to Samuel H. Little fully and completely; that on the 4th of July, 1869, he constructed the first car with some changes from his original plan; and that on the same day he called Little's attention to said change while he was looking at the car, and also to the previous conversation they had had on the 19th of June, in which he had described to Little his first plan.

As far as the early sketches mentioned are concerned, several witnesses swear that they saw them at the time specified. Hart's son testifies that he saw them, "over a year" after the date given above, in a bag or trunk in which his father or mother had placed them. None of them are produced, however, and there is no evidence showing that any search was made for them. Their original existence, and the plan which it is alleged they represented, are testified to by Hart and his son, Bohn, Bothe, and Messing. The testimony of his employer, Wight, was not taken.

The records of the previous interference have been introduced here, and there is no point relating to the invention in dispute—its conception, growth, and completion—in which Hart does not contradict himself at one time or another, or in which he is not flatly contradicted by other witnesses.

To give credence to his testimony in regard to any one of the matters arising at any particular stage of the case is to discredit his statements made at another time upon the same subject, or to impeach the testimony of some one witness in his own behalf, and that of several on the other side.

Bohn does not seem to be much better off. He admits, on cross-examination, that in an equity suit between some of these parties, brought some time previous to the institution of this interference, he testified, in answer to the question, "When did you and Hart first talk about this endless-cord arrangement?" that "To the best of my recollection, I never had a conversation with Mr. Hart about the endless cord arrangement, in particular." He now narrates not only a conversation he had "in particular" with Hart on this very subject in April, 1869, but alleges that he saw Hart temporarily apply the very device in dispute to a car during that spring, and introduces a drawing made with considerable labor, which, he says, is a copy of the sketch Hart showed him at that time. This drawing (Bohn's Exhibit No. 1) was made before testimony in this interference was taken, and under directions by telegraph of John Stephenson's attorney, in New York.

The temporary embodiment by Hart of the device, as mentioned above, was not alluded to by him in his preliminary statement, or in the previous testimony of himself and associates in the other cases; and in the present case, in his testimony in his own behalf, no mention is made of it. It was brought forward by Hart while testifying as a witness for Little, who called him at a late stage of the case to testify in regard to some other matters.

Nothing can be made out of Messing's direct testimony, unless it is that Hart's first and only device was the weight-and-cord arrangement. When pressed, however, upon cross-examination, he comes out more strongly in favor of Hart's claim to the paternity of the subject-matter in controversy. His testimony is very contradictory, and, taken in connection with that of his principal, unreliable.

Hart's son and Bothe, although testifying as to the existence of the sketches made by Hart in the spring of 1869, have nothing to say as to the temporary embodiment in a car of the plan represented thereby, described by Hart and Bohn.

Setting aside as incredible the unsupported statements of Hart and Bohn as to the experimental embodiment of the device at the time alleged by them, and admitting that Hart did make a fugitive sketch or sketches of the same at that time, what is the effect? The majority of witnesses in his behalf testify positively that he had nothing to do with putting the endless-cord arrangement on the street-cars which his company subsequently manufactured. Hart himself swears that shortly after he had conceived the plan of the continuous cord he discovered the plan for using a cord with weights, and that he considered the latter device in comparison with the former as gold compared with brass.

Stephenson introduced cars with the continuous-cord arrangement into St. Louis in 1870. Hart not only had knowledge of, but acquiesced in, that use for two or three years; and when finally the time came for him to declare upon his oath what he knew about the matter, alleged that he had always regarded John Stephenson as the inventor of the device. As a matter of law, and between him and Stephenson, Stephenson was the prior inventor, for, admitting that Hart was the first to con-

ceive the invention, he threw aside all evidences of that conception, made no efforts to complete it or introduce it to the attention of the public, and delayed making his application for a patent until nearly four years after the former had brought it into extensive use.

Unless, for the first time, crude fugitive sketches and inexcusable *laches* are to be regarded as sufficient to establish one's right to an invention, Hart has no standing whatever before the Office.

The only point remaining to be considered is, whether Hart has proved that he imparted to Little the knowledge of this invention on the 19th of June, 1869, as he alleges. This point is easily determined.

The allegation has for its support the testimony of Hart alone. It is denied by Little, whose statement is sustained by corroborative testimony of witnesses, and also by documentary evidence.

In this state of the case, the conclusion in regard to this allegation must be, not proven.

The claims of Little as an original inventor have been so thoroughly sifted and settled in several previous adjudications that I deem it unnecessary to again rehearse the testimony in his behalf. I have, therefore, simply stated the foundation on which Hart builds his claim, and the conclusions at which I have arrived upon reviewing the evidence adduced by Hart and other opponents of Little in this and the previous interferences.

The decision of the Board is reversed, and priority of invention awarded to Little.

DECISIONS OF THE COURTS.

SUPREME COURT OF THE UNITED STATES.

DENNIS G. LITTLEFIELD AND IRA JAGGER, APPELLANTS, *vs.* JOHN S. PERRY, TRUSTEE AND EXECUTOR OF MARY J. PERRY, DECEASED.

[*In Equity.—Appeal from the Circuit Court of the United States for the Northern District of New York.—October term*, 1874.]

The power of assignment under the statute has been so construed by the courts as to confine it to the transfer of an entire patent, an undivided part thereof, or the entire interest of the patentee, or undivided part thereof, within and throughout a certain specified portion of the United States.

One holding such an assignment is an assignee within the meaning of the statute, and may prosecute in the circuit court any action that may be necessary to protect his rights under the patent.

While a mere licensee cannot, in his own name, sue strangers who infringe, yet he would be permitted in a court of equity to bring suit against the patentee for the infringement of the rights secured to him by his license.

An agreement to account and pay a specified royalty, contained in an instrument of assignment, forms part of the consideration of the assignment, and does not reduce the grantee to the position of a licensee.

Neither does a clause of forfeiture for non-performance, contained in an assignment, reduce the grantee to the position of a licensee. For the non-payment or other non-performance a forfeiture may be enforced as for condition broken, but until it is enforced the title granted remains in the assignee.

Where the patentee, Littlefield, under letters patent relating to stoves, executed with Treadwell and Perry a "grant" and a "supplemental agreement" on the same day, by the former of which, for the consideration therein named and of the agreements contained in the supplemental paper, he made conveyance of an absolute interest in his patent for a specified territory, said deed being duly recorded in the Patent Office, while in the supplemental agreement it was stipulated that nothing contained in the grant should give the grantees the right to use the principle of the patent in furnaces erected in cellars, &c., which supplemental paper was never recorded: *Held*, that the "grant" was to be treated as an assignment, and that the grantees and those claiming under them could sue in the circuit court in their own names to prevent an infringement of their rights.

An assignment of an imperfect invention, with all the improvements upon it that the inventor may make, is equivalent in equity to an assignment of the perfected results. In such case the assignees become in equity the owners of the patent issued upon the invention when perfected, and, if the assignor takes the legal title, he holds it in trust for them, and should convey.

In a contest between an assignor in equity and his assignee a court of equity will give the same effect to an equitable title that it would to one that was legal.

Where the patented improvement formed a part only of the infringing stoves made by the defendants, the inquiry in the accounting before the master should have been confined to an account of the profits received by the defendants as the direct result of the improper use of the improvements, and could not include all the profits received from the manufacture of the stoves embracing such improvements.

In cases of infringement the profits actually realized, without interest, are usually the measure of unliquidated damages. Circumstances may, however, arise which would justify the addition of interest, in order to give complete indemnity for losses sustained by wilful infringements.

[*H. E. Sickels* and *E. R. Hoar*, for appellants.
J. H. Reynolds and *E. W. Stoughton*, for appellee.]

WAITE, *Ch. J.*:

We are met at the outset of this case with a question of jurisdiction. All the parties—plaintiff as well as defendant—are citizens of the State of New York. The power of the circuit court, therefore, to entertain the cause, if it exists at all, must be found in the jurisdiction conferred by the patent laws.

The suit is in equity against a patentee by one who claims to be his assignee, to restrain him from infringing upon rights under his patent, which are alleged to have been assigned. The circuit court has jurisdiction of all suits arising under the patent laws, and has power, upon a bill in equity filed by a party aggrieved, to grant injunctions, according to the course and principles of courts of equity, to prevent the violation of any right secured by patent. Every patent, or any interest therein, is by statute made assignable by an instrument in writing, and the patentee or his assignee may, in like manner, grant and convey an exclusive right under his patent throughout any specified part of the United States. All such assignments must be recorded in the Patent Office within three months from the time of their execution. This power of assignment has been so construed by the courts as to confine it to the transfer of an entire patent, an undivided part thereof, or the entire interest of the patentee, or undivided part thereof, within and throughout a certain specified portion of the United States. One holding such an assignment is an assignee within the meaning of the statute, and may prosecute in the circuit court any action that may be necessary for the protection of his rights under the patent.

The title of the complainant in this case grows out of what is termed in the answers "a grant and supplementary agreement," executed in "two parts," between Littlefield, the patentee, and Treadwell & Perry. The "grant" is one of the parts and the "supplementary agreement" the other. The grant, taken by itself, contains, in most unmistakable language, an absolute conveyance by the patentee of his patent and inventions described, and all improvements thereon, within and throughout the States of New York and Connecticut, and an agreement by the assignees to pay a royalty on all patented articles sold, with a clause of forfeiture in case of non-payment or neglect, after due notice, to make and sell the patented articles to the extent of a reasonable demand therefor. This grant was duly recorded in the Patent Office six days after its execution.

The supplementary agreement was never recorded. It contained, among other things, a stipulation to the effect that nothing in the assignment should give to Treadwell & Perry the right to use or apply the principle of the patent to furnaces erected in cellars or basements of houses for the purpose of heating several rooms, it being the intention of the patentee to reserve that to himself. It also contained certain other stipulations between the parties, intended for the protection of their respective rights and the regulation of their conduct under the assignment. The defendants now contend that by reason of this reservation and these several stipulations the title of Treadwell & Perry, under the grant, has been reduced from that of assignees to mere licensees.

Undoubtedly, for the purpose of ascertaining the intention of the parties in making their contract, the two instruments, executed, as they were, at the same time, and each referring to the other, are to be construed together. If, when so construed, they shall be found to convey to the assignees the title to the patent and inventions, and grant a license back from the assignee to the patentee of the right to use the patent and its principle in the manufacture of the designated furnaces, the circuit court had jurisdiction of the cause.

When the "grant" was placed on record, Treadwell & Perry became the apparent owners of the entire patent and inventions throughout the specified territory. Neither the agreement to account and pay the royalty nor the clause of forfeiture for non-performance contained in that instrument reduced them to the position of licensees. The agreement to account and pay formed part of the consideration of the assignment, and was, in effect, an agreement to pay at a future time a sum to be determined by the number of articles made and sold. For the non payment or other non-performance a forfeiture might be enforced as for condition broken, but until it was enforced the title granted remained in the assignees.

The "supplementary agreement" contained a provision that Littlefield should sue infringers "in his own name or otherwise," and also defend all suits against Treadwell & Perry for alleged infringements of other patents by the use of his; and this, it is alleged, is evidence of the intention of the parties to make the grant effective only as a license. It needs only a slight examination of that clause in the contract, however, to become satisfied that it was intended only as a provision for placing on Littlefield the costs and expenses of all such litigation, as well as all damages for infringements growing out of the use of the inventions by the assignees. The suits were to be prosecuted in his name or otherwise, as circumstances should require, and he was to be at all the costs and expense of maintaining patents. That is the extent of the provision.

Upon the argument the reservation of the right to use the principle of the patent and inventions in the manufacture of furnaces seemed to be relied upon with more confidence as establishing this claim on the part of the defendants. All agree that the intention of the parties, when ascertained by an examination of both the instruments, must govern in this action where only the parties themselves are interested. There are no intervening innocent third persons. Jagger, the partner of Littlefield, who is co-defendant with him, is charged with full notice of the rights of Treadwell & Perry and others claiming under them.

It is a significant fact that the agreement was executed in two parts. Ordinarily the whole of such a contract is embodied in a single instrument. Another important fact is that only one of the parts is recorded, and that the one which, taken by itself, places the title in Treadwell & Perry. The record is intended for the benefit of the public. *Bona fide* purchasers look to it for their protection. The record of the grant alone, therefore, furnishes the strongest evidence of the intention of the parties to give effect to the two instruments as an assignment. It is true that in the recorded part reference is made to the other; but the manner of the reference is not such as to indicate that the unrecorded part contained anything to defeat the title granted by that which was recorded. The language is, "in consideration of one dollar, and of the agreements herein contained on the part of the parties of the second part, and of the agreements contained in a certain agreement this day executed between the parties hereto, and bearing even date herewith, hath, and by these presents doth, assign," &c. And again: "It is expressly understood and agreed between the said parties that in case the said party of the first part shall well and faithfully keep and perform all the agreements herein, and in the aforesaid agreement bearing even date herewith contained, and said parties of the second part shall, &c., neglect, &c., that this assignment and transfer shall thereafter be void and of no effect," &c. This is undoubtedly sufficient to charge purchasers with notice of the execution of the supplementary agreement, and possibly of its provisions, but it falls far short of indicating an intention of the parties, by anything contained in the unrecorded instrument, to limit or defeat the assignment made in consideration of it. The most that can be inferred from such language is that the parties had stipulated between themselves, not as to the legal effect of the recorded instrument, but as to their obligations or equitable rights under it. We think, therefore, that Treadwell & Perry were the assignees of Littlefield within the meaning of the patent laws, and that they and those claiming under them may sue in the circuit courts to prevent an infringement upon their rights.

But, even if they are not technically assignees, we think this action is nevertheless maintainable. They certainly had the exclusive right to the use of the patent for certain purposes within their territory. They thus held a right under the patent. The claim is that this right has been infringed. To determine the suit, therefore, it is necessary to inquire whether there has been an infringement, and that involves a construction of the patents. The act of Congress provides "that all actions, suits, controversies, and cases arising under any law of the United States granting or confirming to inventors the exclusive right to their inventions or discoveries shall be originally cognizable, as well in equity

as at law, in the circuit courts," &c. An action which raises a question of infringement is an action arising "under the law," and one who has the right to sue for the infringement may sue in the circuit court. Such a suit may involve the construction of a contract as well as the patent; but that will not oust the court of its jurisdiction. If the patent is involved it carries with it the whole case.

A mere licensee cannot sue strangers who infringe. In such case redress is obtained through or in the name of the patentee or his assignee. Here, however, the patentee is the infringer, and, as he cannot sue himself, the licensee is powerless, so far as the courts of the United States are concerned, unless he can sue in his own name. A court of equity looks to substance rather than form. When it has jurisdiction of parties it grants the appropriate relief without regard to whether they come as plaintiff or defendant. In this case the person who should have protected the plaintiff against all infringements has become himself the infringer. He held the legal title to his patent in trust for his licensees. He has been faithless to his trust, and the courts of equity are always open for the redress of such a wrong. This wrong is an infringement. Its redress involves a suit, therefore, arising under the patent laws, and of that suit the circuit court has jurisdiction.

It is next asserted that the complainant has not by his proof shown himself to be the assignee of Treadwell & Perry. They, on the 25th of March, 1862, assigned all their interest to George W. Sterling. He became dissatisfied with his purchase, and, by agreement of parties, the sale was canceled, he giving effect to the cancellation by executing a reassignment to Treadwell & Perry, bearing date June 2, 1862. Under date of April 7, 1862, Treadwell & Perry executed another assignment to one Dickey. Both the reassignment from Sterling and the assignment to Dickey were left at the Patent Office for record on the 26th June, 1862, and on the 2d July, Dickey assigned to Mary J. Perry, in whose name the suit was commenced.

It is now claimed that this proof shows title in Treadwell & Perry, inasmuch as Sterling reassigned to them after they had assigned to Dickey. Mrs. Perry was the wife of John S. Perry, one of the firm, and he is now a party to the suit, having upon her death succeeded to all her rights as trustee under her will. Treadwell, the other member of the firm, has been several times in the progress of the cause examined as a witness, and has testified that Dickey became the owner of the patents uner a transfer, to which he consented. It is clear, therefore, that Mrs. Perry at the commencement of the action was in equity, if not in law, the owner of whatever had been assigned by Littlefield, and that, if Treadwell & Perry had the legal title, they held it in trust for her, and will be estopped by a decree in her favor from setting up as against Littlefield any beneficial interest under it. At an earlier stage of the proceedings it might have been proper to make Treadwell a party, but upon the case as it now stands no possible harm can result to the defendants from a decree against them in his absence.

This brings us to a consideration of the merits of the case.

On the 15th April, 1851, a patent was issued to Littlefield for a certain improvement in cooking-stoves, and on the 30th December, 1852, he filed in the Patent Office his application for another improvement in stoves, devised "for the purpose of economizing and burning the gases generated by the combustion of anthracite coals." On the 5th April, 1853, he executed the grant and supplementary agreement already referred to. In the grant, after reciting that he held a patent bearing date April 15, 1851, "for a coal burner so constructed as to produce combustion of the inflammable gases of anthracite coals," and that he had "made application to the Patent Office at Washington for letters patent securing to him a certain improvement in the invention so as aforesaid patented to him," and that such application was then pending, he proceeded to assign all the right, title, and interest which he then had, or might thereafter have, "in or to the aforesaid inventions, improvement, and patent, or the patent or patents that may be granted for said inventions or any improvement therein, and on any extension or extensions thereof within and throughout the district, &c., for and during the term for which the aforesaid letters patent were granted, and the terms for which any patent for the aforesaid improvement, or any improvement or improvements thereof, may be granted, &c." The application of December 30, 1852, was rejected at the Patent Office, and finally withdrawn by Littlefield on the 22d day of July, 1853, he at the same time filing another application for "a new and useful improvement in stoves," so devised as "to burn the gaseous or more inflammable elements of the coal in contact with its more refractory portions, and thus secure a complete combustion of them both." Upon this application a patent was issued January 20, 1854. All the patents outstanding, and the subject of this controversy are admitted to be reissues of this or improvements upon it. Littlefield and his co-defendant do not deny that they have used the patents issued after January, 1854, and, if the title to them passed under the assignment of April, 1853, it is admitted that such use is an infringement, and that the complainant is entitled to a decree. The simple question then presented for our consideration is as to the effect to be given to this assignment.

It is well settled that a recorded assignment of a perfected invention, made before a patent has issued, carries with it the patent when issued, (*Gaylor* vs. *Wilder*, 10 How., 477,) and that reissues are not patents for new inventions, but amendments of old patents. If a reissue is obtained with the consent of an assignee it inures at once to his benefit; if without, he has his election to accept or reject it.

The parties have themselves agreed that the invention of 1852 is an improvement upon the patent of 1851. In the grant the patent is described as being "for a coal-burner, so constructed as to produce combustion of the inflammable gases of anthracite coal," and the application as being for an improvement upon the patent. It is true that the application is not referred to by its date, but there can be no doubt as to its identity, because the language adopted to describe the patent is not that of the claim in the patent itself, but of the application of 1852. Besides, the application is said to be then pending, and it is not pretended that Littlefield had any other on file in the Patent Office at that date. This relieves us from an examination of the specifications in the patent and application for the purpose of ascertaining whether in point of fact the one was an improvement upon the other. Littlefield having agreed that it was, and having induced Treadwell & Perry to purchase by reason of this agreement, cannot now deny it.

It is clear, also, that the idea which Littlefield had in mind, and which he was endeavoring by his devices to make practically useful, was greater economy in the use of the inflammable gases of coal to produce combustion. It is not important in this suit that the patent, which had then been obtained, was not in fact suited for that purpose. It is sufficient that it was intended to be so. The subsequent devices, better adapted to the end to be accomplished, may, therefore, properly be regarded as improvements upon the original invention. They produce a stove doing the same thing which the first was intended to do, but doing it better. This is the proper office of an improvement.

The assignment in this case, by its express terms, covers all improvements in the original patent or the invention described in the application of 1852. It carried with it the legal title to the existing patent. If one had been issued upon the application that, too, would have inured to the benefit of the assignee, because in that case it would have been the assignment of a perfected invention. Without considering whether the invention upon which the patent of 1854 issued was not, in fact, the same to all intents and purposes as that of 1852, it is sufficient for the purposes of this case that it was an improvement upon it, or perhaps more properly, that invention perfected. An assignment of an imperfect invention, with all the improvements upon it that the inventor may make, is equivalent in equity to an assignment of the perfected results. The assignment in this case being such an one, the assignees became in equity the owners of the patent granted upon the perfected invention—that is to say, of the patent of 1854. Littlefield took the legal title in trust for them and should convey. Courts of equity in proper cases consider that as done which should be. If there exists an obligation to convey at once, such courts will oftentimes proceed as if it had actually been made.

There is here no attempt to obtain the specific performance of a contract, but to restrain this patentee from infringing upon rights which, in a court of equity, he is deemed to have assigned. In other words, this complainant is in equity an assignee, and entitled to protection as such. If the assignment in precisely its present form had been executed after the last reissue was granted, we think it would hardly be claimed that the legal title to all the present outstanding patents did not pass with it. What such an assignment could do in respect to legal titles this has done in respect to such as are equitable. The contest is now between an assignor in equity and his assignee. A court of equity will in such a case give the same effect to an equitable title that it would to one that was legal.

It is next contended that the assignment in this case was forfeited before the commencement of this action, because of the failure of Treadwell & Perry to perform its conditions. There is no proof that the royalty on the stoves made and sold before the action was commenced was sufficient to discharge that part of the debt due from Littlefield to Treadwell & Perry, which was first to be paid out of it before anything was payable to him, and there could be no forfeiture for a neglect to make and sell until after reasonable notice of the default. No such notice is proven or even claimed.

It is next insisted that, if the plaintiff claims the benefit of the last reissues, he puts it out of his power to have damages for infringements previous to their their date. The original bill in this cause was filed August 27, 1862. Everything since that time has been done *pendente lite*. The first reissue was granted November 19, 1861, and the first patent for an improvement on the patent of 1854 was issued on the 27th June previous. All in the way of reissues or improvements except these has been done pending the suit. The litigation gathers to its harvest the fruits of the labors of Littlefield and his associates during its pendency. His infringement and that of his co-defendant, Jagger, claiming under him, commenced in 1862, only a short time before the action was commenced. The question presented by this objection is, therefore, comparatively unimportant; but if it were not, the result would be the same. For as Littlefield held his patents all the time in trust for these assignees to the extent of the territory they owned, he must account to them for the profits he has made by the unlawful use of the trust property.

We are, therefore, clearly of the opinion that the complainant is in equity the assignee of Littlefield, and that he is entitled to recover of the defendants the profits they have made out of these infringements upon his rights. So far there is no error in the court below.

We now come to the decree itself. The plaintiff is entitled, as has been seen, to recover of the defendants the profits they have made from the use of the several inventions within the assigned territory; but the decree directed an account of "all the profits, gains, and advantages which the said defendants, or either of them, have received, or which have arisen or accrued to them, or either of them, from the manufacture, use, or sale of stoves within the States of New York and Connecticut, embracing the improvements described in and covered by the said letters patent, and the reissues thereof, or any of them." An account stated upon these principles has been approved by the court in the decree appealed from.

The decree is, as we think, too broad. After the interlocutory decree below settling the principle of the accounting, the case of *Mowry* vs. *Whitney*, 14 Wall., 620, was decided in this court. It was there held that the question to be determined in such a case as this was "what advantage did the defendant derive from using the complainant's invention over what he had in using other processes then open to the public, and adequate to enable him to obtain an equally beneficial result? The fruits of that advantage are his profits." For such profits he is compelled to account as damages.

Here the order is to account for all profits received from the manufacture, &c., of stoves, embracing the improvements covered by any of the patents. This would cover all the profits made upon a stove having in it any one of the improvements patented. The true inquiry is as to the profits which the defendants have realized as the consequence of the improper use of these improvements. Such profits belong to the plaintiff, and should be accounted for to him. The account of the master may not charge the defendants with more than the complainant is entited to recover. The conduct of the defendants in withholding statements which it would seem they ought to be able to make, and their evident unwillingness to account, would induce us to sustain the report had the order of reference been less broad. As it is, we think the decree, so far as it settles the principles of the accounting for profits, must be reversed, and that the inquiry before the master must be confined to an account of the profits received by the defendants as the direct result of the use within the assigned territory of the several inventions involved in the case.

This reverses the decree. Many exceptions were taken to the master's report. Some were as to the matters of form, and others were directed to the principles of the accounting as settled by the decree. It is un-

necessary to consider these further. Another account may dispose of them all.

The circuit court, however, in rendering its final decree added interest to the amount found by the master to be due upon the account for profits. In *Mowry* vs. *Whitney supra*, it was held that interest is not allowable in such cases, except under peculiar circumstances. The testimony thus far presented in this case does not in our opinion justify such an allowance. It will be for the court to determine, upon the coming in of the new report, accompanied by other evidence, whether the conduct of the defendants has been such as to subject them to liability in this particular. Profits actually realized are usually, in a case like this, the measure of unliquidated damages. Circumstances may, however, arise which would justify the addition of interest, in order to give complete indemnity for losses sustained by wilful infringement.

The decree of the circuit court is reversed to the extent hereinbefore indicated, and the cause remanded, with instructions to take a new account of profits and proceed in accordance with this opinion.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date June 8, 1875.]

8,373.—Newspaper-Rack.—HORACE Z. BAKER, Providence, R. I. Application filed February 27, 1875. Term of patent 3½ years.

8,374.—Heating-Stoves.—JOHN V. B. CARTER, Detroit, Mich., assignor to DETROIT STOVE WORKS, same place. Application filed June 3, 1875. Term of patent 7 years.

8,375.—Reservoir Cooking-Stoves.—JAMES DWYER, Detroit, Mich., assignor to DETROIT STOVE WORKS, same place. Case A. Application filed June 3, 1875. Term of patent 7 years.

8,376.—Font of Printing-Types.—CARL E. HEYER, Boston, Mass. Application filed February 18, 1874. Term of patent 3½ years.

8,377.—Medal.—ISRAEL Y. KNIGHT, Philadelphia, Pa. Application filed June 1, 1875. Term of patent 3½ years.

8,378.—Carpets.—JOSEPH C. G. LIBERT, Paris, France, assignor to THE ROXBURY CARPET COMPANY, Boston, Mass. Application filed May 17, 1875. Term of patent 3½ years.

8,379.—Font of Printing-Types.—ANDREW LITTLE, New York, N. Y. Application filed April 14, 1875. Term of patent 14 years.

8,380.—Hand-Wheels of Valves.—DANIEL MCLAUGHLIN, Bridgeport, Conn., assignor to THE BELKNAP MANUFACTURING COMPANY, same place. Application filed May 21, 1875. Term of patent 3½ years.

8,381.—Bracket-Saw Frames.—HENRY L. PRATT, Brooklyn, N. Y. Application filed February 5, 1875. Term of patent 3½ years.

8,382.—Writing-Tablets.—JOHN M. QUACKENBOS, Jr., New York, N. Y. Application filed April 29, 1875. Term of patent 7 years.

8,383.—Vase.—ABRAHAM SCHLANK, New York, N. Y. Application filed February 26, 1875. Term of patent 3½ years.

8,384.—Buttons.—JOSEPH R. SMITH, Waterbury, Conn., assignor to THE WATERBURY BUTTON COMPANY, same place. Application filed May 31, 1875. Term of patent 3½ years.

8,385.—Fountain-Inkstands.—LEVI L. TOWER, Boston, Mass. Application filed June 17, 1875. Term of patent 14 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date June 8, 1875.]

2,636.—Saws.—E. C. ATKINS & Co., Indianapolis, Ind.—Case B. Application filed May 6, 1875.
"words 'Silver Steel.'"

2,637.—Seamless Drawn Tubes.—BRIDGEWATER IRON COMPANY, Bridgewater, Mass. Application filed May 5, 1875.
"words 'Bridgewater Seamless Drawn Tubes,' coupled with an anchor."

2,638.—Gilmore's Neuralgia Cure.—W. GILMORE & SON, Pavilion, N. Y. Application filed April 27, 1875.
"shield bearing the legend '*Quæ Prosunt Omnibus.*'"

2,639.—Corn Flour.—GLEN COVE STARCH MANUFACTURING COMPANY, New York, N. Y. Application filed May 28, 1875.
"allegorical picture representing the cultivation of corn, preparation of flour from the corn, and the cooking of the flour by Indians."

2,659.—Cigars.—F. DE BARY & Co., New York, N. Y. Application filed May 8, 1875.
"the word 'Home' and the letters and character 'E & E.'"

2,660.—Perfumeries, Cosmetics, and Soaps.—AIMÉ GUERLAIN, Paris, France. Application filed February 25, 1875.
"a figure representing a genius holding in the right hand a sword and a crown; in the left hand a branch of palm-tree and a crown; standing on a sphere decorated in the middle of a vessel, with a sky full of stars, and surrounded by a circle, with the legend 'Honneur et Patrie,' and on each aid of the sphere a trophy a trophy of flags, and under a cross."

2,661.—Cigars.—S. JACOBY & Co., New York, N. Y.—Case A. Application filed May 26, 1875.
"word 'DOVETAILS.'"

2,662.—Cigars.—S. JACOBY & Co., New York, N. Y.—Case B. Application filed May 26, 1875.
"word 'OVALADOS.'"

2,663.—Stoves.—DENNIS G. LITTLEFIELD, Albany, N. Y. Application filed March 14, 1874.
"word 'Anti-Clogger.'"

2,664.—Soap.—ROBINSON BROS. & Co., Boston, Mass. Application filed March 8, 1875.
"words 'Oat Meal.'"

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., May 19, 1875.

On the petition of ANN JENNETTE HATHAWAY, of Milwaukee, Wis., executrix of JOSHUA HATHAWAY, deceased, authorized by act of Congress approved February 18, 1875, praying for the extension of a patent granted to the said JOSHUA HATHAWAY, on the 3d day of April, 1860, for an Improvement in Devices for Converting Reciprocating into Rotary Motion,

It is ordered that the testimony in the case be closed on the 20th day of July next; that the time for filing arguments and the Examiner's report be limited to the 30th day of July next; and that said petition be heard on the 4th day of August next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

INDEX OF INVENTIONS PATENTED JUNE 8, 1875.

	Class No.	No. of Patent.
Acid for manufacturing nitro-glycerine, manufacture of nitro-sulphuric, P. Castellanos	35	164,260
Acids from the residuum of nitro-glycerine manufacture, apparatus for recovering, P. Castellanos	35	164,262
Acids from residuum of nitro-glycerine manufacture, recovering, P. Castellanos	35	164,261
Album, photograph, J. C. Arms	146	164,249
Animals, bog boot for, W. Jacobs	144	164,174
Apparel, fastening for wearing, R. C. Nichols	23	164,200
Aquarium, bird cage, and flower stand, combined, J. Chase	54	164,074
Asparagus, machine for bunching and sizing, J. A. Ireland	63	164,091
Auger, earth, S. H. Horn	51	164,086
Bale tag, J. M. Goldsmith	146	164,165
Bale tie, E. D. Chadick	7	164,142
Bale tie, J. M. Goldsmith	7	164,164
Battery, galvanic, H. P. Dechert	50	164,270
Bed bottom, spring, W. D. Hatch	62	164,170
Bedstead, J. B. French	62	164,290
Bell pull, S. D. Arnold	34	164,126
Blackboard rubber, D. Jackson	146	164,173
Blasting, G. Frisbee	124	164,062
Blower, rotary pressure, W. Pruett, (reissue)	12	6,481
Blower, rotary pressure, T. L. Varne	12	164,346
Bobbins, machine for turning, Bean and Butters	175	164,130
Boiler tube cleaner, C. Schmandt, (reissue)	148	6,482
Boom, sheer, P. A. Prince	13	164,211
Boot and shoe soles, machine for screwing the uppers to, C. Tyson, (reissue)	16	6,483
Boot and shoe soles, machine for screwing the uppers to, C. Tyson	16	164,345
Boot and shoe soles, machinery for beating out, S. D. Tripp	16	164,235
Boots and shoes, manufacture of, J. L. Joyce, (reissue)	16	6,480
Bottle stopper, M. W. Shaw	1	164,223
Bottle stoppers, making wire fastenings for, H. W. Yerington	170	164,245
Bottle stoppers, making wire fastenings for, H. W. Yerington	170	164,246
Boxes, machine for making, Foster and Ladd	30	164,287
Bracelet, C. Wills	86	164,118
Brick machine, Williams and Allport	20	164,243
Brick mold, E. C. Singer	20	164,108
Bridge truss, J. Wall	21	164,349
Bridges, compound iron column for, A. E. Brown	21	164,137
Bridges, compression member of, A. E. Brown	21	164,135
Bridges, compression member of, A. E. Brown	21	164,136
Bridle winker, P. McFadden	72	164,318
Broom holder, G. W. Hunter	62	164,088
Brooms, device for holding and displaying, J. W. Yewell	54	164,358
Brush, tooth, J. Wayne	161	164,353
Bunga, machine for cutting, J. Bachelder	40	164,251
Burner for removing paint, gas, S. G. Reed	64	164,213
Burner, refuse, W. Glue, (reissue)	154	6,479
Burner, vapor, J. Stever	90	164,230
Bustle, A. W. Thomas	80	164,339
Bustle, A. W. Thomas	80	164,340
Button, &c., sleeve, J. B. Ulmar	23	164,112
Can, oil, G. K. Haswell	107	164,169
Car brake shoe, A. A. Freeman	122	164,061
Car coupling, G. W. Kyle	122	164,188
Car coupling, J. Rhoads	122	164,330
Car coupling, S. Uatick	122	164,113
Car door, R. Ferguson	121	164,285
Car starter, F. Ashley	122	164,127
Car, street, S. H. Little	121	164,311
Carpet beating machines, destroying vermin and collecting dust arising from, J. Doyle	62	164,274
Carriage axle boxes, manufacture of, W. W. Knowles	31	164,187
Carriage, child's, H. J. Shill, Jr	31	164,107
Carriages, standard for children's, G. W. Marble	31	164,195
Carts, spout attachment for dumping, M. A. Alvord	31	164,122
Casks, coating the interior of, G. Heath	107	164,298
Casting, L. Morgan	33	164,188
Casting, sand core for, Luukenheimer and Riegler	33	164,313
Chair, folding, C. D. Oatman	62	164,321
Chair, tilting, O. A. Bingham, (reissue)	62	6,478
Churn, rotary, J. Goodman	45	164,293
Churn dasher, rotary, W. C. Chamberlain	45	164,143
Churn dasher, rotary, J. J. Robiusen	45	164,215
Clamp for holding files in tempering baths, Parker and Colman	85	164,204
Cloth measuring machine, M. Knott	37	164 094
Clothes drier, J. Theobald	91	164,338
Coal chute, Dunbar and Keegan	79	164,278
Cooler, milk, F. W. Moore	45	164,197
Cordage, T. H. Dunham	127	164,154
Corn, implement for holding hot, R. G. J. Kennard	88	164,307
Corn marker, M. A. Throckmoton	133	164 234
Corset, J. Waterman	80	164 239
Cotton gin, O. W. Massey	41	164,316
Cracker machine, A. and J. Exton	6	164 157
Cracker machine, A. and J. Exton	6	164 282
Cracker machine, A. and J. Exton	6	164,283
Culinary apparatus, M. C. Bogia	154	164 235
Culinary utensil, J. H. and N. Weare	154	164,354
Cultivator, sulky, B. C. Cox	43	164,148
Curtain cord holder, F. E. Wagner	62	164 238
Curtain fixture bracket, J. Chase	62	164,073
Dental plugger, A. Williams	48	164,244
Desk and seat, school, H. L. Andrews	62	164,248
Desk, school, H. R. Fry	62	164,160
Digger, potato, E. Vanderveer, Jr	114	164 236
Dish, vegetable, E. Portington	88	164,208
Dividers, compasses, and calipers, adjustable mechanism of, J. H. Potte	97	164,209
Draughtsman's mixing cup, H. King	97	164,308
Dressing case or combined bureau and wardrobe, J. H. Horsfall	62	164,087
Drills, adjustable tripod for mining, J. H. Mandeville	124	164,315
Drills, machine for making twist, Weaver and Decker	100	164,115
Earth closet, C. A. Wakefield	8	164,348
Electrode, cautery, J. Kidder	50	164,183
Electrode, reservoir, J. Kidder	50	164,185
Electrode, vesicular, J. Kidder	50	164,184
Elevator, J. H. Bancroft	79	164,069
Elevator, hydraulic, P. Hinkle	82	164,300
Engine, rotary, Stuart and Emery	150	164 337
Engines, exhaust nozzle for steam, H. D. Dunbar	150	164,277
Engines, valve gear for steam, C. A. Amerman	150	164,123
Engines, &c., metallic packing for piston rods of steam, J. A. Fulton	151	164 158
Equalizer, horse power, A. A. Sheets	159	164,224
Explosive compound, P. Castellanos	71	164,261
Explosive compound, P. Castellanos	71	164,264

	Class No.	No. of Patent.
Feed cutters, changeable feed gear for, R. Seelig	59	164,222
Fence, barbed wire, C. Kennedy	52	164,181
Fence, farm, W. A. Ellason	52	164,279
Fence pickets, machine for making, Dufour and Rowe	174	164,276
Fence, portable, C. Van De Mark	52	164,347
Fire arms, swivel band for, J. M. Clough	55	164,267
Fire box, W. Ennis	154	164,280
Fire escape, F. P. Berney	30	164,131
Floor clamp, W. D. Clark	29	164,145
Fluting and polishing iron, W. L. McCausland	91	164,196
Fluting machine, J. E. Donovan	38	164,273
Food for animals, G. Gordon	58	164,166
Furnace, portable, Lord and Evans	154	164,312
Furnace, warm air, J. B. Reinhard	154	164,101
Furnaces, device for feeding air to, J. L. Winslow	149	164,357
Furniture caster, C. B. Sheldon	24	164,225
Furniture caster, C. B. Sheldon	24	164,226
Furniture spring, H. W. Ladd	62	164,189
Game apparatus, N. Reiz	143	164,338
Garments, tailor's device for laying out, G. E. Tiffany	38	164,343
Gas cock, automatically operated, E. Coe	64	164,146
Gas generator, carbonic acid, C. C. Glover	1	164,163
Gas making process, M. W. Kidder	27	164,093
Gas purifying boxes, lime supporting tray for, G. W. Day	66	164,078
Gate, farm, J. Golden	52	164,292
Gear, running, H. Backer	31	164,129
Generator, sectional steam, Buts and Jones	148	164,072
Grain drill, J. C. Daman	133	164,151
Grate, C. C. Gates	154	164,161
Grate, fire place, G. W. Cummings	154	164,150
Hame, W. A. Henson	72	164,085
Hame top, E. G. Latta	72	164,096
Hammer, blacksmith's forging, A. J. Judson	60	164,180
Hammer, bush, C. Littlefield	57	164,193
Hammers, die for forming the eyes of, J. Pinkerton	60	164,326
Harvester, corn, G. A. Swartz	75	164,111
Heater and filter, feed water, G. F. Jasper	148	164,176
Heaters, radiator for steam, C. R. Ellis	147	164,156
Hinge for seat arms of school desks, W. B. Cogger	24	164,268
Hook, mousing, F. G. Appley	23	164,125
Hoops, machine for cutting, P. Cook	40	164,077
Hoops, machine for cutting, G. V. Griffith	40	164,294
Horse collar, W. J. Thorn	72	164,342
Horse power, L. Stewart	159	164,335
Horse power, Z. D. Waters	159	164,352
Horse power equalizer, A. A. Sheets	159	164,224
Horseshoe nail blank bars, machine for forging, F. H. Richards	60	164,102
Horseshoes, machine for calking, Gleason and Hamilton	60	164,291
Horseshoeing stock, R. S. Harris	144	164,296
Hub band, C. H. Liedle	31	164,310
Hydrant, D. C. Cregier	167	164,149
Jack, lifting L. O'Hara	79	164,323
Key fastener, adjustable, E. B. Everitt	93	164,281
Key ring, J. H. Sanford	23	164,105
Kneading roller, D. C. Knowles	88	164,095
Knife, shoemaker's, G. R. J. Ruggles	16	164,104
Knives, die for manufacturing bolsters for pocket, W. H. and G. W. Miller	44	164,320
Lamp and lantern, combined, G. A. Beidler	90	164,254
Lamp extinguisher, J. O. Soderstrom	90	164,334
Lantern, G. A. Beidler	90	164,253
Lantern, signal, Walton and Merrill	120	164,351
Latch, reversible, E. C. Hussey	93	164,089
Leather, machine for washing, W. Shaw	92	164,106
Lock, combination, G. Riesock	93	164,214
Lock for safe doors, permutation, H. Gross	93	164,167
Loom, circular weaving, D. Avery	95	164,250
Loom shuttle, T. Cheetham	95	164,144
Lubricating compound, J. Williams	87	164,117
Mat, floor, C. M. Roullier	56	164,333
Mechanical movement, Combe and Rhodes	67	164,076
Meter, fluid, D. P. Weir	167	164,116
Mortising machine, lock, C. J. Hardee	173	164,295
Mowing machine, A. L. Little	74	164,192
Nailing machines, nail feed attachment for, F. Rochow	103	164,332
Nitro-glycerine manufacture, apparatus for recovering acids from the residuum of, P. Castellanos	35	164,262
Nitro-glycerine, manufacture of nitro-sulphuric acid for manufacturing, P. Castellanos	35	164,260
Nitro-glycerine manufacture, recovering acids from residuum of P. Castellanos	35	164,261
Oiler, machine, S. Hutchinson, Jr.	87	164,090
Paint compound, A. T. Lyon	107	164,314
Paint exhibitor, revolving, T. C. Van Arsdale	54	164,114
Paint, gas burner for removing, S. G. Reed	64	164,213
Paper bag machine, Glover and Church	109	164,162
Paper box, J. L. Moore	109	164,099
Paper, machine for perforating, L. Francis	109	164,289
Pavement, S. Strong	110	164,231
Peg cutter, M. Buhler	16	164,139
Pendulum, compensation, C. M. C. Prentice	36	164,210
Photograph wrapper, C. Parker	111	164,324
Picture exhibitor, J. Buechner	111	164,138
Picture frame, glass, W. H. Roby	54	164,103
Pipes, composition for drain, Haight and Gladding	30	164,084
Pitcher, syrup, S. W. Babbitt	88	164,128
Plane, bench, T. H. Wall	29	164,350
Planter, cotton seed, J. C. Jenkins	133	164,304
Plow, B. C. Bradley	114	164,134
Plow, Norris, Bowers, and Dimmock	114	164,201
Poison, vessel for containing, W. M. Caterson	68	164,265
Pole, folding and sliding ten foot, S. W. Blatchly	97	164,133
Pot, coffee, E. F. Kennedy	136	164,182
Press, E. Van Gosen	45	164,237
Printing presses, &c., Treadle mechanism for, G. W. Prouty	67	164,212
Propeller, screw, J. Kelly	139	164,305
Pump, W. H. Conver	118	164,147
Pump, chain, C. L. Merrill	118	164,098
Railway, portable, A. Bass	120	164,252
Railway signal, electric, H. W. Spang	50	164,227
Railway signal, electric, H. W. Spang	50	164,228
Rake, horse, R. Brown	74	164,071
Rake, horse, Clinton and Mood	74	164,266
Rake, horse hay, R. Wilson	74	164,356
Rein holder, F. C. Sparhawk	31	164,229
Roofing composition, E. Thayer	126	164,233
Roofing tile, L. Parker	126	164,203
Safe, multiple, J. C. Hintz	128	164,172
Sails, device for reefing, J. Whittington	138	164,242
Saw guide, G. M. Hinkley	130	164,301
Seasickness, ship's furniture to prevent, J. Wertheim	137	164,240
Seed sower, broadcast, R. Furnas	133	164,159
Sewing machine, I. P. Hicks	134	164,299
Sewing machine fan attachment, I. A. Abbot	134	164,120
Sewing machine guide for banding hats, D. Wheeler	134	164,241
Sewing machine shuttle, J. Stamm	134	164,109
Sewing machine shuttle, J. Stamm	134	164,110
Sewing machine take-up, J. T. Jones	134	164,179
Shawl or carrying strap handle, B. Andrews	162	164,247
Shears, tailor's, M. E. Pleas	38	164,327
Sheet iron, machine for polishing, D. M. Reynolds	136	164,329
Ship's furniture to prevent seasickness, J. Wertheim	137	164,240
Shirts, wire rack for exhibiting, W. D. Phelan	54	164,325
Shoemaker's knife, G. R. J. Ruggles	16	164,104
Skirt, J. McCowan	38	164,317
Skirts, ornamenting, I. Hauser	38	164,297
Sleds, propeller for, Schwager and Wissen	38	164,231
Soldering clamp, M. Tandy	136	164,232
Soldering iron heater, C. J. Rogers	136	164,216
Spice cabinet, E. H. Davies	88	164,152
Spike machine, D. H. McGookin	103	164,319
Spinning ring, J. G. Lamb	142	164,309
Spinning rings to their rails, securing, J. Booth	142	164,256
Stamp, hand, J. F. W. Dorman	146	164,273
Stitch ripper, G. St. George, Jr.	38	164,336
Stove, C. Hyde	154	164,303
Stove attachment, H. S. Cook	154	164,269
Stove, magazine cooking, T. N. Caulkins	154	164,141
Stove pipe and drum, J. Keishaw	154	164,306
Stove, portable, S. Thompson	154	164,341
Stove tops, cover, griddle, &c., of, J. W. Lamb	154	164,190
Stoves, ventilating attachment to, C. Carter	154	164,259
Stove ventilator, cooking, A. A. Peterson	154	164,206
Streets, iron curb for, R. Harrington	110	164,168
Stud fastening, J. C. W. Jefferys	23	164,177
Table, extension, Dubroy and Wagner	62	164,079
Table, extension, N. Petry	62	164,207
Table, ironing, O. F. Burlingame	91	164,258
Table, ironing, S. W. Fraley	91	164,288
Table, ironing, Z. M. Hibbard	91	164,171
Thermometer, registering, D. Draper	101	164,275
Thill coupling, C. D. Bundy	31	164,140
Thill coupling, H. K. Forbis	31	164,286
Thrashing machine, J. Johnston	159	164,178
Tobacco, machine for handling straight cut, F. S. Kinney	160	164,186
Tongue support, J. Jarrell	31	164,175
Tool handle, A. Beaudry	29	164,070
Toy money box, R. Friebie	143	164,083
Tram staff, S. B. Williams	57	164,355
Trap, moth, J. Neal	9	164,199
Trowels, manufacture of, J. C. Richardson	100	164,331
Trunk stay, H. L. Andrews	162	164,124
Umbrella, folding, A. M. Alexander	165	164,121
Umbrella handle, L. Schneider	165	164,220
Umbrella stand, W. H. Hovey	62	164,302
Valve gear, cut-off, H. Bilgram	152	164,132
Valve, throttle, Scheidler and McNamar	152	164,319
Vehicle spring shackle, T. T. Pearson	31	164,205
Vehicle torsion spring, D. E. Paris	31	164,202
Vessel for containing poison, W. M. Caterson	68	164,265
Vessels, means for ventilating and discharging bilge water from, D. Leiby	137	164,191
Wagon box strap, J. Scannell	31	164,218
Wagon brake, D. L. Deitbaugh	31	164,153
Wagon brake, J. C. Trullinger	31	164,344
Washing machine, A. O'Dell	91	164,322
Washing machine, C. E. Ross	91	164,217
Watch chain swivel, C. Wills	86	164,119
Watches, safety wheel for, E. Jeanjaquet	36	164,092
Water filter, L. Brach	167	164,257
Weed covering attachment, J. W. Dysard	114	164,155
Windmill, G. Desbrough	118	164,271
Window, M. F. Lyons	30	164,194
Wire, annealing, N. F. English	163	164,080
Wire fastenings for bottle stoppers, making, H. W. Yerington	170	164,245
Wire fastenings for bottle stoppers, making, H. W. Yerington	170	164,246
Wood moldings, machine for finishing, J. S. Loomis	173	164,097
Wrench, dynamic, S. Plymale	100	164,100
Wrench, pipe, M. S. Clark	100	164 075
Yarn, putting up, G. P. Farmer	17	164,284

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JUNE 8, 1875.

	Patent No.
Abbot, I. A., Sewing machine fan attachment	164,120
Alexander, A. M., Folding umbrella	164,121
Aliport and Williams	164,243
Alvord, M. A., Spout attachment for dumping carts	164,122
Amerman, C. A., Valve gear for steam engines	164,123
Andrews, A. H., assignee	164,173
Andrews, B., Shawl or carrying strap handle	164,247
Andrews, H. L., assignee	164,173
Andrews, H. L., School desk and seat	164,248
Andrews, H. L., Trunk stay	164,124
Anthony, R. C., assignee	164,245, 164,246
Appley, F. G., Mousing hook	164,125
Arms, J. C., Photograph album	164,249
Arnold, S. D., Bell pull	164,243
Arras, J. D., assignee	164,328
Ashley, F., Car starter	164,127
Avery, D., Circular weaving loom	164,250

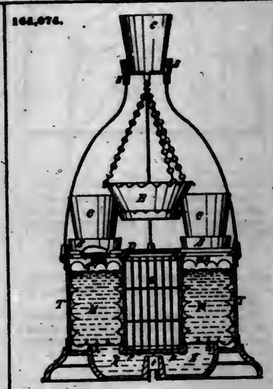
TITLES, DRAWINGS, AND CLAIMS

OF



PATENTS GRANTED JUNE 8, 1875.

164,069.

164,071.

164,076.

164,069. ELEVATOR. Jonas H. Bancroft, Boston, Mass. [Filed May 15, 1875.]

Brief.—A disk at each end of a winding-drum shaft lies against the inside, adapted to lock therewith by a spring-latch engaging with a pivoted pawl, the latter protruding over a ratchet-disk on the outside. On winding, the shaft is thus attached to the drum, the pawl being held free; on unwinding, by reason of the weight of the platform, they are in the same condition. When, however, the drum stops, through an obstruction to the platform, the latch is released, and the pawl falls into the ratchet.

1. The combination of the driven shaft and its catch with the winding-drum and its pivoted latch, substantially as and for the purpose described.

2. The driven shaft and its catch, in combination with the winding-drum, its pivoted latch and finger, and the stationary toothed ratchet, into which the finger engages when the descent of the car is arrested, substantially as described.

3. The combination of the car, the operating-rope, winding-drum, and pivoted latch with the catch and driven shaft, and the winding-drum surrounding the driven shaft, and operating substantially as described.

4. The combination of the driven shaft, the disk provided with a space, *o*, and the catch with the winding-drum and latch, substantially as described.

164,070. TOOL-HANDLES. Alex. Beaudry, Boston, Mass. [Filed Apr. 30, 1875.]

Brief.—The adz is attached to the handle by means of a square shank on the head of the tool, which fits in a corresponding metal socket on the end of the handle. The lower portion of the shank and socket are beveled, so as to fit snugly together. The whole is secured in place by a wedge-nut provided with a screw-thread on its interior, and having its under side convex, and fitting into a countersink upon the upper side of the head of the handle.

An adz or ax, with its beveled seat 10 and square shank *a* provided with a screw-thread, *b*, in combination with the nut *c* and a handle, B, having a square socket, *d*, provided with beveled edges 11 and a countersink, 12, substantially as and for the purpose set forth.

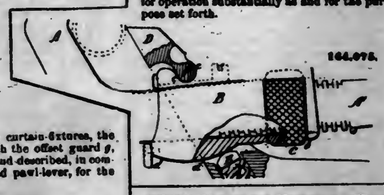
164,071. HORSE-RAKES. Robert Brown, Dayton, Ohio. [Filed Mar. 24, 1874.]

Brief.—The rake-head is raised by the hand-lever until the stud upon the rake-bar strikes the pawl-lever, and carries the latter to force the pawl into engagement with the ratchet, when the raising of the teeth is completed automatically. The pawl is released by its free end coming in contact with the curved end of the "ratchet-release piece," and the teeth and bar drop back.

The combination, in a horse-rake, of the stud A, the pawl-lever B, the pawl C, the ratchet D, the wheel E, and the ratchet-release piece F, with each other and with the axle G and rake-head H, operating automatically for the lifting and dropping of the teeth and rake-head, substantially in the manner specified.

164,072. SECTIONAL STEAM-GENERATORS. Edward M. Butts and Geo. M. Jones, Allegheny, Pa. [Filed May 5, 1875.]

Brief.—A series of circulating-tubes are attached to the opposite sides of a centrally-partitioned water-chamber.



1. A vertical central water-supply chamber, *a*, with a system of pipes, *a'*, leading horizontally therefrom on each side, a system of exterior pipes, *a*, leading back to the vertical side chambers *a''*, each parts being arranged and combined substantially as and for the purpose set forth.

2. The central steam-chamber *c*, in combination with the side chambers *c'*, and with the steam-superheating pipes, arranged substantially as set forth.

164,073. CURTAIN-FIXTURE BRACKETS. Jas. Chase, Rochester, N. Y. [Filed Mar. 2, 1875.]

164,073.

164,075.

As an improvement in curtain-fixtures, the bracket B, provided with the offset guard *g*, substantially as shown and described, in combination with the pivoted pawl-lever, for the purpose set forth.

164,074. COMBINED AQUARIUMS, BIRD-CAGES, AND FLOWER-STANDS. Jas. Chase, Rochester, N. Y. [Filed Apr. 2, 1875.]

1. In a combined aquarium and fernery, the cap D, constructed, as shown and described, so as to receive and sustain in their proper relative position the pivoted censers I and the suspension-rods L, for the purpose of constituting in the same article an ornamental plant-stand.

2. In combination with a combined aquarium and fernery, or bird-cage, the suspended or elevated plant-crock and saucer, and the hanging basket S.

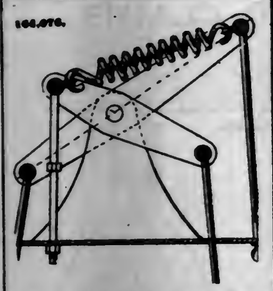
3. The side and end plates P and R, having a curved offset at the ends, in combination with the clamping-rods *r* and glass plates T, as and for the purposes set forth.

4. The pivoted centering-saucers S, constructed substantially as shown and described, in combination with the plate D and crocks C, for the purposes set forth.

5. The combination, with the chambers M, either or both, the depressed chamber R, substantially as and for the purposes set forth.

164,075. PIPE-WRENCHES. M. S. Clark, New York, N. Y. [Filed Mar. 26, 1875.]

Brief.—A collar actuated by a milled nut on the wrench-lever which carries the fixed jaw has an arch-shaped socket to receive the pivot or journal made in a slot in the wrench-lever which carries the moving jaw.

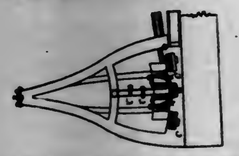


1. The slide B, constructed with the socket *c* and arc-shaped surface *d*, in combination with the screw-threaded shank of the jaw A, the nut C, and movable jaw D, constructed with the shoulder or bearing *f*, substantially as and for the purpose set forth.

2. The spring-actuated pressure-block E, in combination with the slide B, constructed with the arc-shaped surface *d* and socket *c*, the screw-threaded shank of the fixed jaw A, the nut C, and movable jaw D, constructed with the shoulder or bearing *f*, the whole arranged for operation substantially as and for the purpose set forth.

164,076. MECHANICAL MOVEMENTS. Hiram S. Combs, Georgetown, Conn., and Wm. Rhodes, New York, N. Y. [Filed May 14, 1875.]

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



164,076.

The combination of rods with stops and levers with the spring, to secure a direct and reverse motion, in the manner substantially as described.

164,077. MACHINES FOR CUTTING HOOPS. Peter Cook, Detroit, Mich. [Filed Sept. 5, 1874.]

Brief.—The material is held in a self-adjusting clamp, which, as the swinging frame moves back and forth, places it in the proper position to cut the hoops alternately beveling in opposite directions.

1. The feed-guide D, made in two parts, hung upon the adjustable suspenders *d d'*, and oscillating over the knives K K' and concave beds C C', substantially as and for the purposes described.

2. The feed-guide D, hung upon a short arm, in combination with the swinging hopper B, hung upon a longer arm, and both oscillating over the knives K K' and concave beds C C', as and for the purposes described.

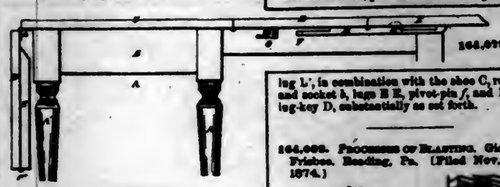
164,078. LIME-SUPPORTING TRAYS FOR GAS-PURIFYING BOXES. Geo. W. Day, Haverhill, Mass., assignor to Manhattan Lime-Hurdle Company, same place. [Filed Feb. 19, 1875.]

1. The improved lime-supporting hurdle or tray, as specified, the same consisting of the rectangular side bars A A, the cylindrical bars B B, and the series of slats *a a*, &c., the said bars B extending transversely through the bars A and the series of slats *a*, and the latter secured to the bars B, in manner as shown and described.

2. The combination, with the bars A A, bars B B, and the series of slats *a a*, constructed, arranged, and combined together as described, of the adjusting clamp-rods, as and for the purpose set forth.

164,079. BETTERMENT-TABLES. Anthony Dubroy and John F. Wagner, Cleveland, Ohio. [Filed Mar. 4, 1875.]

1. The slide F, provided with grooves *e* and *f*, in the upper and lower edges thereof, and pivoted to the frame B of the table by swivel-guides, constructed substantially as described, in combination with the leaves D E and table A, as and for the purpose set forth

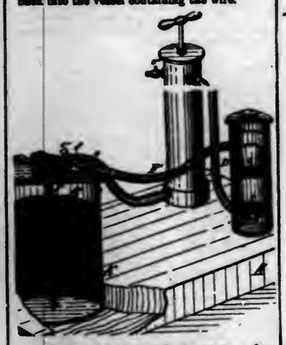


2. The slide M, in combination with the round shoe C, and locking-key D, substantially as and for the purpose set forth.

3. The sections G G', constituting the sides of the table-frame, arranged in relation to each other, as described, strip H, and bar J, in combination with the slide F, substantially as and for the purpose set forth.

1. The sole A, provided with the leg B, in combination with the round shoe C, and locking-key D, substantially as and for the purpose set forth.

2. The combination of the locking-key D having projection *g* and leg *h*, with the recess *b* in the shoe, substantially as set forth.



3. The sole A, provided with the leg B and leg L', in combination with the shoe C, recess and socket *b*, legs B E, pivot-pin *f*, and locking-key D, substantially as set forth.

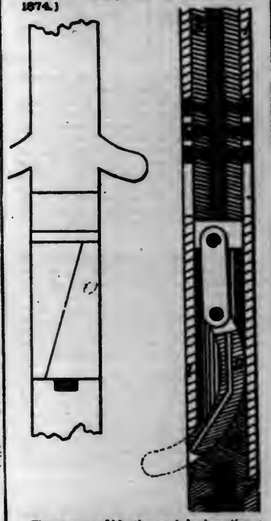
164,079.

164,080. ANNEALING WIRE. N. F. English, Hartland, Vt., assignor to A. Lapham, Washington, D. C., and George H. Osborn, Pittsford, Vt. [Filed May 18, 1875.]

Brief.—The air is pumped from the vessel in which the wire is heated, and is made to pass (through a receptacle containing quicklime and metallic sodium. By this means the air is freed from water, carbonic acid, and oxygen, and the remaining nitrogen passes back into the vessel containing the wire.

1. The combination, with the retort A, for annealing wire, of the central pipe *c'*, pipe *c*, and pump C having vent-cock *c'''*, substantially as and for the purposes described.

2. The combination of the retort A, central pipe *c'*, pipe *c*, and pump C, with pipe E, holder D, and vessels F and G and their contents, pipe F', opening *f'* in the cap of the retort A, whereby a continuous circulation is had by taking the air from the bottom of the retort and supplying its place at the top of the retort, substantially as described.



3. The process above described of preventing scale or oxide on wire in annealing and cooling it, by exhausting the air in the retort and causing it to be circulated first through quicklime, then through sodium, before it is forced into the retort, substantially as described.

164,081. GAS-BRAKE SHOES. A. A. Freeman, Philadelphia, Pa., assignor of one-half his right to Wm. M. Gingerly, same place. [Filed Apr. 6, 1875.]

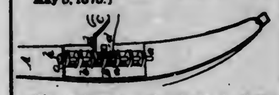
Brief.—Peculiar looking-plates, lugs, and recesses for attaching shoe to sole.

164,082. PROCESSES OF BLASTING. Gideon Frisbee, Reading, Pa. [Filed Nov. 23, 1874.]

The process of blasting rock by inserting a plug in a common long hole-bore at any desired point, and enlarging the hole at that point, to form a chamber for holding explosive, by means of an expanding bit placed and operated upon the plug, substantially as described.

164,083. TOY MONEY-BOXES. Russel Frisbie, Cromwell, Conn., assignor to the J. & H. Stevens Company, same place. [Filed Apr 17, 1875.]

Brief.—The head is not moved by the descent of the coin, but both head and arm must be manipulated by pressure upon the pivoted foot.

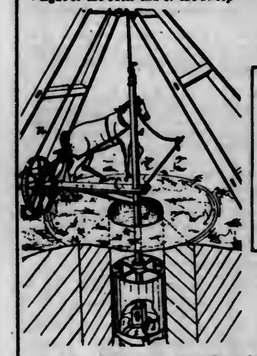


1. The parts *c f g e*, in combination with the arm, head, and foot of the figure, so that the arm and head are moved by the movement of the foot, substantially in the manner herein described.

2. In a toy money-box, the combination of the sliding plate *o* and set-screw *p* with an opening and slot in the bottom plate, substantially in the manner described.

164,084. COMPOSITIONS FOR DRAIN-PIPES. William H. Haight and Thos. G. Gladding, Leavenworth, Kans. [Filed May 17, 1875.]

A compound composed of oxide of iron, plaster-of-paris, brimstone, coal-tar, distillate of coal-oil, and sand and gravel, substantially in the proportions and for the purposes above set forth.



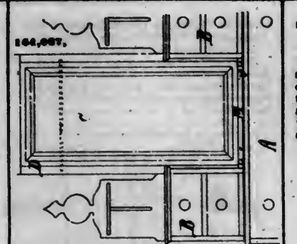
164,085. HAMES. Wm. A. Hodson, Dyer's Station, Tenn., assignor of one-half his right to Jas. P. Snoddy, same place. [Filed May 5, 1875.]

The combination, with a hame, A, of the plate B, provided with perforated ears *a* and recesses *b*, the trace-hook C, having perforated projections *d*, and the pin A, all substantially as and for the purposes herein set forth.

164,086. EARTH-AUGERS. Sidney H. Horn, Bloomfield, Iowa. [Filed Mar. 22, 1875.]

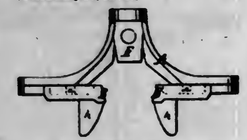
Brief.—The bucket is provided with a socket for the shaft at its lower end, with four inclined cutting-lips, and the rim carries four reamers. The hub is provided with radiating braces extending to the bottom and secured therein. A sweeping beam is supported on a traveling wheel, and combined with the auger-shaft, to prevent it from being bent by the weight of the outer end of the sweep.

1. In a well-boring apparatus, the socket *a* having a centering-point on its under side, the inclined cutting-lips 1 2 3 4, the rim *b b*, carrying the reamers *c*, when arranged and combined substantially as and for the purposes shown and described.



2. The hub B, having radiating-braces *g*, in combination with the rim *b b*, to brace the auger and support the bucket G, substantially as and for the purposes shown and described.

3. The sweeping-beam C, supported upon the traveling-wheel E, in combination with an auger-shaft, A, substantially as and for the purposes shown and described.

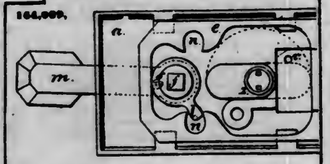


164,087. DRESSING-CASES, OR COMBINED BUREAUS AND WARDROBES. J. H. Horsfall, New York, N. Y. [Filed May 3, 1875.]

The combined wardrobe and dressing-case herein described, composed of the base A, sets of drawers B E, mirror C, wardrobe D, and slide M, all arranged and adapted to serve as and for the purposes herein set forth.

164,087.

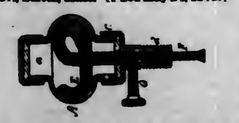
164,088. HOLDERS FOR BROOMS. Geo. W Hunter, Philadelphia, Pa., assignor of one-half his right to W. F. Stone, same place. [Filed May 17, 1875.]



1. In a broom hanger, the cam-shaped jaws provided with flaring guides, having a serrated periphery and outer flange, substantially as described and shown.

2. The plate A, provided with stop-shoulders *a a*, and jaws B B, provided with ears or stops *e e* and projections *b b*, when combined for operation substantially as shown and described.

3. As an article of manufacture, a broom-holder having cam-jaws hung upon arms A, in the angle of which is placed the plate E, beveled at its sides to furnish angular slots for the insertion of the knife, substantially as set forth and described.



164,089. REVERSIBLE LATCHES. Elisha C. Hussey, Rutherford Park, N. J. [Filed Jan. 12, 1875.]

164,089.

The reversible frame *e* and latch *d* within the case, and the arm *i*, spindle *f*, and weighted handle *m*, constructed and arranged as specified, so that the arm *i* enters the notch *n* in the lower part of the frame *e*, and acts to project or retract the latch by a direct movement, as set forth.

164,090. MACHINE-OILERS. S. Hutchinson, Jr., Salem, Mass. [Filed May 24, 1875.]

1. A machine-oiler having to its wick-tube D and fastening-neck *d* a separate wick-carrying tube, F, and a clamp-screw, G, arranged in the neck, as set forth.

2. The oil-reservoir or its cap C, provided with the tubular fastening-neck *d*, and the wick-clamp screw G, arranged in such neck, as set forth.

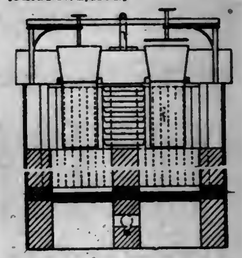
3. The oil-reservoir or its cap C, provided with the wick-tube D and the tubular fastening-neck *d*, and also with the wick-clamp screw G, arranged in said neck, as specified.

164,091. MACHINES FOR BUNCHING AND SIZING ASPARAGUS. Japhet A. Ireland, Bakersville, N. J. [Filed Dec. 16, 1874.]

Brief.—The bed is concave, and has a corresponding hinged presser-bar. The length is determined by pivoted plates that can be turned across the trough at the rear end. The asparagus is laid in the trough upon strings, which tie it into bundles, after which a cutter severs the ends.

The trough A, in combination with the tie-cords B, the sizing-plates D, the hinged cap E, and the knife F, for the purpose shown and described.

164,092. SAFETY-WHEELS FOR WATCHES. Eugene Jeanjaquet, Springfield, Ill. [Filed Dec. 18, 1874.]



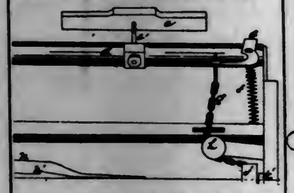
1. The combination, with the center-staff A, having the flange *a* and chamber *a'*, of the wheel B, secured to said flange, as set forth.

2. The pinion C, sleeved on the staff A, and provided with the raised part *c* and notch *c'*, as set forth.

3. The combination, with the staff A, having the flange *a* and pin *b*, of the pinion C, having the raised part *c* and notch *c'*, as set forth.

164,093. GAS-MAKING PROCESSES. Moses W. Kidder, Boston, assignor of one-half his right to Person Noyes, Lowell, Mass. [Filed Nov. 2, 1874.]

1. The process, substantially as herein described, of generating and combining gases from burning coal with volatilized hydrocarbon and producing fixed illuminating-gas, and purifying the fixed gas by means of steam and air introduced into an apparatus or furnace beneath and passed upward through burning coal, as specified, and by liquid or vapor of hydrocarbon introduced at or near the top of the furnace and mingled with the first-named gases, as set forth; then by passing the whole product of the coal, steam, air, and hydrocarbon combined, or mingled gases and vapors, downward through the incandescent coal, the gas-producing coal to each gas-generating compartment or furnace serving alternately to purify and combine the gas generated in the other compartment, substantially as described.



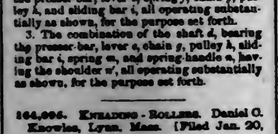
2. The process, substantially as herein described, of generating and purifying gas from burning coal by means of steam and air introduced into an apparatus or furnace beneath, and passed upward through the burning coal, as specified; then by passing the gases or whole product of the steam, air, and coal combined, from one gas-generating apparatus or compartment through an upper trunk, B, and downward through incandescent coal in another trunk connected gas-generating compartment, changing the direction and current

of the gas from one generator to the other, and vice versa, and causing the gas-producing coal in each gas-generating furnace or compartment to serve alternately as a purifier for the gas generated in the other compartment, substantially as described.

3. The process, substantially as herein described, of purifying gas by alternately passing the gas from one gas-generating apparatus or compartment, through an upper trunk, E, and downward through incandescent coal in another trunk-connected gas-generating compartment, changing the direction and current of the gas from one gas-generator to the other, and vice versa, and causing the gas-producing coal in each gas-generating furnace or compartment to serve alternately as a purifier for the gas generated in the other compartment, substantially as described.

164,094. CLOTH-MEASURING MACHINE. Mark Knott, Willimantic, Conn. [Filed Apr. 9, 1875.]

Brief.—A mechanism for holding up a presser-bar while the workman is adjusting the cloth between the presser-bar and roll.



1. The combination of the cloth-roll *a*, presser-bar *c*, rod *c'*, shaft *d*, lever *e*, and spring *f*, all operating substantially as shown, for the purpose set forth.

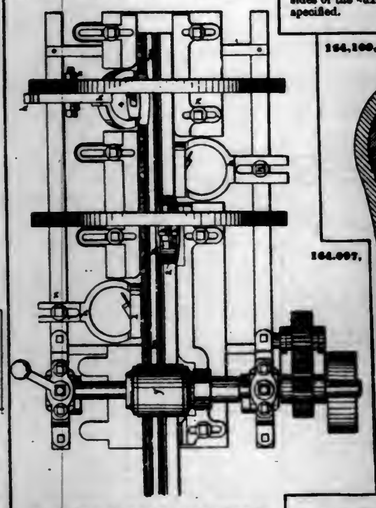
2. The combination of the shaft *d*, bearing the presser-bar, lever *e*, spring *f*, chain *g*, pulley *h*, and sliding bar *i*, all operating substantially as shown, for the purpose set forth.

3. The combination of the shaft *d*, bearing the presser-bar, lever *e*, chain *g*, pulley *h*, sliding bar *i*, spring *m*, and spring-handle *n*, having the shoulder *n'*, all operating substantially as shown, for the purpose set forth.

164,095. KNEADING-ROLLERS. Daniel G. Knowles, Lynn, Mass. [Filed Jan. 20, 1875.]

As a new article of manufacture, a kneading-roller, A, having the concentric projections C, the latter having the diversified surfaces or peripheries E F, and being separated by the interstices D, substantially as described, for the purpose specified.

164,096. HAME-TUPS. R. G. Latta, Friendship, assignor of one-fourth his right to Pratt & Letchworth, Buffalo, N. Y. [Filed May 8, 1875.]

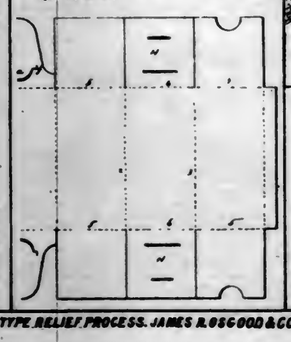


1. The combination, with the body of the hame, of the tip C and corrugated strip portion D, cast in one piece, and constructed substantially as and for the purpose herein before set forth.

2. The tip C, cast of malleable metal, with the socket *d* and lip *f*, substantially as and for the purpose herein before set forth.

164,097. MACHINES FOR FINISHING WOOD MOLDINGS. John G. Loomis, Brooklyn, N. Y. [Filed Sept. 22, 1874.]

Brief.—The molding, after being roughly formed by rotating cutters, is carried by yielding feed-rollers over a bed and beneath adjustable smoothing-planes, which remove the corrugations left by the rotating cutters.



A new mode of backing wood moldings by means of planes 1 2 3 4 arranged upon a table or frame, F, and secured at any required angle in the slotted arches A A, and to the heads *h h* with nuts and bolts *n n*, in combination with the feed-roller *g*, which operates the molding *m*, at a high or low speed, by the gearing H, substantially in the manner and for the purpose set forth.

164,098. CHAIN-PUMPS. Chas. L. Merrill, Evansville, Ind., assignor of one-half his right to Lorenzo D. Bartlett, Hudson, N. Y. [Filed Apr. 22, 1875.]

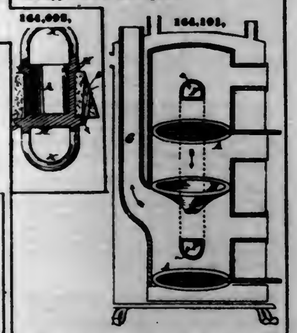
Brief.—The hollow cylinder of the bucket in its descent conveys air beneath the surface of the water, and, liberating it there, agitates and purifies the water.

The chain-pump bucket M, consisting of the cylinder H, air-space *h*, links K, flanges *I J*, and packing G, provided with orifice *g*, substantially as and for the purposes set forth.

164,099. PAPER BOXES. James L. Moore, Stratford, Conn., assignor of one-third his right to E. B. Munson, same place. [Filed Apr. 12, 1875.]

1. The combination of the scouring-tongue O and auxiliary tongue *e* formed therein, with the fold H provided with slits corresponding to said tongues, substantially as specified.

2. The combination of the scouring-tongue O and auxiliary tongue *e* formed therein, with the fold H provided with slits corresponding to said tongues, and shoulder *f* on one or both sides of the auxiliary tongue, substantially as specified.

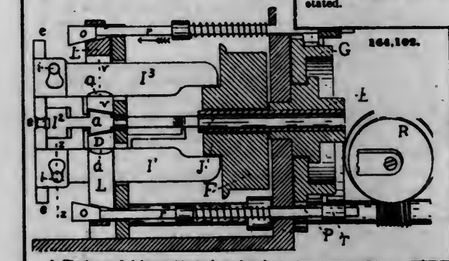


164,100. DYNAMIC WRENCHES. Sebastian Piymale, Portland, Oreg. [Filed Feb. 20, 1875.]

Brief.—A dynamic wrench composed of a ratchet, pawl, link, levers, fulcrum, spring, screw, and pin, operating in a case on an indicator over a dial.

The ratch A, pawl B, link C, levers D and F, fulcrum E, spring H, screw I, and pin M, operating in a case, J, on an indicator, G, over a dial, I, substantially as described, and for the purpose set forth.

164,101. WARM-AIR FURNACES. John B. Reinhard, Louisville, Ky. [Filed Mar. 26, 1875.]



Brief.—The draft passes from the upper grate through the side flues to the lower grate. Partially-burned fuel may be discharged from the upper to the lower grate.

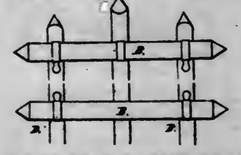
The combination of the grates A A, partition-plate H, descending flues F F, and discharge-flue G, arranged, constructed, and operated substantially as and for the purpose herein-before set forth.

164,102. MACHINES FOR FORGING HORSE-SHOE-NAIL-BLANK RODS. F. H. Richards, New Britain, Conn. [Filed Mar. 3, 1874.]

Brief.—Four radially-disposed hammers—one pair swinging in a horizontal and the other in a vertical plane—are operated, to vary the stroke and determine the amount of the reduction of the rod, by means of wedges on the ends of bars, reciprocated simultaneously by templets on a revolving wheel, such wedges bearing against the outer ends of sliding blocks, in which the hammers are pivoted. Said hammers are operated in pairs to strike blows by a cam revolving on a tubular bearing, through which the rod, as it is forged, is drawn and wound upon a drum.

164,102.

164,103.



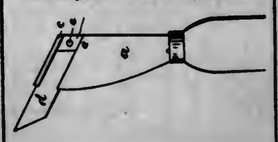
1. The levers I, fulcrum-blocks L, and wedges O, in combination with patterns P, arranged to operate said wedges O.

2. The levers I, fulcrum-blocks L, or their equivalent, wedges O, or their equivalent, and patterns P, arranged substantially as described, in combination with cam J.

3. The spring-braces *b*, constructed and arranged as described, in combination with levers I.

4. The combination, as herein described, of levers I, having segmental fulcrums *a* constructed to bring the center of their oscillation near the common center of tools *c*, with the fulcrum-blocks L, having concave bearings for said fulcrums *a*.

164,103. GLASS PICTURE-FRAMES. Wm. H. Roby, East Cambridge, Mass. [Filed Apr. 7, 1875.]



1. A picture-frame having its bars A A and B B formed of glass, and united by metallic clasps, substantially as shown and described.

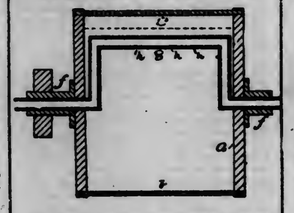
2. A glass picture-frame, having its bars A A, B B, and C formed of glass and united by metallic clasps, substantially as shown and described

---

164,104. SHOEMAKERS' KNIVES. George R. J. Ruggles, Milford, Mass. [Filed Feb. 15, 1876.]

Brief.—The blade-holder is provided with a transverse slot and grooves, permitting an endwise adjustment of the blade, as required.

The holder *a*, provided with the groove *c c* and slot *f*, in combination with the adjustable blade *d* and the fastening device *e g*, all substantially as and for the purpose herein shown and described.

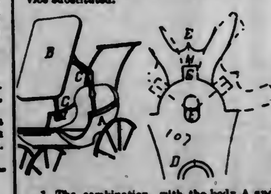


164,105. KEY-RINGS. Joseph B. Sanford, Brockton, Mass., assignor to himself and Charles F. Sylvester, same place. [Filed Apr. 23, 1875.]

Brief.—A steel ring is re-enforced with soft metal, which can be readily engraved, and also strengthens the ring and increases its torsion.

1. The improved key-ring, as described, the same having its body A formed of steel, and a re-enforce, *b*, of soft metal applied thereto, substantially as and for the purpose set forth.

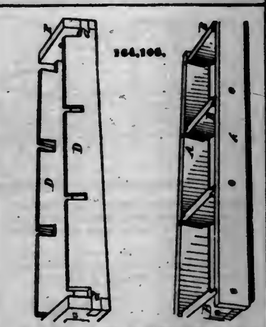
2. An improved key ring, having its body A formed of steel, and re-enforced with the soft-metal plates *a* and *c*, and constructed and applied substantially as and for the purposes stated.



164,106. MACHINES FOR WASHING LEATHER. William Shaw, Kingman, Me. [Filed Apr. 6, 1875.]

The combination of a revolving drum or cylinder provided with a door upon its surface, with hollow journals, and *d* perforated pipe passing through the journals and across the cylinder, all substantially as and for the purposes described.

164,107. CHILDREN'S CARRIAGES. Harry J. Still, Jr., Philadelphia, Pa. [Filed Mar. 8, 1875.]

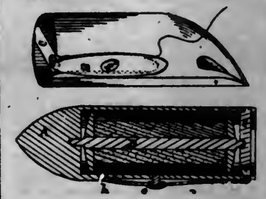


Brief.—Permits firm adjustment of top in three positions. Top-standards may be withdrawn from sockets, and baby-fastening device substituted.

1. The combination, with the body A and the top B of a juvenile-carriage, of pivot F, standard-sections E, having projections C and G, and standard-sections D, having slots *e* and sockets H, whereby the sections are rendered capable of extension and vibratory motion, and their right-line position is retained, substantially as set forth.

2. The combination of the body A, sockets I, ring-cheeks J, and the strap K, substantially as forth.

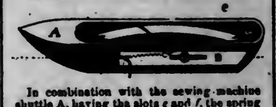
164,108. BRICK-MOLDS. Edgar C. Singer, Marlin, Tex. [Filed May 17, 1875.]



164,108.

1. A brick-mold, provided with interior movable sides, the adjoining surfaces of the stationary and movable sides being inclined so that the inner movable sides when moved will spread outward, substantially as and for the purpose herein set forth.

2. The combination, with a brick-mold, A B C, having the inner surfaces of its sides inclined as described, of the movable sides D D, having their outer surfaces inclined, and provided at their ends with projecting square tenons *d d*, and the slotted slides E E, all constructed substantially as and for the purposes herein set forth.



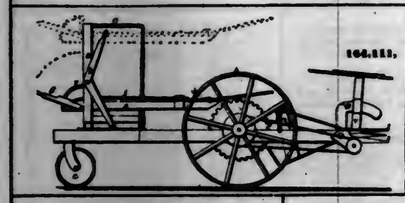
164,109. SEWING-MACHINE SHUTTLES. J. Stamm, Covington, Ky. [Filed Mar. 17, 1875.]

1. In combination with a sewing-machine shuttle, having a slot, *h*, extending from its rear end forward for the thread to pass through, the spring B, nut *c*, and pins *f* and *h*, the parts being arranged to operate substantially as and for the purpose set forth.

2. In a sewing-machine shuttle, the spring B, latch C, screw-pin *f*, and nut *c*, substantially as described.

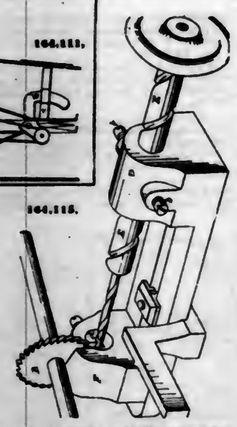
164,110. SHUTTLES FOR SEWING-MACHINES. J. Stamm, Covington, Ky. [Filed Aug. 13, 1874.]

In combination with the sewing-machine shuttle A, having the slots *e* and *f*, the spring B, slotted at *h*, bent at the front end to enter the slot *f*, and having the forks *i* and *i'* of unequal length, substantially as described.



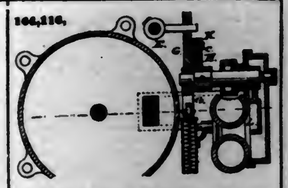
164,111. CORN-HARVESTERS. G. A. Swarts, Orangeville, Ill. [Filed Dec. 9, 1874.]

1. The vertically-adjustable clasp, in combination with a frame provided with a roller and way upon which to travel, whereby the stalks may be readily lifted over the side of the frame, substantially as specified.



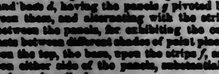
2. The combination of the shaft *c*, wheels *s t*, rods *u*, supports *v* pivoted upon the shaft, and guides *w*, substantially as specified.

3. The combination of the bar 2, arms 3, rods 4, rod 5, lever 6, and ratchet, substantially as described.



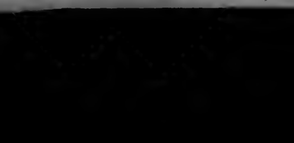
4. The combination of the clasp, frame, and lever 9, substantially as set forth

164,111.



164,115.

164,116.



164,112. SLEEVE-BUTTONS, &c. John B. Ulmar, Boston, Mass., assignor to himself and George R. Keiso, same place. [Filed Feb. 19, 1870.]

Brief.—One end of the spring is extended and bent around the edge of the outer disk, to facilitate the adjustment of the parts.

A sleeve-button or stud made in two parts, *a c*, the former having a single flat spring, *b*, provided with shoulders *c c* and an operating-arm, *d*, and the latter having a flat, tubular shank, *f*, provided with ledges *f g*, to engage the shoulders *c c*, the arm *d* having its outer end extended over the edge of the disk, in manner and for the purpose set forth.

164,113. CAR-COUPLINGS. Stephen Ustick, Philadelphia, Pa. [Filed Aug. 14, 1874.]

1. The bar C, suspended by means of the hangers D, and extending from end to end of the car, in combination with the draw-bars of a railroad-car, as set forth.

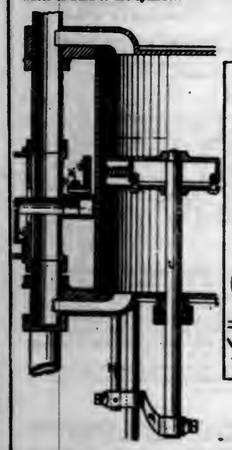
2. The rod I, having a coupling, K, in combination with the draw-bar B and rod J, for adjusting the height of the bar, and admitting of its oscillating freely, substantially as described.

3. The combination of the pivoted draw-bar B, permanent bar C, and rods I and J, substantially as and for the purpose set forth.

164,114. REVOLVING PAINT-EXHIBITORS. Theodore C. Van Arsdale, Brooklyn, N. Y. [Filed Apr. 30, 1875.]

The revolving frame consisting of the top *a* and base *d*, having the panels *g* pivoted between them, and alternating with the strips *f* between the panels, for exhibiting the contrasts between different shades of paint placed upon the top, the base, upon the strips *f*, and upon either side of the panels, substantially as above described.

164,115. MACHINES FOR MAKING TWIST-DRILLS. L. Weaver and Theodore Decker, Seymour, Conn. [Filed Feb. 23, 1875.]



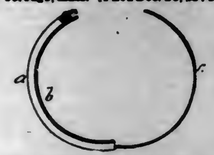
Brief.—A mandrel with a single spiral groove, for holding and feeding forward a blank to the tool. The mandrel, as it is fed forward, is caused to turn by a screw passing through the head into the spiral groove, and is (for forming a second groove in the same blank) turned half a revolution, and another screw on the opposite of the head set into the groove.

1. The combination of the nut or guide-piece D, the feeding-mandrel E, with single spiral groove, and the two screws *b b*, or their mechanical equivalents, for feeding up the blank and for gaging and spacing the grooves therein, substantially as described and represented.

2. The combination of the adjustable head F, the changeable bushing *d*, oblique slot *e*, and milling or cutting tool B, as and for the purpose described and represented.

164,116. FLUID-METERS. Daniel P. Weir, Salem, Mass. [Filed Jan. 8, 1875.]

Brief.—A sliding valve loosely fitted to a stem is operated by means of a jointed spring-lever and slotted dog, motion being given to the lever by tappets upon a shaft attached by an arm to the piston-rod, for admitting the water or fluid to the cylinder.

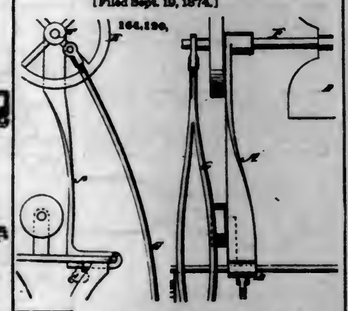


In combination with the inlet and outlet ports of a water-meter, the sliding valve L, loosely fitted to the stem H, slotted dog E, and jointed spring-lever C, all arranged to operate substantially as specified.

164,117. LUBRICATING COMPOUNDS. Jos. Williams, Sharpsburg, Pa. [Filed May 11, 1875.]

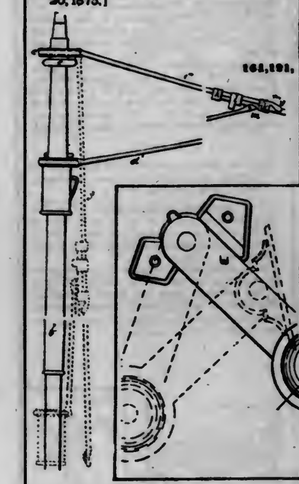
A lubricating compound composed of tallow, sulphur, lime, oil, black-lead, potter's clay or fire-clay, substantially as described.

164,118. BRACELETS. Chas. Wills, Attleborough, Mass. [Filed Dec. 26, 1874.]



The bracelet having its front *a* provided with a shoulder, *a'*, over and upon which the lining *b* is rolled, and having an internal spring, *c*, throughout its entire length, rivited at each end to the bracelet, all constructed and arranged substantially as hereinbefore specified.

164,119. WATCH-CHAIN SWIVELS. Chas. Wills, Attleborough, Mass. [Filed Oct. 19, 1874.]



The combination of the bead-sections *a a'*, case *d*, and ring *f* with the arm *b*, screw *c*, and rod *e*, substantially as described, and for the purpose set forth.

164,120. SEWING-MACHINE FAN ATTACHMENTS. Isaac A. Abbott, New Orleans, La. [Filed Sept. 19, 1874.]

A fan attachment consisting of shaft F, having the D and wheel E, standard A, having tubular bearing at top, bar G, and treadle H, all connected with the same supporting-frame, as shown and described.

164,121. FOLDING UMBRELLAS. Alfred M. Alexander, Indianapolis, Ind. [Filed Mar. 20, 1875.]

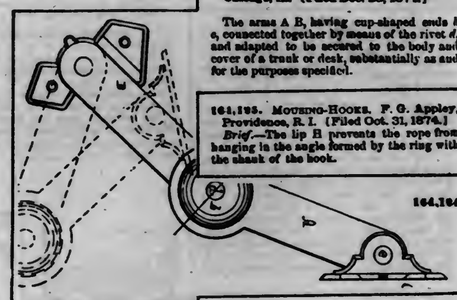
164,121.

1. The sectional rib *g*, provided with a guide-clamp, *h*, having a guard, *c*, and shoulder *s*, substantially as and for the purpose set forth.

2. The sectional rib A, provided with the guide-clamp *h'*, in combination with the sectional rib *g*, provided with the guide-clamp *h*, having guard *c* and shoulder *s*, and the brace *d'*, substantially as described.

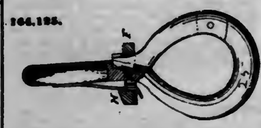
3. The combination, with a sectional extensible umbrella-rib, C, of the lock-brace *d'* and shoulder *s*, constructed and arranged substantially as specified.

164,122. VALVE-GEARS FOR STEAM-ENGINES. Charles A. Amerman, Hartford, Conn. [Filed Feb. 18, 1875.]



In combination with the valve-spindles F' F' of a steam-engine, each provided with a shoe, *d*, the shaft G, with the spiral ribs *s* arranged thereon, and of increasing elevation from one end to the other, in the relative position described, and having a continuous revolution imparted through said shaft, combined with an adjustable axial movement, substantially as described.

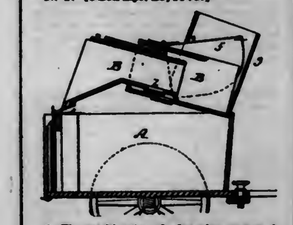
164,123. TRUNK-STAYS. H. L. Andrews, Chicago, Ill. [Filed Dec. 26, 1874.]



The arms A B, having cup-shaped ends *b c*, connected together by means of the rivet *d*, and adapted to be secured to the body and cover of a trunk or desk, substantially as and for the purposes specified.

164,124. MOUSING-HOOKS. F. G. Appley, Providence, R. I. [Filed Oct. 31, 1874.]

Brief.—The lip H prevents the rope from hanging in the angle formed by the ring with the shank of the hook.



164,124.

164,125.

The mousing-hook ring F, having the lip H, as and for the purpose set forth.

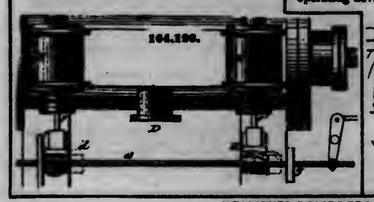
164,125. SPOUT ATTACHMENTS FOR DUMPING-CARTS. Mary A. Alvord, New York, N. Y. [Filed Apr. 20, 1875.]

1. The combination of a dumping-wagon, A, with a discharge-spout, B, hinged thereto at *c c*, in such a manner that it may rest entirely on the top of the cart as set forth.

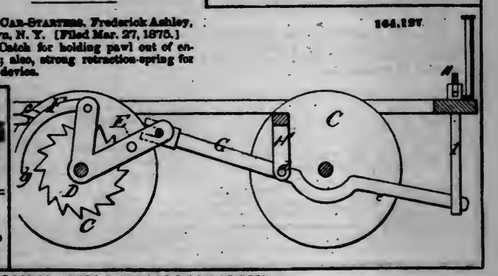
2. The vehicle discharge-spout B, consisting of one or more troughs or tubes, and of the pivoted blade *f*, substantially as herein shown and described.

3. The pivoted guard *g*, combined with the blade *f* and discharge-spout B of a dumping-wagon, substantially as specified.

164,126. BELL-PULLS. Stephen D. Arnold, New Britain, Conn., assignor to P. and F. Corbin, same place. [Filed Apr. 14, 1875.]



Brief.—The inner end of the lever may be cut off to adapt the device to doors of different thickness.



The lever bell-pull *f g*, pivoted to the plate *r*, and provided with two or more wards, *i i*, in combination with the bridle *e*, lever *d*, hammer *l*, and bell *a*, substantially as set forth.

164,127. CAR-STARTERS. Frederick Ashley, Brooklyn, N. Y. [Filed Mar. 27, 1875.]

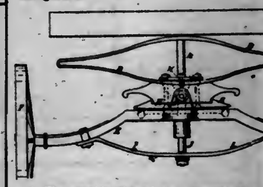
Brief.—Catch for holding pawl out of engagement; also, strong retraction-spring for operating device.

164,128.

164,127.

1. In a horse-car starter, the combination of angular lever E, having its fulcrum in one of the car-axles, hinged pawl F, having a projection, *b*, the toothed wheel D, lever G, bi-furcated at its rear end, rod I and treadle H, all substantially as described, for the purposes set forth.

2. The combination, in a car-starter, of a reaction-spring, S, a propulsion-pawl, F, having a lug or arm, *c*, the necessary connecting mechanism, and a shelf, J, for holding the said pawl free from the toothed periphery of the rack-wheel, substantially as set forth.



164,128. SPOUT-PITCHERS. S. William Babbitt, West Meriden, Conn. [Filed May 14, 1874.]

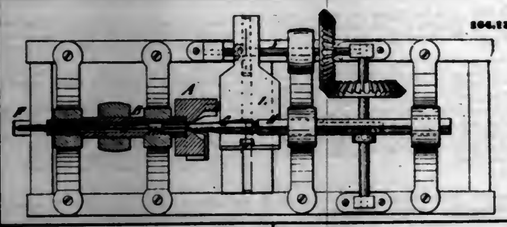
A supplemental spout consisting of the ring B, inclined passages D, and nozzle C, the whole adapted to be set in the mouth of a pitcher and held therein or removed therefrom, substantially as described.

164,129. RUNNING-GEARS. Henry Backer, Union Hill, N. J. [Filed Mar. 13, 1875.]

Brief.—Front axle peculiarly curved, braced, and guided.

1. The combination of the strengthening-bar I, with the bent axle E, and the ring-bolt J, substantially as and for the purpose set forth.

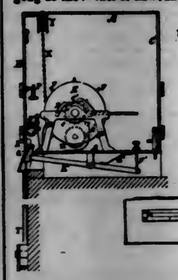
2. The combination of the arm *b'* and the loop or staple M, with the brace K, the axle E and the bolt J, substantially as and for the purpose set forth.



164,130. MACHINES FOR TURNING BOBBINS. Luther Bean and James M. Butters, Stratford Hollow, N. H. [Filed Oct. 24, 1874.]

Brief.—The blanks from which the articles are to be made are fed to the machine, and after being turned removed therefrom, by a reciprocating table.

1. The combination of the cutter-head A, hollow mandrel B, sliding centers E H, and the sliding table or carrier I, substantially as specified.



2. The combination of cam J, spring F, centers E H, sliding table I, tappet M, cam-shaft, tappet-shaft, and the gearing connecting the said shafts, all substantially as specified.

164,130.

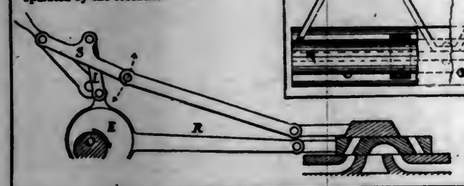
164,131. FIRE-ESCAPES. F. P. Berney, San Quentin, Cal., assignor to L. B. Matthews, same place. [Filed Mar. 6, 1875.]

Brief.—A flexible ladder is wound on a reel which is incased in a housing on the roof or upper part of the house. The doors of the housing, when released by the rod and lever, are forced open by springs, and a ball, which is attached to a rope, which in turn is secured to the lower end of the ladder, drops to the ground, and the ladder is unwound by this means for use. A friction-brake secured to the axle of the drum is operated by the unwinding of the ladder. Projections on the drum strike a spring, which in turn strikes a gong as the ladder is unwound.

1. An automatic brake, H I J *g'*, worked by a screw attached to shaft of reel, as and for the purpose specified.

2. The combination of the chain or cord L, the rubber ball M, the pin N, and the springber O, with the ladder K and with the doors B of the box A, substantially as herein shown and described.

3. The combination of the inclined catch-bolt Q, the rod or chain S, and the lever U, with the box A and the catches E and doors B, substantially as herein shown and described.



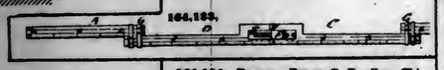
4. The combination of the box W and the pipe T with the lever U and the rod or chain S that operates the catch-bolt, substantially as herein shown and described.

5. The combination of the chain or rope X and the pulley Y with the ladder K and the box A, substantially as herein shown and described.

6. The combination of the lever E', the pivoted rod F', and the spring G' with the catch-bolt Q and the box A, substantially as herein shown and described.

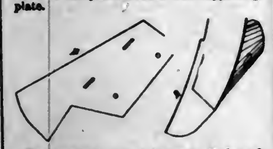
164,132. CUT-OFF-VALVE GEARS. Hugo Bilgram, Philadelphia, Pa. [Filed May 22, 1875.]

Brief.—The quantity of steam admitted to the cylinder is regulated by the inclination of the rocker, which is adjusted by a lever, and operated by the eccentric.



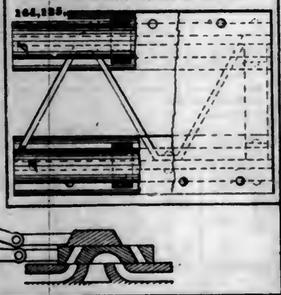
The combination of the rocker S, which is angularly adjustable by its fulcrum *f*, and is operated by the eccentric E through the eccentric-strap and the link L, with a rod, C, conveying motion to the cut-off valve P of an engine.

164,133. FOLDING AND SLIDING TEN-FOOT POLES. Stephen W. Blatchly, Dickson City, Pa. [Filed Jan. 30, 1875.]



Brief.—A measuring device made in four sections, in order that it may be folded up into a compact form. The middle pieces are hinged together, and attached to the hinge is a sliding bar, so that when the device is opened this sliding bar is run across the hinge, thereby forming a rigid joint. The end pieces are attached to the middle pieces by loose bands, so that they can slide backward and forward. The whole device, when opened, measures ten feet.

As a new article of manufacture, a ten-foot pole made in four sections, the two middle ones hinged together and provided with slide F, the shouldered part C I having bar F, and the parts A D having bands G H, all constructed, notched, and arranged substantially as and for the purpose specified.



164,134. PLOWS. Byron C. Bradley, Chicago, Ill. [Filed Mar. 19, 1875.]

Brief.—Method of construction and attachment of the plow-standard and supporting-plate.

The standard A and the parts B, formed or rigidly secured together, and constructed as described, forming a foundation for, and in combination with, the mold-board C and land-side D, and points E, all as and for the purpose herein described.

164,135. COMPRESSION-MEMBERS OF BRIDGES. Alexander E. Brown, Cleveland, Ohio. [Filed May 18, 1875.]

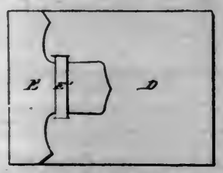
1. The column or compression-member of a bridge, truss, or other structure, consisting of the combination, with a truss-work, A, of railway T rails B, firmly secured to the surface of the said truss-work at or near its outer edges, substantially as and for the purpose described.

2. The combination, with a plate or truss-work, A, of four railway T-rails secured firmly thereto, the said rails B located two upon one face and two upon the other face of the plate or truss, at or near its outer edges, substantially as and for the purpose described.

164,136. COMPRESSION-MEMBERS OF BRIDGES. Alexander E. Brown, Cleveland, Ohio. [Filed May 18, 1875.]

1. A compression-member of a bridge or other truss, consisting of two or more railway T-rails placed head to head and firmly bound together, substantially as and for the purpose described.

2. A compression-member of a bridge or other truss, consisting of railway T-rails placed head to head and firmly bound together, in combination with plates C, secured to the bottoms of the flanges, substantially as and for the purpose described.



164,137. COMPOUND IRON COLUMNS FOR BRIDGES. Alexander E. Brown, Cleveland, Ohio. [Filed Feb. 16, 1875.]

1. A compression-member of a bridge-truss or other structure, consisting of a hollow column formed by arranging railway T-rails about a central open space and fastening them rigidly together, substantially as and for the purpose described.

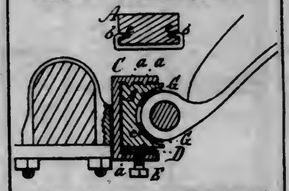
2. The column or hollow compression-member, consisting of the combination, with three or more railway T-rails, A, of the central stay-brace D and suitable fastenings, whereby the rails are bound snugly together, substantially as and for the purpose described.

164,138. PICTURE-EXHIBITORS. J. Buechner, St. Paul, Minn. [Filed Apr. 24, 1875.]

1. As a new article of manufacture, a picture-case composed of an ordinary frame with hinged back part, having inclosing flaps and tongue for folding entirely around the same, or separately at the back for inclosing and exhibiting pictures, substantially as specified.

2. The folding bottom flap of the back part, provided with tongue locking-straps at both sides, for securing the flaps of the case at front or at the back, substantially as described and shown.

164,139. PEG-CUTTERS. Matthew Buhler, Lamoille, Ill. [Filed Apr. 24, 1875.]

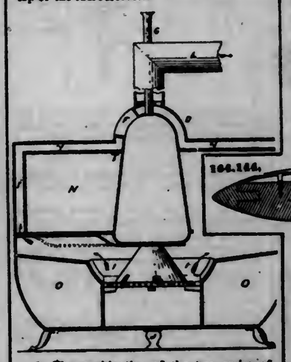


1. The peg-cutter A, having its lower surface wrought into cutting and rasping edges, and provided with end cutters A and aperture H, all substantially as and for the purpose set forth.

164,139.

2. The shank C, having mortises D E cut in from opposite sides, and united at the end of the shank to receive the stem B, as and for the purposes described.

164,140. TELL-COUPLINGS. C. D. Bundy, Lima, N. Y. [Filed Nov. 20, 1874.]



1. The metallic wear-plates G G, provided with the bent spars *b b*, in combination with the rubber packing A, having sockets *a a* for the reception of said spars, as and for the purpose specified.

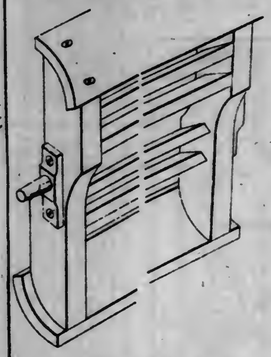
2. The combination, with a rubber packing, A, provided with the self-attaching wear-plates G G, of a case, C, covering said packing at its top, bottom, and rear, and provided with points *a a* for holding in the rubber, the compression upon the packing being produced by a follower, D, and set-screw E, as shown and described.

164,141. MAGAZINE COOKING-STOVES. T. N. Caulkins, Owasco, N. Y. [Filed Apr. 16, 1874.]

Brief.—One series of ovens surrounds the ash-pit and the other the magazine. Cold air is introduced through a pipe which leads through the interior of the smoke-flue to the top of the fuel-reservoir.

1. The combination of the two series of ovens O and N, the main combustion-chamber between them, the flues *f* and *g*, and the dome D, substantially as described, for the purpose set forth.

2. The combination of the air-pipe G, the ebullition-pipe L, and the dome D, in the manner and for the purpose specified.



164,142. BALE-TIES. Edwin D. Chadick, Denison, Tex. [Filed May 22, 1875.]

A bale-tie consisting of the tubular T-shaped buckle A, in combination with a wire band, as described.

164,143. ROTARY CHURN-DASHERS. Wm. C. Chamberlain, Dubuque, Iowa. [Filed Mar. 22, 1875.]

Brief.—A churn-dasher so constructed that when revolved in one direction the stripe present breaking surfaces to the cream, and when revolved in a contrary direction they form scoops, in which the butter is gathered.

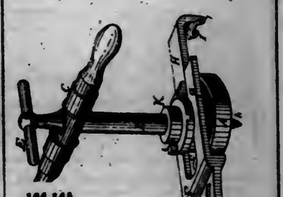
1. The combination, in a dasher, of the end pieces A and the permanent stripe B C D, constructed, arranged, and operating as described.

2. The dasher, having the stripe B C and the stripe B' C' arranged permanently upon its end pieces in the relation to one another as shown, for the purpose of gathering butter after the operation of churning, substantially as set forth.

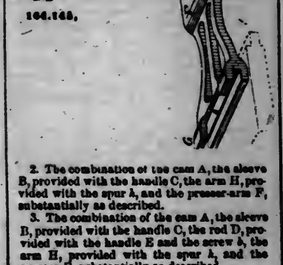
3. The dasher, having the stripe B C D and the stripe B' C' D' arranged upon its end pieces in the relation to one another as shown, for the purpose of both agitating and gathering butter, substantially as described.

4. The dasher, with stripe C D diverging from one another toward the agitating side of the dasher for the purpose of facilitating the escape of small lumps of butter, substantially as described.

164,144. SHUTTLES FOR LOOMS. Thomas Oberthaim, Lewiston, Me. [Filed Apr. 24, 1875.]



The combination, with a shuttle having a spindle, B, delivery-eye *b*, and friction-pad *c*, of the threading-guide *c*, constructed as shown, all arranged and operating together substantially as specified.



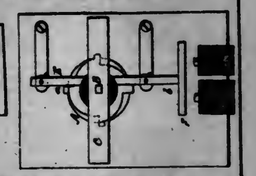
164,145. FLOOR-CLAMPS. Wm. D. Clark, Springfield, Ill. [Filed Apr. 8, 1875.]

Brief.—Tongued and grooved flooring-boards can be placed in position, and securely held while being nailed, by means of a cam attached to the lower end of a sleeve squared in its upper end to hold a transverse handle, by turning which the cam is pressed against a grooved and slotted arm, which forces the board into position. The clamp is held down to the floor or beam by a rod passing through the sleeve, and provided at its lower end with a screw-point, in connection with a horizontal holding-arm, secured on its inner end to the main sleeve, and provided upon its outer and rear part with one or more spurs.

1. The combination of the cam A, the sleeve B, provided with the handle C, the rod D, provided with the handle E and the screw *b*, and the presser-arm F, substantially as described.

164,145.

2. The combination of the cam A, the sleeve B, provided with the handle C, the arm H, provided with the spur *h*, and the presser-arm F, substantially as described.



3. The combination of the cam A, the sleeve B, provided with the handle C, the rod D, provided with the handle E and the screw *b*, the arm H, provided with the spur *h*, and the presser F, substantially as described.

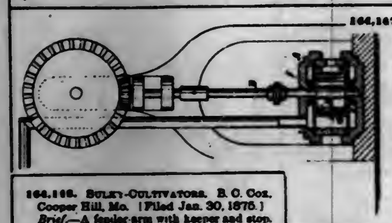
4. The combination of the cam A, provided with the slot *a* in its upper surface, the sleeve B, provided with a handle, the rod D, provided with a handle and a screw, *b*, and the presser-arm F, provided with the pin *f* on its under side, adapted to draw back the presser-arm when the cam is turned, substantially as described and shown.

5. The combination of the cam A, the sleeve B, provided with the handle C, the rod D, provided with the handle E and screw *b*, the ring E, provided with set-screw *i*, the arm H, provided with the spur *h*, and the forked presser-arm F, made to inclose a part of the arm H, so that said presser-arm must move in a straight line, substantially as described.

164,146. AUTOMATICALLY-OPERATED GAS-COCKS. Edward Coe, New Haven, Conn. [Filed Nov. 14, 1874.]

Brief.—Closing the circuit withdraws the lower projection upon the upright armature-bar from engagement with the projecting tooth, and draws down the upper projection upon the lower surface of the cam, which holds the cock until the circuit is broken. Breaking the circuit allows the cock to revolve, and the upper projection, riding upon the cam, raises the lower projection into the path of the next projecting tooth.

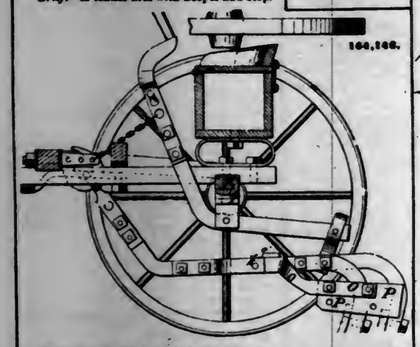
The combination of the shaft B, spring D, toothed wheel A, cam P, and reciprocating bar E, provided with an arm, *c*, above, and an arm, *b*, below, the wheel and cam, the said arms arranged relatively to each other, and to the teeth of the wheel and cam, substantially as described.



164,147. PUMPS. William H. Conver, Agnew's Mills, Pa. [Filed Apr. 24, 1875.]

Brief.—Two gears intermeshing and operated in the usual manner, and contained in a rectangular case, are packed upon their sides by leather diaphragms and springs, and upon the pressure side of their faces likewise.

1. The combination of packing-diaphragm E and springs F with the toothed wheels B and a cam, A, substantially as specified.



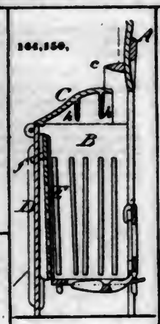
2. The combination of face-packings G and springs H with the toothed wheels B and packings E, substantially as specified.

164,147.

164,148. SULKY-CULTIVATORS. R. C. COX, Cooper Hill, Mo. [Filed Jan. 30, 1875.]
Brief.—A feeler-arm with keeper and stop.

164,148.

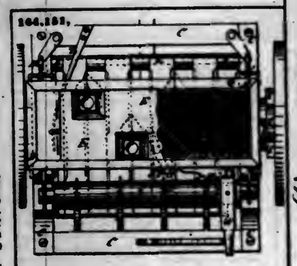
The half-keeper *b'*, pivoted toe-bars O *o'*, and plates P, combined with plow-beams, substantially as and for the purpose set forth.



164,149. HYDRANTS. Dewitt C. Cregar, Chicago, Ill. [Filed Feb. 23, 1874.]
Brief.—The waste device is cast with the valve-seat, and has its opening so arranged that all the water above the valve will be drawn off. The top is provided with guards for protecting the ends of the valve-stems and socket.

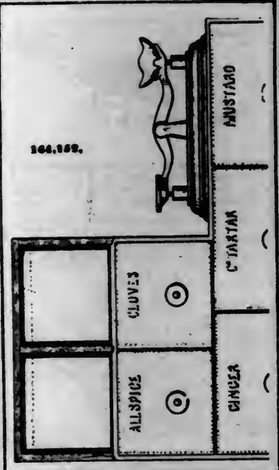
1. The combination, with the main seat E, having the chamber F, channel N, and lug *d* cast therewith, of the stem T and spring S, substantially as and for the purpose described.
2. The combination of the socket X, rotating stem-screw Y, union U, guide-bolt *z*, and main stem J, substantially as and for the purpose herein stated.
3. The top Y, provided with the guards C C C, for the purpose of protecting the ends of the valve-stems S and socket X, in the manner set forth.

164,150. FIRE-PLACE GRATES. George W. Cunningham, Franklin, Pa. [Filed May 15, 1875.]
Brief.—The inclined ends support the back plate, and allow expansion.



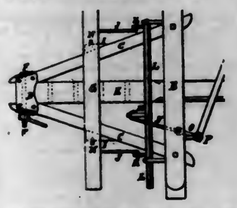
164,150.

1. The combination of the perforated false back E, inclined studs *f*, and perforated back D, substantially as specified.
2. The arched crown O, having ribs *h*, in combination with the front plate A, provided with the air-box *i*, substantially as set forth.
3. The back plate D, provided with ribs, in combination with the jambs B and rod G, substantially as and for the purpose set forth.



164,151. GRAIN-DRILLS. James C. Daman, Elk Point, Dak. [Filed Jan. 26, 1875.]
Brief.—The lever that operates the roller by which the drill-teeth are raised is cut away at its front end to fit into a notched board secured to the back of the vibrating hopper, for throwing the same out of contact with cams on the inner surface of one of the bearing-wheels, and is held by a spring-catch.

164,151.



The combination of the lever W with roller V, beams J, reciprocating seed-box D, having spring Q, catch-block X, and spring-catch Y, applied to the frame G, all constructed and arranged as shown and described, to operate as specified.

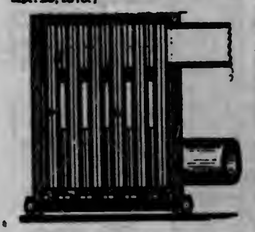
164,152.

The spice-cabinet constructed substantially as described, with sheet-metal drawers, a sheet-metal covering to the under side of the horizontal partitions, and with a recess forming a scale-stand, as specified.

164,153. WAGON-BRAKES. D. L. Dedbeugh, Bedford, Pa. [Filed Mar. 20, 1875.]

The combination of the hook-bolts H and triangular blocks I with the brake-bar G and the bands C, substantially as set forth.

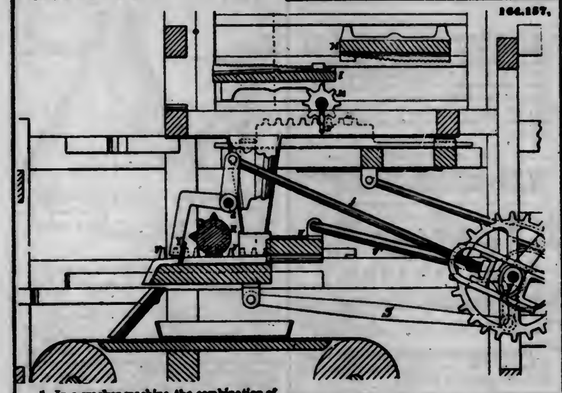
164,154. COMBAGE. Thomas H. Dunham, Boston, Mass. [Filed May 15, 1875.]



The improved cordage herein described, made by combining metal wires, threads, or ribbons with fibrous strands, the two being laid together as in rope-making, and the interstices filled with tar or tar compound, whereby both the metal and fibrous strands will be covered by the tar compound, as described.

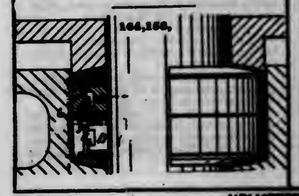
164,155. WEED-COVERING ATTACHMENTS. Joseph W. Dysard, Michigan City, Ind. [Filed May 1, 1875.]

The wheel D, the adjustable curved and bent bar E, the hinged plate F, and the clamp G H I J, in combination with each other, to adapt the device to be attached to the beam of a plow, substantially as herein shown and described.



164,156. RADIATORS FOR STEAM-HEATERS. Charles R. Ellis, Brooklyn, N. Y. [Filed Apr. 29, 1875.]

The combination, in a cast-metal radiator, of tablets composed of pairs of plates with flanges around their edges, blocks and collars setting together, and clamping bars and bolts to hold the tablets, substantially as specified.



164,157. CRACKER-MACHINES. Adam Exton and John Exton, Trenton, N. J. [Filed Nov. 30, 1874.]
Brief.—The crackers are cut from a long roll of dough laid between oppositely-reciprocating grooved plates, the edges of the grooves being serrated. Thence they drop into ways or channels leading to the tubes, which carry them to the "docker." They are swept from the ways into said tube by fingers attached to a rod having rotary reciprocating motion. The tubes deliver them upon a reciprocating table, where they are pushed under the "docker-roll" by a vibrating slide. A rising and falling sweep drops behind the finished crackers as they come from under the roll, and pushes them into a hinged and grooved chute, which delivers them in pans placed upon an endless belt.

164,157.

1. In a cracker-machine, the combination of the grooved reciprocating table Q, rods S, rotary crank-shaft T, and the vibrating sweep Y, elbow-levers *c*, fixed shaft *d*, rod *f*, and cam *g*, all constructed and arranged as shown and described, to operate as specified.
2. The combination of the tubes P, (when arranged as described,) the pusher U, board or table Q, sweep Y, and roller R, in a cracker or biscuit machine, for the purposes described.

164,158.

164,159. SCHOOL-DESKS. Henry R. Fry, Marion, Ind. [Filed Apr. 10, 1875.]
Brief.—The seatless forming the end pieces are moved in such a manner that when their edges are brought together the grain of the wood, at their upper ends, runs transversely, and at their lower ends obliquely. The arrangement of the seat-lever and metallic plates to which the lever is pivoted in such that, when the seat is down, the inner end of the lever has a firm bearing against the standard.

1. The end support of a desk constructed of two independent pieces or sections, each moved into the desired shape, and connected edge to edge, substantially as described.
2. The metallic castings or plates applied to the lower and outer sides of the standards, in combination with the lever carrying the seat, and pivoted between said plates, and having the rearwardly-extending foot, substantially as described.

164,160. METALLIC PACKINGS FOR PISTON-RODS OF STEAM-ENGINES, &c. J. A. Fulton, Cambridge, Mass. [Filed Feb. 26, 1875.]

The combination of the sectional packing-ring D, grooved on its external periphery for the reception of the spring *a*, with the external packing-ring E, grooved on its internal periphery in such manner as to set over the periphery of the internal ring D, as and for the purpose described.

164,160. BROADCAST SEED-SOWERS. Robt. Furnas, Decatur Township, Marion County, Ind. [Filed Mar. 11, 1875.]

The hollow revolving head M, constructed with gear L near its rear side, and forming, with the flange Y at the front side, bearings for the head to revolve upon, in combination with the hollow shaft T, provided with an opening in the bottom, to allow the seed to enter the revolving head, and the cap N, all constructed and arranged substantially as specified.

164,159.

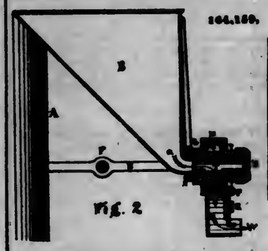


Fig. 2

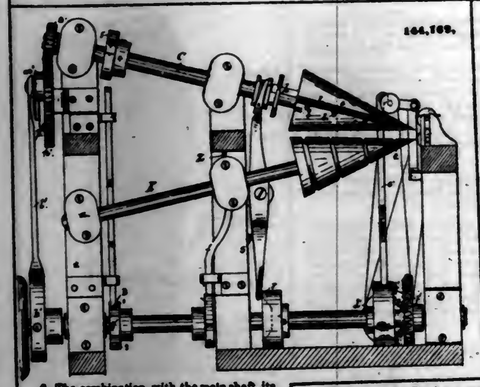
164,161.

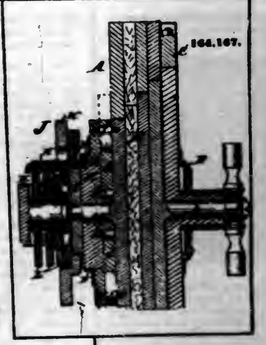
164,161. GRATES. Chas. C. Gates, Albany, N. Y., assignor to J. L. Mott Iron-Works, New York city. [Filed May 18, 1875.]
Brief.—The ring, being inclined outwardly and grooved, readily discharges refuse.



1. The grate B, in combination with its outer vibrating ring, the grate and the ring being in the same horizontal plane, and the ring being corrugated on its upper surface with grooves inclining downward radially from the inner to the outer periphery, and having a center-pin, on which it vibrates, substantially as specified.
2. The horizontally-oscillating ring A, having the center bearing-hook I for the pivot J of the grate, the hook being contrived to support the grate flush with the upper surface of the ring, and arranged forward of the grate's center on the depressing side of the grate, to lessen the dip of the grate in the ash-pan, substantially as specified.

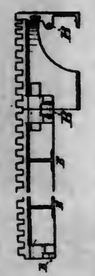
164,162. PAPER-BAG MACHINES. Almon B. Glover and D. M. Church, Derby, Conn. [Filed Mar. 19, 1875.]
Brief.—Takes a nearly a, ure piece of paper and winds it under pressure around the former, which is caused to rotate a little more than one revolution, and then reverse a distance equal to the lapped and pasted seam. Removes the cornucopia from the cone by feed-rolls, one within and the other without the cone, and compresses it between calender-rolls.

1. The forming-cone, made hollow, and provided with the internal automatically-operated nipper-shaft *a*, set at an inclination to the cone-shaft and parallel with the peripheral surface of the cone, the cone-shaft terminating within the cone, substantially as and for the purpose set forth.
2. In combination with the hollow cone, and with the nipper-shaft within the same, set at an incline to its axis, the slide *p*, automatically operating to actuate the nippers, substantially as shown and described.
3. The gearless shaft E, on which is the lower cone, having peripheral groove, in combination with the pivoted bearing *n*, cam *o*, lifting-rod *m*, shifting-block *n*, and reacting-spring *r*, as and for the purposes set forth.
4. In combination with the upper hollow forming-cone, the discharging-rolls *d* D, the one journaled in the cone near its tip, and the other arranged to be automatically and intermittently spaced to engage and discharge with it, and both serving to loosen the cornucopia from its cone, and then to pull it endwise therefrom.
5. In combination with the upper cone or former mechanism, substantially as, and operating as described, to rotate the former beyond a full revolution, and to reverse the movement to the point of such full revolution, and bring the clips into position to grasp the paper for another lap.



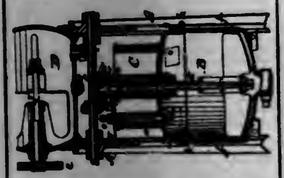
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

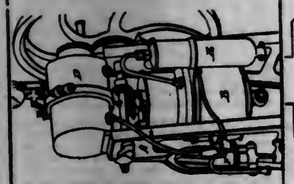
164,169.



6. The combination, with the main shaft, its eccentric and eccentric rod, and with the shaft C and its gear c', of the gear n', toothed plate or ratchet and pawl, the gear n' at times being the driver of c', and at other times being or turned back by c', while the main shaft continues its revolution in one direction only.

164,167.





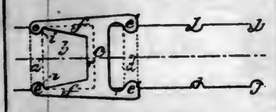
164,168.

164,169. CARBONIC-ACID-GAS GENERATORS. Charles C. Glover, New York, N. Y. [Filed Apr. 19, 1875.]

Brief.—A gas-generator which has the pump between the generator and the receiver. The pump, causing a partial vacuum, causes the gas to enter the washer, while at the same time the pump, by its action, forces the purified gas and liquid to be aerated into the receiver.

1. In an apparatus for generating and charging carbonic-acid gas, the pump F, interposed between the generator B and the receiver D, to act by suction on the generator, and by force on the receiver, substantially as specified.

2. The combination of the valve l with the actuating-lever J, and with the cam p on the wheel P', substantially as specified.



3. The adjustable sleeve r, carrying the cam p', combined with, and applied to, the wheel P', which carries the cam p, all arranged to permit the lengthening and shortening of the cam p, substantially as specified.

4. The combination of the generator B and perforated tube K with the carbonic-acid vessel C and the valve l, all arranged to prevent the discharge of acid into the generator in case of undue pressure within the latter, substantially as described.

5. The silver-shell M, supported by a support, P', at its upper end on the hinged bushing t, which rests on the tube-extension f, so that the cold shell is suspended into the generator without having a step or bearing therein, substantially as set forth.

6. The generator B, pipe e, washer E, pipe f, pump F, and receiver D, all combined and arranged, with respect to one another, substantially as herein shown and described.

164,165. BALE-TIES. J. M. Goldsmith, Boston, Mass. [Filed May 10, 1875.]

1. In a bale-tie, the combination, with a binder, B, having notches t in one end and spaced notches f in the other, of the plate A, having slots a b, with retaining-lugs s s' over bars d and a recess, r, under the body of the plate, substantially as specified.

2. The plate A having slots a b, lugs s s', and recess r, adapted for use, substantially as specified.

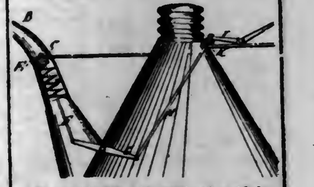
164,166. BALE-TAGS. J. M. Goldsmith, Boston, Mass. [Filed Mar. 6, 1875.]

The bale-tag consisting of the oblong plate A, having slots b and tongues a, adapted for use substantially as specified.

164,166. FOOD FOR ANIMALS. G. Gordon, Boston, Mass. [Filed Apr. 17, 1875.]

The composition for food for animals, consisting of the residuum of brewers' malt and the residuum of palm-nuts, substantially as described.

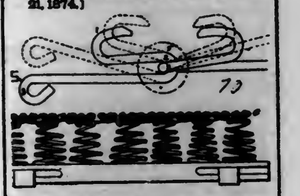
164,167. PERMUTATION-LOCKS FOR SAFE-DOORS. Henry Gross, Cincinnati, Ohio. [Filed Nov. 6, 1874.]



1. The door B, moving in revolutions or parts of revolutions, to operate the lock and bolt-work of the safe, substantially in the manner and for the purpose specified.

2. The combination of the rotating door B, bolt-work G F E, and crank-wheel H, locking M, drive-wheel I, and tumblers L of a stationary lock, J, constructed, connected, and operating substantially as and for the purpose specified.

164,168. IRON CURBS FOR STREETS. Richd. Harrington, Shenandoah, Pa. [Filed Dec. 3, 1874.]



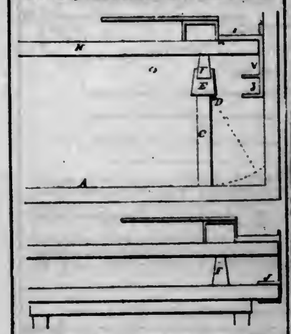
A cast-iron curbing constructed in single sections and with parallel sides, with the laterally-projecting perforated flanges B at each end for the passage of a bolt, a series of laterally-projecting perforated flanges, E, at the base of the sections for securing the same to its foundation, and a horizontal rib, F, near the upper edge of the sections for supporting the pavement, all as herein shown and described.

164,169. OIL-CANS. G. K. Haswell, New York, N. Y., assignor to himself and Chas. H. Haswell, Jr., same place. [Filed May 8, 1875.]

The combination, with spout and vent-hole, of spring-valve C D, rods F H, levers G I, and pad K, all arranged as shown and described, for the purpose specified.

164,170. SPRING BED-BOTTOMS. Warren D. Hatch, Peterborough, N. H. [Filed Nov. 21, 1874.]

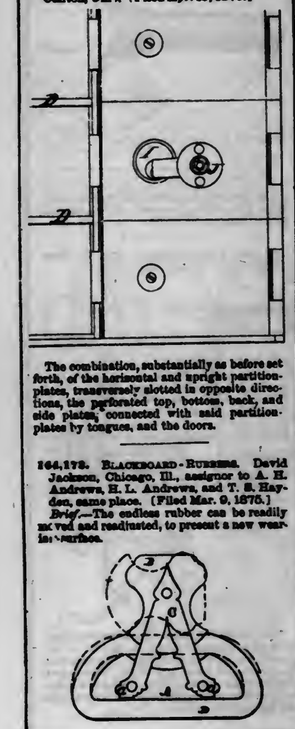
1. The combination, with spring-supporting pieces, springs, and slats, of hooked or hinged jaws c, attached to the springs and holding the slats, substantially as described.



2. The combination, with the springs and slats, of the hooked or hinged jaws c', grasping the slats and connecting the springs, substantially as described.

3. The slat-holding jaws, hooked or hinged together, and adapted to receive and retain the slats, substantially as set forth.

4. The combination, with the series of springs, of metallic slat-holders connected on the springs, and metallic slat-holders connecting the adjacent springs, substantially as described.



164,171. IRONING-TABLES. Zebina M. Hibbard, Freeport, assignor of one-half his right to S. R. Hibbard, Chicago, Ill. [Filed Apr. 26, 1875.]

Brief.—A metal plate that may be attached to a wall, in connection with an ironing-board and a detachable leg, so that the plate and board may be connected with a common table.

The plate V, provided with inwardly-projecting jaws or clamp J, nib B, and attaching-plate I, in combination with the hinged removable standard C and dovetail parts E F, attached to a board, H, as and for the purpose set forth.

164,172. MULTIPLE SAFES. Julius C. Hintz, Canton, Ohio. [Filed Apr. 19, 1875.]

The combination, substantially as before set forth, of the horizontal and upright partition-plates, transversely slotted in opposite directions, the perforated top, bottom, back, and side plates, connected with said partition-plates by tongues, and the doors.

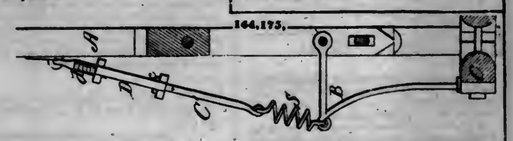
164,173. BLACKBOARD-RUBBERS. David Jackson, Chicago, Ill., assignor to A. H. Andrews, H. L. Andrews, and T. S. Hayden, same place. (Filed Mar. 9, 1875.)

Brief.—The endless rubber can be readily moved and readjusted, to present a new wearing surface.

A black board-rubber, consisting of the parts A, B, C, and D, constructed and arranged to operate substantially as and for the purposes specified.

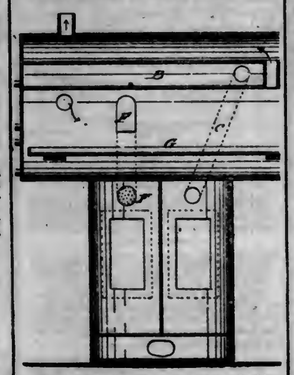
164,174. BOG-BOOTS FOR ANIMALS. W. Jacobs, Charleston, S. C. [Filed Mar. 29, 1875.]

A bog-boot for animals, whereof the upper is composed of two side pieces, A, front piece B, and heel-stiffening C, and provided with the fastening-straps D and loops E, substantially as specified.



164,174.

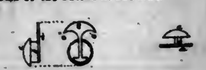
164,175. TONGUE-SUPPORTS. Jas. Jarrell, Thorntown, Ind. [Filed Apr. 24, 1875.]



In a tongue-support, the angular support B, spring S, link C, and turn-buckle D, in combination with a vibratory tongue, A, substantially as specified.

164,175.

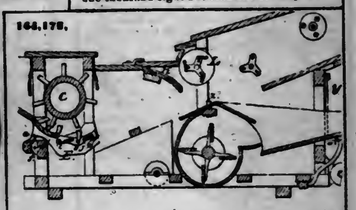
164,176. FEED-WATER HEATERS AND FILTERS. G. F. Jasper, Freeburg, Ill. [Filed Apr. 24, 1875.]



Brief.—The water is heated in the box by the exhaust steam, and passes down through one filter and up through the other into a pan, in which the sediment is deposited.

The combination of the water-box, double filter-receptacle, connecting-pipe C, return pipe F, and sediment-pan G, substantially as and for the purpose specified.

164,177. STUD-FASTENINGS. John C. W. Jefferys, Tottenham Court Road, England. [Filed Jan. 16, 1875.]



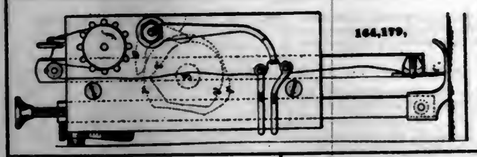
Brief.—The helix is attached to a flat shank, and falls outside of the periphery of the front disk of the button at one side.

A stud formed of back a, having horns a' a^2, flat shank b, and head c, the said back a being extended beyond the upper disk or head c at one side, all being constructed substantially as shown and described.

The above specification signed by me this 6th day of November, in the year of our Lord one thousand eight hundred and seventy-four

164,178.

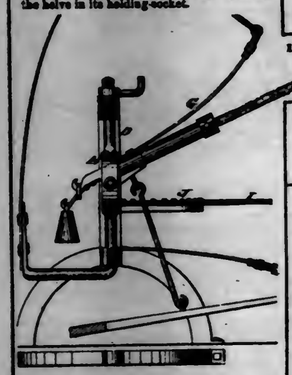
164,178. THRASHING-MACHINES. Arthur Johnston, Lockport, N. Y. [Filed July 29, 1874.]



Brief.—Adjustable concave of a fixed and a swinging section, and provided with adjustably inclined and depressed teeth. Expansible real-beater over carrier. Journal-bearings of stacker-arms formed on brackets secured to frame of machine, to relieve roller-bearings of stacker-apron from their weight.

164,179. SEWING-MACHINE TAKE-UPS. J. T. Jones, Ilion, N. Y. [Filed Apr. 24, 1875.]

Brief.—The take-up receives its backward movement from a spring, as usual, but while the stitch is being drawn taut it receives a positive movement.



The combination, with the thread-controlling lever m, spring-arm o, and cam r, of a second cam, arranged as described, whereby the thread-controller is caused to act positively and independently of the spring during a portion of the movement, for the purposes and substantially as specified.

164,179.

164,180. BLACKSMITHS' FORGING-HAMMERS. Andw. J. Judson, Hillville, assignor of three-fourths his right to Jacob Truby, Catskill, Pa. [Filed Apr. 2, 1875.]

Brief.—A lever attached to the yoke-piece in which the hammer-helve is pivoted is used to turn it around, the said lever afterward dropping into one of the notches of a bar, and holding said yoke-piece in any desired position. The range of the hammer can be lengthened or shortened at pleasure by adjusting the helve in its holding-socket.

1. The hammer-helve and its lifting-springs, arranged to swing laterally in the pivoted support D, in combination with the lever I and holding-bar J, substantially as specified.

2. The foot-power hammer A, having an extensible helve, in combination with a laterally-swinging support, D, for the helve, substantially as specified.

164,181. RABBED-WIRE FENCES. Charles Kennedy, Hinckley, Ill. [Filed Jan. 30, 1875.]

The fence-wire, in combination with a barb having body C, both the fence-wire and the body being bent together, and having bends of corresponding forms, whereby the barb is prevented from moving longitudinally or turning, substantially as and for the purpose specified.

164,182. COOPER-POTS. R. P. Kennedy, Oil City, Pa. [Filed Jan. 14, 1875.]

1. The double-walled inverted cup D, reticulated cup b, and their connecting-conduit c, combined and arranged substantially as specified.

2. The combination of a condensing-cup, F, with a filtering-cup, b, tube c, passing through air-chamber d, ebullition-chamber E, and pipe e, substantially as specified.

164,183. CAUTERY-ELECTRODES. Jerome Kidder, New York, N. Y. [Filed Mar. 29, 1875.]

164,184.

1. In galvano-cautery instruments for excising tumors, an insulating-handle, extending back of the fixed supporting-ring to such length that a firm hold for the hand is produced, substantially as specified.

2. In galvano-cautery instruments, the insulating-handle having the loop-drawing sliding-ring at the upper section and the fixed holding-ring at the lower section, arranged in connection with the circuit opening and closing spring-button, near the fixed ring, whereby the excising action of the instrument is instantly obtained by the joint employment of the thumb and fingers, substantially in the manner and for the purpose set forth.

164,184. VESICULAR ELECTRODES. Jerome Kidder, New York, N. Y. [Filed Mar. 29, 1875.]

A double vesicular electrode provided with an insulating head in which the metallic conductors are embedded flush with the surface, substantially as and for the purpose set forth.

164,185. RESERVOIR-ELECTRODES. Jerome Kidder, New York, N. Y. [Filed Mar. 29, 1875.]

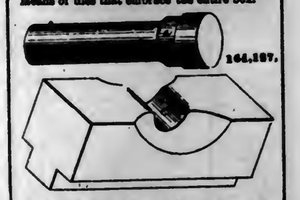
An electrode, for common exterior application, provided with a reservoir for hot water, substantially as and for the purpose set forth.

164,186. MACHINES FOR HANDLING STRAIGHT-CUT TOBACCO. F. S. Kinney, New York, N. Y. [Filed Dec. 19, 1874.]

Brief.—The tobacco, as it is cut, falls upon an endless belt, from which it is taken by a pendent fork, and the fiber is kept straight and laid between pins upon a board by reversing the latter over the fork.

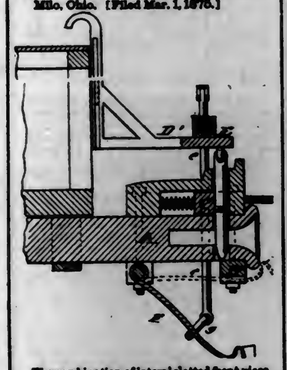
1. The fork I J, in combination with the grooved roller G, the endless chains F, and the roller B, connected with a tobacco-cutting machine, substantially as herein shown and described.

2. The reversing-board K, provided with pins L, in combination with the fork I J, for removing the tobacco from said fork without disturbing the fibers, substantially as herein shown and described.



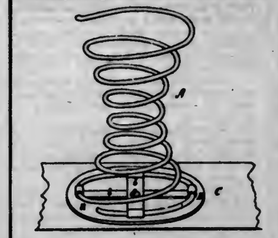
164,186.

164,187. MANUFACTURE OF CARRIAGE-AXLE BOXES. Wilson W. Knowles, Mount Carmel, Conn., assignor of one-half his right to J. A. Grannis, same place. [Filed May 19, 1875.]



Brief.—The mandrel, including its enlarged shoulder, is passed into the tube, the shoulder closely fitting the interior of the tube at its end, and the latter is then drawn down upon the shank portion of the mandrel by the dies, the mandrel and tube being rotated during the operation. The swaged tube is then placed on another similar mandrel, and finished by means of dies that embrace the entire box.

164,187.



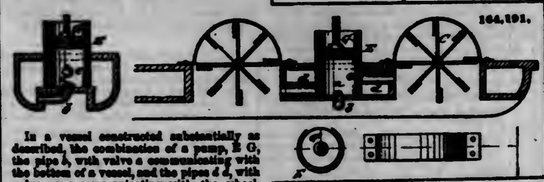
The method described for making axle-boxes from tubing by means of the dies, and as hereinbefore described.

164,188. CAR-COUPLINGS. Geo. W. Kyle Milo, Ohio. [Filed Mar. 1, 1875.]

The combination of lateral slotted front piece B of pin-suspending frame D', pivoted levers f, spring-acted connecting-rods e, bottom rod g, and pivoted upset-arm F, for raising and dropping the upset with the raising and dropping of the coupling-pin, substantially as and for the purpose set forth.

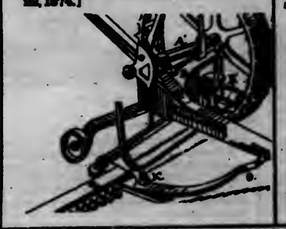
164,189. FURNITURE-SPRINGS. Harmon W. Ladd, Chelsea, Mass., assignor to Fannie R. Ladd, same place. [Filed Dec. 30, 1874.]

1. The rivet c, the cap or disk B, and the connecting-straps b, arranged and combined together, and with the spring A and the canvas or cloth cover C, substantially in the manner and to operate as specified.



2. In combination with the spring A and the canvas or cloth cover C, the flexible cap B, arranged between the said cloth cover and the bone-coil of the spring, all substantially as specified.

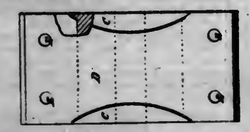
164,190. COVERS, GRIDDLES, &c., OF STOVE-TOPS. J. Warren Lamb, Whitestone, N. Y. [Filed May 26, 1875.]



A cover, griddle, or other movable part of the top of a stove or range made of malleable iron, substantially as described.

164,191. MEANS FOR VENTILATING AND DISCHARGING BILGE-WATER FROM VESSELS. Daniel Leahy, Riverside, Pa. [Filed Apr. 10, 1875.]

In a vessel constructed substantially as described, the combination of a pump, E G, the pipe b, with valve a communicating with the bottom of a vessel, and the pipes d f, with valves e e communicating with the wheelhouses thereof, as and for the purposes herein set forth.



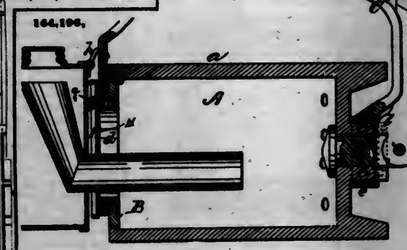
164,192. MOWING-MACHINES. Alton L. Little, Sheboygan Falls, Wis. [Filed June 22, 1874.]

The main frame B, to which the tongue C is attached, constructed as described, with the frame U, having rod V, on which the stable-lever vibrates, in combination with the shuttle G and wheel A, having pins and rollers E, substantially as described.

164,193. BOOM-HARDWARE. Charles Littlefield, Vinalhaven, (Carver's Harbor P. O.), Me. [Filed Apr. 17, 1875.]

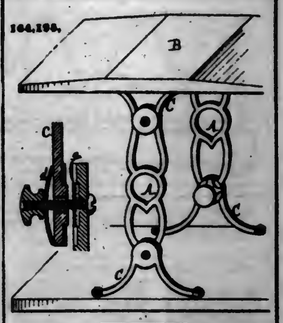
Brief.—The side plates are formed with curved recesses, fitting within the flanges formed upon the main hammer-head. The cutters are held firmly together by bolts passing through the side plate.

The described combination of main piece A, having flanges C, plates D D, having holes F, and the bolts F, all constructed and arranged substantially as and for the purpose specified.



164,194. WINDOWS. Michael F. Lyons, New York, N. Y. [Filed May 14, 1875.]

Brief.—Iron bars or gratings are secured in the frame, and enter cavities in the mullions of the sash, so that when the windows are closed the iron bars or gratings are invisible. For use in lunatic asylums.



164,194.

164,195.

164,195.

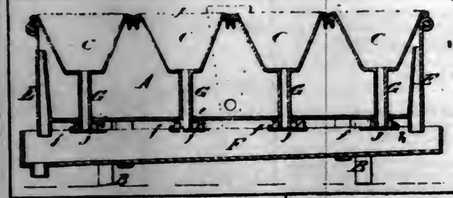
164,196. FLUTING AND POLISHING IRONS. William I. McCausland, Louisville, Ky. [Filed Apr. 17, 1875.]

Brief.—The smoothing and the fluting surfaces are cast in one piece, and the handle is adjustable, so that either of the four surfaces may be used.

1. In a fluting and smoothing iron, the combination of a hollow casting, A, having smoothing-surfaces a and fluting-surfaces b, and a vertically-vibrating operating-handle, C C' d, adapted to be locked into position vertical to either of the surfaces, substantially as specified.

2. The hollow casting A, having tubular notched trunnion c, vertically-vibrating handle C C' d, with spring-latch G, in combination with a locking-rod, F, having a leg, l, and slot, f, and pivoted in the end of a rotating bolt, E, substantially as specified.

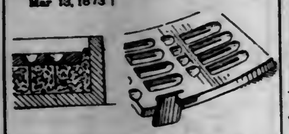
3. The hollow casting A, having a notched trunnion, c, rotating bolt E, and a locking-rod, F, in combination with a rotating handle, C C' d, substantially as specified.



4. The arm C, having tubular cylindrical end d, with buttons g, in combination with lamp D', plate H, having openings e, and a wick-tube reaching into the interior of the ironing-plate, substantially as specified.

164,197. MILK-COOLERS. F. W. Meeks, Bristol, N. Y. [Filed Mar. 20, 1875.]

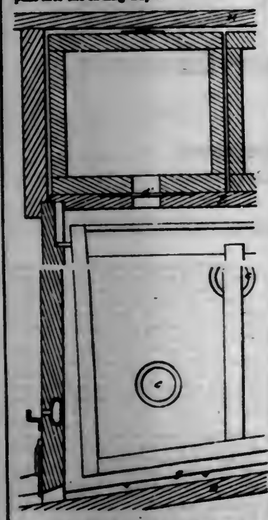
Brief.—Valves for covering the outlet-pipes are pivoted on flanges of the nut, which compresses the rubber packing-ring. The covers of wire-cloth, with edges clamped in metal, clasp the upper edges of the milk-pans.



1. In a milk pan and cooler, the combination of the tank A, pans C, draw-off pipes G, washer f, cover-ring h, and gate j with the inclined trough F, supported upon legs B, substantially as described.

2. Removable wire-gauze covers J, having flanges n, which are disconnected at their ends, and pressed on their edges, as described.

164,196.



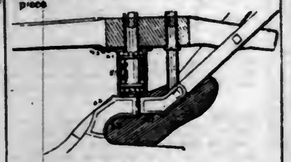
164,196. METHODS OF CASTING. Lyman Morgan, Port Washington, Wis. [Filed Mar 13, 1873.]

The method of molding for casting staves for cant-machine cases by striking the cores through the pattern, and then lifting the pattern off of the cores, leaving them sticking in the sand, substantially as described.

164,199. MOTH-TRAPS. Jacob Neal, Moulton, Iowa. [Filed Apr. 24, 1875.]

Brief.—Above the bee-entrances are placed checks, which lead to perforations through the wall of the hive, through which the moths pass into the sliding trap s.

The combination, with the perforated hive-wall, of the concave miller-slides in rear of said perforations, and the check-ledges below the moth perforations and above the bee-entrances, substantially as specified.



164,200. FASTENINGS FOR WEARING APPAREL. Robert C. Nichols, Boston, Mass. [Filed May 11, 1875.]

As a new article of manufacture, the fastening shown and described, consisting of the beaded part combined with the flat ring pierced with thread-holes, as and for the purpose specified.

164,201. PLOWS. John B. Norris, Marcus M. Bowers, and Wm. C Dimmock, Richmond, Va. [Filed Aug. 4, 1874.]

Brief.—Cylindrical weed feeder on plow standard, friction balls; land side grooved on the under side; mold board formed with projection to fit around the cylinder; notches in lower end of cylinder, detachable breast-piece.

1. The neck or stem of a plow, with movable and fixed annular collars or rings forming ledges around the neck or stem, each of said ledges being provided with a suitable number of anti-friction balls combined with a revolving cylinder or collar suspended over and resting upon the top series or group of balls, as shown in Fig. 8, substantially as and for the purpose described.

2. The revolving cylinder or collar of a plow formed with one or more nicks or notches, *l*/ *l*/, as shown in Figs. 5, 11, for the purpose substantially as set forth and described.

3. A plow-beam or pedestal bracket formed with an inclined or an oval breast, a^1, and an elliptical or elongated arched arm, b^1 b^1, formed with a mortise through the breast part thereof, and provided with a detachable breast-piece, d^1, substantially as shown and described, for the purpose set forth.

4. The mold board formed with the spur-like projection or scraper a^7, in combination with the revolving cylinder k^1, Figs. 1, 2, 12, substantially as shown and described.

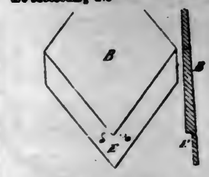
5. A land-side strip and share of a plow, fluted or grooved on the under side, as shown at S, Figs. 1, 4, 8, 9, substantially as set forth and described.

6. The feeder-pin a^1, the feeder-plate a^1, and the lateral shield-plates a^2, combined with the plow-beam, and the revolving cylinder or collar k^1, Figs. 1, 8, as shown and for the purposes substantially as set forth and described.

7. An equalizing plate or yoke constructed with inclined slots, in combination with the projecting arms of a torsional spring, substantially as described, whereby the arms move upwardly as the spring is pressed downwardly.

8. The combination of a double slotted equalizing bar or connecting yoke with the outwardly projecting arms of a double torsional spring.

9. An equalizing plate or yoke constructed with an opening to admit of the ready attachment and detachment of the arms of a torsional spring.



10. In combination with the arms of a torsional spring and their supporting and connecting plate, a washer, arranged on said arms, for limiting and regulating the motion of the arms in their bearings.

11. A torsional spring composed of two parallel bars connected at one end by a loop turned upward or downward, for resisting and preventing separation or breaking.

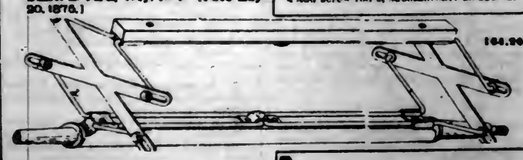
12. The combination, in a torsional spring, of two separate parallel bars or rods turned in a direction opposite that of the arms, so that they will press against each other as the two arms of the spring are turned outward.

164,202. ROOFING-TILES. La F. Parker, Davenport, Iowa. [Filed Mar. 11, 1875.]

Brief.—A rhomboidal shaped tile with overlap on two lower edges; the body gradually increasing in thickness from upper to lower angle, and provided with a nail-hole at each side angle, the heads of the nails being accommodated by recesses in the lap portion of the succeeding tile.

1. The diamond-shaped tile herein described, having the overlaps E, of about the same thickness as the upper point, and the body B, tapering in section, as in Fig. 3, all constructed substantially as and for the purposes specified.

2. The depressions *a a* to receive the heads of the nails, as described.



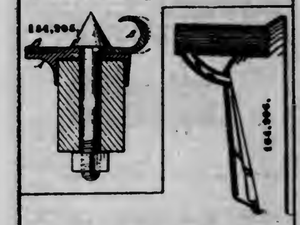
164,204. CLAMPS FOR HOLDING FILES IN TRIMMING-RATES. Robt. Parker and J. B. Colman, Corry, Pa. [Filed Apr. 28, 1875.]

Brief.—Teeth may be made removable.

1. The combination of the jaws *a b*, teeth *c*, rods *l*, screw-rod *e*, sleeves *d e*, and stuffing-boxes *h s*, substantially as shown.

2. The jaws *a b*, provided with the sleeves *d e*, in combination with the stuffing boxes *h s* and screw-rod *e*, substantially as shown.

164,203. TONGUE-SUPPORTS FOR VEHICLES. Daniel B. Paris, Troy, N. Y. [Filed May 20, 1875.]



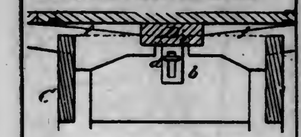
1. The combination, with the outwardly projecting arms of torsional springs and their connecting-bar, of the equalizing or connecting yokes, the connecting bar being of a length less than the distance between the connecting-yokes, whereby the said connecting-bar is adapted to pass down between the connecting-yokes and cause the outwardly-projecting arms to pass beyond their horizontal position, as set forth.

2. An equalizing-plate or connecting-yoke having slotted openings to receive the arms of torsional springs, and constructed with a horizontally-projecting supporting-flange, substantially as described, for suspending the springs upon the bolster or axle of a vehicle, as set forth.

164,205. VEHICLE-SPRING SHACKLES. Thos. T. Pearce, Hopewell Corner, Canada, assignor of one-half his right to Chas. A. McLane, same place. [Filed Apr. 28, 1875.]

Brief.—The shaker is secured to the axle and bolster, and is used preferably with longitudinal springs.

The combination of clip piece A, adjustable leg *a*, and the shackle-piece B, as and for the purpose set forth.



164,206. 164,208.

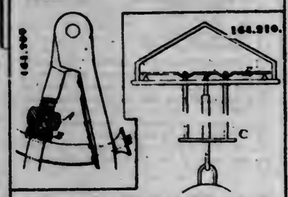
164,206. COOKING-STOVE VENTILATOR. Andrew A. Peterson, Chicago, Ill., assignor of one-half his right to Niels J. Nelson, same place. [Filed Mar. 23, 1875.]

Brief.—The device is adapted to conduct fumes from cooking to the smoke-pipe, the several parts being combined in one article.

The combination of the steam and smoke gatherer A and the pipe D with the stove-pipe C, substantially as and for the purpose specified.

164,207. REVERSION-TABLES. W. Perry, Rockport, Mo. [Filed Oct. 17, 1874.]

In an extension-table, the combination of the support A, the notched end boards C, the rising center board E, the extension-wings G, slide-bars H, slotted arms *h*, and pins *d*, all arranged to operate as described.



164,208. VEGETABLE-DISHES. Ella Portington, Factoryville, N. Y. [Filed May 1, 1875.]

164,209. ADJUSTABLE MECHANISMS OF DIVIDERS, COMPASSES, AND CALIPERS. Jos. H. Potts, Pennington ville, Pa. [Filed Feb. 15, 1875.]

1. The combination, with dividers and compasses, of the nut A and thread upon which it works, both encircling the leg of the dividers, as shown in Fig. 1, and to operate as and for the purpose described and set forth.

2. The combination, with compasses, dividers, and calipers, of the spring B.

3. The adjusting mechanism of compasses, dividers, and calipers, consisting of the nut A and spring B, or their equivalent, to operate substantially as and for the purpose above described.

164,209. 164,210.

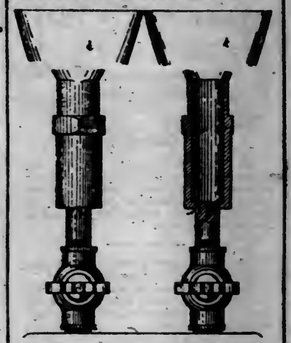
164,210. COMPENSATION-PENDULUMS. C. M. O. Prentice, Monroeville, Ohio. [Filed Mar. 13, 1875.]

1. A compensating pendulum consisting of a series of metallic rods, B, each rod suspended from a point between the fulcrum and point of application of the power of a lever, E, and secured rigidly to a plate, C, at their lower ends, in combination with one or more rods, A, possessing a greater degree of expansion, the said rod A being connected with plate C at bottom, and acting as a power for the lever E, substantially as and for the purpose described.

2. The combination, with plates C and D and levers E on the upper plate, of rod or rods A and rod or rods B, the said rod or rods A, by their greater expansive properties, acting to raise the levers E, and thus preserve the pendulum constant in length, substantially as and for the purpose described.

164,211. SHEET-BOOKS. Peter A. Prince, Porter's Mills, Wis. [Filed Mar. 20, 1875.]

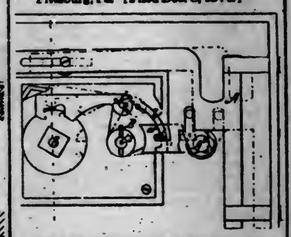
164,211.



The combination, with boom A, of pivoted weighted center-boards B, working in diagonal slots, chains D, revolving on pulleys E, and book-chains H on pulleys J, as and for the purpose specified.

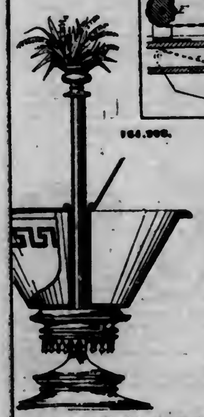
164,212. TREADLE MECHANISMS FOR PRINTING-PRESSES AND OTHER PURPOSES. Geo. W Prouty, Boston, Mass. [Filed Feb 10, 1876.]

In a treadle mechanism for operating printing presses and other machinery, the combination of a pivoted treadle, L, rod K, connecting said treadle to the device or devices to be operated thereby, and the radius-arm O, pivoted at one end to the rod K, and at the other to a fixed or stationary portion of the machine, all constructed, arranged, and operating substantially as described.



164,213. GAS-BURNERS FOR REMOVING PAINT. Samuel G. Reed, Wellesley, Mass. [Filed Apr. 14, 1875.]

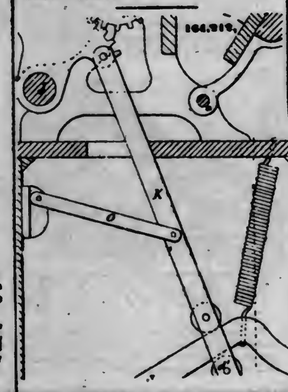
Brief.—The flattened openings placed in line to afford a broad continuous sheet of flame.



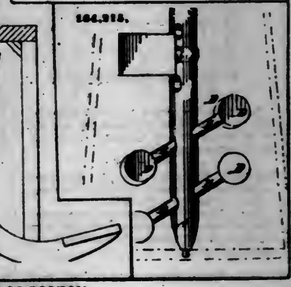
The combination, with the chamber *b*, of two or more burners having flattened mouths *k* arranged together, and in line to produce a broad sheet of flame, substantially as and for the purpose set forth.

164,214. COMBINATION-LOCKS. G. Blessek, Pittsburg, Pa. [Filed Dec. 8, 1874.]

The bolt A, having a projection, a^1, or similar device, in combination with the locking-case B, constructed to engage with the projection upon bolt A, so as to hold the bolt when withdrawn, substantially as specified.



164,215. VEGETABLE-DISHES. Thos. Hall, Jr., Philadelphia, Pa. [Filed Mar. 20, 1875.]

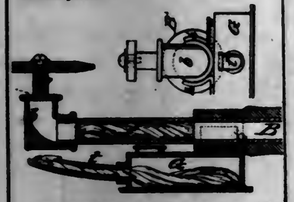


164,208.

1. A vegetable-dish composed of a detachable and subdivided vessel, revolving on a supporting-stand, substantially as and for the purpose set forth.

2. A vegetable-dish having radial partitions, forming compartments for different articles, and a central socket-tube for being detached from and replaced on the stand, substantially for the purpose specified.

164,215.

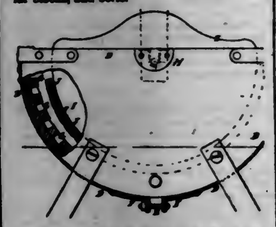


164,216.

164,915. ROTARY CHURN-DASHERS. James J. Robinson, Gibson City, Ill. (Filed Apr. 10, 1875.)

The combination of shaft A, oblique bars B, cross-bar C, and disks D, constructed and arranged substantially as and for the purpose specified.

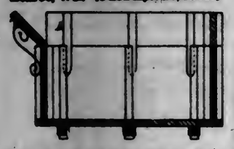
164,916. SOLDERING-IRON HEATERS. Chas. J. Rogers, Norwich, Conn. (Filed Nov. 7, 1874.)



Brief.—A removable lamp applied by means of spring-clasp to a hollow handle, which serves as a connection between a reservoir and a gas-generator, and as a holder for the soldering-iron.

The detachable lamp G *i*, provided with spring-clasps *h h*, in combination with the reservoir A, flexible tube C, tubular handle B, having a wooden holder, B', gas-generator, *b*, and soldering-iron, substantially as and for the purpose set forth.

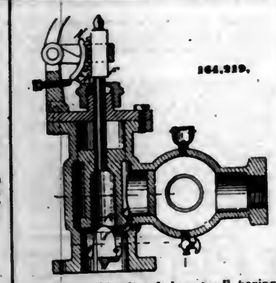
164,917. WASHING-MACHINES. C. B. Ross, Lincoln, Ill. (Filed May 15, 1875.)



Brief.—A concave tub with a convex rubber, both having curved cleats, and strengthened by corner-clamps, metallic straps, angular blocks, and bolts.

1. The corner clamps *c*, the metallic straps D, the angular blocks or plates F, and the bolts E, in combination with suds-box A B, substantially as herein shown and described.

2. The rubber H I K, curved cleats G and J, made with a single or double curve, in combination with the concave surface of the suds-box A B, substantially as herein shown and described.

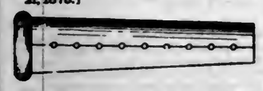


164,918. WAGON-BOX STRAPS. J. Scannell, Monroe, Wis. (Filed Apr. 27, 1875.)

The wagon-box strap *a*, provided with a recess, *c*, upon one side, to receive the strape *b* on the secondary box, substantially as and for the purpose specified.

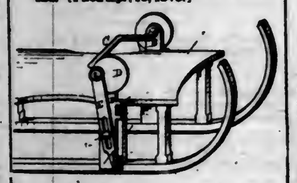
164,919. THROTTLE-VALVES. Reinhard Schedtler and John E. McNamar, Newark, Ohio. (Filed Mar. 29, 1875.)

Brief.—The valve is operated by a segment of a gear-wheel. The valve is held open, more or less, by a screw-stop in contact with the segment.



1. The combination of the valve E, having fingers G and arched openings I, the stem F, having rack M, the sector N, stop P, and lever O, substantially as and for the purpose described.

2. In combination with the valve E, the bar K, substantially as described.



3. In combination with the sector N, the adjustable screw P, for the purposes described.

164,920. UMBRELLA-HANDLES. Louis Schneider, Philadelphia, Pa. (Filed Jan. 21, 1875.)

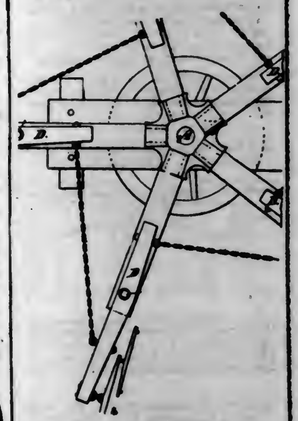
As a new article of manufacture, a handle for canes, umbrellas, or parasols, consisting of a casing of the thin or shell part of horn, in combination with a wooden or other suitable core or former, substantially as shown and described.

164,921. PROPELLERS FOR SLEDS. Charles Schwager and Jos. Wilson, Indianapolis, Ind. (Filed Apr. 20, 1875.)

The plates B B, cranked shaft C, face-plates D, wrist-pins *e*, pointed levers E E, and fulcrum-studs *e*, in combination with a sled, substantially as and for the purpose specified.

164,922. CHAINDRABLE FEED-GEARS FOR FEED-CUTTERS. Romaun Seelig, Chicago, Ill. (Filed Apr. 20, 1875.)

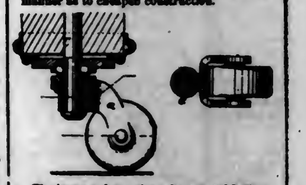
The reversible sleeve E and its pinions *a' b'*, in combination with the gear-wheel D, having gears *a b* of different diameters, substantially as and for the purposes set forth.



164,923. BOTTLE-STOPPERS. M. W. Shaw Galveston, Tex. (Filed Mar. 20, 1875.)

Brief.—A valve-stopper for bottles, provided with a flange or rim at its lower part, so as to convey the liquor directly from the perforations along the flange to the vessel to be poured into without spreading it over the cap

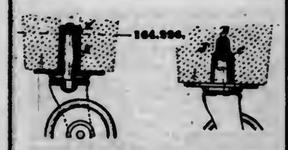
A valve-stopper for bottles provided with flange D, as and for the purpose specified.



164,924. HORSE-POWER EQUALIZERS. A. A. Sheets, Maumee City, Ohio. (Filed May 19, 1875.)

The levers D D, &c., pivoted upon the top or bottom of the sweeps of a horse-power, and connected together by chains, in the manner and for the purpose shown and described.

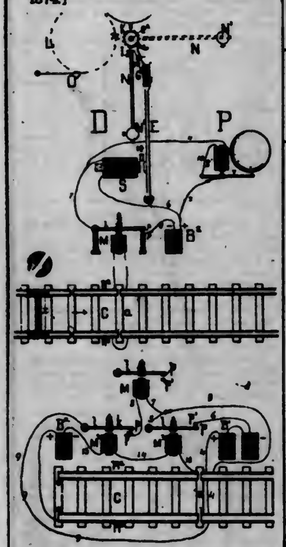
164,925. FURNITURE-CASTERS. Covedra B. Sheldon, New York, N. Y. (Filed Jan. 31, 1874.)



Brief.—Forming a rolled-up eye for the swivel-pin of the caster, the whole struck up from a single piece of sheet metal in such manner as to cheapen construction.

The improved one-piece sheet metal horn *a*, having the rolled-up eye *a'*, as shown and described.

164,926. FURNITURE-CASTERS. Covedra B. Sheldon, New York, N. Y. (Filed Apr. 17, 1875.)



Brief.—A hard-metal washer is interposed near the top of a stamped or struck-up spindle-socket, the spindle passing through the washer and riveted above, the object being to give solidity and bear the weight without wearing away the soft metal. There may also be a shoulder for the washer formed in the socket by a contraction of the upper ends thereof, the spindle in each case passing entirely through and riveted above.

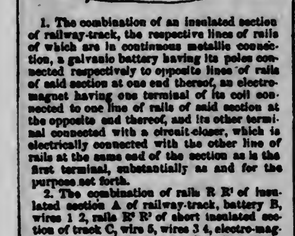
1. The combination, with spindle and spindle-shaft, of bush or washer C, secured in the socket by the spindle end passing through the same, and riveted above, as and for the purpose described.

2. The shoulder for washer or wearing-bush, formed in the socket by a contraction, F, at the upper end thereof, the spindle passing through and riveted above the socket, as and for the purpose specified

164,927. ELECTRIC RAILWAY-SIGNALS. H. W. Spang, Reading, Pa. (Filed Feb. 4, 1874.)

1. The combination of an insulated section of railway-track, the respective lines of rails of which are in continuous metallic connection, a galvanic battery having its poles connected respectively to opposite lines of rails of said section at one end thereof, an electro-magnet having one terminal of its coil connected to one line of rails of said section at the opposite end thereof, and its other terminal connected with a circuit-closer, which is electrically connected with the other line of rails at the same end of the section as is the first terminal, substantially as and for the purpose set forth.

2. The combination of rails R R' of insulated section A of railway-track, battery B, wires 1 2, rails R' R' of short insulated section of track C, wire 5, wires 3 4, electro-magnet M, and signal apparatus D or P, or both, substantially as described.



3. The combination of insulated or separated sections of single rails R R', short insulated sections of rails R' R', connected rails R' R' R' R', galvanic battery B, wires 1 2, galvanic battery B', wires 6 7, electro-magnet M, arranged to operate a signal or signals, wires 3 4, electro-magnet M', having armature-lever composed of parts *l l'*, insulated from each other, points *p p' p' p'*, wires 8 9 5 10 11, resistance-coil Y, wire 12, electro-magnet M', arranged to operate a signal or signals, wire 13, circuit-closer O, and wires 14 and 15, substantially as and for the purpose set forth.

4. The combination of separated short rail-section R' of section C, connected rails R' R', wire 7, battery B', wire 6, separated rail R', wire 8, electro-magnet M', wire 9, lever *l*, points *p p'*, wire 4, electro-magnet M, arranged to operate a signal or signals, wire 3, separated rail R of section of track A, wire 1, battery B, wire 2, and connected rail R', substantially as and for the purpose set forth.

5. The combination of electro-magnet M', arranged to operate a signal or signals, wire 13, separated rail R', wire 12, resistance-coil Y, wire 11, lever *l*, points *p' p'*, wire 10, separated rail R', wire 6, galvanic battery B', wire 7, connected rails R' R' R', wire 15, circuit-closer and breaker C, and wire 14, substantially as and for the purpose set forth.

6. Rails R R' of insulated section of track A, having a galvanic battery, B, and electro-magnet M' arranged for controlling or operating a signal or signals connected therewith at one end, *b*, of said insulated section of track, and galvanic battery B', and electro-magnet M, arranged for controlling or operating a signal or signals connected therewith at the other end, *a*, of said insulated section of track, in combination with a circuit-closer and breaker, or devices for closing and breaking circuit at each end *a* and *b* of said insulated section of track A, substantially as described, and for the purpose set forth.

7. Rails R R' of insulated section of track A, having galvanic battery B and electro-magnet M' arranged for controlling or operating a signal or signals connected therewith at one end, *b*, of said section of track, and galvanic battery B' and electro-magnet M arranged for controlling or operating a signal connected therewith at the other end, *a*, of said section of track, in combination with galvanic battery B' and electro-magnets M' M', (or one electro-magnet, M', with two levers or conductors, *l l'*, as in Fig. 7,) and rails R' R' of short section of track C; also with galvanic battery B', electro-magnets M' M', or one electro-magnet, M', and two levers, *l l'*, or

conductors, and rails R' R' of section of track C', substantially as and for the purpose set forth.

8. The combination of spring O' with vibrating signal-disk L, as and for the purpose set forth.

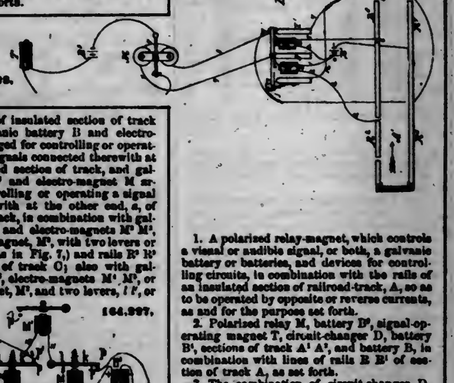
9. The combination of spring O' with vibrating signal-disk L, as and for the purpose set forth.

10. The insulated switch-rail R', arranged to slide upon insulated plate R'' for the purpose of being brought into line with either rail R' or R', which are electrically connected, substantially as and for the purpose set forth.

11. The combination of rails R' R'' R'' of siding or crossing section A', insulated at S' S', rails R' R' R' of section of track A, frog E, wire 9, plates H' H, and wires 1 2 of battery B, substantially as and for the purpose set forth.

12. Resistance-coils D D', in combination with rails R B' of insulated section of track A, (or with wires 5 5, and 1 2,) substantially as and for the purpose set forth.

13. The combination of rails R R' of insulated section of track A, wires 1 2, battery B, wires 3 5, electro-magnet M, wire 4, and rails R' R' of insulated section of track C, substantially as described.



14. Rails R R' of insulated section of track A, in combination with wires 1 2, battery B, wire 3, electro-magnet M, wire 4, and short insulated track-section C, or other circuit-closer, substantially as described.

15. Circuit-closer and breaker or changer G, actuated by switch-rod *f'*, or its equivalent, in combination with rails R' R', plate H, wire 5, connecting-wire 9, or equivalent, rail R', wire 6, wire 7, insulated rail R, wire 3, electro-magnet M, wire 4, circuit-closing section of track C, or its equivalent, having metallic connection with rail R', substantially as and for the purpose set forth.

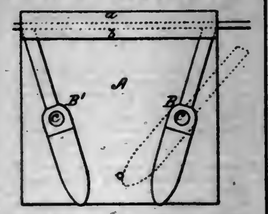
16. Insulated or separated section of track A' of branch track, or siding, or crossing at grade, in combination with rails of insulated section of main track A, battery B, magnet M, and short insulated section of track C, or other circuit-closer, substantially as and for the purpose set forth.

17. Rails R R' of insulated section of track A, in combination with wires 1 2, battery B, wires 3 5, magnet M, wire 4, electro-magnet M', wires 8 7, battery B', wire 6, and rails R' R' of section of track C or other circuit-closer, substantially as shown and described.

164,928. ELECTRIC RAILWAY-SIGNALS. H. W. Spang, Reading, Pa. (Filed Oct. 2, 1874.)

1. A polarized relay-magnet, which controls a visual or audible signal, or both, a galvanic battery or batteries, and devices for controlling circuits, in combination with the rails of an insulated section of railroad-track, A, so as to be operated by opposite or reverse currents, as and for the purpose set forth.

2. Polarized relay M, battery B', signal-operating magnet T, circuit-changer D, battery B', sections of track A' A', and battery B, in combination with lines of rails R R' of section of track A, as set forth.



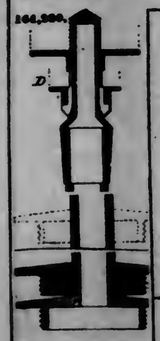
3. The combination of circuit-changer D, having two magnets, E E', of different resistances, battery B', and sections of track A' A', as set forth.

4. The combination of magnet M, battery B', wires 2 6 7, and rails R R' R' R', arranged to be operated by the metallically-connected wheels of a car or train, substantially as set forth.

5. The combination of magnet M, battery B', wires 2 7 8 9, and rails R' R R' R', arranged to be operated by the metallically-connected wheels of a car or train, substantially as set forth.

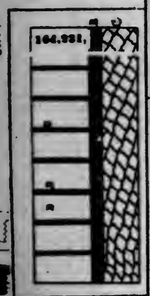
164,929. REIN-HOLDERS. F. C. Sparhawk, Newburyport, Mass. (Filed Jan. 30, 1875.)

Brief.—The two clamping-dogs turn in opposite directions, and are weighted, so as to act automatically in clamping the reins.



The plate A, provided with the overlapping shelf *a* and the dependent flange *b*, in combination with the weighted and pivoted dogs B B', all arranged as shown and described.

164,220. VAPOR-BURNERS. Jeremiah Stever, Bristol, assignor of one-half his right to I. B. Newton, Waterbury, Conn. [Filed Dec. 16, 1874.]

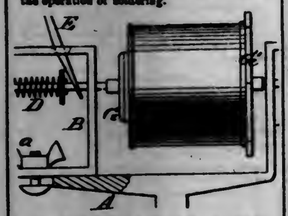


Brief.—The distance of the burner from the wick is adjustable by means of the sleeve. The packing prevents escape of gas, and insures sufficient friction between the sleeve and wick-tube.

The combination of the wick-tube B, sleeve C, burner D, and the packing E, substantially as described.

164,220.

164,221.



164,221. PAVEMENTS. Saml. Strong, Washington, D. C., assignor to himself and Elbon C. Ingersoll, same place. [Filed May 12, 1875.]

Brief.—On a well pounded or rolled foundation of small broken stone, gravel, and cement is spread a one-inch layer of water-proof cement, upon which hard-pressed bricks are laid, either on their sides, ends, or edges, breaking joints. The interstices between the bricks are filled with tar or grouting.

My improved mode of paving streets and roadways with hard-burnt pressed bricks, combined with foundation C, water-proof cement B, and packing D, as herein specified.

164,222. SOLDERING-CLAMPS. Mark Tandy, Dallas City, Ill., assignor of one-half his right to E. Mendenhall, same place. [Filed Dec. 5, 1874.]

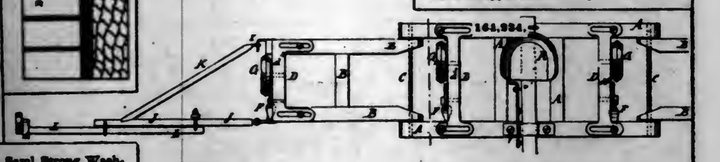
Brief.—Two clamping-disks are mounted opposite each other upon horizontal axes, one of which is adjustable longitudinally to suit vessels of different lengths. A lever and compressing-spring are mounted on one of the axial arms to hold and release the vessels in the operation of soldering.

In a machine for holding cans, the adjustable frame B, carrying the lever E, shaft C, clamp G, spring D, and clamping device e, in combination with the slotted frame A, carrying the shaft C' and clamp G', substantially as described.

164,223. ROOFING COMPOSITIONS. Eli Thayer, Worcester, Mass. [Filed May 12, 1875.]

Brief.—Slaked lime and sand are mixed to a mortar with water. Hair or other fibrous material is then added. Coal tar, pitch, or other kindred substance is then introduced at ordinary temperatures, which expels the water therefrom.

The process herein described of expelling water from roofing and similar compositions containing it by the use of coal-tar, pitch, or other similar hydrocarbons, substantially as specified.



164,224. CORN-MARKERS. Miles A. Throckmorton, Andersonville, Ohio. [Filed Apr. 24, 1875.]

Brief.—A marker made in sections, and hinged together, the sections provided with adjustable cross-bars carrying marking-plows and wheels. Hinged to the outer sections of the frame are extensible arms, having marking-plows and wheels for varying the width of the rows.

1. The combination of the adjustable bars D, the bottom plates d^3, and the slotted cross-head or L, plates d^2 with the frames A B B, substantially as herein shown and described.

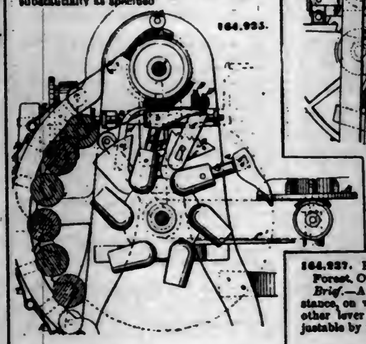
2. The combination of the marking-plows F and the V-faced wheels G with the adjustable bars D d^2 d^3, and with the frames A B B, substantially as herein shown and described.

164,224.

3. The detachable extension-frame J K I, provided with the cross-bar O, the double-pointed plow Q, and the wheel P, in combination with the frames A B C, the adjustable bars D d^2 d^3, the plows F, and the wheels G, substantially as herein shown and described.

164,225. MACHINERY FOR BEATING OUT THE SOLES OF BOOTS AND SHOES. S. D. Tripp, Lynn, Mass. [Filed May 8, 1875.]

Brief.—A series of last-supporting arms are mounted upon a shaft, which, by its rotation, brings the sole of the boot or shoe in contact with a chain rubbing mechanism, a series of formers, and a series of rollers at each rotation.



1. In a machine for smoothing the soles of boots and shoes, the combination of a rotary last-support, chain-rubbing mechanism, and pressing-formers, all substantially as and for the purpose described.

2. In a machine for smoothing and shaping the soles of boots and shoes, the combination, with a rotary last-support, a chain-rubbing mechanism, and pressing-formers, of pressing rollers, substantially as and for the purpose set forth.

3. The combination of the rubbing-chain mechanism with a series of revolving lasts, substantially as specified

4. The combination of the revolving pressing-formers with a series of revolving lasts, substantially as specified

164,225.

5. The combination of pressing-rollers with a series of revolving lasts, substantially as specified.

6. The combination of rubbing-chain C, arm j, rock-shaft K, arm i, and cam k, as and for the purpose specified.

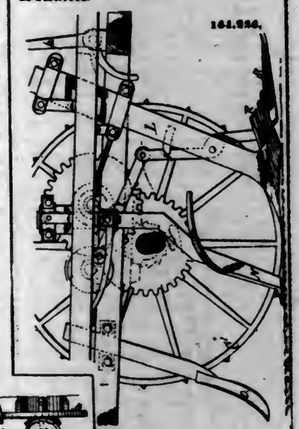
7. The combination described of arm j, pulley D, and spring m, with shaft K, and chain C, as and for the purpose specified.

8. The described combination of last-support G, with rest q, and the detachable hook d, for securing the last rigidly in the manner and for the purpose specified.

9. The combination of the revolving table A' with a series of revolving lasts and smoothing and shaping mechanism, substantially as specified

164,226. POTATO-DIGGERS. Elias Vandervoer, Jr., Manalapan, N. J. [Filed Oct. 12, 1874.]

Brief.—The share has separating-fingers projecting in the rear, and below and behind these another set, which have a throwing motion upward and backward by means of a pivoted lever, having its fulcrum situated upon the standard a short distance above the fingers, and worked by crank and connecting-rod at its upper end.

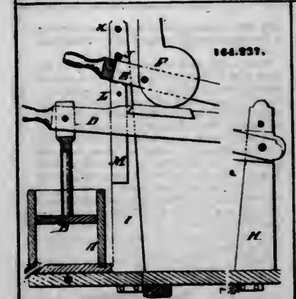


1. In combination with the potato-plow M, having rear sifter-bars, the vertically-reciprocating sifter-bars S, substantially as described.

2. The pitman I, pivoted lever K, standard L, and sifter S, in combination with the plow M and rear sifter-bars R, substantially as described.

3. The potato-plow M, in combination with the colter N, having a side arm, n, and forward colter O, all arranged as and for the purpose substantially as described.

4. The combination of the potato-plow M, having sifting-bars R, colter N, and arm n, colter O, and vertical cleaker S, substantially as described.



164,226.

164,227. PRESSES. Edward Van Gosen, Forest, Ohio. [Filed May 15, 1875.]

Brief.—A hand-lever used in the first instance, on which a cam-lever pivoted to another lever is afterward pressed, and is adjustable by pins in a series of holes.

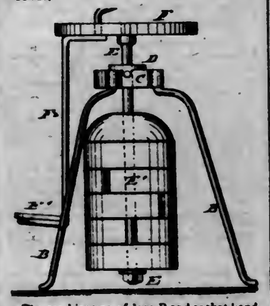
164,227.

The levers D, E, and F, standards H and I, pins J K L, and the rests M, combined with the follower B and press-case, substantially as specified.

164,228. CURTAIN-CORD HOLDERS. F. B. Wagner, Buffalo, N. Y. [Filed Mar. 24, 1875.]

The bracket F, having an extended lower end, terminating in the loop M, in which the scroll-wheel K is pivoted, the latter being corrugated upon part of its periphery, and smooth as to the rest, as and for the purposes described.

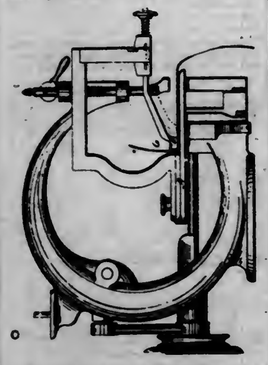
164,229.



164,230.

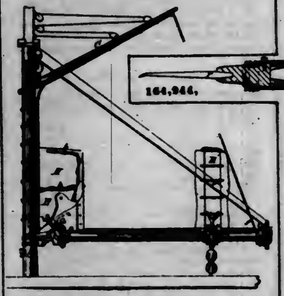
164,229. CORSETS. Julius Waterman, New York, N. Y., assignor to Waterman & Mayer, New York city, and Chauncey L. Olmstead, West Brookfield, Mass. [Filed Mar. 13, 1875.]

The combination, in a corset, of the removable bustle-hoop c, the pockets or receptacles d for the ends of the hoop, the straps e, with loops on their ends, through which the hoop passes, the loops t, and the cord or lace f, substantially as described, and for the purposes set forth.



164,230. SHIPS' FURNITURE TO PREVENT SEASICKNESS. Joseph Wertheim, Frankfort-on-the-Main, Prussia. [Filed Apr. 17, 1875.]

The combination of legs B and socket-band C with rod E, having seat F at the top, weight E' at the bottom, and intermediate ring D, all constructed and arranged substantially as and for the purpose specified

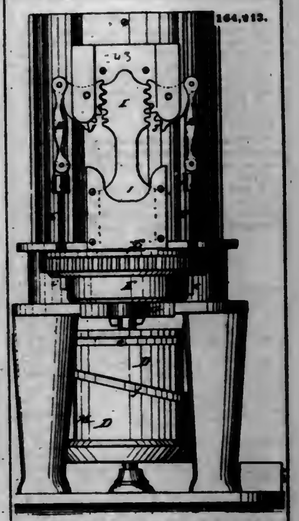


164,241. SEWING-MACHINE GUIDES FOR BANDING HATS. Dwight Wheeler, Bridgeport, Conn. [Filed Dec. 26, 1874.]

Brief.—The main or principal guide, against which the lower edge of the crown of the hat is guided, is secured to the bed plate of the machine, and has rising from its front edge an arm, which passes forward over the work, and then downward at its front end, through which slides a secondary guide, which acts upon the outside of the hat at the junction of the rim and crown, pressing it against the main or principal guide, and holding the hat in position for stitching the upper edge of the band.

The combination of the principal guide B on the work-plate, and auxiliary guide G, arranged above the work-plate, and having a combined rotative and longitudinal movement, substantially as specified.

164,242. DEVICES FOR REEFING SAILS. J. Whittington, Elida, Ohio. [Filed Apr. 17, 1875.]

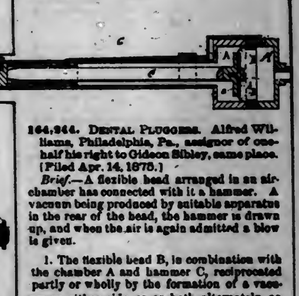


In a sail adapted to be reefed by a revolving boom or gaff, or both, the herein described arrangement of pinions and gear-wheel at the forked end of the boom, and the loose collar for connection with the sheet upon the revolving end thereof, the devices at the forked end being unobstructed by the sail in their operation, by reason of the bonnet H therein, and the apron B' over the loose ring on the revolving end, permitting the sail to be reefed without interference, all substantially as and for the purpose set forth.

164,243. BRICK-MACHINES. Carmi H. Williams and Walter W. Allport, Chicago, Ill. [Filed May 7, 1875.]

Brief.—A toothed arm at the bottom of a vertical pug-mill shaft rotates, successively, mold-boards around it. Cam-slots on the surface of a cylinder beneath the mill reciprocate toothed cam-segments, gearing with a rack between them, of a form that will give a connected plunger the greatest pressure when completing its descent.

164,212.



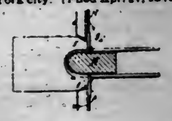
1. The plunger I, provided with the toothed rack at the top, and toothed levers J J, in combination with jointed shafts L L', and follower E, with arms e, substantially as and for the purpose set forth.

2. The combination of the shafts L L', coupling-arms K, and toothed levers J, with the plunger I, substantially as and for the purposes specified.

3. The main cylinder D, having cam-grooves e and f, and shafts L L', in combination with the follower E, coupling-arms K, toothed arms J, and plunger I, all as and for the purpose described.

164,244.

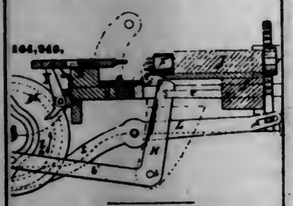
164,244. DENTAL PLUGGERS. Alfred Williams, Philadelphia, Pa., assignor of one-half his right to Oldeon Bibley, same place. [Filed Apr. 14, 1875.]



Brief.—A flexible head arranged in an air-chamber has connected with it a hammer. A vacuum being produced by suitable apparatus in the rear of the head, the hammer is drawn up, and when the air is again admitted a blow is given.

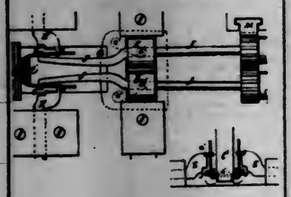
1. The flexible head B, in combination with the chamber A and hammer C, reciprocated partly or wholly by the formation of a vacuum on either side, or on both alternately, as a device for producing blows in a dental plugger.

2. The slide G, having a shoe, e, in combination with the tool-holder E and opening f of chamber A, substantially as and for the purpose set forth.



3. The flexible head I, in combination with the chamber H, as a conveyer of motive power to a dental plugger, substantially as described, or by any other suitable means.

164,245. MAKING WIRE FASTENINGS FOR BOTTLE-STOPPERS. Henry W. Yarington, Oceanic, N. J., assignor to R. C. Anthony, New York city. [Filed Apr. 17, 1875.]

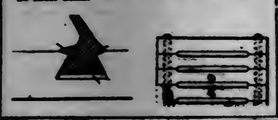


1. The female die C, constructed with the cam-sides and the continuous groove in its end and sides, to form the spiral bands, substantially as described.
2. The cylinders K K, provided with the pins *o p o p* and the lips *n n*, combined together and operated substantially as described.
3. The follower X, combined with the cylinders K K, and operated substantially as described.
4. The combination of the die C, the former H, the shafts N N, the cylinders K K, and the follower X, operated to make a bottle-stopper fastening, substantially as described.

164,946.

164,946. MAKING WIRE FASTENINGS FOR BOTTLE-STOPPERS. Henry W. Yerington, Oneonta, N. J., assignor to R. C. Anthony, New York city. [Filed Apr. 17, 1875.]

1. The benders E E, provided with the cleats *a a'*, in combination with the die C, and operated substantially as described.
2. The combination of the die C, the spring D, and the benders E E, operated substantially as described.
3. The combination of the benders E E with the teeth *b' b'* of the twisting-rods J J, operated substantially as described.

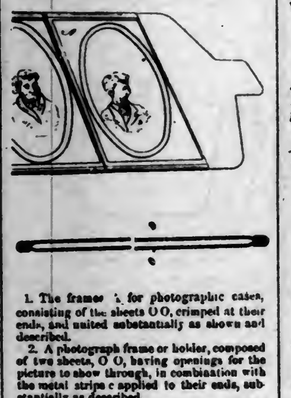


164,947. SHAWL OR CARETTE STRAP HANDLE. Benjamin Andrews, Philadelphia, Pa. [Filed Sept. 4, 1874.]

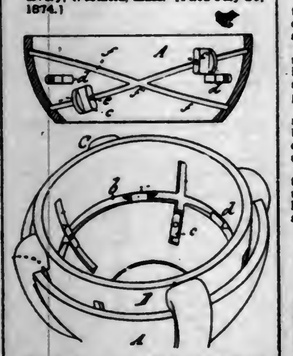
The cast handle A, with recessed ends B C, in combination with the plates F F, for confining both the straps D and rings or loops E E, substantially as and for the purpose set forth.

164,948. SCHOOL DESKS AND SEATS. H. L. Andrews, Chicago, Ill. [Filed Apr. 15, 1874.]

Brief.—The chair of the bench and seat are connected by a dovetail joint, wherein a space is left between the metal and wood, to prevent the latter from being split by shrinkage. The series of open slats rest against one another at their ends.



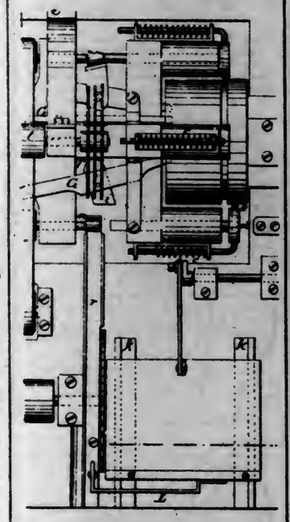
1. The frames A, for photographic cases, consisting of the sheets O O, crimped at their ends, and united substantially as shown and described.
2. A photograph frame or holder, composed of two sheets, O O, having openings for the picture to show through, in combination with the metal stripe c applied to their ends, substantially as described.
3. A photograph-case composed of a series of frames or holders, A, composed of the sheets O O, united by the metal stripe c, and frames being united and provided with a cover, as set forth.



1. The herein-described dovetail-joint, having a space left between the face of the metal that enters the groove and the wood, to prevent the latter from being split by shrinkage, substantially as set forth.
2. A school seat or settee, having its seat or back composed of a series of open slats, resting one against another at their ends, and secured to the frame by means of a dovetail joint, as set forth.

164,949. PHOTOGRAPH-ALBUMS. James C Arms, Northampton, Mass. [Filed Apr 14, 1875.]

Brief.—The frames are made of two perforated sheets with a metal binding. These frames may be bound together into a book, or attached one to the other by flexible connections, so as to be folded or extended into a long strip.

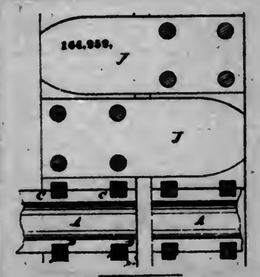


164,950. CIRCULAR-WEAVING LOOMS. D. Avery, Westfield, Mass. [Filed July 30, 1874.]

The shell A, of spherical form in its cross-section, and provided with the grooves *f*, in combination with the slotted shell B, also of spherical form, and the loosely-pivoted bobbin-holders *c*, whereby said bobbin-holders *c* are actuated and guided in a vertical direction, and the bobbin-holders *d* are actuated in a horizontal rotary manner, and all of which said bobbin-holders are always equidistant from the point at which the threads unite to form the fabric, substantially as described.

164,951. MACHINES FOR CUTTING BUNGS. Jno. Rachelder, Gardiner, Me. [Filed Mar 9, 1875.]

Brief.—The strip of wood from which the bung is to be formed is placed upon a reciprocating table, and fed to the cutting-off saw, when a bung-blank of the proper length is instantly severed. The blank is then deposited in a trough, from which it passes, and is caught and held between head and tail spindles, that are independently rotated and revolved in the stocks which support said spindles. The blank is reduced to the desired shape by one saw having an inclined vibratory motion, or a series of circular saws of graduated diameters, after which it is finished by suitable knives, whose action is governed by a fixed cam provided upon its face with a peculiar-shaped groove.



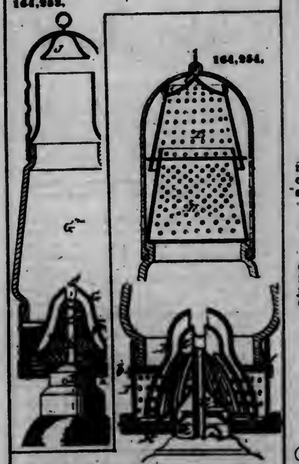
1. In a bung-machine, the combination of the revolving head and tail spindles, fixed cam, trimming-knives, and saws, constructed and operating substantially as specified.
2. In a bung-machine, in combination with revolving head and tail stocks, finishing-knives, arranged, constructed, and operated substantially in the manner and for the purpose described.
3. In a bung-machine, the combination of revolving head and tail stocks, finishing-knives, and their supporting-levers with a cam, substantially as and for the purpose described.
4. In a bung-machine, the reciprocating saw-table, provided with the spring L, in combination with the trough *r*, and the revolving head and tail stocks, substantially as shown and described.

164,952. PORTABLE RAILWAYS. Alex. Ross, Las Canas, near Alacranes, Cuba. [Filed May 10, 1875.]

Brief.—A portable railway-track in which the rails of the sections are secured to the iron ties by square-sided rivets, and each section is provided at its ends with projecting locking-pieces, which articulate with those on the end of the adjacent section, and thereby tend to prevent lateral displacement of the sections.

1. The combination, with the rails A A and cross-pieces B of the sections of a portable railway, of square-sided rivets for securing the rails and cross-pieces together, substantially as described.
2. The combination of the locking-pieces J J with the sections O, arranged and operating substantially as described.

164,953.

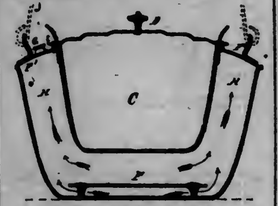


164,953. LANTERNS. George A. Beidler, Philadelphia, Pa. [Filed Apr. 9, 1875.]

Brief.—An outer shell and inner perforated cone connected. A solid air-breaker pendent from the perforated flange around the deflector, and a sectional air-breaker in the dome.

1. In the burner described, the combination of the exterior cone G and the interior perforated shell G', surrounding the entire interior of the cone G, and extended above the wick-tube, for the purpose of creating a single current of air to the flame, and to prevent an excess of heat on the wick-tube, substantially as set forth.
2. The combination, with the burner G G', of the arms *b b*, collar *d*, with the semi-tubular projections *e e*, and the legs or bulges *f f* on the wick-tube C, substantially as and for the purposes herein set forth.
3. The combination, with the perforated rim E and interior perforated air-breakers *a a* and *f*, of the annular solid air-breaker *h*, depending from the perforated diaphragm *f*, substantially as and for the purposes herein set forth.
4. An air-breaker, consisting of the cylindrical section I and the bell-shaped section J, arranged within the dome of a lantern, substantially as and for the purposes herein set forth.

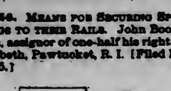
164,953.



164,954. COMBINED LAMPS AND LANTERNS. George A. Beidler, Philadelphia, Pa. [Filed Mar. 17, 1875.]

Brief.—The ring and chain for handling the lamp are connected thereto by means of a rod, for preventing contact with the lamp.

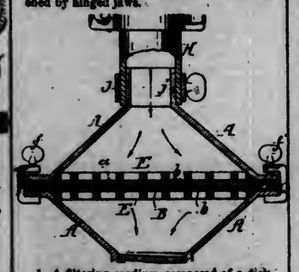
1. In combination with the reservoir A and a burner thereon, the perforated diaphragm H and perforated rim I, with perforated flange *b*, substantially as and for the purposes herein set forth.
2. In combination with the perforated dome K of the lantern, the perforated air-breaker L L, made in sections, loosely connected together, and loosely sustained within the dome by means of the rings *e* and rod *f*, all substantially as set forth.
3. The combination of the links *e*, rod *f*, and chain *h* with the dome K of a lantern, all constructed substantially as and for the purposes herein set forth.
4. The combination with the reservoir A and the burner thereon, the perforated diaphragm H, perforated rim I, having perforated flange *b*, the detachable globe J, and dome K, having sectional air-breaker L L, all substantially as set forth.



164,955. CULINARY APPARATUS. Matthew C. Bogia, Philadelphia, Pa. [Filed Sept. 16, 1873.]

Brief.—The cooking or food-containing vessel is suspended in a casing which has an opening or hole in its bottom, over which is placed a deflector-plate, to protect the bottom of the containing-vessel from excessive or irregular heat.

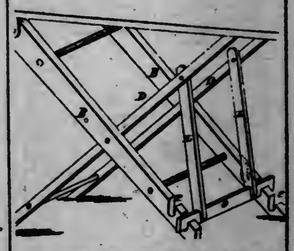
The exterior pot A, with ledge F on top, and opening B in bottom, the interior closed pan C suspended from the ledge F, the deflector F, between the open bottom of the pot A, and closed bottom of the pan C, and the damper G in the ledge F, all constructed, combined, and operating substantially as and for the purpose set forth.



164,956. MEANS FOR SECURING SPINNING-RINGS TO THEIR RAILS. John Booth, Lincoln, assignor of one-half his right to F. J. Rabbeth, Pawtucket, R. I. [Filed Feb. 24, 1875.]

The combination of a spinning-ring and its rail with eccentric frictional engaging devices or surfaces for connecting the two together, substantially as described.

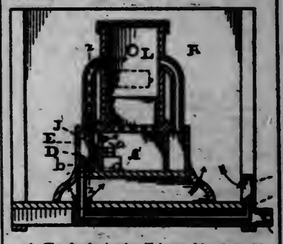
164,957. WATER-FILTERS. Isidor Bruch, Philadelphia, Pa. [Filed Apr. 24, 1875.]



Brief.—A filter formed by the combination of a disk of pressed carbon, felt, and a grating, combined as shown. The flexible tube joining the filter to the hydrant-nozzle is fastened by hinged jaws.

1. A filtering medium composed of a disk, *a*, of compressed carbon interposed between two strips, *b b*, of felt, as set forth.

2. The combination of the gratings E K, filtering medium B, and rubber ring D, with the flanged edges of the two halves A and A' of the casing, and with the screw-clamps F F.
3. The combination of the flexible tube H, with the hinged jaws I and J for connecting the filter, and a hydrant, as set forth.



164,958. INKING-TABLES. Oliver F. Berlingame, Sterling, assignor of one-half his right to F. B. Palmer, Rock Falls, Ill. [Filed Jan. 30, 1875.]

The combination, with the table A, of the legs B B hinged to the table and having notches P P at their lower ends, the legs D D pivoted to the legs B B, and the arms or rods L L having bar O and pivoted to the legs D D near the upper ends for supporting the free end of the table, all constructed substantially as shown and described.

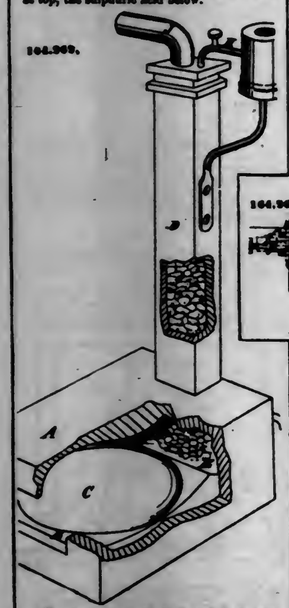
164,959. VENTILATING ATTACHMENTS TO STOVES. Charles Carter, Philadelphia, Pa. [Filed May 14, 1875.]

Brief.—The contaminated air is supplied to the grate or combustion-chamber. The pipe that conducts it is inclosed by the fresh-air conduit, which is thereby partially warmed.

1. The fresh-air pipe F, in combination with the pipe D inclosed thereby, and communicating with the ventilating-register C, and with the reservoir E of a combustion apparatus, B, substantially as and for the purpose set forth.
2. The pipe D, communicating with the ventilating-register C, in combination with the reservoir E, communicating with said pipe, and with the ash-pit A' and chamber L of a combustion apparatus, B, substantially as and for the purpose set forth.
3. The reservoir E, in combination with the pipe D, having opening *b*, the pipe H, with openings *a* and *d*, the pipe J, with opening *d*, and the pipe K and combustion-chamber, and with the adjustable damper M, substantially as and for the purpose set forth.

164,960. MANUFACTURE OF NITRO-SULPHURIC ACID FOR MANUFACTURING NITRO-GLYCERINE. Prudencio Castellanos, San Francisco, Cal. [Filed Oct. 27, 1874.]

The process of preparing a mixture of nitric (NO_5) and sulphuric acid (SO_3) for the manufacture of nitro-glycerine by condensing vaporized nitric acid in liquid sulphuric acid, as set forth.



164,961. RECOVERING ACIDS FROM RESIDUUM OF NITRO-GLYCERINE MANUFACTURE. Prudencio Castellanos, San Francisco, Cal. [Filed Oct. 27, 1874.]

The process herein described for treating and recovering acids from the residuum remaining after the manufacture of nitro-glycerine, consisting in dropping the dilute residuum in small quantities through a heated chamber filled with obstruction, passing sulphurous-acid gas into the same, and collecting the resulting nitric acid in leaden chambers, while the sulphuric acid is drawn off from the bottom of the heated chamber.

164,869. APPARATUS FOR RECOVERING ACIDS FROM THE RESIDUUM OF NITRO-GLYCERINE MANUFACTURE. Prudencio Castellanos, San Francisco, Cal. [Filed Oct. 27, 1874.]

Brief.—The products of combustion and sulphurous-acid gas pass from the furnace up the tower through the obstructions, over which the dilute residuum from nitro-glycerine manufacture drops from the tank above. The gases, with the nitrous fumes, pass off by the pipe at top, the sulphuric acid below.

164,869.

The furnace A, with its hearth C, for producing heat and sulphurous acid, in combination with the vertical chamber or tower D, with its inclined floor E and obstructions, as shown, the tank G, inlet-pipe H, and discharge-pipes F and J, substantially as and for the purpose herein described.

164,868. EXPLOSIVE COMPOUNDS. Prudencio Castellanos, San Francisco, Cal. [Filed Apr. 6, 1875.]

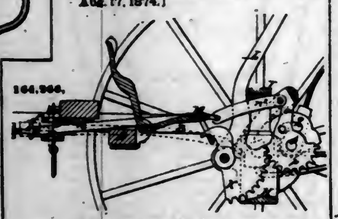
An explosive compound, consisting of nitro-glycerine, nitro-benzole or benzine, fibrous material, and pulverized earth, substantially as and for the purpose set forth.

164,866. EXPLOSIVE COMPOUNDS. Prudencio Castellanos, San Francisco, Cal. [Filed Oct. 27, 1874.]

An explosive compound or powder consisting of nitro-glycerine, nitrate of potash or soda, picrate, sulphur, a salt insoluble and incombustible in nitro-glycerine, and carbon, in about the proportions herein described.

164,865. VESSELS FOR CONTAINING POISON. W. M. Cotesworth, Philadelphia, Pa. [Filed Apr. 13, 1875.]

164,865.



As a new manufacture, a vessel of glass or other plastic or vitreous material, on which is represented the front of a skull, substantially as and for the purpose set forth

---

164,866. HORSE-RAKES. Chas. M. Clinton and Lyndred Mood, Ithaca, N. Y. [Filed Aug. 17, 1874.]

164,866.

1. The combination, with the rotatory rake-head, of a draft device, having a motion independent of the rest of the machine, substantially as described, and which, when operating to lift the rake, exerts no material tendency to draw the machine along.

2. In a wheeled horse-rake in which the movements of the teeth are controlled by a rake-head, independent of the axle, the combination, with the said rake-head, of a draft device, arranged and operating to hold the rake down to its work, substantially as set forth.

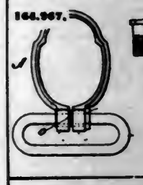
3. In a wheeled horse-rake in which the rise and fall of the teeth are effected and controlled by the rake-head, the combination, with the said rake-head, of a draft device, the whole so arranged and operating that, by means thereof, the rake-teeth can be either lifted or depressed by the action of the draft power.

4. The combination, with the rake-head and the teeth thereto attached, and thereby controlled, of a draft device which operates both to hold down and to lift up the rake-teeth, when arranged to pull directly on the rake-head.

5. As a means for utilizing the draft power to both hold down the rake (in gathering) and to lift the rake, (in dumping,) the sliding draft-rod arm *e*, and rotatory rake-head, combined and operating together, substantially as set forth.

6. A tooth-holder or device by means of which the teeth is secured to the rake-head or shaft, formed substantially as described, so as to constitute both a socket for the reception and retention of the rear of the tooth, and a clamp to embrace and make fast to the rake-head, substantially as described.

7. A tooth-holder, formed substantially as described, so as to constitute both a socket for the rear of the teeth and a clamp to embrace the rake-head, as described, and having its socket so made as to permit in the tooth a slight play or oscillation, as and for the purpose set forth.



8. In combination with the rake mechanism and a means for lifting the rake by the power of the driver, the jointed draft device *a b* and a locking pin or device, the whole so arranged and operating that the power of the team may be brought into, or kept out of, action at pleasure, during the operation of the machine.

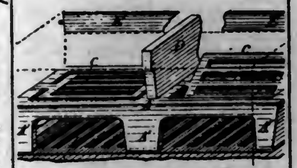
164,867. SWIVEL. RAINS FOR FIRE-ARMS. J. M. Clough, Troy, N. Y., assignor to E. Remington & Sons, same place. [Filed May 7, 1875.]

1. The clamp-band A, in combination with the tubular screw *a* and loop B, substantially as described.

2. A swivel for guns, consisting of a loop, B, having its ends mounted in a tubular screw, with a pin, *c*, inserted in said screw between the ends of the loop, as set forth.

164,867.

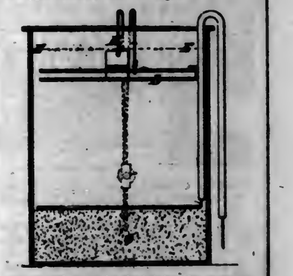
164,868.



164,868. HINGES FOR SEAT-ARMS OF SCHOOL-DESKS. William B. Cogger, Morris, assignor to the Sherwood School-Furniture Company, Chicago, Ill. [Filed Mar. 17, 1875.]

In combination with the frame A, having grooves *a*, and the seat-arm C, the bar E, extended and curved at its lower end to lie within one of the grooves *a*, and held by the bolt and nut, as set forth.

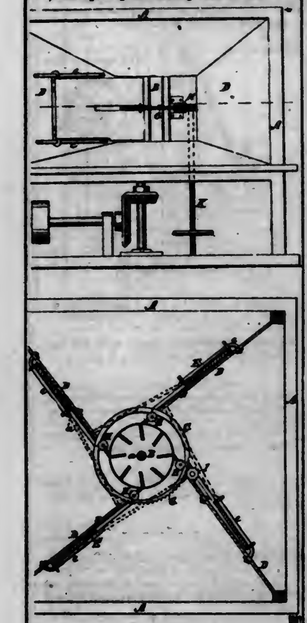
164,869. STOVE ATTACHMENTS. Hezekiah S. Cook, Albany, N. Y. [Filed July 18, 1874.]



Brief.—The attachment is adapted to contract the fire-pot laterally and vertically.

The portable summer attachments A B C, as herein described, for cooking stoves and ranges, provided with a removable partition, D, in its fire bed or grate, the several parts constructed and combined with each other substantially as set forth.

164,870. GALVANIC BATTERIES. Howard P. Dechert, New York, N. Y. [Filed Nov. 12, 1874.]



Brief.—Interposes a secondary or local-action copper pole between the poles of a sulphate-of-copper battery, and near the zinc pole, in order to prevent the accumulation of copper upon the zinc pole when the sulphate-of-copper solution rises too high.

A secondary or local circuit-pole, separate and distinct from the primary pole, applied in connection with a primary pole, substantially as and for the purpose set forth.

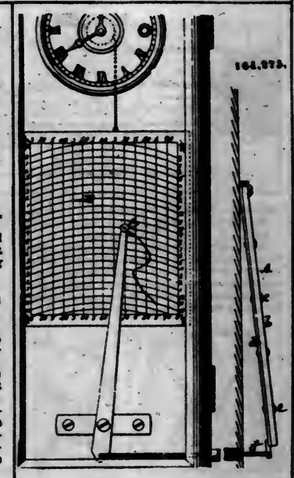
164,871. WINDMILLS. George Desbrough, Utica, N. Y., assignor to Alex. H. Chapin, same place. [Filed May 14, 1874.]

Brief.—The rack is reciprocated circularly by a pinion meshing therewith, and mounted on a vertical shaft provided with hand-wheel. By turning said hand-wheel in one direction or the other, the pinion will cause the rack to slide over the rollers, carrying the gates with it, thus opening and closing them at will.

The slotted gates, supported at their outer ends on rods *e*, the circular reciprocating rack G, the flanged friction-rollers H, the pinion I, and shaft K, in combination with the partitions D, arranged with relation to the wheel B, as shown and described.

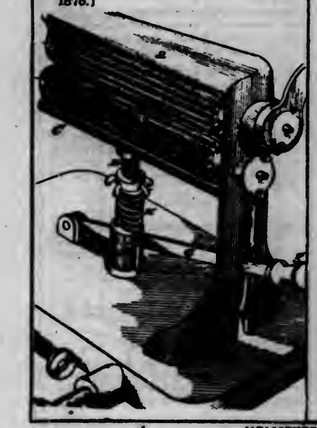
164,872. HAND-STAMPS. J. F. W. Dorman, Baltimore, Md. [Filed May 5, 1875.]

Brief.—The adjustable block is surrounded by rubber bands carrying type, which project through the slot in the hinged type-bearing plate.



1. The rubber type-bands E, block C, and type-case B, combined substantially as specified.

2. The hinged rubber-faced type-plate D, having the opening *d*, combined with the type-case B, substantially as shown.

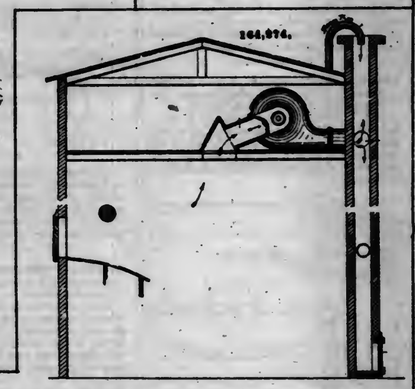


3. The slotted type-case B, combined with the block C and screw *b*, substantially as set forth.

4. The combination of the type-case B, inserted in the handle A, vertically-adjustable block C, rubber type-bands E, and self-clasping hinged plate D, having the rubber type-face *d*, substantially as and for the purposes specified.

164,873.

164,872. FLUTING-MACHINES. Jno. E. Donovan, Cincinnati, Ohio. [Filed Feb. 18, 1875.]

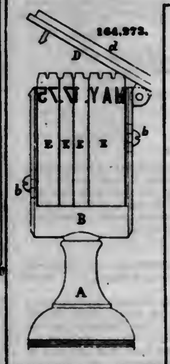


1. The combination of adjustable lower roller-frame C D, slotted post E, socket F, lever G, and spring H, arranged to operate substantially as and for the purpose specified.

2. The combination of adjustable lower roller-frame C D, slotted and screw threaded post E *c*, socket F, lever G, spring H, and adjustable nut I, substantially as and for the purpose specified

3. The combination of adjustable lower roller-frame C D, slotted post E, socket F, lever G, spring H, and catch *e''*, substantially as for the purpose specified

164,874.

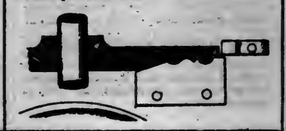


164,874. METHODS OF DESTROYING THE VERMIN AND COLLECTING THE DUST ARISING FROM CARPET-BEATING MACHINES. John Doyle, Philadelphia, Pa. [Filed Mar. 12, 1875.]

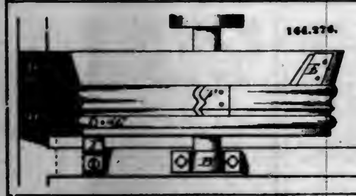
1. The combination of the following elements or devices, namely: an apartment for containing the carpet or fabric, a chimney or receptacle for the reception of the refuse material, a fan for conveying said material from the apartment to the receptacle, and a steam-pipe opening into said chimney or receptacle, the whole being arranged to operate substantially as and for the purpose set forth.

2. The herein-described method of gathering the dust and destroying the insects arising from the cleaning of carpets or other fabrics—that is to say, by conveying the dust, insects, &c., by means of a blast, into a chimney or other suitable receptacle, and there subjecting them to the action of steam, substantially as described.

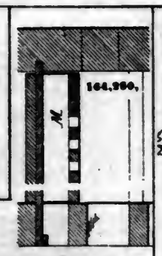
164,872.



164,875. REGISTERING-THERMOMETERS. D. Draper, New York, N. Y., assignor to G. Tagliabue, same place. [Filed Mar. 4, 1875.]



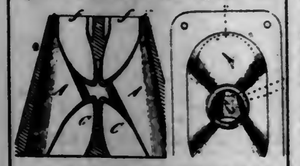
A self-registering thermometer composed of the compound strip of hard rubber and metal, a marker, a time mechanism, and a movable tablet or indicator card, constructed and arranged to operate substantially as described.



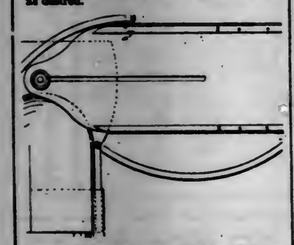
164,876. MACHINES FOR MAKING FENCE-PICKETS. Hillary Dufour, Peter C. Dufour, and E. B. Rowe, Chicago, Ill. [Filed Sept. 7, 1874.]

Brief.—Fence-pickets can be rapidly formed without liability of splitting or injuring the same during the operation of shaping the ornamental head by means of a grooved and ridged revolving cylinder mounted in a suitable frame, and provided with a series of cutters set in recesses in said cylinder, and having their cutting-edges shaped to correspond with the grooves and ridges in the same, in connection with a bearing-plate of corresponding form, for supporting the picket, and suitable rests or guides.

The combination of the grooved and ridged revolving-cylinder, the knives having their cutting-edges shaped to correspond with the grooves and ridges, the bearing-plate H for supporting the picket while being dressed, and the combined rests and guides I I', the whole being constructed for operation, substantially as described.

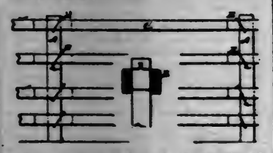


164,277. EXHAUST-NOZZLES FOR STEAM-ENGINES. Henry D. Dunbar, North Hartland, Vt. [Filed Oct. 27, 1874.]



Brief.—The end of one of the exhaust-pipes of each cylinder is surrounded by the main exhaust of the opposite cylinder, by which arrangement the exhaust of each cylinder tends to produce a vacuum in the other, and thereby assists the exhaust of each engine.

The combination and arrangement of the pipes A and C with the exhaust-passages of a steam-engine, the same forming an improved exhaust-nozzle, substantially as described.



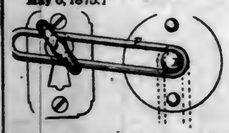
164,278. COAL-CHUTES. Robert Dunbar, Mansfield Valley, and John Keegan, McDonald, Pa. [Filed May 18, 1875.]

Brief.—A coal-chute provided with a swinging and sliding scoop, connected by curved adjustable guard-plates to the sides of the chute-section, so that the lower pivoted end may be set at any angle, to distribute the coal as desired.

A chute for discharging coal or other articles into cars, boats, &c., provided with a swinging and sliding scoop, connected by curved adjustable guard-plates to the sides of the chute-section, to be set to any angle thereto, for conveying the coal without shovelling to any part of the car or boat, substantially in the manner and for the purpose set forth.

164,279. FARM-FENCES. Wm. A. Hinson, Statesville, N. C., assignor of one-half his right to Jacob H. Best, same place. [Filed Feb. 1, 1875.]

In a post and rail fence, the combination of wires B, forming loops on the front and rear of each posts, with the rails, in the manner described, whereby each rails are preserved from contact with the posts, substantially as specified.

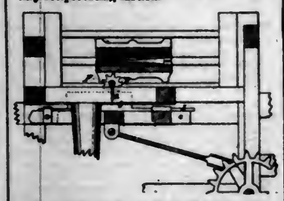


164,280. FIRE-BOXES. William Banis, New York, N. Y. [Filed Oct. 22, 1874.]

Brief.—The interior supporting-bar, of iron, is protected by the inclosing semicircular fire-brick sectional bars.

1. The combination, with a furnace of fire-clay pipes M, supported by internal bars of iron, and having openings, through which air admitted to the said pipes can pass downward therefrom into the fire-place, all substantially as set forth.

2. The combination of the pipes M, each made in two parts, the internal supporting-bars, and the retaining-slabs *d*, all as specified.

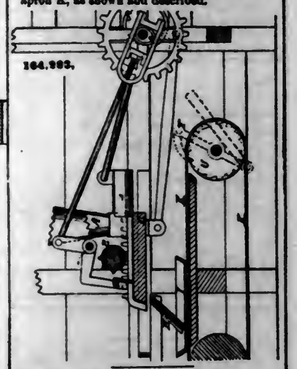


164,281. ADJUSTABLE KEY-FASTENERS. E. B. Everitt, West Meriden, Conn. [Filed May 6, 1875.]

The combination of the button B, having the circumferential groove *c*, and carrying the sliding eye E, and provided with the long shank S, working in the recess R, and the flanged collar C, substantially as described, and for the purpose specified.

164,282. CRACKER-MACHINES. Adam Exton and John Exton, Trenton, N. J. [Filed Mar. 30, 1875.]

Brief.—The cut crackers are delivered upon a table leading to the tubes, which conduct them to the docker. They are swept into the mouth of said tubes by fingers attached to a rod placed over said table, and having a rotary reciprocating motion.



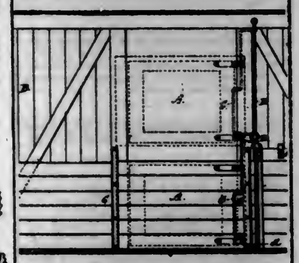
In a cracker-machine, the combination, with a hopper having series of parallel ways or channels, of a rocking shaft arranged at right angles thereto, and provided with radial fingers for taking into said channels, a sliding rack-bar, and a reciprocating frame, upon which the shaft is mounted, as shown and described, whereby the molded crackers are conveyed or impelled along the channels for delivery to the docking apparatus.

164,283. CRACKER-MACHINES. Adam Exton and John Exton, Trenton, N. J. [Filed Mar. 30, 1875.]

1. In a cracker-machine, the combination, with a grooved reciprocating table, of the docking-roller B, having a reciprocating rotary motion, substantially as shown and described.

2. In a cracker-machine, the combination of a reciprocating table, C, a sweep operated so as to rise and fall, as described, and the inclined chute H, all arranged as shown and described.

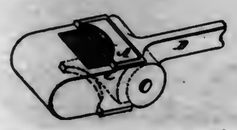
3. In a cracker-machine, the hinged and inclined chute H and the horizontal traveling apron K, as shown and described.



164,284. PUTTING UP YARN. G. P. Farmer, Brooklyn, N. Y. [Filed May 7, 1875.]

1. The mode herein described of putting up cords, yarns, &c.—that is, by inclosing one or more continuous pieces in a wrapper, and arranging each piece in a series of folds, whereby the cord will unlap without entangling when any part is drawn from the end of the wrapper, as set forth.

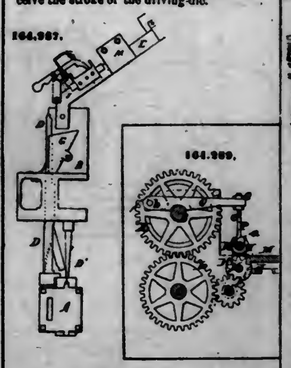
2. As a new article of commerce, a bundle or package of yarn, thread, cord, or other like articles coiled and wrapped in the manner described.



164,285. CAR-DOORS. Robert Ferguson, Toronto, Canada. [Filed Feb. 16, 1875.]

Brief.—Door slides up and turns out of the way, so as to lie flat against the inner sides of the car.

In a car, the combination of sliding bar C, the lower end of which forms arm *d*, door A, rod D, and checking and locking device E, substantially as and for the purposes set forth.



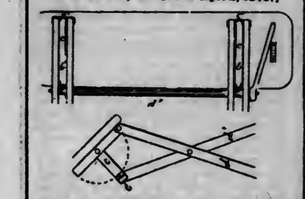
164,286. TRILL-COUPLINGS. Herbert K. Forbis, Danville, Ky., assignor of one-half his right to A. H. Peacock, same place. [Filed Dec. 16, 1874.]

The combination of the block A, concave on its front side, provided with recess B in its rear, and having corner projections *a a* and flanges *x x*, with the clip shaft-iron and the rubber block C, all substantially as set forth.

164,287. MACHINES FOR NAILING BOXES. John H. Foster and Dennis O'Brien Ladd, Chicago, Ill.; said Ladd assignor to said Foster. [Filed Nov. 10, 1874.]

Brief.—The nails pass through a tube which terminates in a swinging end, and delivers them to the clip in a proper position to receive the stroke of the driving-die.

1. The combination of the traveling hollow spindle or guide and nail-conductor, open at or near the top and bottom, the clip, and the die, all arranged and operating together substantially as described, and for the purposes specified.



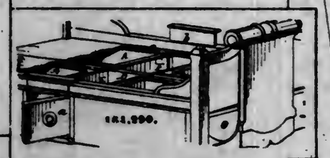
2. The combination of the hollow spindle D, the yielding finger D', the clip, and the die, substantially as and for the purposes specified.

3. The combination of the fixed guide or hopper G and the hollow spindle D D', carried by the die and passing freely through the clip, substantially as and for the purpose specified.

4. The combination of the guide-bars E E, the yielding frame H, provided with the pin I and the stop J, the lever K, and the hollow spindle, substantially as and for the purposes specified.

5. The guide-bars E E, provided with the vertical pieces M M, in combination with the removable block N, attached to the said pieces by means of bolts and nuts, substantially as shown and described, for the purpose of thereby rendering the said bars adjustable to nails of different sizes.

164,288. IRONING-TABLES. S. W. Fraley, Wilkesbarre, Pa. [Filed Apr. 2, 1875.]



In an ironing-board, the combination of the arms *a a*, pivoted to the central point of the cleats *b b'*, and provided with the hooks *c'*, with the sections *d d'*, of the folding frame, substantially as set forth.

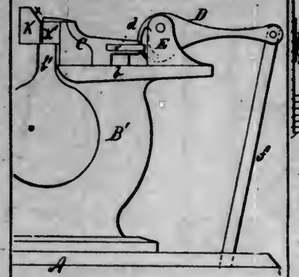
164,289. MACHINES FOR PERFORATING PAPER. Lewis Francis, New York, N. Y. [Filed May 18, 1875.]

Brief.—Feed-rolls work intermittingly to agree with the action of perforating-cylinder.

1. In a machine for perforating paper and other materials, the guide-rollers H I, having a like surface speed to the cutters D, the upper one of which is arranged to partake of the rising and falling movement of the cutters, substantially as described.

2. The combination, with the cutter shaft of a paper-perforating machine, of the pivoted yokes O, vertical arms P, and feed-rollers H and I, substantially as shown and described, the said yokes and arms forming the connection between the feed rollers and the cutter shaft, as set forth.

164,290. BEDSTEADS. Julia B. French, Boston, Mass. [Filed May 3, 1875.]



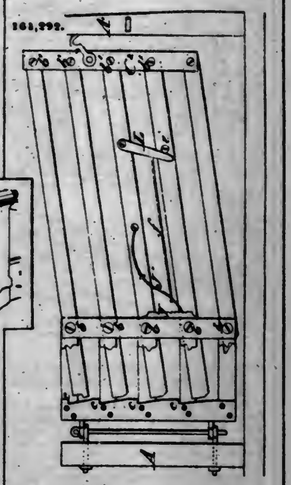
1. The combination, substantially as described, of drawers beneath the bed-bottom, grooved side rails, and a sectional bed-bottom, whose sections constitute a cover for the drawers, and enter the grooves in the side rails, substantially as shown and set forth.

2. The combination, with the foot-board, of the sectional mirror, having its upper section hinged and arranged with relation to the foot-board and the lower section, substantially as and for the purposes set forth.

3. The foot-board and hinged sectional mirror, in combination with a removable cap, substantially as and for the purposes set forth.

164,291. MACHINES FOR CALKING HORSE-SHOES. Erastus Gleason and R. Hamilton, Greenwich, N. Y. [Filed Apr. 23, 1875.]

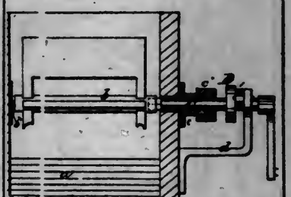
Brief.—Dies are reversible, to serve as the jaws of a vise or calking-dies. Improvement consists chiefly in details of construction.



1. The combination of the standard B, having top surface B'', shoulder *c''*, and vertical dovetail-groove *c'*, with the standard B', having projecting top *b*, dovetailed projections *b'*, and the slide C, having vertical dovetail-groove *c*, and operated by the cam-lever D, substantially as set forth.

2. The combination of the reversible dies having dovetailed projections *m*, with the standards B B' and slide C, substantially as and for the purposes set forth.

3. The combination of the standards B B', and slide C, having dovetailed groove *c'* and *c*, and removable dies and cam-lever D, pivoted between the ears E, the pitman *f*, and a treadle, *g*, all substantially as and for the purposes set forth.



164,292. FARM-GATES. Johnston Golden, Bradford, Vt., assignor of one-half his right to Geo. Baldwin, same place. [Filed Apr. 3, 1875.]

Brief.—When the lever is adjusted on one side of the pin, the pawl will be disengaged from the teeth of the bar; but when the lever is adjusted on the opposite side of pin, the pawl will engage with the bar, and sustain the section after it is raised to the desired height.

The sections C C' of the swinging gate pivoted together, in combination with a pawl, J', and ratchet-bar J, substantially as described.

164,293. ROTARY CHURNS. Jos. Goodman, Pittsburg, Pa. [Filed Apr. 6, 1875.]

The projecting L-shaped bracket *d*, recessed at its upper end, and holding the grooved dog or clamp *e*, in combination with the sliding shaft C, having the shoulder D, working in the stuffing-box *e e'*, substantially as shown and described, and for the purpose specified.

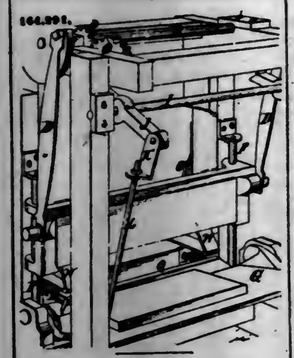
164,294. MACHINES FOR CUTTING HOOPS. Geo. V. Griffith, Huntington, Ind. [Filed Jan. 23, 1875.]

Brief.—The feeding-table oscillates upon trunnions so placed that the edge of the table against which the knife cuts shall be at the center of oscillation.

1. In a hoop-cutting machine, the combination of a reciprocating knife, E, with an oscillating table, G, whose inner edge forms the axis of oscillation, for the purpose of supporting the hoop-planks close to the cutting-edge of the knife, substantially as described.

2. The oscillating table G, adapted for adjustment to and from the knife, substantially as described, for the purpose specified.

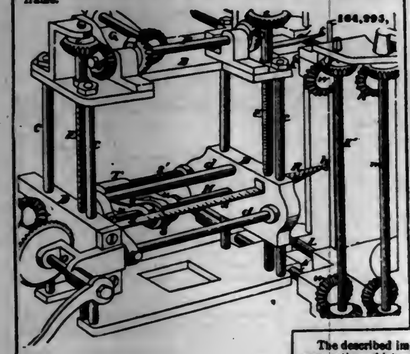
3. The oscillating table operated from the main shaft through the medium of the gearing, the cams M, the pivoted arms J, and the connecting-rods and links L K, substantially as described.



4. The oscillating table having the extent of its oscillations adjustable by means of the screw-rods L and pivoted links K, substantially as described, for the purpose specified.

5. The yielding stop or gage Q, combined with the reciprocating knife and oscillating table, substantially as described, for the purpose specified.

6. The yielding stop or gage Q, adapted for adjustment to regulate the thickness of the hoops, substantially as described.



HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

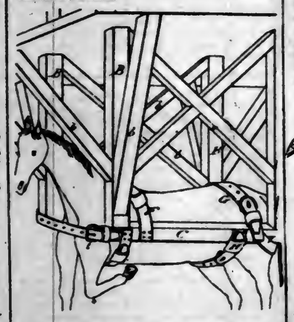
164,991.

164,992. LOCK-MORTISING MACHINES. C. J. Hardee, San Francisco, Cal. [Filed Apr. 10, 1875.]

Brief.—Mortises for the reception of mortise-locks in the edges of doors without removing them from their hinges are made by means of an auger-bit of concave-convex form, having its point sharpened in the cutting side, and bent at right angles to the bit, and mounted in a longitudinally-adjustable frame. The auger is fed to the work by an adjustable nut, provided with two arms, which embrace a collar formed upon the shank of the auger, and with an index-finger for indicating the depth of bore, in connection with a graduated scale attached to the auger-frame. The machine is clamped to the door by two adjustable jaws mounted upon the front of the main frame.

1. The frame, consisting of the sliding heads D D and bolts or rods d d arranged to be moved up or down along the guiding-rods c c by means of the screws E, bevel-wheels e g, and shaft F, and carrying the spindle N, with its boring and lateral-cutting bit R operated by the shaft O and bevel-wheels P g, in combination with screw S, with its nut T having the arms v v and sliding collar S, all combined and arranged to operate substantially as and for the purpose above described.

2. A boring or mortising auger N R, in combination with a laterally-adjustable frame, D, and clamping-jaws J J, when constructed to operate substantially as and for the purpose set forth.



3. In combination with a boring and mortising tool, having the feed-screw S', nut T, with its arms v v, and sliding collar S, the graduated scale X, and index-finger y, substantially as and for the purpose described.

4. In combination with a mortising-bit, R, the short bit 2, for counteracting the edge of the mortise, substantially as specified.

164,993.

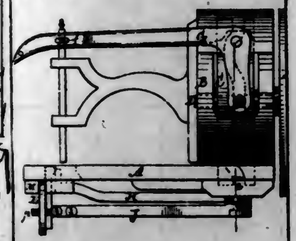
164,994. HORSESHOEING-STOCKS. Robert S. Harris, Wilmington, Del. [Filed Feb 20, 1875.]

Brief.—Consisting of four posts suspended from the ceiling, thoroughly braced by inclined braces, two bars secured to the suspended posts, to which are attached straps to fasten the animal.

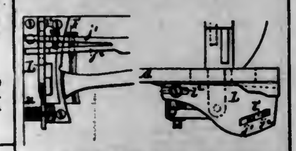
The horseshoeing-stocks herein described, consisting of the pendants B B B B, longitudinal rails C C, and straps D, E, F, G, H, and I, constructed and combined substantially as shown and described.

164,997. METHODS OF ORNAMENTING SKIRTS, &c. Isidor Hauser, New York, N. Y., assignor to Louis Dryfoos, same place. [Filed Mar. 5, 1875.]

The process of ornamenting skirts and other articles, which consists in printing or embossing upon said article the desired ornamental pattern or design, in which are left spaces, as described, then applying to said spaces patches or medallions of fabric differing in color from the fabric of which the body of the skirt or other article is composed, said patches or medallions—when thus placed—being incorporated in and becoming an integral part of the printed or embossed design or pattern, as shown and set forth.



164,998. PROCESSES FOR COATING THE INTERIORS OF CASKS. Geo. Heath, Seneca Falls, N. Y., assignor of one-half his right to A. Proudfoot, same place. [Filed Apr. 8, 1875.]



Brief.—The composition used consists of alcohol, gum-shellac, pulverized charcoal, and beeswax.

The process of coating the interior surfaces of casks with the composition herein described, applied while hot to the heated cask, and then ignited, and the volatile portions burned away, substantially as described, and for the purpose specified.

164,999. SEWING-MACHINES. I P Hicks, Pine Plains, N. Y. [Filed Mar. 4, 1875.]

Brief.—The needle-bar and shuttle and feed-levers are all operated by a single-grooved cam. The end of the feed-levers fits into an inclined slot in the feed-bar, and gives the necessary four motions to the feed-surface. The end of the lever is branched, the branches being moved to and from each other by screws, to regulate the length of stitch. A coil-spring in a cap bears against the side of the feed-bar, to prevent its moving forward till the branched arm strikes the end of the slot, and after the upward motion is given by the inclined slot.

1. The combination of the single-grooved cam C and the needle-lever G, shuttle-lever H, and feed-lever J, arranged and operating substantially as shown and described.

2. The combination of the lever J, divided into branches P P, provided with the set-screws P^1 P^2, and the feed-bar L, having the inclined slot P_3, substantially as shown and described.

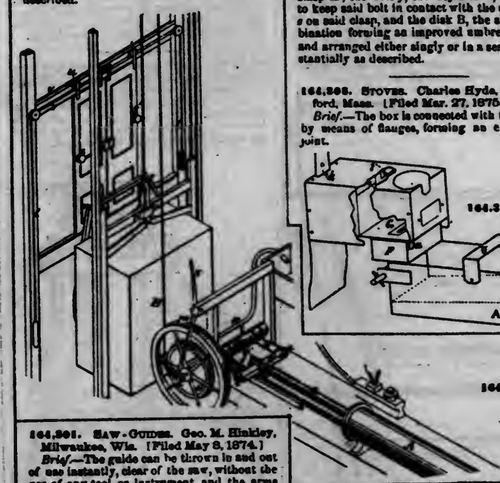
3. The combination of the cap M, spring m, and screw m^1, with the feed-bar L, having the slot P, as shown and described, for the purpose specified.

165,000. HYDRAULIC ELEVATORS. Philip Hinkle, San Francisco, Cal. [Filed Mar. 1, 1875.]

Brief.—The drum-shaft is provided with two pulleys of different diameters, either one to take and wind the rope, according to amount of load. The large pulley is provided with a lip in its flange, and a sliding pin, a forked lever, and clutch, for controlling the operation. The cross-head is connected with the drum by cords carried around pulleys in said cross-head, to equalize the draft. The escape-water, when a load is descending, operates an injector to raise a portion of it. The carriage, ascending, opens the doors at the landings.

1. The pulleys F and G, of different sizes, secured side by side upon the same shaft, the pulley F, having a lip, m, in combination with the shipping mechanism, by which the rope can be run upon either one of the pulleys, substantially as and for the purpose set forth.

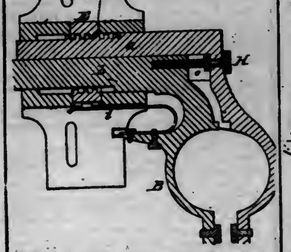
2. The lever J, having its fulcrum upon an arm of the pulley F and attached to the pin l, together with the lever K and central pin L for operating the lever J and shifting the rope H from one pulley to the other, substantially as herein described.



3. In combination with one or more swiveling cross-heads or yokes, C, the pulleys c, with the ropes D in pairs and winding upon the drum E spirally, substantially as and for the purpose herein described.

4. The escape-pipe N, with the branch-pipe extension O to draw away waste water from the tank M and discharge it into the tank P, substantially as herein described.

5. The device consisting of the inclined planes or arms r r, secured to the cage, and the pulleys or rollers s s upon the sliding doors, together with the cords t and the weight or springs for opening and closing the doors as the cage arrives opposite to them and departs, substantially as herein described.

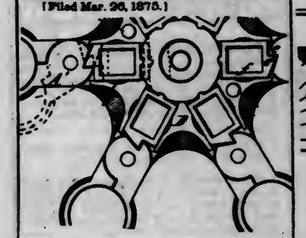


HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

6. The roller s, mounted upon a vibrating shaft, and the arm w and bell-crank lever x, to constructed as to operate as a latch, which is operated by the arm v, substantially as herein described.

164,001. SAW-GUIDES. Geo. M. Hinkley, Milwaukee, Wis. [Filed May 8, 1874.]

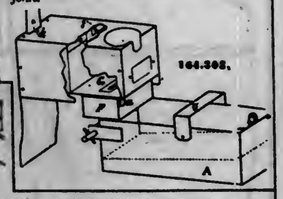
Brief.—The guide can be thrown in and out of use instantly, clear of the saw, without the use of any tool or instrument, and the arms of the guide can be adjusted with relation to each other, or laterally, without changing their relative position.



1. A saw-guide constructed substantially as shown and described, and operated in the manner set forth.

2. The saw-guide consisting of the arm A, having the grooved and threaded shank a, the arm B, having the shank b fitted into the shank a, the screw H, and the bed-plate C, having the nut E mounted therein.

3. In combination with the arms A B, having the shanks a b, constructed and arranged as shown, the support C, nut E, and spring i, arranged as shown.

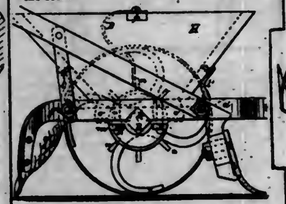


164,002. UMBRELLA-STANDS. William H. Hovey, Springfield, Mass., assignor to himself and Francis Hovey, New York city. [Filed Mar. 26, 1875.]

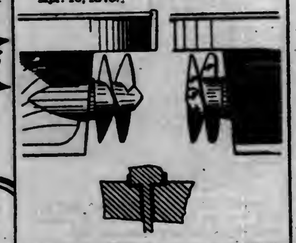
The combination of the following elements: The support C, the plate D, having the fixed projection A thereon, the pivoted swinging clasp A^1, the bolt f, the key-hub m, a spring to keep said bolt in contact with the shoulder g on said clasp, and the disk B, the said combination forming an improved umbrella-rack, and arranged either singly or in a series, substantially as described.

164,003. STOVES. Charles Hyde, Chelmsford, Mass. [Filed Mar. 27, 1875.]

Brief.—The box is connected with the stove by means of flanges, forming an extension-joint.



In a stove substantially such as described, the box F, in combination with the tank A^1, tube G, body a, and funnel M, provided with the cap O, substantially as and for the purpose specified.



164,004. COTTON-SEED PLANTERS. Joseph C. Jenkins, Lebanon, Tenn., assignor of one-half his right to James G. Jolley, same place. [Filed Apr. 20, 1875.]

Brief.—Depending from a cross-piece into the hopper is a leaf-spring, that is struck by paddles on the revolving cylinder to agitate the seed.

The combination, in a cotton-seed planter, of the hopper H, the leaf-spring D, depending from the cross-piece p, and the cylinder O with its paddles or feeders n, as described.

164,005. SCREW-PROPELLERS. John Kelly, Baltimore, Md., assignor of one-half his right to Jos. H. Barker, same place. [Filed Apr. 10, 1875.]

1. A propeller-wheel having a tapering or conical hub, and provided with spiral blades or projections, said blades being arranged in relation to the hub and to each other, so as to form sections of a full screw, substantially as and for the purpose set forth.

2. A propeller-wheel having a series of spirally-projecting blades or projections so arranged that the outer or terminal points of each shall be in advance of the point where the next of the series starts from the largest part of the hub, substantially as and for the purpose set forth.

3. The socket B for the reception of the hub A, in combination with a propeller-wheel and a vessel, substantially as set forth.

164,006. STOVE PIPES AND DRUMS. John Kelshaw, Indianapolis, Ind. [Filed Mar. 10, 1875.]

Brief.—To retard the circulation, and produce a vertical or whirling motion, which is designed to render more certain the consumption of the gases.

A vertical flue, F, formed by a series of alternately projecting diagonal aprons or shelves, in combination with a pipe or drum, substantially as herein shown and described, to operate in the manner set forth.

164,007. IMPLEMENTS FOR HOLDING HOT COAL. Robert G. J. Kennard, Brooklyn, N. Y. [Filed Mar. 26, 1875.]

1. The handle B, provided with the shank A, and plates D, attached to the sides of the shank, in combination with the levers C, pivoted between the plates D, and with springs E for pressing the jaws of the levers apart, substantially as described.

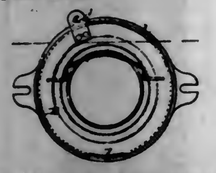
2. The caps or casings G, attached to the plates D, for protecting and concealing the working parts of the implement, substantially as described.

164,008. DRAUGHTSMEN'S MIXING-CUPS. Harry King, Washington, D. C. [Filed Apr. 1, 1875.]

Brief.—The ink is puddled at any side by turning the top upon the diagonal base, and the cover is lifted by pressing down the lever.

1. In a draughtsman's mixing-cup, the combination, substantially as set forth, of a two-part frame, which is diagonally divided, and paddles the ink by rotation of one part on the other, and a compound lever mechanism, which lifts the top by depressing the end of the lever.

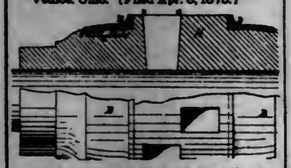
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



2. In a draftsman's mixing-cup, the combination, substantially as described, of the cup-frame, the top clamp, the link, and the hand lever, these members being constructed and operating so as to lift the top from the cup by means of pressure of the hand on the lever, in the manner set forth.

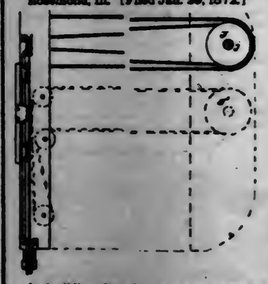
3. In a draftsman's mixing-cup, the combination, substantially as described, of the lid-lifting mechanism and adjustable stop, whereby the opening sweep of the lid may be limited.

4. In a draftsman's mixing-cup, the combination, substantially as described, of the lid-lifting mechanism and adjustable clamps, whereby cups of various diameters may be used, in the manner set forth.



164,309. SETTING-RINGS. Jos. G. Lamb, Norwich, Conn. [Filed Apr. 19, 1875.]

Brief.—The annular plate or upper part of the ring is applied by inserting its edge at one side under one of the lugs, dropping its opposite side, by means of a recess therein, past the opposite lug, and turning it by means of the projection. The shoulders prevent it being turned too far.

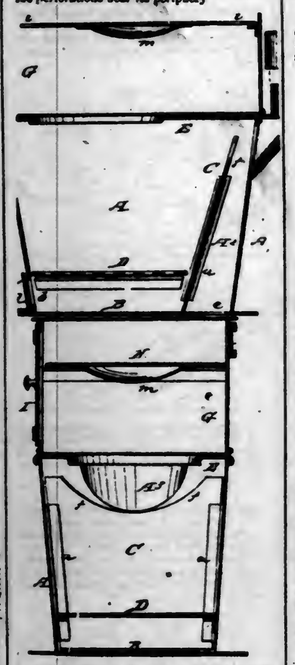


The shell or lower and outer section A of the ring, provided on its upper edge with overlapping lugs or catches and shoulders, in combination with the annular plate B, provided with a projection, *c*, and a bar-traveler arranged within the ring, substantially as described.

164,310. BANDS FOR HUBS. C. H. Liedke, Venice, Ohio. [Filed Apr. 3, 1875.]

As a fastening for wheel-hub bands, the combination, with the band B, of the wedge-shaped bars *b*, having sharpened lower edge *c*, right-angled outer end *c*, and rounded bluntedged inner end *c'*, substantially as set forth.

164,311. STREET-CARS. Samuel H. Little, Rosemond, Ill. [Filed Jan. 20, 1872.]

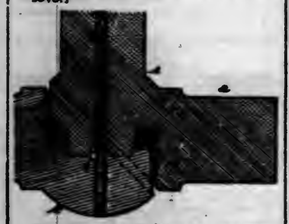


1. A sliding door for street-cars, operated in both directions by means of a continuous cord arranged within reach of the driver.

2. The combination of the door B, cord or strap *c c'*, and drum J, with necessary intervening pulleys, to enable the opening and closing of the door by the driver on the front platform, substantially as described.

164,312. PORTABLE FURNACES. Eli H. Lord and Barnabas D. Evans, Petersburg, Va. [Filed May 19, 1875.]

Brief.—The draft can be modified by adjusting the fire-back. The stove can be placed upon an ordinary stove having flat top with aperture, and the draft allowed to pass down through such aperture, in which case the cap is placed upon the collar. The convex surface beneath the shelf deflects hot air toward the perforations near its periphery

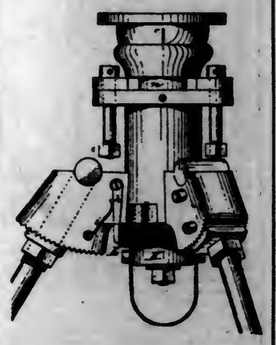


1. The stove or furnace A, provided with the movable fire-back C, forming a partition to divide it into the fire-chamber A^1 and flue A^2, substantially as and for the purposes herein set forth.

2. The combination of the stove A, movable fire-back C, grate D, extension A^3, and collar *h* with cap h^1 and the openings *b c*, substantially as and for the purposes herein set forth.

3. The combination, with a portable stove or furnace, A, of the oven G, shelf H, having perforations *i* and convex surface *m*, the door I, and damper *p*, substantially as and for the purposes herein set forth.

164,313. SAND-CORES FOR CASTINGS. *N.* Lemkenheimer, Cincinnati, Ohio, and A. Ziegler, Newport, Ky. [Filed Apr. 12, 1875.]



In combination with a two-part sand-core, A A *c c*, the molten-metal plug B, substantially as and for the purpose specified.

164,314. PAINT COMPOUNDS. Asa T. Lyon, Cincinnati, Ohio. [Filed Apr. 23, 1875.]

The paint compound consisting of caustic lime, alum, sulphate of zinc, coal-ashes, whiting, asbestus, and boiled linseed-oil, in the proportions named, substantially as described.

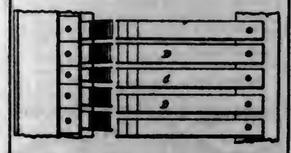
164,315. ADJUSTABLE TRIPODS FOR MINING-DRILLS. James H. Mandeville, Washington, D. C. [Filed May 27, 1875.]

Brief.—The drill-cylinder is adjustably secured to a rotating cylinder by means of a ball-and-socket joint. The legs of the tripod are secured at any angle by lock-nuts.

1. The combination, with a tripod, of a rotating cylinder and a ball-and-socket-joint fastening, for adjusting a drill to work at any angle, substantially as described.

2. A rotating cylinder, in combination with a ball-and-socket-joint fastening, when constructed substantially as described.

3. The combination, with a rotating cylinder, of a table and clamping device, substantially as described.



4. In a tripod for mining-drills, the combination of a stop mechanism with a rotating cylinder, substantially as described.

5. The swinging ball, or its equivalent, in combination with the sleeve or with the tripod, substantially as described.

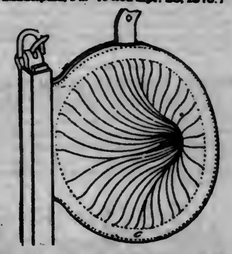
6. The combination, with a serrated hub, of the T-headed legs, the serrated washers, and the fastening-nuts, substantially as described.

164,316. COTTON-GINS. Orren W. Massey, Macon, Ga. [Filed Apr. 26, 1875.]

Brief.—By inclining the ribs toward the center, new surfaces of the roll of unginned cotton are constantly presented to the saws, and the roll compressed endwise, thus lessening the friction of the roll against the ends of the feed box.

The center rib C, made gradually narrower from the upper bend above the saws to the top, in combination with the inclined side ribs D D, inclining from the bend above the saws to the top or center-rib, substantially as shown and described, for the purpose set forth.

164,317. SKIRTS. John McGowan, New York, N. Y. [Filed Apr. 27, 1875.]

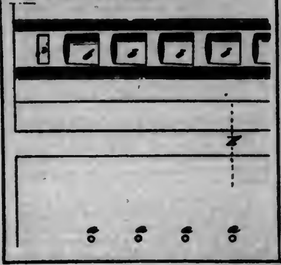


As a new article of manufacture, a felt skirt having an imitation quilted facing embossed in color directly on, and indented into, the cloth of which the skirt is made, substantially as and for the purposes set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

164,317.

164,318. BRIDLE-WINKERS. P. McFadden, Philadelphia, Pa. [Filed Apr. 28, 1875.]

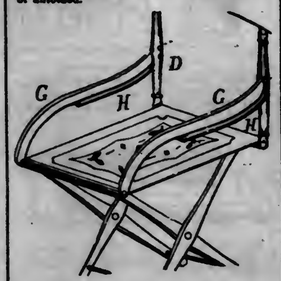


As a new article of manufacture, a bridle-winker having a central elevated portion, C, entirely surrounded at its base by a flange, *c*, produced by two rows of stitching, substantially as described.

164,319. SPIKE-MACHINES. Dennis H. McGookin, Philadelphia, Pa. [Filed Apr. 15, 1875.]

In a spike-machine, the eccentric rolls 18 and 19, constructed with the respective offsets, eccentric and concentric curves, in their perimeters, and arranged to operate together upon the hot bar of iron Z, as described, and shown in Figs. 12, 13, 14, and 15, for the purposes specified.

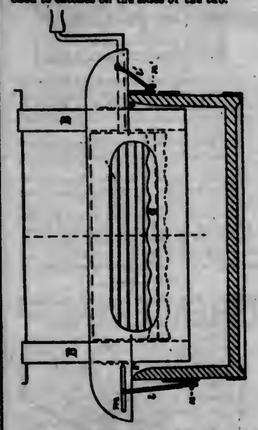
164,320. DIES FOR MANUFACTURING BOLSTERS FOR POCKET-KNIVES. William H. Miller and Geo. W. Miller, Meriden, Conn. [Filed Dec. 3, 1874.]



Brief.—The lower die has the impress of a series of half-bolsters, with a shallow recess on each side of the series, to receive the excess surplus metal. The upper die has a plane surface, with a number of circular indentations, that serve to form rivets by which to unite the bolster to the scale.

As a means of forging a series of bolsters, at one operation, from a single bar of metal, the counter-die B provided with a series of cavities, *b*, and the recess *c* and the die A provided with the series of holes *a*, substantially as herein set forth.

164,321. FOLDING CHAIRS. C. D. Cutman, New York, N. Y. [Filed Mar. 13, 1874.]

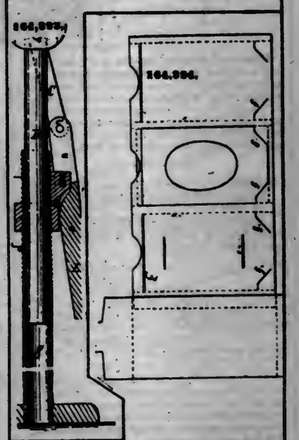


Brief.—Slotted metallic plates are applied to the under side of the arm-rests, so that the guiding and holding screws on the back will move freely in such slots as the chair is folded or unfolded.

In a folding chair, having a hinged back, D, and arm-rests G, the slotted metallic plates H, rigidly secured to said arm-rests and connecting with the back, substantially as and for the purpose set forth.

164,322. WASHING-MACHINES. A. O'Dell, Liverpool, Ohio. [Filed May 2, 1874.]

Brief.—The machine has one main roller, ribbed and grooved longitudinally, having its bearings in a frame or casing directly above, and in contact with a number of smaller rollers, ribbed and grooved transversely; said smaller rollers being likewise journaled within the casing, and receiving motion by contact with the clothes as they pass between them and the main roller. The machine is secured to the tub by means of side pieces provided with springs, which are sprung on and fastened to catches on the sides of the tub.



1. In a washing-machine, the combination of the side pieces having the extensions *b b'* and slots *m*, the rectangular-hooked spring-fastening *l*, pin *n*, loop *l'*, catch *n'*, and tub, constructed as shown.

2. In a washing-machine having the end pieces B, the combination of the main roller C, grooved lengthwise, as shown, and the small rollers *e*, ribbed or corrugated transversely, as shown, for the purposes set forth.

164,323. LIFTING-JACKS. Lewis O'Hara, Oswego, N. Y. [Filed May 20, 1875.]

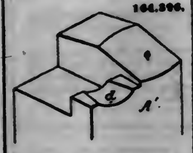
The combination, in a lifting-jack, of the hollow standard S, with its main screw *b*, the rod E, the lever L, with its bifurcated short arm *a'*, the connecting-rods O C, and the screw-slide *c*, as described.

164,324. PHOTOGRAPH-WRAPPERS. Chas. Parker, Newark, N. J. [Filed Sept. 19, 1874.]

As a new article of manufacture, a photograph-wrapper, formed of one thickness of paper, made or folded in two or more sections, having graduated spaces between them, and provided with the transverse openings *c*, and oblique openings *f*, and the tuck-cover, substantially as and for the purposes specified.

164,325. WIRE RACKS FOR EXHIBITING SHIRTS. William D. Phelan, Pittsburg, Pa. [Filed May 17, 1875.]

1. In a rack for displaying shirts, the combination of the two pivoted adjustable frames or sections *a a' a'*, the section *a* being formed or provided with retaining loops or devices to hold the shirt in position, substantially as described.

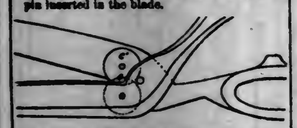


2. The combination, with the pivoted frames *a a' a'*, constructed substantially as shown, of the spring *c*, as and for the purpose specified.

3. As a new article of manufacture, a shirt-rack, consisting of the pivoted adjustable wire frames or sections *a a' a'*, the section *a* having the loops *b b d d e e* and spring *c*, and the section *a'* having the eyes *c*, all as and for the purpose specified.

164,326. DIES FOR FORMING THE RIMS OF HARNESS. John Pinkerton, Philadelphia, Pa. [Filed Apr. 20, 1874.]

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



164,206.

The combination of the dies A A', each having a hollow face, *d*, constructed toward the rear end, and a concave face, *c*, inclined from its rear edge *a* downward toward the front of the die, when the said dies are constructed and arranged relative to each other to permit the transfer of the article being forged from one face to the other, all as set forth.

164,207. TAILORS' SHEARS. Maurice B. Pleas, North Manchester, Ind. [Filed May 15, 1875.]

Brief.—At the rear end of each blade a circular rotating cutting-disk is secured upon a pin inserted in the blade.

In a pair of shears, the rotating circular cutters *c c'*, attached, respectively, to the rear end of each blade in such manner that their exposed surfaces shall be on a line with the inner sides of the blades, substantially as and for the purpose set forth.

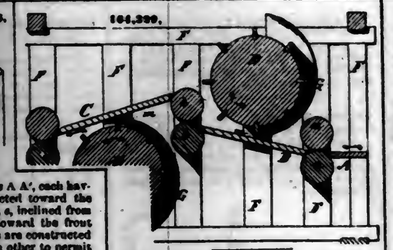
164,208. GAME APPARATUS. Nicholaus Reis, Dayton, Ohio, assignor of one-half his right to J. D. Arres, same place. [Filed Feb. 28, 1875.]

Brief.—Dice with two faces only figured, the other faces being blanks to increase the risk.

As an improvement in game apparatus, a cubical die or dice having four blank faces, and upon the remaining two faces a star, stripe, or other device, substantially as described, and for the purpose set forth.

164,209. MACHINES FOR POLISHING SHEET-IRON. David M. Reynolds, Port Deposit, Md. [Filed Mar. 3, 1875.]

Brief.—The cylinders have blades of india-rubber inserted in their outer surfaces, that operate as polishers; and hinged aprons m, extending across the sheet and actuated by weights, constantly press the passing sheet down upon the upper surface of the inclined table B, and up against the lower surface of the table C.

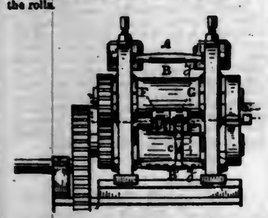


1. In a machine for cleaning and polishing sheet metal, the cylinders D E, having adjustable gum plates or rubbing-surfaces, substantially as described, for the purpose specified.

2. The two rubbing and polishing cylinders D E, combined with the feed-rolls *a a b b*, and inclines B C, arranged and combined to polish the metal sheets on both sides, substantially as described.

3. The combination of the rubbing and polishing cylinders D or E with the inclines B or C, the feed-rolls, and the weighted plates *m*, arranged and operating substantially as and for the purposes set forth.

4. The concave G, combined with the cylinder D, feed-rolls *a a*, and incline B, substantially as and for the purposes set forth.

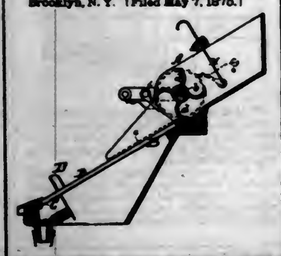


164,210.

The combination of the buffer B, draw-bar D, slides *b* and *c*, spring *g*, and box U, substantially as set forth.

164,211. MANUFACTURE OF TROWELS. J. C. Richardson, Manlius, N. Y. [Filed Nov. 26, 1874.]

Brief.—Diamond-shaped blanks are cut from plate metal. The shank is formed at one point, and the central portion of the blade thinned under a drop-die. The handle is then bent, and the article finished by the operation of the rolls.



1. The improvement in the manufacture of trowels involved in the successive forging operations stated, and illustrated in Figs. 1 to 11 and 1° to 1', inclusive, for the purpose set forth.

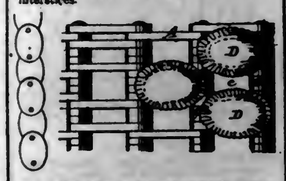
2. The dies A'', with working faces *a''* *a'''* *a''''*, substantially as and for the purpose set forth.

3. The dies B'', with working faces *b''* *b'''* *b''''*, substantially as and for the purpose set forth.

4. The die F, with groove *a*, die G, with groove *b*, and the roll B', with groove *c*, continuous of the groove *b*, in combination with the upper guide H and lower guide H', substantially as and for the purpose set forth.

164,212. NAIL-FEED ATTACHMENTS FOR NAILING-MACHINES. Ferdinand Rochow, Brooklyn, N. Y. [Filed May 7, 1875.]

1. The hopper A, constructed with the converging side plates *a a*, for receiving the nails from the transverse feed-wheel *d*, in combination with the slotted nail-guide B, all substantially as and for the purpose stated.

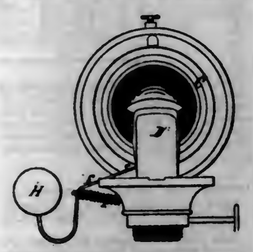


2. The transverse shields D D, in combination with the inclined slotted guide B of the nail-feed, substantially as and for the purpose specified.

3. The reciprocating notched nail-conveyer C, for receiving the nail from the guide and delivering it to the nail-tube, in combination with the guide B, nail-funnel E, and stationary wiper *h*, mounted above the conveyer, and adapted to dislodge the nail from the notch when brought directly over the tube, all substantially as shown and described.

4. The slotted nail-guide B, constructed with beveled sides, as shown, to prevent the nails from resting upon its upper surface between the hopper and conveyer, as set forth.

164,213. FLOOR-MATS. Chas. M. Roullier, Paris, France. [Filed Apr. 12, 1875.]



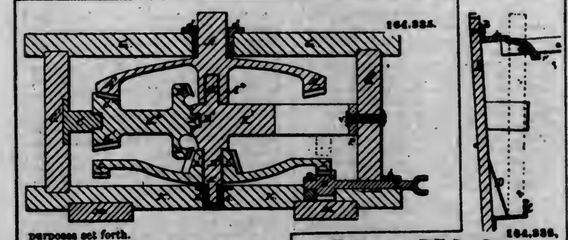
Brief.—This mat may be rolled or folded as woven carpets are, being formed of short links in longitudinal direction, held or hinged upon transverse rods reaching from side to side. The links may be made small to produce meshes, or brushes may be held in alternate interstices.

A self-cleaning mat or carpet, having an interticed articulated foundation, substantially as described.

164,214. LAMP-EXTINGUISHERS. John O. Soderstrom, Pepin, Wis. [Filed Apr. 14, 1875.]

Brief.—The jaws, supported by the curved springs, are kept apart by the arms of the weighted lever, while the lamp is undisturbed.

1. The opposite concave jaws D D, sliding one within the other over the burning wick, as and for the purpose specified.



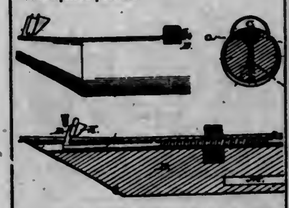
2. The combination, with sliding jaws, of diverging arms *c c*, arranged to vibrate on the inside of and unattached to said jaws, as and for the purpose set forth.

3. The combination, with lever E, having arms *c c*, of rod weight H and spring F, arranged to hold the jaws back from the wick-tube, or allow them to be slid over it by the spring.

164,215. HORSE-POWERS. Lewis Stewart, Camp Hill, Pa. [Filed Apr. 24, 1875.]

Brief.—A three-way bracket serves as an axle for the large gears inserted loosely thereon, and as an inner support for the inner gear-shaft.

1. The spider or bracket structure K' F, provided with the journals B B', and the bearing B', as a central support for the members A' L and C' C' D D', its parts being constructed and arranged substantially as and for the

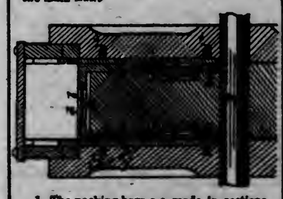


purposes set forth.

2. The combination of the bracket structure K' F, the multiplying members A' L and C' C' D D', all arranged and supported in the frame G G' G' K, and operating to rotate the shaft H by pinion H', substantially in the manner as and for the purpose herein set forth

164,216. STITCH-RIPPERS. Geo. St. George, Jr., Philadelphia, Pa. [Filed May 4, 1875.]

Brief.—The cone is placed in the hem, or between the two pieces of fabric, forming an open seam, and the adjustable knife fixed at the required position.



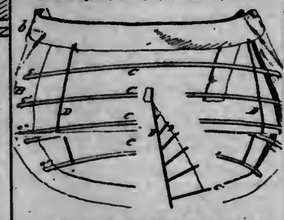
1. The cone A, formed with the opening C and channel *a*, in combination with the slit handle B, substantially as and for the purpose set forth.

2. The combination, with the cone, of the knife D, having an adjustable or sliding movement on the cone, substantially as and for the purpose set forth.

3. The guard-lips L, in combination with the knife D, substantially as and for the purpose set forth.

164,217. ROTARY ENGINES. Timothy B. Stuart, Boston, and John A. Emery, Cambridge, Mass. [Filed Apr. 24, 1875.]

Brief.—Steel plates are inserted at the overlapping joints of the packing-bars, to allow said bars to expand and contract, and prevent the ingress of steam behind them. The abutment is raised and lowered through intermediate mechanism attached to an eccentric on the main shaft



1. The packing-bars *a a*, made in sections, with overlapping joints, provided with steel plates *d* in the joints, and pressed outward by means of springs *b b*, substantially as and for the purposes herein set forth.

2. The combination, with the abutment G of the rod A, adjustable link H, arm I, bar E, steel *k*, with roller *i*, and the eccentric J, all substantially as and for the purposes herein set forth.

3. In a rotary engine, the combination, with the cut-off valve P and its rod *t*, of the slotted adjustable link E, the arm V, and eccentric W, for operating the valve, and the rod *o*, extending through the link E, and forming a handle, S, to catch into the rack *w*, for adjusting the valve substantially as herein set forth.

164,218.

1. The rim B, bent or curved to form upward extensions, which proceed to the waistband, and rest against the person of the wearer, in combination with the upwardly-folding transverse bows C C', &c., connected to said rim, as shown, so as to form an acute angle on their upper sides, and facilitate the closing, substantially as set forth.

2. The rim B, constructed to rest against the person of the wearer, its ends being secured to the waistband, in combination with folding transverse bows C C', &c., attached to it, substantially as described, so that said transverse bows when folded toward the waistband will produce a torsion in the rim, or cause it to bend, so as to produce a spring, substantially as described.

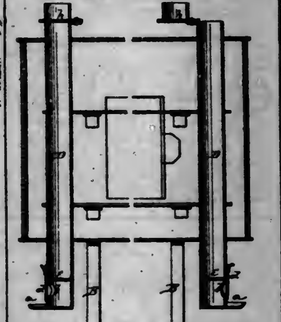
164,219. BUSTLES. Amos W. Thomas, Philadelphia, Pa. [Filed Oct. 17, 1874.]

1. In a bustle, a base-bow, F, formed or combined with upright extensions or ribs F', which rest against the person of the wearer, and provided with spiral curves *f f*, arranged so as to permit said bow to fold upwardly toward the waistband, and cause it to spring downwardly when impost is released, substantially as shown and set forth.

2. In a bustle having a muslin or equivalent back, a bow having its ends bent toward each other, and secured to said back by metal clamps or other fastening devices, substantially as shown and described.

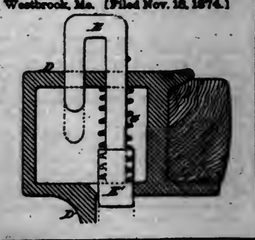
3. The base-bow F, bent to form, or combined with, upward extensions to rest against the person of the wearer, in combination with the transverse bows D D, having their ends attached to a muslin or equivalent back, and a cord or tape, G, confining said bows D D and F, substantially as shown and described.

164,220.



4. In a bustle having vertical ribs or equivalent supports to rest against the person of the wearer, the transverse bows C C', having their ends connected to a fibrous or equivalent back independently of such ribs, so that their bulge or center shall be vertically nearer the waistband than their extremities, as shown and described.

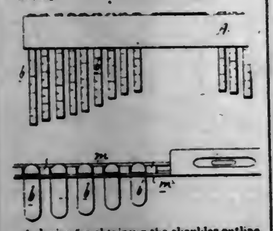
5. The rib F', extending downward vertically from the waistband, forming a base, which rests against the person of the wearer, for the attachment of the transverse folding bows D D, and bulging outwardly from the corners *f f* to form a bow which will fold on its base upwardly toward the waistband, as shown and described.



6. The cords G' G', for holding the bustle in position and preventing displacement, substantially as set forth, said cord being attached to the lower extremity or base of the bustle, as shown.

164,221. PORTABLE STOVES. S. Thompson, Pecatonica, Ill. [Filed Apr. 23, 1875.]

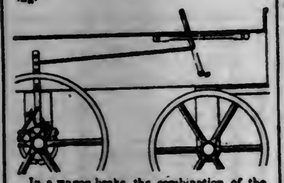
The combination of the stove A, having door C, and interior shelves E E, and the vertical pipes D, with hinged caps *h h* at the top, and provided with hearth *a*, draft-aperture *b*, slides *d*, and grates *e* at or near their lower ends, all substantially as and for the purposes herein set forth.



164,222. HORSE-COLLARS. Wm. J. Thorn, Westbrook, Me. [Filed Nov. 12, 1874.]

1. The U-shaped bolt E, with unequal arms, in combination with the spring G, and parts C D recessed to receive it, substantially as herein specified.

2. The shield D', on the part D, arranged, as shown, relatively to the bolt E and spring G, for the purposes specified.



164,343. TAILORS' DEVICES FOR LAYING OUT GARMENTS. Geo. E. Tiffany, Indianapolis, Ind., assignor of one-half his right to Wm. H. Richardson, same place. [Filed Apr. 7, 1875.]

A device for obtaining the shoulder-outline for garments, consisting of the frame A, the two sets of guide-rods b, the rods of each set having bent ends of different lengths, the springs n, and the spirit-level d, all combined substantially as set forth.

164,344. WAGON-BRAKES. J. C. Trullinger, Portland, Oreg. [Filed Mar. 22, 1875.]

Brief.—Friction applied at hub, instead of at circumference, by devices shown in drawing.

In a wagon-brake, the combination of the clutch A, the hub b, the rock-shaft C, the levers L and l, and the connecting-rods c and d, whereby friction is applied to the wheels of a vehicle at the hub or side of the wheel, substantially as set forth.

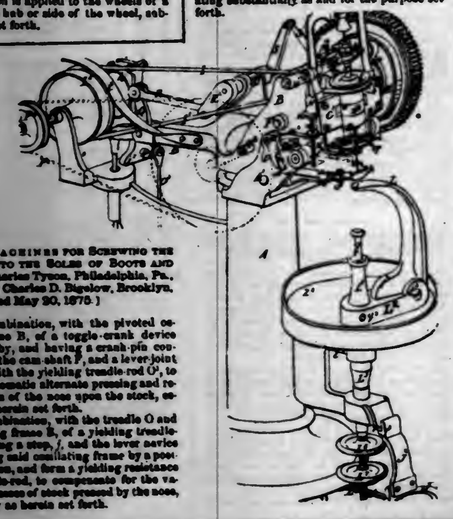
3. The combination, with the clamp depressor E, by means of which the wire is clamped to the spindle, of a hand stop-lever device, whereby the operator is enabled to relieve the clamp-depressor from the action of the cam E^3, and control the operation of driving the screws without stopping the machine.

4. The combination, with the hand controlling-lever device T^2 T', and its spring-pin u, of the fixed and loose arms T E^2, and the interlocking projection t^2, whereby the fixed and loose arms are locked and unlocked to receive the action of the cam E^3 to operate the clamp depressor E, and to render such action non effective in relation to the depressor, as set forth.

5. The combination, with the spindle and its operating cam H, connected for operation substantially as described, of a take-up device, whereby any backlash or play of the spindle is prevented while cutting the screws, and the latter thereby formed free of blanks or irregular threads.

6. The combination, with the cam H, the spindle C, and the rock shaft connection therewith, of the take-up cam S, and an adjustable lever, S_1, on said rock-shaft, whereby to effect a perfect adjustment in preventing backlash of the screwing-spindle, substantially as here in set forth.

7. The combination, with the treadle O and a fixed stop, r, of a pivoted spring-treadle latch, for joint operation with said treadle, substantially as and for the purpose stated.



8. The combination, with the pivoted oscillating frame, the nose which it carries, and the treadle O O^2 of the pivoted spring-treadle latch $J J^2$, and the fixed stop r, substantially as and for the purpose herein set forth.

9. The combination, with the spindle-connecting devices, and the rod N n, uniting the detent therewith, of the detent-arm n^1, having a free or sliding connection upon the rod n, whereby the detent-points are caused to operate as an escapement with rigid coacting points, as herein set forth, and for the purpose stated.

10. The combination, with the detent-carriers, of the connecting-spring n^2 and the arresting device M, whereby both the detent and the arrester are held in proper positions for joint operation.

11. The combination, with the treadle O, and its yielding rod O^1, of the carrier-frame P, having a movement with the treadle-rod O and the band-shifter O^4, and a slight movement independent of them when the treadle is depressed, as set forth, and for the purpose stated.

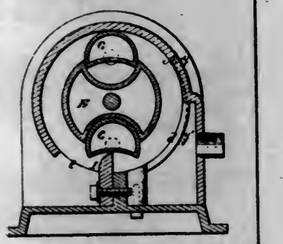
12. The combination, with the pivoted oscillating frame, and its pressing-nose, of the yielding treadle-rod O, its adjustable stop j, and the carrier-frame P, connected and operating substantially as and for the purpose set forth.

164,345. MACHINES FOR SCREWING THE UPPERS ONTO THE SOLES OF BOOTS AND SHOES. Charles Tyson, Philadelphia, Pa., assignor to Charles D. Bigelow, Brooklyn, N. Y. [Filed May 20, 1875.]

1. The combination, with the pivoted oscillating frame B, of a toggle-crank device carried thereby, and having a crank-pin connection with the cam-shaft F, and a lever-joint connection with the yielding treadle-rod O^1, to effect the automatic alternate pressing and releasing action of the nose upon the stock, essentially as herein set forth.

2. The combination, with the treadle O and the oscillating frame B, of a yielding treadle-rod, O^1, having a stop, j, and the lever series Q, for uniting said oscillating frame by a positive connection, and form a yielding resistance by the treadle-rod, to compensate for the varying thicknesses of stock pressed by the nose, substantially as herein set forth.

---

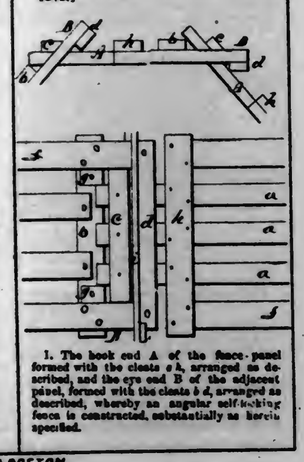


13. The combination of the pivoted band-shifter i, and the stops i^2 i with the rod O^4, its spring O^5 and O^6, and the treadle, for the purpose stated.

14. The combination, with the rotatable work-supporting horn L, of a guard pan, Z^1, to catch and hold the brass cuttings, as described.

15. In a sole screwing machine, the combination, with the cutter-stem p, of the separate cutter-point 3, having its shank 4 soldered in an open angular socket in the stem, to render the cutter point solid, and allow it to be removed and renewed when broken, and without requiring a new cutter-stem.

164,346. ROTARY PRESSURE-BLOWERS. T. L. Varne, Kokomo, Ind. [Filed May 12, 1875.]



Brief.—Improvement on patent to Wm. Pruett, No. 153,202, and consists in placing the gate and inlet and outlet in the lowest part of the outer cylinder, as requiring the wings always to hang evenly balanced, with their concave side downward. The outer cylinder, for a little way above the outlet, is bored out eccentrically, to allow a leakage of air backward to equalize pressures.

1. In a rotary blower, having an interior revolving cylinder, E, with two wings, G G, operating therein at opposite sides, the gate or cut-off I, arranged in a vertical position at the bottom of the stationary case or cylinder, in combination with the wings G G, hung with their concave sides downward, substantially as and for the purposes herein set forth.

2. In a rotary blower, having a revolving cylinder and rotating wings operating within an interior cylinder, the stationary cylinder A, made eccentric on its interior from y to y', substantially as and for the purposes herein set forth.

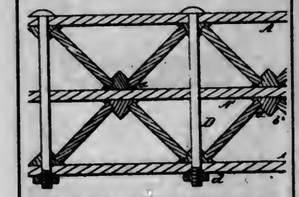
164,347. PORTABLE FENCES. Charles Von De Mark, Hillsdale, Mich. [Filed Apr. 9, 1875.]

1. The hook end A of the fence-panel formed with the cleats a b, arranged as described, and the eye end B of the adjacent panel, formed with the cleats b d, arranged as described, whereby an angular self-locking fence is constructed, substantially as herein specified.

2. The hook-end A of the fence-panel formed with the cleat c, overlapped by the boards a a, and the eye end B of the adjacent panel, formed with the cleat b, overlapping the boards a a, and provided with blocks g g, whereby a straight self-locking fence is constructed, substantially as herein specified.

3. In combination with the fence-panels constructed as herein described, the brace C, formed with its sides f f overlapping the top of the fence to form a rider-notch, l, and with notches l m n, substantially as herein specified.

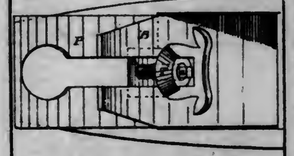
164,348. EARTH-CLOSETS. C. A. Wakefield Pittsfield, Mass. [Filed Mar. 17, 1875.]



Brief.—The lower compartment has a door having beveled or inclined upper and lower edges, and irregular portion near the center of each side. The door fits into a correspondingly-shaped opening in the casing.

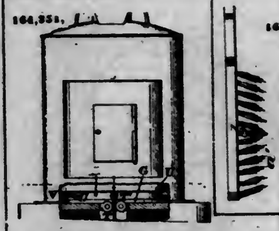
The door I J, having the beveled or inclined upper and lower edges i and zigzag or irregular portion i^2, in combination with the correspondingly-shaped opening in the casing, substantially as and for the purpose shown and described.

164,349. BRIDGE-TRUSSES. Jonathan Wall, Wilmington, Ohio. [Filed Mar. 27, 1875.]



Brief.—A truss for bridges, consisting of three horizontal plates held together by bolts, and braced by short diagonal struts fitted into angle-blocks, which are recessed to receive the ends of said struts.

The combination, in a truss, of the three plates A A' B, short diagonal struts C, recessed angle-blocks $b b' b^2$, and tension-bolts D, said struts being arranged on lines intersecting at or near the middle of the plate A' with their ends resting in the recesses a of the angle-blocks b^2, and the latter arranged on opposite sides, respectively, of the plate A', all substantially as shown and described.



164,350. SHOOK-PLANES. Thos. H. Wall, New Bedford, Mass. [Filed Apr. 20, 1875.]

Brief.—The plane-iron can be readily and conveniently adjusted, and securely held in position, by means of a screw set in the bed of the plane, and extending upward in a line perpendicular to the surface of the bed through a slot in the plane-iron, and a corresponding slot in the break-iron, in connection with a thumb-nut arranged to turn down upon the screw.

The combination, as a plane-iron fastener, of the screw S, set in the bed A, the plane-iron P, and the thumb-nut T, as described.

164,351. SIGNAL-LANTERNS. Geo. Walton and William F. Merrill, Cincinnati, Ohio. [Filed Mar. 22, 1875.]

In a signal-lantern having an outside stationary case and an inside revolving case or screen, adapted to be operated from a distance by means of cords passing to the operator, the combination of the weight S with the inside screen, for returning the latter to its normal position when the operating-cord is released, substantially as described.

164,352. HORSE-POWERS. Z. D. Waters, Brookville, Md. [Filed May 22, 1875.]

Brief.—A cylindrical body is provided with two internal rows of gear-teeth, a combination of wheels and pinions revolving therein around and about a central shaft. The sweeps are provided with rollers engaging under a flange on the body.

1. In combination with the stationary body or shell A, having the two rows of teeth a and b, the central shaft C, the frame M, provided with the pinions N, the frame J, provided with the central pinion K and planetary pinions L, the pinion G, and wheel D, constructed and operating substantially as shown and described.

2. In a horse-power, the combination of an outside circular body or shell, provided with two internal rows of teeth, with two series of planet-wheels and central pinions, substantially as shown and described.

3. In combination with the shouldered central shaft C, having the wheel and pinion D G mounted thereon, the recessed plate H, supported on the shoulder of the shaft, and the gear-frame J, provided with the central hub-bearing in the plate, as shown.

4. In a horse-power, a rotary pinion-carrying frame, consisting of an upper plate and a lower plate, one of said plates being provided with lugs t, and the two plates being united by bolts w, as shown.

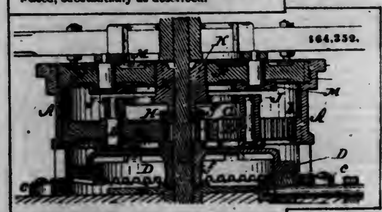
5. In combination with the pinions, having central hubs on their under sides, the frames provided with oil cups or recesses to receive said hubs, as shown and described.

6. In a horse-power, the combination of a vertical central shaft, having two or more pinions or pinion-frames mounted thereon, a foot-plate, d, provided with a recess or oil-cup, e, and a wheel or pinion supported by a hub, f, bearing in said recess, substantially as shown, so that the oil descending on the shaft is finally caught at its foot and applied to the bottom pinion.

7. The gear-carrying frame M, supported by the central screw P, bearing upon the upper end of the shaft C, as shown.

8. In combination with the body A, provided with a flange, s, the gear-frame M, provided with the sweeps or draft-bars O, having the rollers m attached thereto, and arranged to bear under the flange, as shown.

164,353. TOOTH-BRUSHES. Joseph Wayne, Philadelphia, Pa. [Filed Apr. 17, 1875.]



Brief.—The bristles are inclined toward the center of the brush, to produce a better effect in cleaning the teeth.

A tooth-brush having the body of its bristles divided into two sections, a a', each section having its bristles parallel to each other, and inclined toward the other section, the space between the sections being occupied by a central tuft of bristles perpendicular to the base of the brush, substantially as described, and for the purpose set forth.

164,354. CULINARY UTENSILS. John H. Weare and Nathan Weare, Cincinnati, Ohio. [Filed Mar. 20, 1875.]

1. The vessel A, in combination with the plate C, suitably attached at the top, and provided with the lugs g g, adapted to engage inside of the rim a, to effect the bottom fastening, substantially as and for the purpose specified.

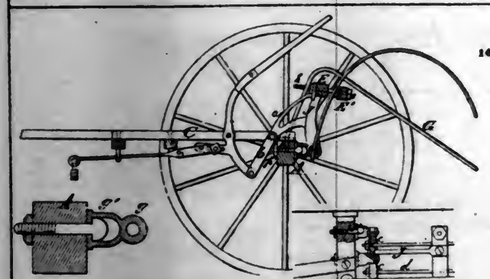
2. The vessel A, in combination with the detachable plate C, having flange d, substantially as and for the purpose specified.

3. The combination of vessel A, having clamping flanges B B and laterally-applicable plate C, constructed and operating substantially as and for the purpose specified.

164,355. TRAM-STAVES. Samuel B. Williams, Bridgeport, Ohio, assignor of one-half his right to Seymour C. W. Dunlevy, same place. [Filed Mar. 6, 1875.]

Brief.—Swinging freely on a vertical spindle, and adjustable by a top screw, is an upright piece extended below into two horizontal arms. To the under side of the arms is attached a guide-bar extending across the face of the stone. By adjustable screws a quill on the bar is put in contact with all points of the circumference. The implement, when adjusted, is fixed by screws on the bottom of the spindle.

The combination of the tram-staff A, bracket B, standard C C^1 C^2, shaft D D^1, and crank-screw E, all constructed and arranged substantially as and for the purpose specified.

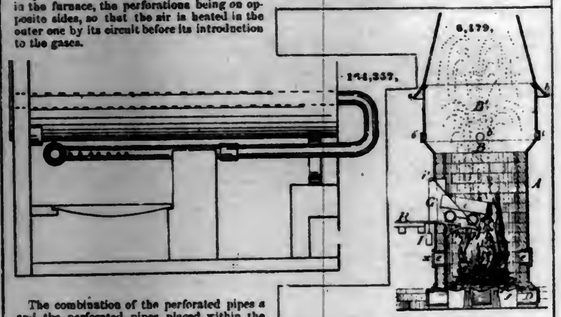


164,356. HORSE HAY-RAKES. Robert Wilson, Ithaca, N. Y. [Filed May 7, 1875.]

Brief.—Each tooth is separately fastened to its own head, which has its bearings in two eye-brackets rigidly secured to the axle. The eye-brackets, by reason of their hollow slotted bases, may be removed by simply loosening the nuts of the securing-bolts.

1. The holding-down bar E and the adjustable under bar E^1 in combination with the raking-teeth, whereby the raking ends of the teeth can be adjusted and set at any desired height from the ground, substantially as described.

2. Angular clearing-teeth G projecting above the axle of the rake, then extending backward and downward over the bars E E^1, substantially as described.



3. The eye-brackets g formed with hollow slotted bases g^1, as and for the purposes set forth.

141,356.

141,356. DEVICES FOR FEEDING AIR TO FURNACES. Joseph L. Winslow, Deering, Me. (Filed May 3, 1875.)

Brief.—A perforated air-tube is concentrically located within another, and both placed in the furnace, the perforations being on opposite sides, so that the air is heated in the outer one by its circuit before its introduction to the gases.

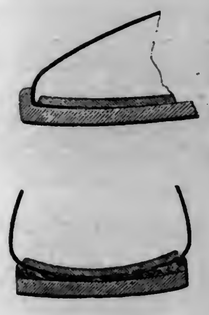
141,357.

6,179.

The combination of the perforated pipes *a* and the perforated pipes placed within the same, the perforations being made upon opposite sides of the respective pipes, for the purpose of transmitting a forced and heated current of pure air into the gases arising from combustion in a furnace or other heating device, as and for the purposes herein described.

141,358. DEVICES FOR HOLDING AND DISPLAYING BROOMS. Jno. W. Yewell, Washington, D. C. (Filed May 3, 1875.)

As a new article of manufacture, the hereinbefore-described holder, constructed of wire in the general form of a triangle, the ends of said wire meeting at one side, and provided with suitable engaging-hooks, substantially as and for the purpose specified.



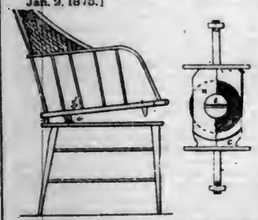
1. The door H, hinged at its bottom edge, and provided with rails, upon which a truck or car travels, having their upper ends curved to stop the car, as and for the purpose described.

2. The cold-air openings b' b', located in section B', and above the combustion-chamber of a refuse-burning furnace, substantially as and for the purposes described.

3. The combination of railway R and truck or car R' with a furnace having opening G and door H, constructed to close automatically, substantially as and for the purpose described.

4. A furnace for burning refuse matter, composed of sections A, B, B', and C, constructed to be supplied in refuse, and the combustion thereof regulated, in the manner and by the means substantially as described.

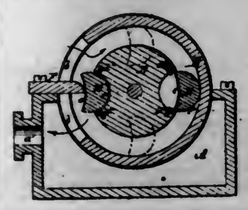
6,360. MANUFACTURE OF BOOTS AND SHOES. Joseph L. Joyce, New Haven, Conn., assignor to the Joyce Protection-Toe Association, same place. Patent No. 141,357, dated July 29, 1873. (Filed May 4, 1875.)



1. In the manufacture of boots and shoes, the insole beveled from the lower side back toward the top and from the upper, or so as to form a space between the edge of the insole and the upper, substantially as and for the purpose specified.

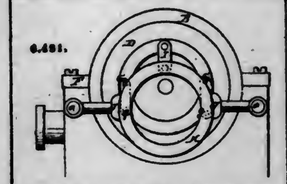
2. In the manufacture of boots and shoes from leather, the sole constructed with a recess, into which the insole and the upper at the edge of the insole are embedded, the surrounding edge of said recess formed from the sole itself, within and so as to preserve the outer edge of the said sole, to show as the whole or part of the principal or outer sole, substantially as described.

REISSUES.



6,479. TILTING CHAIRS. Osmore A. Bingham, Keene, N. H., assignor to George C. Winchester, Ashburnham, Mass. Patent No. 147,891, dated Feb. 24, 1874. (Filed Jan. 2, 1875.)

The flat spring, coiled as described, its outer end carried by and moving with the seat, and its inner end at the center of the coil connected with a pivot-pin, on which the seat turns, in combination with the seat-frame, its support and pivot-pin, and with a side plate, to prevent the spring from moving away from the center of the chair and off from the pivot-pin, substantially as and for the purpose described.



6,479. REFUSE-BURNERS. William Glue, Muskegon, Mich. Patent No. 145,861, dated Dec. 23, 1873. (Filed May 19, 1875.)

Brief.—The door is opened by the loaded car, and, falling to nearly a horizontal position, allows the car to run into the furnace until it is arrested by the curved ends of the track. The cold air openings are above the combustion-chamber, and supply air to keep the upper part of the furnace comparatively cool.

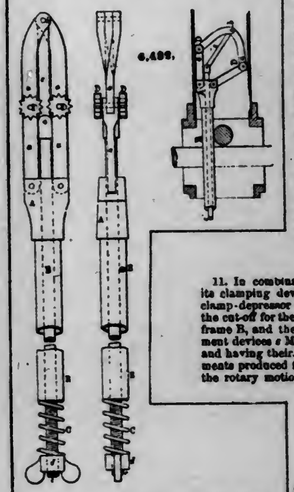
6,481. ROTARY PRESSURE-BLOWERS. Wm. Pruett, Kokomo, Ind., assignor to Tobias L. Varns and Andrew F. Dayhuff. Patent No. 153,202, dated July 21, 1874. (Filed May 22, 1875.)

Brief.—The inner cylinder is longitudinally recessed to receive concavo-convex wings, which are journaled in the cylinder-heads, all revolving together. The concave sides are presented outward as they pass a fixed gate or abutment. Motion of the wings is controlled by an external ring connected by bars to the axes of the wings, and itself controlled by a steadying bar and shoes.

6,481.

1. The combination, in a rotary pressure-blower, of the revolving wheel or cylinder D, having semicircular recesses on opposite sides, and the revolving wings E E, constructed with one concave side, *e*, and one convex side, *e'*, and placed in the recesses on the cylinder D, a gate or cut-off, and mechanism to communicate the described motion to the wings, substantially as and for the purposes herein set forth.

2. The combination of the recessed revolving cylinder D, the revolving concavo-convex wings E E, and the adjustable gate or cut-off F, substantially as and for the purposes herein set forth.



3. In a rotary blower, the combination of the cylinder B and the cylinder D, with heads *d d*, having circumferential grooves, and the packing-rings *d' d'* therein, all substantially as and for the purposes herein set forth.

4. The combination, with the cylinder D and wings E E, of the connecting-rods G G and I and ring H, for the purposes herein set forth.

5. The combination of the ring H, connecting-rods G G, guiding-rod I, and steadying-shoes J J, as herein set forth.

6,482. BOILER-TUBE CLEANERS. Charles Schmandt, Baltimore, Md., assignor of one-half interest to Charles Mittendorff, same place. Patent No. 161,556, dated Mar. 30, 1875. (Filed Apr. 26, 1875.)

Brief.—The jointed arms of the cleaner are provided with revolving cutters, to cut the scale upon the inside of the flues.

6,482.

1. The combination of the wheels D with the jointed arms of a tube or flue cleaner, substantially as and for the purpose specified.

2. The jointed arms a pivoted to the block A, and provided with the revolving wheels D, in combination with the rods *e*, substantially as set forth.

3. The combination of the block A, jointed arms *a*, cutters D, rod *e*, pipe B, spiral spring C, and thumb-nut *d*, substantially as and for the purposes specified.

6,482. MACHINES FOR SCREWING THE UPPERS ONTO THE SOLES OF BOOTS AND SHOES. Charles Tyson, Philadelphia, Pa., assignor, by mesne assignments, to Chas. D. Bigelow, Brooklyn, N. Y. Patent No. 149,007, dated Mar. 24, 1874. (Filed May 27, 1875.)

Brief.—Mechanism is provided for automatically feeding the wire, cutting a screw-thread thereon, determining the length of screw required, proportionate to the varying thicknesses of parts to be united, for inserting the screw, and setering it after insertion.

1. In a machine for screwing the uppers onto the soles of boots and shoes, a clamp, D, for the wire, having a rising and falling movement upon the screwing-spindle, in combination with the spindle C, having an axial and revolving motion, essentially as and for the purpose stated.

2. The combination of the sliding clamp-head D with the toggle-clamp for the wire, and the screwing-spindle, operating substantially as described.

3. The combination of the clamping device for the wire with a depressing device, E, or its equivalent, for operating the clamping device, essentially as described.

4. The combination of the clamping device for the wire and its operating device E, with an arresting device, M, for releasing the wire from the clamp, essentially as described.

5. The arresting device M, for releasing the wire from the clamp, in combination with a holding-and-tripping or escapement device, *s* M', for holding the arrester and allowing it to drop out of the way of the clamp, for the purpose stated.

6. In combination, the depressor E, clamp D for the wire, arrester M, and nose K, and the beak-iron L, operating substantially as and for the purpose described.

7. The combination, in a sole-screwing machine, of the depressor E, the clamp for the wire, the arrester M, the presser-nose K, and the fixed horn, with their operating mechanism, whereby the distance between the nose and the horn will be made equal to that between the depressor and the arrester, to determine the length of each screw by the thickness of the material which may be at the time between the horn and the nose.

8. The escapement-detent *s*, and the stop M', arranged upon the fixed frame, in combination with the screwing-spindle and the operating-cam H, arranged upon the tilting frame B, connected, substantially as described, and for joint operation to release the arrester M at the moment the wire is unclamped, to free the arrester for the farther descent of the spindle, essentially as described.

9. The arrester M, in combination with the escapement devices and the weighted arm *f*, whereby the arrester is raised in position to be held by the detent during the ascent of the spindle, for the purpose, and essentially as described.

10. The combination, with the cam H, of the adjustable connecting-rod N, and the escapement-detent device *s* M', operating substantially as described, and for the purpose set forth.

11. In combination, the screwing-spindle, its clamping device D, for the wire, and the clamp-depressor E, the presser-nose K, and the cut-off for the screw, carried by the tilting frame B, and the arrester M and its escapement devices *s* M', carried by the fixed frame, and having their several and distinct movements produced from the cam-shaft F (except the rotary motion of the spindle) automatically, and in their respective successive relations to each other, for the purpose, and essentially as described.

12. The combination, in a sole-screwing machine, of the oscillating pivoted frame B, with mechanism by which the presser-nose K is alternately depressed and elevated automatically at the insertion of each screw during the operation of the machine, substantially as herein set forth.

13. The combination of the reciprocating frame T with the oscillating pivoted frame B, and the treadle-rod O', to effect the automatic alternate pressing and releasing action of the nose K upon the stock, essentially as described.

14. The combination, with the oscillating pivoted frame and its pressing-nose of the adjustable stop *j*, treadle-rod O', and treadle, whereby the descent of the nose is regulated within fixed limits, to afford working freedom with the horn, as set forth.

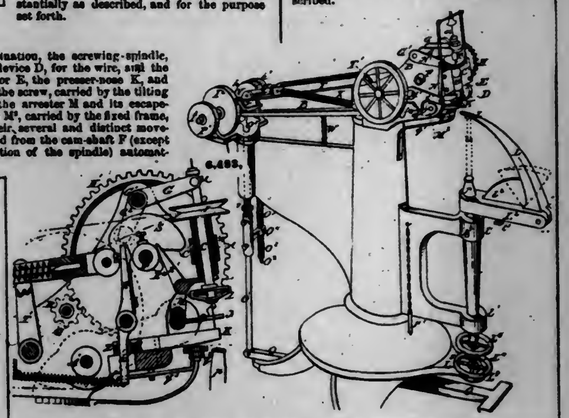
15. The combination, with the oscillating frame B, the treadle-rod O', and the treadle O, of the connected side rod O², provided with the springs O³ and O⁴, and the pivoted band-shifter *i*, whereby the band-shifter has a cushioned connection with the treadle and the shifting of the band made by the act of bringing the nose into working position, as herein set forth.

16. The combination, with the treadle and its rod O', of the yielding connecting-rod U, of the reciprocating frame T, and the oscillating pivoted frame B, whereby the nose is made to press upon different thickness of work, as set forth.

17. The combination, with the adjustable treadle-stop *j* and the pressing-nose K, of the vertically adjustable horn-stem L², whereby both the horn and the nose have fixed adjustments in relation to each other, as set forth.

18. The cutter Y, for severing the screw, having a screw-stem, Y', and nut *n* for adjustment, as described.

19. The removable plates *a a'* of the nose K, arranged and secured as described, and for the purpose stated.



20. The combination of the spindle C for rotating the wire with the lever G connected with said spindle, and an escapement-detent, substantially as described, with the clamping device D, and a screw-cutter, Y, whereby the thread is cut upon the wire without a screw-spindle.

21. The beak-iron L, pivoted as described, in combination with the stem-adjusting screw L³ and its lock-nut L⁴, as and for the purpose described.

22. The socketed stem L² of the beak-iron, in combination with the extensible post *p*, essentially as described, and for the purpose stated.

23. The combination of the socketed extensible post *p* with the removable supporting-pin *p'* for said post, as described.

24. The combination, with the driving-pulley F and the oscillating frame B, of the brake *r*, arranged to be operated by the said oscillating frame in the manner and for the purpose described.

COMMISSIONER'S DECISIONS.

BALDWIN *vs.* BIGELOW.—*Appeal.*

[*Appeal from the Examiners-in-Chief in the matter of the interference between the application of Stephen W. Baldwin and the patent of Horace H. Bigelow, for an* "IMPROVEMENT IN MACHINES FOR MAKING HEELS FOR BOOTS AND SHOES."—*Decided May* 1, 1875.]

An applicant first to conceive, complete, and practically test an invention in a full-sized working machine, which he preserved, held to be the first inventor, although, before he made his application for patent, an independent inventor had procured a patent comprehending the same invention.

Where, for the purpose of practically testing complicated mechanism a slight use of it was made, held that such use was experimental, and not a public use that would work abandonment of the invention, if a patent was not applied for within two years.

The practical utility of some inventions will appear upon inspection; but complicated machinery often requires actual use to demonstrate its success. The statute should not be so applied that such a test would prevent the grant of a patent unless applied for within two years from the time it was made.

THACHER, *Commissioner:*

There seems to be no occasion for entering into an extended review of the testimony in this case, as both the Examiner of Interferences and the Examiners-in-Chief have decided the question of priority in favor of Baldwin, which finding is not seriously questioned. The following brief summary in the facts in the case by the Examiners-in-Chief is sufficient for present purposes:

Baldwin's application was filed August 8, 1871, long after Bigelow had obtained his patent. His application can only be allowed therefore on such evidence as would defeat a suit at law on Bigelow's patent.

His case is a very plain one, leaving no room for doubt, except upon a single point. One McKay had come to an understanding during the war of the rebellion with the War Department, upon the strength of which he undertook to get up machinery for the manufacture of boots and shoes for the use of the army, which he was to supply the government. In carrying out this arrangement he employed Baldwin to get up the machine in question, which was to be employed with others in the production of the articles to be furnished. Baldwin entered upon the construction of it, and there is no doubt had it perfected, so as to operate successfully in the spring of 1865. Something like sixty heels were made, and it was unquestionably complete for practical use. Some slight alterations were made in it, but all within a short time, and none of them affected the principle of its operation.

The close of the war put an entire end to McKay's expectations of making sales of army shoes to the government. It had a large stock on hand, and the market was glutted with them for a long time. McKay at once suspended his preparations to manufacture, and the machine in question was stored away without any further use being made of it. No step was taken afterward in prosecuting the invention for six years, when his application was filed on the 8th of August, 1871.

In the meanwhile Bigelow had constructed his machine, had not merely introduced it into use, but had operated it extensively; had produced a large number of shoes embodying the results of the invention, and sold them in market.

From this statement it is perfectly clear that Baldwin first conceived, completed, and practically tested the invention in a full-sized working machine, which is now in existence. There can be no hesitation in declaring him the prior inventor.

In their decision the Examiners-in-Chief express the opinion that the application of Baldwin—

should be referred to the Primary Examiner to consider whether Baldwin has not so used his invention more than two years before applying for a patent as to lose his right to it under the statute.

The recommendation of the Board was adopted, the Interference suspended, and Baldwin's application remanded to the Principal Examiner for the consideration and determination of the question of public use.

In a very full and elaborate opinion, the Examiner decided that the evidence in the case did not show such use as would operate to bar the grant of a patent to applicant.

After a question of this kind has been determined in the ordinary way by an Examiner I am not disposed to review the matter unless it is apparent that a gross error has been committed. In this case, however, the interests at stake are apparently so important, and the contest has been so vigorous, that I have carefully examined this question with the purpose of satisfying myself whether the decision of the Examiner is correct.

I fully concur in his opinion that there is no evidence of public use which would bar the grant of a patent to Baldwin. Only fifty or sixty heels were made upon the machine, and this use was simply for the purpose of testing the practical working of the apparatus. Such a test, in the case of complicated machinery, is necessary to a satisfactory demonstration of the completion and perfection of the invention. There are many inventions, the practical utility of which will be recognized upon mere inspection, and in such cases there is no occasion for any application of the test of use; but all inventions cannot be judged by the same test. A machine involving the combination of many devices will almost invariably require demonstration of its practical success by actual use. If such a test should be used to prevent the issue of a patent to the inventor, unless he applies within two years thereafter, (no other use of the machine having intervened,) it would in my opinion be gross injustice, and such an application of the law as was never intended or warranted by any decision with which I am familiar. The completion of the invention by Baldwin, and the demonstration by experimental use that it was practical and adapted to the purpose for which it was designed, gave to him an indefeasible right thereto, which would prevent the issue of a valid patent to any subsequent inventor. As there was only this experimental use of the machine for the purpose of testing its utility before the application for a patent was made, there was no forfeiture by Baldwin of his right to a patent unless he distinctly dedicated his invention to the public, evidence of which is entirely wanting.

Priority of invention and the right to a patent are awarded to the applicant, Stephen W. Baldwin.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

CHRISTOPHER MEYER AND JOHN EVANS *vs.* STEPHEN PRITCHARD.

[*In equity.—Before* BLATCHFORD, *J.—May*, 1874.]

The invention covered by the letters patent to Christopher Meyer and John Evans, July 16, 1872, for an "improvement in rubber overshoes," which claims, "As a new article of manufacture, india-rubber shoes, with strengthening or other pieces homogeneous with the body, formed by thickening up the said substance in forming the sheet, substantially as specified," is, to thicken up the plastic india-rubber in desired places, in the sheet, as the sheet is being formed between two rolls, by means of grooves and ribs on one of the rolls, the other roll being plain, so as to leave the sheet thicker where the india-rubber has entered the grooves than it is in the other parts, and thus make a sheet which is a flat plane on one side and has raised ribs or projections on the other side, and to make such ribs or projections on that part of the sheet which is to be used to form the upper part of the shoe.

As the process of making the sheet into the shoe and vulcanizing the shoe is not different from the process used to make a sheet into a shoe and vulcanize the shoe when the ribs or projections are formed by pasting the strips on by hand, it follows that the patented invention is really complete when the sheet is made by the means described, ready to be made up into a shoe and to be vulcanized.

A sheet out of which to cut the upper part of an india-rubber shoe, such sheet and such upper part having a variety of thickness in different parts, and being formed in one piece at a single operation by the use of rollers, one of which has a surface the reverse of the form to be produced, is an analogous manufacture in all respects to the sheet out of which to cut the sole of an india-rubber shoe, as described in the patent of Hyatt and Meyer of January 17, 1854, such sheet and sole having a variety of thickness in different parts, and being formed in the manner above described.

The shoe having the material of the upper part so thickened up is not a new article of manufacture in view of the prior shoe having the material of the sole so thickened up.

The fabric not being new, the application of it to make the upper part of the shoe is a mere double use of the same invention.

[*S. D. Law*, for complainants.
George Harding and *J. H. Ackerman*, for defendant.]

BLATCHFORD, *J.*:

This suit is brought on reissued letters patent granted to the plaintiffs, July 16, 1872, for an "improvement in rubber overshoes," the original letters patent having been granted to them, as inventors, February 21, 1871. The specification says:

Our invention relates to the strengthening-ribs employed upon the uppers of india-rubber shoes, and consists in an improvement which will be hereinafter described, and subsequently specified in claim.

Figures 1 and 3 represent plan views of two modifications of these ribs, and Fig. 2 a sectional view of forming-rolls, with the plastic substance passing therethrough. Fig. 4 is a section of Fig. 1.

A A, in Fig. 1, represent plain ribs, inclosing a space, in configuration similar to the openings in the uppers of ordinary rubbers. B represents a rib around the top or mouth of the shoe. *b* is an imitation thread passing around each rib. A' A', in Fig. 3, represent the ribs arranged in the form of a single ornamental buckle. B', in Fig. 3, represents rolls, of which the lower is plain, and the upper ribbed or pointed at *d*, and grooved at *c*, to make the strengthening-ribs A A' or B, and the rows of imitation-stitches *b*, which said ribs and grooves will be in any form or shape and location on the roller, according to the form or location of the rib or other device it is desired to produce. The imitation-stitches may consist either of indentations formed in the surface of the sheet or points projecting above the surface—the one will be formed by projections on the rollers, and the other by indentations. *a a* represent the ribs formed from plastic rubber as it is carried through the rolls, and it will be observed that they are not corrugations, like the strengthening-ribs used upon metal, but a thickening up of the substance in certain lines or directions. *a'*, in this figure, represents the indentations to imitate thread-stitches.

The process through which the material passes, to bring it into the form required, is as follows: The mass of plastic rubber is forced into the opening between the molding or shaping rolls, and drawn out into a sheet, with the ribs and points or indentations completely shaped. It is then made up into the shoe or sandal and vulcanized.

We thus produce these ribs or figures in homogeneous connection with the other part of the sheet. They are, therefore, better than when of separate strips, pasted on in the gummy state after the sheet is formed and secured to it in the vulcanizing process, as in the common way; and, being formed at the same time the sheet is rolled, and by the same operation, it is done without expense other than the preparing of the grooves, indentations, and points in the rollers. Moreover, the said ribs or figures will be much more perfect and uniform than when done by hand. The same is true in regard to the imitation-stitching, also, which has heretofore been made by a pointed wheel rolled alongside of the ribs by hand.

The claim is in these words:

As a new article of manufacture, india-rubber shoes, with strengthening or other ribs homogeneous with the substance of the body, formed by thickening up the said substance in the forming of the sheet, substantially as specified.

The invention set forth in this specification, as shown by the description and the claim, is to thicken up the plastic india-rubber, in desired places, in the sheet, as the sheet is being formed between two rolls, by means of grooves and ribs on one of the rolls, the other roll being plain, so as to leave the sheet thicker where the india-rubber has entered the grooves than it is in the other parts of it, and thus make a sheet which is a flat plane on one side, and has raised ribs or projections on the other side. The application of this idea, developed in the specification, is, to make these ribs or projections on that part of the sheet which is to be used to form the upper part of the shoe—that part which covers the top of the foot, and that part which surrounds the opening through which the foot enters the shoe. The advantage set forth is, that the ribs or projections thus made are of one substance with the rest of the material, and in homogeneous connection with it, and, therefore, better and more cheaply, uniformly, and perfectly made, than when made by pasting on strips by hand to form the ribs or projections. The patented invention is really complete when the sheet is made by the means described, ready to be made up into a shoe and to be vulcanized. The process of making the sheet into the shoe and vulcanizing the shoe is no different from the process used to make a sheet into a shoe and vulcanize the shoe, when the ribs or projections are formed by pasting strips on the sheet by hand.

With this view of the invention, it is impossible to say that there is anything of patentable novelty or patentable invention in it beyond what is fully shown in the patent granted to Elias C. Hyatt and Christopher Meyer, January 17, 1854, for an "improvement in the manufacture of boot and shoe soles of gutta percha or india-rubber." The specification of this patent describes the use of two rollers. One of them is a smooth roller. The other roller, called the soling-roller, has three distinct circumferences, which produce three different thicknesses of the sole. The material, in a soft state, is passed between the rollers in a continuous sheet. The smooth roller produces a smooth surface on one side of the soling. The other roller produces, of different thicknesses, the fore part, the shank, and the heel of the sole. Thus, in one operation is performed what had previously been done in three distinct processes, and the soling is formed in one continuous sheet. The specification goes on to say:

Heretofore india-rubber soling has been made one strip of equal thickness throughout, or by several strips of different thicknesses for heel, shank, and forepart, cemented together at their ends, or of one strip having the length and breadth of the sole, with separate pieces cemented thereon to give proper thickness to the heel and forepart of the sole. It is at once evident that the first is an inferior sole, and requires more material than the others; and that the second and third require additional labor in the manufacture, and that the parts are liable to become separated in the process of manufacture, or afterward, causing loss to the manufacturer or consumer. It is equally obvious that all these inconveniences and imperfections are avoided by making the sole in one piece, as above described, by one process, and that such sole is thus produced at once, better and cheaper than heretofore. We are aware that india-rubber has long since been reduced to sheets by rolling, and that the rollers used for this purpose have sometimes been engraved to produce a figured surface, analogous to that often cemented to the heels and fore parts of shoes; but these sheets have been of substantially uniform thickness, varying only in the slight indentations, &c., required to produce an ornamental or figured surface. This we do not claim. But we are not aware that india-rubber has ever been rolled into sheets having a substantial variety of thickness in its different parts. Nor are we aware that shoe-soles, having the proper variety of thickness, have ever been rolled out or made in one solid piece before our invention. Nor was it known that such forms could be produced as we have produced them in india-rubber, until our experiment practically illustrated the fact.

The claims of this patent, three in number, are in these words:

1. Producing a shoe-sole, or other analogous manufacture, in india-rubber or gutta-percha, in one piece, having variety of thickness in its different parts, by the use of rollers, whose surfaces present the reverse of the forms to be produced, at a single operation, substantially as herein described.

2. Forming soling of india-rubber or gutta-percha, with shanks, fore parts, and heels of appropriate differences of thickness, in one solid piece, and at one operation, as described, thus producing a useful, economical, and novel manufacture.

3. We also claim such soling or analogous manufacture in continuous sheets, at one operation, by rolling, as described.

The specification of this patent to Hyatt and Meyer fully instructs those engaged in the manufacture of india-rubber shoes how to roll unvulcanized india-rubber into a sheet having a substantial variety of thickness in its different parts, the sheet being made in one solid piece, the variety of thickness being produced by a thickening up of the material in any desired place, one face of the sheet being smooth and the other face having projections upon it, the projections having a homogeneous connection with the other parts of the sheet, with the advantage of cheapness and durability, as contradistinguished from giving the increased thickness by pasting on, or cementing on, separate strips or pieces of the material, and the result being produced by the use of rollers, one of which is smooth and the other is of such configuration on its surface as to admit of more material in thickness being left at one place than at another. A person who makes a sheet according to the patent sued on makes it strictly in accordance with the directions of the earlier patent, without any addition. A sheet out of which to cut the upper part of an india-rubber shoe, such sheet and such upper part having a variety of thickness in different parts, and being formed in one piece, at a single operation, by the use of rollers, one of which has a surface the reverse of the form to be produced, is an analogous manufacture, in all respects, to a sheet out of which to cut the sole of an india-rubber shoe, the sheet and the sole having a variety of thickness in different parts, and being formed in the manner above described. When the sheet is prepared from which to make the upper part of the shoe, such upper part is cut and made from it in the same manner in which the sole is cut and made from the prepared sheet from which to make the sole. The shoe having the substance or material of the upper part so thickened up is not a new article of manufacture, in view of the prior shoe having the substance or material of the sole so thickened up. It is a mere double use of the same invention. The fabric not being new, the application of it to make the upper part of a shoe is not invention, nothing novel being required to adapt it to make such upper part. The fabric which is described in the plaintiffs' patent is directly within the first and third claims of the earlier patent. The fabric of the earlier patent includes the whole of the invention set forth in the plaintiffs' patent. (*Smith vs. Elliott*, 9 Blatchf. C. C. R., 400.)

The bill must be dismissed, with costs.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date June 15, 1875.]

8,386.—Chapeau-Block.—THOMAS AGENS and JOHN C. POST, Newark, N. J. Application filed February 1, 1873. Term of patent 7 years.

8,387.—Glassware.—WILLIAM LEIGHTON, Jr., Wheeling, W. Va. Application filed May 27, 1875. Term of patent 14 years.

8,388.—Medal.—JOSEPH W. LINCO, Philadelphia, Pa. Application filed April 28, 1875. Term of patent 7 years.

8,389.—Handles of Table-Knives.—LUCAS J. MARCH, Deerfield, assignor to JOHN RUSSELL CUTLERY COMPANY, Turner's Falls, Mass. Application filed April 3, 1875. Term of patent 7 years.

8,390.—Beer-Mugs, Ale-Glasses, &c.—THOMAS C. PEARS, Pittsburg, Pa. Application filed May 31, 1875. Term of patent 7 years.

8,391.—Locomotive Head-Lights.—THOMAS S. RAY and CHARLES T. HAM, Buffalo, New York. Application filed June 3, 1875. Term of patent 3½ years.

8,393.—Drinking-Fountain.—WILLIAM TWEEDDALE, Brooklyn, N. Y. Application filed May 28, 1875. Term of patent 7 years.

8,393.—Plates of Range.—NICHOLAS S. VEDDER and TOMAS S. HEISTER, Troy, N. Y., assignors to CHARLES NOBLE, M. D., CHARLES NOBLE, and FRANCIS P. NICHOLSON, Philadelphia, Pa. Application filed June 4, 1875. Term of patent 14 years.

8,394.—Range.—HENRY A. WOOD, Bangor, Me. Application filed April 3, 1875. Term of patent 7 years.

8,395.—Coffin-Handles.—MARTIN H. CRANE, Cincinnati, Ohio, assignor to CRANE, BREED & Co., same place.—Case B. Application filed May 12, 1875. Term of patent 7 years.

8,396 and 8,397.—Chain-Pump Curb.—HENRY L. FRY, Cincinnati, Ohio, assignor to JAMES L. HAVEN & Co., same place.—Cases A and B. Applications filed April 10, 1875. Term of patents 14 years.

8,398.—Game-Board.—CHARLES G. HARGER, Jr., Watertown, N. Y. Application filed May 28, 1875. Term of patent 14 years.

8,399 to 8,403, inclusive.—Oil-Cloths.—JAMES HUTCHISON, Newark, N. J., assignor to THOMAS POTTER, SONS & Co., Philadelphia, Pa.—Cases A, B, C, D, and E. Applications filed June 8, 1875. Term of patents 3½ years.

8,404 and 8,405.—Carpets.—THOMAS J. STEARNS, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place.—Cases H and I. Applications filed June 8, 1875. Term of patents 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date June 15, 1875.]

2,665.—Salted, Pickled, and Preserved Salmon.—J. W. & V. COOK, Clifton, Oregon. Application filed June 5, 1875.

"a design representing the imperial crown of Great Britain, having the words 'Crown Brand' printed upon its base band."

2,666.—Cigars.—F. DE BARY & Co., New York, N. Y. Application filed May 12, 1875.

"words 'La Perla,' with the other features of the fac-simile, as described."

2,667.—Coffee.—GILLESPIE, ZELLER & Co., Philadelphia, Pa. Application filed June 2, 1875.

"the representation of two coffee-bags, one lying across the other, on the upper one of which are the letters 'G. Z. & Co.'"

2,668.—Anti-Friction Metal.—GEORGE S. HUNT, Sacramento, Cal., and BENJAMIN F. HUNT, St. Louis, Mo. Application filed May 24, 1875.

"word 'diamond.'"

2,669.—Medicated Belts.—LOVE & WILLSON, Atlanta, Ga. Application filed June 8, 1875.

"the representation of an anchor."

2,670.—Gin.—M. E. OSBORN & Co., Cincinnati, Ohio. Application filed June 4, 1875.

"words 'CRYSTAL WAVE.'"

2,671.—Summer-Furnaces.—CHRISTOPHER RIEGNER, Washington, D. C. Application filed June 9, 1875.

"words 'SUMMER QUEEN.'"

2,672.—Camp-Lounges.—THE CAMP-LOUNGE COMPANY, Troy, N. Y. Application filed January 18, 1875.

"a pictorial representation of our camp-lounge folded and ready for transportation."

2,673.—Pans.—A. A. VANTINE & Co., New York, N. Y. Application filed April 30, 1875.

"the pictorial representation of the main building of the Centennial Exposition Buildings at Philadelphia."

2,674.—Flour.—M. R. BORTREE & Co., Chicago, Ill. Application filed April 19, 1875.

"words 'Fancy Loaf,' and the size and style of the letters in the word Fancy and in the word Loaf, the figures 196, the XXXX, the word Palmyra, and the letters M and O."

2,675.—Bosom-Shirts.—GEORGE B. CLUETT, BRO. & Co., Troy, N. Y. Application filed June 7, 1875.

"words 'Monarch Shirts,' and the cut of a crown interposed between, or similarly placed near them."

2,676.—Pavements.—LEWIS S. FILBERT, Philadelphia, Pa. Application filed May 6, 1875.

"words 'Vulcanite Pavement.'"

2,677.—Cigars.—FOSTER, HILSON & Co., New York, N. Y. Application filed May 15, 1875.

"the representation of a lion, with a figure of a boy resting in graceful position on the body of the same, being allegorically expressive of reliance in strength."

2,678.—Combined Planing and Matching Machines.—FRANK & Co., Buffalo, N. Y. Application filed April 29, 1875.

"word 'ECONOMIST.'"

2,679.—Articles of Ladies' and Children's Wear.—GEORGE FROST & Co., Boston, Massachusetts. Application filed June 8, 1875.

"Maltese cross."

2,680.—Hosiery.—JOHN J. GLAZIER, BROTHER & Co., Philadelphia, Pa. Application filed May 17, 1875.

"word 'CENTENNIAL.'"

2,681.—Toy Balloons.—GEORGE F. HEIDET, New York, N.Y. Case A. Application filed May 20, 1875.

"the representation of the front elevation of the proposed Centennial Exhibition Building at Philadelphia."

2,682.—Toy Balloons.—GEORGE F. HEIDET, New York, N. Y. Case B. Application filed May 20, 1875.

"word Centennial.'"

2,683.—Medicine.—HENRY C. HOUGH, Providence, R. I. Application filed May 28, 1875.

"words 'Dr. Hough's Anti Scrofula Syrup or Matchless Purifier of the Blood' and a correct likeness of myself."

2,684.—Brandy.—IVES, BEECHER & Co., New York, N. Y. Application filed May 15, 1875.

"words 'Renault & Co., Cognac.' Over said letters is an armorial crest, consisting of a lion rampant standing on a crown."

2,685.—Hosiery.—KIBBE, CHAFFEE & Co., Philadelphia, Pa. Application filed June 5, 1875.

"letters 'K, S, C, and B,' arranged in the form of a diamond, with an arrow in the open space between."

2,686.—Cigars.—A. LICHTENSTEIN & BROTHER, New York, N. Y.—Case A. Application filed May 31, 1875.

"the representation of the head of an elk."

2,687.—Cigars.—A. LICHTENSTEIN & BROTHER, New York, N. Y.—Case B. Application filed May 31, 1875.

"word 'ELK.'"

2,688.—Hats.—MALLORY MANUFACTURING COMPANY, Bridgeport, Conn. Application filed May 24, 1875.

"the figure of a twisted drooping spring-hoop, such as is inserted in the brims of hats to cause the brims to droop at the front and rear and rise at the sides."

2,689.—Medicine.—WILLIAM H. PANCOAST, Millstone, N. J. Application filed April 30, 1875.

"words 'Shake No More.'"

2,690.—Toilet-Powder.—OTTO TOUCHÉ, New Orleans, La. Application filed May 8, 1875.

"words 'Ladies' Favorite' and a female bust with arms and hands, in the latter of which is shown a package, upon which is inscribed the words 'Ladies' Favorite.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date June 15, 1875.]

256.—Title: **"Great Fever Remedy—Ten-Day-Ague Cure."**—ANNIE M. COBB, Newark, N. J. Application filed May 11, 1875.

257.—Title: **"The Standard Desk-Pad."**—H. T. JOHNSON & Co., Boston, Mass. Application filed May 27, 1875.

258.—Title: **"Dr. Evans' Herb Syrup."**—ELIZA MILLER and EMELINE E. EDWARDS, Philadelphia, Pa. Application filed May 13, 1875.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 13, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture	2,500
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS	6,000
BRIDGES; including ferry-guards, girders and columns, piers	400
CARDING, CLOTH, CORDAGE, KNITTING, SILK, SPINNING, WEAVING	4,800
RAILWAYS, complete, about	3,500
ELECTRICITY, (in progress,) to July, 1871	888
TEXTILE, (in progress,) to July, 1871, about	4,800

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., May 19, 1875.

On the petition of ANN JENNETTE HATHAWAY, of Milwaukee, Wis., executrix of JOSHUA HATHAWAY, deceased, authorized by act of Congress approved February 18, 1875, praying for the extension of a patent granted to the said JOSHUA HATHAWAY, on the 3d day of April, 1860, for an Improvement in Devices for Converting Reciprocating into Rotary Motion,

It is ordered that the testimony in the case be closed on the 20th day of July next; that the time for filing arguments and the Examiner's report be limited to the 30th day of July next; and that said petition be heard on the 4th day of August next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

INDEX OF INVENTIONS PATENTED JUNE 15, 1875.

	Class No.	No. of Patent.
Acid, dissolving tribasic phosphate of lime in water containing carbonic, A. Jas	35	164,457
Alarm register, fire, W. W. Sawyer	42	164,506
Alarm signal box, fire, S. Chester	50	164,425
Alarm signal box, fire, W. E. Facer	50	164,537
Alarm signal box, fire, R. N. Tooker	50	164,406
Alkali, composition for coating blocks of caustic, T. C. Taylor	35	164,405
Anger, earth, J. T. Kemper	51	164,460
Bag, cloth, T. W. Grister	95	164,549
Bag, cloth, T. W. Grister	95	164,550
Band used in driving machinery, regulating and adjusting, C. Anderson	87	164,411
Bank check, &c., I. P. Turner	54	164,614
Barrel, ventilating, E. B. Georgia	58	164,542
Bars and rods, machine for upsetting metallic, E. Kaylor	60	164,450
Bath tub, E. Chamberlain	8	164,493
Beams and girders, manufacture of metallic, A. Kloman	60	164,379
Bedstead, sofa, A. Holmers	62	164,454
Belting, leather, C. H., H. W., and E. P. Alexander	81	164,507
Bit, driving, Huis and Jenks	72	164,375
Blackboard eraser, G. H. Grant	146	164,547
Blind slat adjuster, W. M. Lanphere	24	164,464
Blind stop, T. T. Duffy	24	164,431
Boiler feeder, T. Reese	148	164,595
Boiler, portable, Johnson and Wilde	59	164,564
Boiler, sectional steam, A. Kipp, Jr	148	164,377
Boiler stand, range, L. Brandels	154	164,420
Boilers, crown sheet for steam, S. B. Ganon	149	164,540
Boot tree, R. Turneaure	16	164,496
Boots and shoes, machine for attaching soles to, C. W. Collyer	16	164,363
Brake and elevator, automatic, Smith and Myers	79	164,603
Bridge, truss, H. Barton	91	164,511
Bridle bit, Harteon and Bronson	72	164,554
Bridle bit, J. G. Peterson	72	164,500
Broom brace, J. B. Sharp	22	164,490
Brush, fountain, R. S. Van Zandt	22	164,498
Brushes, mold for arranging bristles for, C. R. Baker	22	164,412
Buckle, trace, B. F. Winey	23	164,501
Burial casket case, J. S. Waterman	39	164,619
Burner, gas, I. Cook	64	164,587
Burner, gas, I. Cook	64	164,588
Burner spring, lamp, W. N. Weeden	90	164,622
Bustle, M. K. Bortree	80	164,515
Camphor, permanent flour of, I. M. Phelps	35	164,478
Can, oil, Kittredge and Clark	107	164,378
Candle holder clamp, F. A. Schroeder	90	164,509
Cap, mask, M. Marks	76	164,473
Car coupling, H. Blackmore	122	164,419
Car coupling, J. G. Rogers	122	164,487
Car coupling, H. B. E. Von Elsner	122	164,615
Car mover, Woodworth and Fredricks	79	164,504
Car starter, G. Hunter	122	164,455
Car wheel, G. G. Lobdell	122	164,570
Car window, J. L. M. Du Four	121	164,534
Carbureter, J. H. Bean	27	164,360
Carbureter, J. C. Henderson	27	164,558
Card, playing, P. D. Anb	143	164,508
Carding and combing machines, cylinder for wool, J. K. Proctor	28	164,503
Carriage fifth wheel, J. Clubb	31	164,426
Chain swivels, die for making heads of, W. C. Edge	86	164,366
Chair, convertible, H. H. Ham	62	164,370
Chair, recumbent, J. H. Swasey	62	164,607
Chemise, O. Westcott	38	164,408
Churn, rotary, O. M. Merrick	45	164,491
Churns, stand for barrel, J. H. Dunbar	45	164,235
Cloth tentering machine, W. H. Palmer, Jr	37	164,587
Clothes pin, E. F. Kreiwits	91	164,461
Cock, stop, J. L. Frisbie	148	164,538
Coffee steeper, E. R. Daken	136	164,530
Cooler, milk, Read and Allen	45	164,480
Cooling apparatus for rooms, W. Braeunlick	58	164,421
Crochet machine, S. L. Otis	99	164,585
Cultivator, W. L. Hopper	43	164,372
Cultivator axles, Die for molding, C. H. Thompson	60	164,610
Cultivator, rotary, J. H. Coon	43	164,428
Curtain fixture, H. M. Converse	62	164,524
Curtain roller, Extension, O. P. Furman	62	164,440
Curtain rollers, device for operating, F. H. Bettys	62	164,361
Dentifrice, composition for, A. C. Dung	46	164,433
Doll, W. Miller	143	164,582
Drawing and spinning machines, regulator for hemp, J. Good	142	164,546
Drill for drilling metal, H. Smith	100	164,604
Drill, rock, G. H. Reynolds	124	164,394
Drill tripod, rock, G. H. Reynolds	124	164,395
Drill tripod, rock, G. H. Reynolds	124	164,396
Eaves troughs, machine for making, W. W. Laing	136	164,567
Elevator, D. S. Bailey	79	164,359
Elevator, grain, J. S. Metcalf	79	164,577
Elevators, automatic brake for, Smith and Myers	79	164,603
Engine valve gear, steam, Hutchison and Govier	152	164,456
Exercising machine or health lift, J. P. Marsh	143	164,574
Eyeletting machine, J. E. Wiggin, (reissue)	23	6,469
Fabric, napped, L. W. Whipple	95	164,626
Faucet, H. Gnoesell	167	164,545
Faucet, R. L. Hallett	167	164,448
Feed water regulator, G. Henry	148	164,559
Fence, portable, S. Olmstead	52	164,474
Fence, portable, J. L. Welshans	52	164,500
Fence, wire, J. Haich	52	164,552
Fence, wire, L. and J. C. Merrill	52	164,576
Fertilizer crusher and distributer, W. McE. Dye	133	164,435
Fertilizer distributer, C. Bailey	133	164,509
Fifth wheel, O. B. Thompson	31	164,611
Fifth wheel for carriages, J. Clubb	31	164,426
Fire brick for furnaces, F. Strattner	154	164,494
Flour sieve, G. C. Eastman	98	164,436
Forge, portable, D. C. Baxter	60	164,512
Furnace, H. M. Smith	149	164,402
Furnace, H. M. Smith	149	164,404
Furnace, hot air, G. W. White	154	164,627

	Class No.	No. of Patent.
Furnace, steam boiler, H. M. Smith	149	164,403
Furnaces, fire brick for, F. Strattner	154	164,494
Gas, machine for manufacturing vapor, G. B. Caldwell	66	164 422
Gate, automatic, R. A. Horning	52	164,373
Gate, farm, T. Snider	52	164,605
Generators, circulation in steam, E. Mill	148	164,580
Glass, &c., mold for, A. P. Brooke	68	164,517
Glove, W. Meyer	38	164,578
Grain drill and planter, Reutchler and Morgan	133	164,482
Grate bar, J. A. Sinclair	149	164,401
Grates, shutter for, F. S. Bissell	154	164,418
Grinding machine, E. Morris	70	164,583
Hair weaving loom, M. R. Kenyon	95	164,565
Halter straps, holder or fastener for, A. and S. L. Hagny	144	164,551
Hammer, drop, F. A. Pratt	60	164,393
Harrow, J. Rloth	73	164,484
Harvester, L. and J. Miller, (reissue)	74	6,485
Harvester crank and pin, J. Kline, (reissue)	67	6,490
Harvester cutter, R. Dutton	74	164,434
Hat bodies, machine for forming, J. Gill	76	164 544
Head light, locomotive, W. H. and A. E. Briggs	90	164,516
Heel polishing machine, L. Graf	15	164,443
Hinge, S. T. Davis	24	164,365
Hinge, lock, J. Aikman	24	164,410
Hives, mold for shaping wax comb guides for, J. F. Ervin	9	164,438
Hoisting machine, V. Dubamel	79	164 432
Honey extractor, centrifugal, A. W. Dawley	135	164 531
Horse detacher, J. A. Maze	31	164,467
Horse power, H. Parkhurst	139	164 588
Horse power link, B. L. Olds	150	164,473
Hub borer, A. Bascom	31	164,415
Hydrant, W. Scott	167	164,489
Insect destroying composition, Douglass and Green	63	164 533
Ironing apparatus, J. W. Gardner	91	164,441
Kettle, tea, N. A. Menaar	136	164,385
Knit fabric, F. A. Calley	89	164,362
Ladder, extension, R. Gilchriest	30	164 442
Lamp shade, S. R. Kneeland	90	164 380
Lamps, formation of glass, J. J. Hoyt	68	164 374
Lap board, O. M. Merrick	38	164,388
Lathe beds to different heights, mechanism for adjusting, W. H. Hoffman	100	164,560
Leather washer, C. T. Grilley	92	164,444
Leather washer, C. T. Grilley	92	164,446
Leather washers, mechanism for forming, C. T. Grilley	92	164,445
Lighter, portable, J. A. Watson	90	164,620
Lighting and heating houses, apparatus for, F. C. Hooton	90	164,371
Lime in water containing carbonic acid, dissolving tribasic phosphate of, A. Jas	35	164,457
Liquor tester, filterer, and emptier, combined, W. F. Hellen	47	164,451
Lock, combination seal, H. Clarke	93	164,522
Lock for sliding doors, mortise, B. Mallory	93	164 572
Locomotive head light, W. H. and A. E. Briggs	90	164,516
Loom, hair weaving, M. R. Kenyon	95	164,565
Loom shuttle, E. M. Stevens	95	164,493
Machinery, regulating and adjusting bands used in driving, C. Anderson	87	164,411
Mail bag catch, B. Uneles	162	164,616
Mask cap, M. Marks	76	164,573
Measure, rotary, A. Chambers	42	164,434
Mechanical movement, W. F. and J. Barnes	67	164,413
Mechanical movement, W. F. and J. Barnes	67	164,414
Metal shearing machine, F. A. Pratt	119	164,391
Metal working machines, tool receptacle for, W. H. Hoffman	100	164,561
Motor, C. Van De Mark	67	164,407
Nut lock, J. C. Wright	14	164,505
Oiler, R. B. Perkins	87	164,589
Ordnance, breech loading, P. B. Lawson	105	164,568
Organ reed, J. E. Norton	106	164,472
Organ stop knob, R. Burdett	106	164,518
Organ valve, Nordstrom and Hutchings	106	164,585
Paint compound, I. L. Merrell	107	164,469
Palate, artificial, J. Peyer	156	164,591
Pan forming machine, W. Chalmers	136	164,520
Paper bag, E. Langgesser	109	164 462
Paper bag, E. Mill	109	164,389
Paper bag machine, T. W. Grinter	109	164,548
Paper box, E. D. F. Shelton	109	164,601
Paper feeding machine, Schoffield and Baker	117	164,488
Paper making machines, cylinder for, R. McMurray	109	164,468
Pencil case, magic, A. T. Cross	146	164,430
Pencil sharpener, M. McCall	146	164,575
Photographs, lubricator for, E. R. Weston	111	164,625
Piling, driver for sheet, S. Gardner	82	164,541
Pins and dowels, machine for making, R. H. and O. S. Eldridge	173	164,367
Pipe tongs and cutter, C. Fenton	100	164,368
Planers, wood holding device for metal, A. B. Prouty	100	164,594
Planter, corn, J. K. Welter	133	164,624
Plow, C. Myers	114	164,471
Plow irons, roll for welding, W. M. Watson	114	164,621
Plumber's joint, I. F. Van Dusen, (reissue)	136	6,488
Polishing or rod iron, W. B. Sanders	91	164,597
Potato bug destroying machine, T. Job	63	164,376
Press, W. H. Penniston	7	164,476
Press, cotton and hay, Tapley, Steel, and Beasley	7	164,606
Printer's side stick and quoin, W. Gilbert	117	164,543
Printing, producing plates for, L. H. Miller	54	164 581
Printing press, C. Wells	117	164,499
Pruning shears, manufacture of, S. S. Miles	63	164,579
Pump, E. F. Adsitt	118	164 506
Pump and check valve, Johnson and Nettleton	118	165.563
Pyrophore, G. E. F. Kastner	102	164 458
Radiator, steam, J. Shackleton	147	164,600
Railroad rails, roll for utilizing the fag ends of, H. Chisholm, (reissue)	120	6,484
Railway axle box, J. N. Smith, (reissue)	123	6,487
Railway rail chair, G. O. Ross	120	164,596
Railway rail joint, W. Haddock	120	164 369
Railway switch, W. W. Colley	120	164 523
Railway time signal, J. C. Paige	120	164,475
Rake, F. W. Hawkins	77	164,450
Range boiler stand, L. Brandels	154	164,420
Range, portable, G. G. Wolfe	154	164 630
Relishing machine, G. W. Conlee	173	164 427
Roll for welding plow irons, W. M. Watson	60	164,621
Rooms, cooling apparatus for, W. Braeunlick	58	164,421
Roof, M. A. Shepard	126	164,602
Sad iron heater, J. S. Bitler	91	164,513
Sash fastener, A. Long	24	164 571
Sash fastener, A. C. Manning	24	164,465
Sash fastener, ventilating, A. C. Manning	24	164,466
Sausage machine, J. H. Beam	25	164 416
Saw buck, Hayton and Hurlburt	131	164,556
Saw frame, W. Hankin	131	164,449
Saw sharpening machine, J. A. Miller	131	164,470
Scraper, E. Dickinson	51	164,532
Screw cutting die, V. J. Reece	14	164,481
Sewing machine, C. S. Cushman	134	164 529
Sewing machine motor, G. R. Everson	134	164,439
Sewing machine shuttle, Beaver and Tallman	134	164,417
Shafts, fastening wheels and pulleys to, J. F. Thomas	87	164 609
Shearing machine, metal, F. A. Pratt	119	164,391
Sheet metal, machine for corrugating, W. B. and O. P. Scaife	136	164,399
Ships, &c., device for automatically discharging water from, Peters and Holt	137	164,477
Shirt collar, Wall and Ludington	38	164,617
Shoe sole edge trimmer, J. W. Lefferts	16	164,560
Shoe tip, C. T. Grilley	16	164,447
Shutter, fire proof, G. F. Kissam	4	164,566
Shutter worker, T. J. Carroll	24	164,519
Shutter worker, W. M. Lanphere	24	164,463
Sidewalks, device for distributing ashes on icy, W. W. Hughes	110	164,562
Siding, machine for cutting, W. W. Le Grande	92	164,381
Sign, H. J. Blowney	146	164,514
Signaling apparatus, switch, Toucey, Smith, and Buchanan	120	164 612
Sing, machine for granulating, S. Robbins	85	164,397
Soap cutting machine, C. F. Sieber	26	164 400
Soap, transparent, S. Struez	26	164,606
Spark arrester, D. R. Proctor	94	164,393
Spinning jacks, stopping mechanism for, F. H. Crocker	142	164,429
Spinning machines, regulator for hemp, C. Herschaft	142	164,452
Spinning ring, W. W. Stearns	142	164,492
Spinning rings, holding and adjusting driver for, F. J. Dutcher	142	164,536
Stool, rotary, A. Rice	62	164,483
Stove, base burning, Hawley and and Lennox	154	164,555
Stove, heating, M. Pierce	154	164 592
Stove reservoir, C. Truesdale	154	164,613
Stove, reservoir cooking, G. G. Wolfe	154	164 629
Sugar cutting machine, F. Rochow	155	164,485
Sugar cutting machine, F. Rochow	155	164,486
Switch rod, safety, D. Rowe	120	164 398
Table, extension, W. Maus	62	164,383
Table, extension, J. Poolman	62	164,479
Tank regulator, A. Fuller	167	164,539
Target, T. B. Connery	143	164,525
Tiling, manufacture of, F. H. Hall	126	164,553
Time recording instrument, T. Mayhew	42	164 384
Toy pistol, R. W. Churchill	143	164 521
Toy wagon, F. W. Porter	143	164 390
Treadle, S. Elliott	67	164 437
Tubing, manufacture of metal, W. L. McNair	163	164,497
Valve gear, Wannieck and Koeppner	152	164 618
Walls of buildings, construction of, J. Wingrave	4	164,628
Wash bench, O. M. Merrick	91	164,386
Washing machine, W. Combs	91	164 364
Washing machine, Wise and Lane	91	164,502
Water filter, P. Ball	167	164,510
Water wheel, C. H. Sturges	168	164,495
Weather board gage, D. Neff	29	164,584
Weather strip, N. Liddell	30	164,382
Weather threshold, W. H. Wood	30	164,503
Wells, pumping, Nickerson and Streeter, (reissue)	118	6,486
Whiffletree, W. G. Hearn	31	164,557
Wind wheel, L. D. Abrams	118	164,409
Windmill, B. Welrich	118	164,623
Wooden pins, machine for making, G. W. Conlee	175	164,526
Wrench, I. W. Heysinger	100	164,453

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JUNE 15, 1875.

	Patent No.
Abrams, L. D., Wind wheel	164,409
Adsitt, E. F., Pump	164,506
Aikman, J., Lock hinge	164,410
Alexander, C. H., H. W., and E. P., Leather belting	164,507
Allen and Read	164,480
Anderson, C., Regulating and adjusting bands used in driving machinery	164,411
Armstrong, F., assignee	164,519
Aub, P. D., Playing card	164,508
Aultman, C., & Co., assignees, (reissue)	6,485
Baer, J. H., assignee	164,509
Bailey, C., Fertilizer distributer	164,509
Bailey, D. S., Elevator	164,359
Bailey, G. W., assignee	164,571
Baker and Scholfield	164,488
Baker, C. R., Mold for arranging bristles for brushes	164,412
Ball, P., Water filter	164,510
Banigan, J., assignee	164,562
Barnes, W. F. and J., Mechanical movement	164,413
Barnes, W. F. and J., Mechanical movement	164,414
Barton, H., Truss bridge	164,511
Bascom, A., Hub borer	164,415
Bass, J. P., assignee	164,625
Baxter, D. C., Portable forge	164,512
Beam, J. H., Sausage machine	164,416
Bean, J. H., Carburetor	164,360
Bear, W., assignee, (reissue)	6,490
Beasley, Tappey, and Steel	164 608
Beaver, J., and J. M. Tallman, Sewing machine shuttle	164,417
Benedict and Burnham Manufacturing Company, assignee	164 622
Bennett, J. G., assignee	164,525
Bery, J. L., assignee	164,557
Bettye, F. H., Device for operating curtain rollers	164,361
Bicknall, E. J., assignee	164,565
Bissell, F. S., Shutter for grates	164,418
Bitler, J. S., Sad iron heater	164,513
Blackmore, H., Car coupling	164,419
Blowney, H. J., Sign	164,514
Bortree, M. K., Bustle	164,515
Braeunlich, W., Cooling apparatus for rooms	164,421
Brandeis, L., Range boiler stand	164,420
Briggs, W. H. and A. E., Locomotive head light	164,516
Brooks, A. P., Mold for glass, &c	164,517
Brookfield, J. M., assignee	164,517
Bronson and Hartson	164,554
Bryan, J. P., assignee	164,599
Buchanan, Toucey, and Smith	164,612
Burdett, R., Organ stop knob	164,518
Caldwell, G. B., Machine for manufacturing vapor gas	164,422
Calley, F. A., Knit fabric	164,362
Carbureted Gas Machine Company, assignee	164,558
Carroll, T. J., Shutter worker	164,519
Chadwick, J., assignee	164,469
Chalmers, W., Pan forming machine	164,520
Chamberlain, E., Bath tub	164,423
Chambers, A., Rotary measure	164,424
Chester, S., Fire alarm signal box	164,425
Chisholm, H., Roll for utilizing the fag ends of railroad rails, (reissue)	6,484
Churchill, R. W., Toy pistol	164,521
Clark and Kittredge	164,378
Clarke, H., Combination seal lock	164,522
Clubb, J., Fifth wheel for carriages	164 426
Codd, G. S., assignee	164,524
Colley, W. W., Railway switch	164,523
Collyer, C. W., Machine for attaching soles to boots and shoes	164,363
Combs, W., Washing machine	164,364
Conlee, G. W., Relishing machine	164,427
Conlee, G. W., Machine for making wooden pins	164,526
Connery, T. B., Target	164,525
Converse, H. M., Curtain fixture	164,524
Cook, I., Gas burner	164,527
Cook, I., Gas burner	164,528
Coon, J. H., Rotary cultivator	164,428
Cornell and Shelton, assignees	164,601
Crocker, F. H., Stopping mechanism for spinning jacks	164,429
Cross, A. T., Magic pencil case	164,430
Cushman, C. S., Sewing machine	164,529
Dakon, E. R., Coffee steeper	164,530
Dale, H., assignee	164,469
Davis, S. T., Hinge	164,365
Dawley, A. W., Centrifugal honey extractor	164,531
Delamater, C. H., assignee	164,394, 164,395, 164,396
Dexter Spring Company, assignee	164,611
Dickinson, E., Scraper	164,532
Douglass, J. B., and E. S. Green, Insect destroying composition	164,533
Duffy, T. T., Blind stop	164,431
Du Four, J. L. M., Car window	164,534
Dubamel, V., Hoisting machine	164,432
Dunbar, J. H., Stand for barrel churns	164,535
Dungan, A. C., Composition for dentifrice	164,433
Dutcher, F. J., Holding and adjusting driver for spinning rings	164,536
Dutton, R., Harvester cutter	164,434
Dye, W. McE., Fertilizer crusher and distributer	164,435
Dyer, H. H., assignee	164,427, 164,526
Eastman, G. C., Flour stove	164,436
Edge, W. C., Die for making the heads of chain swivels	164,366
Eldridge, R. H. and O. S., Machine for making pins and dowels	164,366
Elliott, S., Treadle	164,437
Elsas, May & Co., assignees	164,462
Ervin, J. F., Mold for shaping wax comb guides for hives	164,438
Everett, E., assignee	164,377
Everson, G. R., Sewing machine motor	164,439
Facer, W. E., Fire alarm signal box	164,537
Fenton, C., Pipe tongs and cutter	164,368
Forbs, C., assignee	164,512
Fredericks and Woodworth	164,504
Friehle, J. L., Stop cock	164,538
Fuller, A., Tank regulator	164,539
Furman, O. P., Extension curtain roller	164,440
Ganon, S. B., Crown sheet for steam boilers	164,540
Gardner, J. W., Ironing apparatus	164,441
Gardner, S., Driver for sheet piling	164,541
Georgia, E. B., Ventilating barrel	164,542
Gilbert, W., Printer's side stick and quoin	164,543
Gilchriest, R., Extension ladder	164,442
Gill, J., Machine for forming hat bodies	164,544
Gnosell, H., Faucet	164,545
Good, J., Regulator for hemp drawing and spinning machines	164,546
Govier and Hutchison	164,456
Graf, L., Heel polishing machine	164,443
Grant, G. H., Blackboard eraser	164,547
Green and Douglass	164,533
Grilley, C. T., Leather washer	164,444
Grilley, C. T., Mechanism for forming leather washers	164,445
Grilley, C. T., Leather washer	164,446
Grilley, C. T., Shoe tip	164,447
Grinter, T. W., Paper bag machine	164,548
Grinter, T. W., Cloth bag	164,549
Grinter, T. W., Cloth bag	164,550
Grove, M. N., assignee, (reissue)	6,490
Haddock, W., Railway rail joint	164 369
Hagny, A. and S. L., Holder or fastener for halter straps	164,551
Hall, N. B., assignee	164,505
Halsh, J., Wire fence	164,552
Hall, F. H., Manufacture of tiling	164,553
Hallett, R. L., Faucet	164,448
Ham, H. H., Convertible chair	164,370
Hankin, W., Saw frame	164 449
Hartson, L. F., and J. W. Bronson, Bridle bit	164,554
Harvey, T. A., assignee	164,509
Hawkins, F. W., Rake	164,450
Hawley, M. C., and W. Lennox, Base burning stove	164,555
Hayton, R. C., and C. A. Hurlburt, Saw buck	164,556
Hearn, W. G., Whiffletree	164,557
Heinemann, A., assignee	164,508
Hellen, W. F., Liquor tester, filterer, and emptier combined	164,451
Henderson, J. C., Carburetor	164,558
Henry, G., Feed water regulator	164 559
Herschaft, C., Regulator for hemp spinning machines	164 452
Hetzel, M., assignee	164,542
Heysinger, I. W., Wrench	164,453
Heywood, W., Chair Company, assignee	164,483
Hochstetter, J. J., assignee	164,623
Hoffman, W. H., Mechanism for adjusting lathe beds to different heights	164,560
Hoffman, W. H., Tool receptacle for metal working machines	164,561
Hofmann, C., assignee	164,401
Holmers, A., Sofa bedstead	164,454
Holt and Peters	164,477
Hooton, F. C., Apparatus for lighting and heating houses	164,371
Hopper, W. L., Cultivator	164,372
Horning, R. A., Automatic gate	164,373
Hornish, G. B., assignee	164 471
Howe, E., assignee	164 541
Hoyt, J. J., Formation of glass lamps	164,374
Hughes, W. W., Device for distributing ashes on icy sidewalks	164 562
Hule, C., and A. S. Jenks, Driving bit	164,375
Hunter, G., Car starter	164,455
Hurlburt and Hayton	164,556
Hutchings and Nordstrom	164,585
Hutchison, J. A., and J. W. Govier, Steam engine valve gear	164,456
Hutchison, M., assignee	164,557
Jas, A., Dissolving tribasic phosphate of lime in water containing carbonic acid	164,457
Jenks and Hule	164,375
Jewett, J. F., assignee	164,548, 164,549, 164,550
Job, T., Machine for destroying potato bugs	164,376
Johnson, A. W., and H. A. Nettleton, Pump and check valve	164 563
Johnson, G. F., and D. Wilde, Portable boiler	164,564
Kastner, G. E. F., Pyrophore	164,458
Kaylor, E., Machine for upsetting metallic bars and rods	164,459
Kelly, C., assignee	164,616
Kemper, J. T., Earth auger	164,460
Kenyon, M. R., Hair weaving loom	164,565
King, J., assignee	164,575
King, R. W., assignee	164,624
Kipp, A., Jr., Sectional steam boiler	164 377
Kissam, G. F., Fire proof shutter	164,566
Kittredge, A. O., and W. H. and W. J. Clark, Oil can	164,378

	Patent No.
Kittredge Cornice and Ornament Company, assignee	164,378
Kline, J., Harvester crank and pin, (reissue)	6,490
Kleman, A., Manufacture of metallic beams and girders	164,379
Kneeland, S. R., Lamp shade	164,380
Koeppner and Wannieck	164,618
Kreiwitz, E. F., Clothes pin	164,461

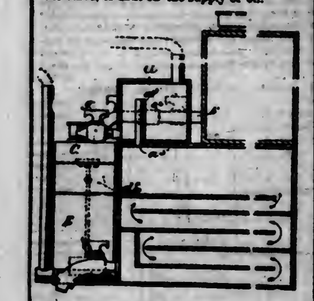
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED JUNE 15, 1875

164,380. ELEVATORS. Dexter S. Bailey, Dover, Me. [Filed May 4, 1875.]



Brief.—The pinion of a sprocket wheel gears with a wheel on which is another pinion, which gears with a wheel on the shaft on which the sprocket-wheel revolves, the whole suspended in a yoke.

The combination of the sprocket-wheel A, and multiplying-gear B O D E, with the grooved wheel F, and band-chain G, all arranged and suspended in a yoke, substantially as set forth and described.

164,381. CARBURETERS. Joseph H. Bean, Cincinnati, Ohio. [Filed Apr. 27, 1875.]

Brief.—The liquid hydrocarbon flows from the reservoir through the filter into the valve-box, thence into the carburetor. An excess of oil in the carburetor flows into the float-chamber, where it raises the float operating the valve, to shut off the supply of oil.

1. The condensation-chamber G, having the draw-off cock g', in combination with the supply-pipe e^2 and delivery-pipe f, whereby the waters of condensation from the service-pipe are caught and prevented from entering into the carburetor and float-chamber, as described.

2. The combination of the reservoir B, having pipe b^2, with the filtering-chamber C, having pipe c and the union c^2, as described.

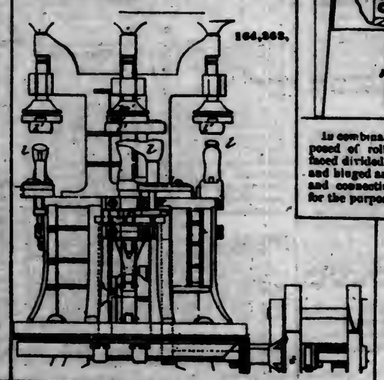
3. The combination, with the valve-chamber, of the filtering-chamber, as described.

4. In combination with the carburetor described, the float-chamber H and filter-chamber C, placed on the outside of the carburetor proper, and connected therewith by suitable openings, as shown.

164,382. DEVICES FOR OPERATING CURTAIN-ROLLERS. Freeman H. Bottys, Rochester, N. Y., assignor to S. E. Rowe, Jr., same place. [Filed May 15, 1875.]

1. In combination with the roller R, spring a, spindle S, revolving head A, and pawls f and f', the fixed primary head or cap d, provided with a notched rim, e, substantially in the manner and for the purposes set forth.

2. In combination with the revolving head A, pawls f and f', and fixed primary cap d, the secondary cap c, substantially as and for the purposes set forth.



3. In combination with the notched rim e of the cap d, the pivoted or swinging pawls, provided with the stop-notch n, as and for the purposes set forth.

164,383. KNIT FABRICS. Freeman A. Colby, Graniteville, Mass., assignor to C. G. Sargent, same place. [Filed Jan. 18, 1875.]

Brief.—The fabric is made on the Lamb machine by drawing in or out of action the right-hand front stop, and drawing down out of operation every alternate needle in the front row.

As a new article of manufacture, the herein described fabric, consisting of alternate single and double courses of loops and bars or runners a, looped into the inner ribs, and overlying the outer loops between the ribs, substantially as shown.

164,382.

164,384. MACHINES FOR ATTACHING SOLES TO BOOTS AND SHOES. Thos W. Collyer, Marblehead, Mass. [Filed Apr. 24, 1875.]

Brief.—The machine is intended for attaching soles to the uppers where cement is employed in place of stitching. The lasted shoe is mounted upon a jack, which is of the moment depressed, and by an arrangement of treadles and stops it is elevated and brought into forcible contact with a die, and so held, as the table turns, during nearly its whole revolution

1. The combination of a traveling support with the shoe-holding jacks and independently-actuated levers and sole-pressing dies, adapted to operate substantially as described.

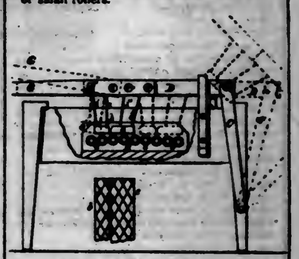
2. The combination of the jack and toggle-lever with the slide bar and its operative cam, substantially as described.

3. The combination, with the jack and toggle-lever of the slide-bar, its operating-cam, and the treadle for moving the cam, substantially as described.

4. The combination, with the traveling support, of the jacks pivoted thereto, the links, and the cam-projection r^2 for turning the jacks out as the support rotates, substantially as described.

5. The combination, with the traveling support, of the shipper, toggle-lever, and stop s^2, to stop the support while the toggle-lever is straightened, and to release the shipper to allow the support to be moved, substantially as described.

6. The combination, with the toggle-lever, of the shipper and its actuating-cam r' to throw back the toggle-lever, substantially as described.

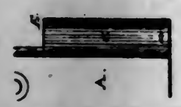


7. The removable die i, in combination with the plate i' and rubber packing and springs, substantially as described.

8. The dies i^2, in combination with their carrying-rods and adjusting-screws, substantially as described.

9. The combination, with the traveling support, of the loose pulley t or clutch and the mechanism for operating them to move the traveling support, substantially as described.

164,384. WASHING-MACHINES. W. Combs, Geneva, N. Y. [Filed Apr. 17, 1875.]



Brief.—A reciprocating divided rubber with serrated face combined with a bed composed of small rollers.

In combination with the wash-board H, composed of rollers e, the diagonally corrugated divided rubbing-board b c, rods f and f', and hinged arms G, pivoted swinging arms D, and connecting-links C, in the manner and for the purposes set forth.

164,385.

164,865. HINGE. Samuel T. Davis, Washington, D. C. [Filed Mar. 13, 1875.]

Brief.—The lower hinge of a pair or series of loose-joint hinges is slotted the entire length of the eye-piece or knuckle, thus enabling it, after the upper hinges are hung, to be placed on the pintle, after which a sliding key, preferably wedge-shaped, closes the slot; or a loose-joint hinge may be more inexpensively provided with a vertical slot along the knuckle, somewhat shorter than the pintle, so that when raised, and placed over the pintle, the door or shutter will readily drop into place, after the upper hinge or hinges are partially hung.

1. A loose-joint hinge in which the eye-piece or knuckle A is provided with a slot, E', starting from the bearing-seat for the pintle-piece, and continued a suitable distance, in order that the pintle of the lower hinge may be inserted and drop into place after the upper hinge is partially hung, all substantially as and for the purpose set forth.

2. A loose-joint hinge in which the eye-piece or knuckle A is formed with a slot, E, which is closed by a sliding key, C, substantially as and for the purpose specified.

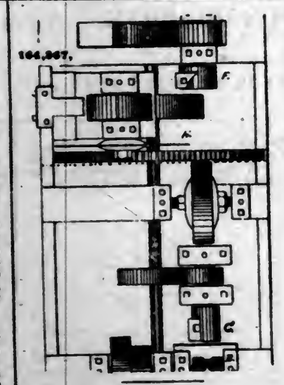
164,866. DIES FOR MAKING THE HEADS OF CHAIN-SWIVELS. William C. Edge, Newark, N. J., assignor to Smillie, Dorrance & Edge, New York city. [Filed Apr. 16, 1875.]

Brief.—A series of dies for reducing a plain circular metal disk by successive steps to the proper shape for a chain-swivel head—the steps being, first, to make it into a cup; second, pierce the cup with a square punch; third, make the cup pear-shaped; and, last, finish between drop-dies.

1. The series of dies herein described for making the heads of chain-swivels.

2. The combination of the dies *b' b² b³ b⁴*, and molds B C, for the purpose set forth.

3. The combination of the die b^4, guide-ring c^1, plunger b^5, pin f^1 and spring f^2, arranged for the purpose of contracting the open end of the cup-shaped swivel-head blank, substantially as set forth.



4. The reciprocating mold B, combined with the stationary mold C, the opposite faces of the two molds having cavities for the reception of a swivel-head blank, c^2, which is to be formed into a swivel-head, c^3, by the operation of the molds, substantially as specified.

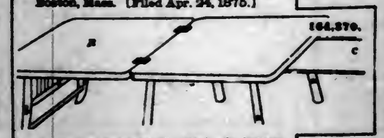
164,867. MACHINES FOR MAKING PIPE AND DOWELS. Randall H. Eldridge and Orin S. Hildreth, Lowell, Mass. [Filed Jan. 19, 1874.]

Brief.—The pins are rounded by passing through a revolving cutter-head, cut to the desired length by a reciprocating circular saw, and then pointed by a revolving conical cutter.

1. The combination of the automatically-sliding shoulder saw E, the cutter C, and the cutter F, as and for the purpose herein described.

2. The combination of the feed-roller B, provided with the roughened annular groove herein described, with the revolving cutter C and the bed S, as and for the purpose herein described.

164,868. PIPE TONGS AND CUTTERS. Chas. Fenton, New York, N. Y. [Filed July 14, 1874.]

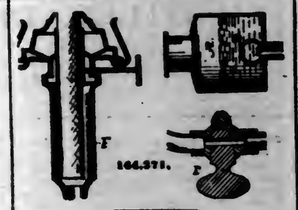


A tool adapted to be used as pipe tongs or cutter, constructed with a jaw, H, provided with an extension, H^1, formed with a female screw, H^1, and groove H^2, the said extension H^2 being adapted to slide in a body, A, provided with an extension, B, and screw b^1, the extension H^2 being drawn to and fro by means of a shaft, C, provided with screw-thread C', a head or handle, D, and collar E, the whole being constructed and operating substantially as shown and described.

164,869. RAILWAY-RAIL JOINTS. Worcester Haddock, Pittsburg, Pa. [Filed Nov. 3, 1874.]

A key or bolt for fish-bars for railways, made in two pieces, the points of which are beveled and the necks enlarged, substantially as herein described, and for the purpose set forth.

164,870. CONVERTIBLE CHAIRS. H. H. Hall, Boston, Mass. [Filed Apr. 24, 1875.]

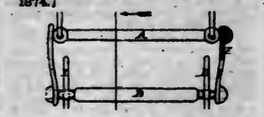


In the construction of a chair, the bottom A and supporting-legs *a*, with its sliding table C and arms *c*, in combination with a folding bottom, B, resting upon it, and secured to it by hinges or other suitable contrivance, and provided with upright posts *b*, which, with suitable cross-bars, enable the device to be used at pleasure as a chair or a bench, substantially as and for the purpose specified.

164,871. APPARATUS FOR LIGHTING AND HEATING HOUSES. F. C. Hooton, West Chester, Pa. [Filed Jan. 11, 1875.]

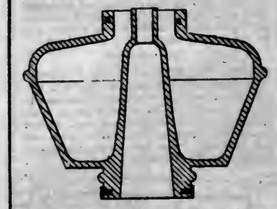
Brief.—The wick-tube for feeding is smaller than the bore of the tube to admit of expansion, and it is held in place by a ring in the reservoir, to which the said wick is attached.

The combination of reservoir A, ring B, tube C, wick D, cut-off E, and fount F, substantially as and for the purpose set forth.



164,872. CULTIVATORS. Wm. L. Hopper, Monmouth, Ill. [Filed Jan. 5, 1875.]

Brief.—The arched connecting bar is strengthened by a backing of wood, bolted in a bracing position. A shoe is attached to each beam for transporting the machine.

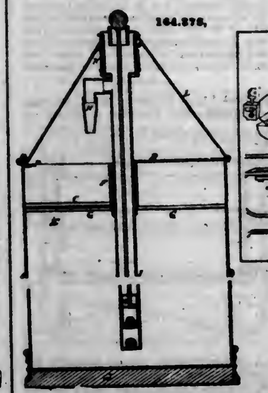


164,873. DRIVING-BITS. Chas. Huie and A. S. Jenks, Philadelphia, Pa. [Filed July 16, 1874.]

The combination, with a double-barred bit, substantially as shown and described, and in which the adjustable bar B and plates E E are adapted to revolve freely around the bar A, of the rein attachments D D and D' D', by which the severity of the bit may be lessened or increased without altering the position of the bar B.

164,874. FORMATION OF GLASS LAMPS. Jonathan J. Hoyt, Chelmsford, assignor to the Standard-Lamp and Glass-Pipe Company, Boston, Mass. [Filed Dec. 17, 1874.]

Brief.—Plastic glass in a mold is pressed upon by a plunger from above, and a pin from beneath, to form the central draft-tube, the upper portion of the body being turned inward to form the dome; also, a process of blowing the same article, combined with use of the mold

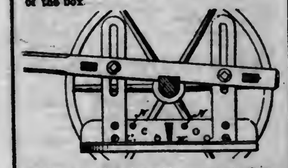


1. The process of forming the glass lamp and its glass central wick draft-tube *g* concentric with its circumference, by forming it and the said tube upon the pin B, and withdrawing the latter after the tube has cooled sufficiently to retain its form, and before it has appreciably contracted around the pin, substantially as described.

2. The process of molding the glass lamp and its glass central wick draft-tube *g*, and then adjusting the dome or top and neck of the lamp over to form the opening through the neck concentric with the upper end of the tube *g*, substantially as described.

164,875. OIL-CANS. Anson O. Kittredge, William H. Clark, and William J. Clark, Salem, Ohio, assignors to the Kittredge Cornice and Ornament Company, same place. [Filed Mar. 25, 1875.]

Brief.—An ordinary pump is provided with a detachable spout for admission to the tank, and for locking the same thereto. One-half of the inner top is fixed; the other half revolves, passing under the fixed portion on a ledge. The outer top is one-half stationary; the other half slides beneath it.



164,875.

A boiler, composed of a number of horizontal sections, placed one on the other, said sections having raised outside rims, inclosing shallow air-spaces, into which open the mouths of numerous vertical air-passages through the sections, the air-passages being surrounded by water-spaces communicating with each other, and with those of adjoining sections, through necks, as described, so that when bolted together, vertical and branching airflues are formed, intermediate with which are a suitable number of vertical water and steam passages, substantially as described.

164,876. MACHINES FOR DESTROYING POTATO-BUGS. Thos. Job, Ryon Township, Schuylkill County, Pa. [Filed Jan. 20, 1875.]

Brief.—A body or box is mounted upon a pair of wheels, and is vertically adjustable, with a slit longitudinally along the bottom, provided upon each side with flexible aprons. Cross-bars are placed above the opening, and a row of brushes inserted across each section of the box

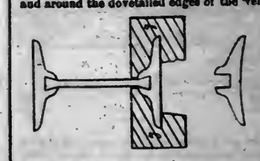
The vertically-adjustable receptacle C, in combination with flexible aprons H, brushes O, and rods N, as and for the purpose specified.

164,877. SECTIONAL STEAM-BOILERS. A. Kipp, Jr., Sing Sing, N. Y., assignor of one-half his right to Edwd. Everett, same place. [Filed Apr. 2, 1875.]

Brief.—The boiler is made up of sections bolted together, through which are double passages, the water circulating through one series, while the flame or heat circulates through the other series.

164,877.

1. In combination with an oil-can, a revolving sink, consisting of the bottom E and side F, resting upon a ledge, O, and whereon it revolves under the stationary top D, substantially as described, and for the purpose specified.



2. The combination of the can A, revolving sink C, stationary top D, conical stationary top L, and revolving door M, collar N, and sleeve O, constructed and arranged substantially in the manner as described, and for the purpose set forth.

3. The pump I, provided with a detachable spout, H, for locking the same in the can A, as and for the purpose specified.

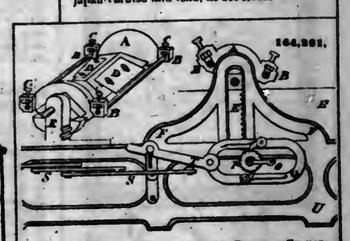
4. The can A, receiving sink C, stationary top D, revolving door M, stationary top L, and pump I, constructed in the manner substantially as described, and for the purpose set forth.

164,878. MANUFACTURE OF METALLIC BEAMS AND GIRDERS. Andrew Kloman, Pittsburg, Pa. [Filed Mar 27, 1875.]

Brief.—The heads of the beam are first rolled to form, and then passed between other rolls, that straighten the base and throw the edges of the lips inward toward one another, thus forming a dovetailed groove. The rolled web is then passed endwise into the grooves of the heads, and the whole is then passed between rolls, that compress the lips down upon and around the dovetailed edges of the web.

The manufacture of I-beams in detached parts, with dovetail-joints united and compressed, substantially as set forth.

164,880. LAMP-SHADES. S. R. Kneeland, Boston, Mass. [Filed June 1, 1874.]



As a new article of manufacture, a glass lamp-shade consisting of a truncated conical portion, A, and diaphragm B, said diaphragm being translucent, and said conical portion being transparent and surrounded by a reflecting medium, B, protected by a layer of japan-varnish and lead, as set forth.

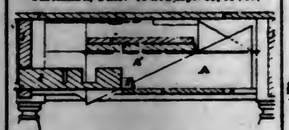
164,881. MACHINES FOR CUTTING SIDING. William W. Le Grande, Louisville, Ky., assignor of one-half his right to T. D. Osborne, same place. [Filed Mar. 13, 1875.]

Brief.—Weather-boards and veneers are cut from a bolt of wood placed upon a reciprocating bed, and automatically fed under an angular-shaped oscillating cutter-head, provided with adjustable cutters, which cut a board from the bolt at each reciprocation of the bed. The cutter-head is mounted in adjustable bearings, which drop automatically the required distance each time a board is cut from the bolt

1. The oscillating cutter-head A, with its pressure-rollers B B, adjusting-screws C C, and adjustable knives D D, as above described, in combination with the rocks E E, shaft and pinion N, ratchet-wheel P, yoke Q, and cam-hook T, by which it is operated, when arranged, constructed, and operated substantially as and for the purpose set forth.

2. The combination of the carriage G, shaft and pinion L, wheel M, pulleys J J and K, with the shifting-levers B B B, bed-frame U, and bearing-stands F F, when arranged, constructed, and operated substantially as and for the purpose herein before set forth.

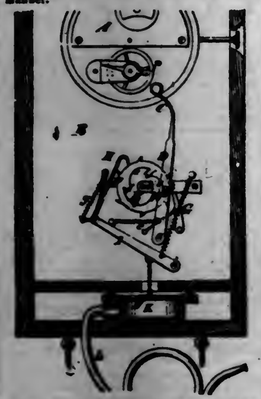
164,881.



164,882. WEATHER-STRIPS. N. Liddell, La Fayette, N. Y. [Filed Apr. 16, 1875.]

164,892.

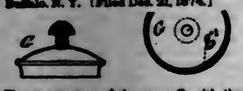
The construction of the flanged backing to the elastic material, as and for the purpose described.



164,893. EXTENSION-TABLES. W. Mann, Cincinnati, Ohio. [Filed Apr. 10, 1875.]

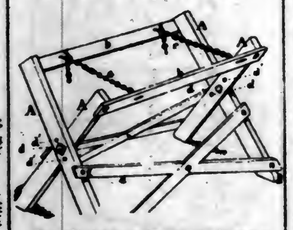
In an extension-table, the combination of the centrally-located leaves *c c*, one of which has inclined projections A' A' upon its under surface, a slide, *e*, which has reversed inclines upon its upper surface, and a handle or rod, *d*, arranged to operate substantially as described, whereby it may be used to move the slide *e* and lock it in any desired position, substantially as set forth.

164,894. TIME-RECORDING INSTRUMENTS. Theophilus Mayhew, Poughkeepsie, N. Y. [Filed Jan. 23, 1875.]



Brief.—A time-recording instrument operated by pneumatic pressure upon a friction brake, in which, when both hands are engaged, the pressure may be applied by a tube placed in the mouth, or exerted in any other suitable manner.

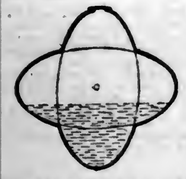
1. A pneumatic time-recording instrument, consisting of the combination of a pneumatic device, the works and index of a time-recorder, a lever-connection between the same, and an fastening-cam, the said instrument being adapted to be worn upon the person, and to be operated by a tube held in the mouth, substantially as and for the purposes herein specified.



2. The combination of the following elements: A timer or time-recording instrument, A, arranged in case or box B, brake C, brake-lever D, cam E, ratchet-wheel F, pawls G and H, lever I, and the pneumatic device K N L, substantially as and for the purposes herein specified.

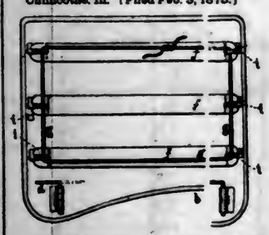
164,895. TEA-KETTLES. W. A. Monnet, Buffalo, N. Y. [Filed Dec. 22, 1874.]

The combination of the cover G with the rim, formed slightly elliptical, and having its diameter smaller at *g* than at *g'*, substantially as and for the purposes described.



164,896. WASH-BENCHES. O. M. Merrick, Chillicothe, Ill. [Filed Feb 3, 1875.]

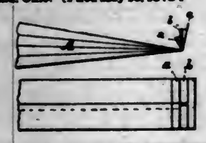
The adjustable washing-trestle, composed of the cross-legs A A, having several change able pivots, *d' d'*, with bolt *d*, cross-braces *c c*, upper bars *b b*, and stay chain or chains *e e*, with hooks *i i*, substantially as described.



164,897. ROTARY CHURNS. O. M. Merrick, Chillicothe, Ill. [Filed Feb. 3, 1875.]

Brief.—Formed of two equal elliptical vessels, united to form one reservoir, in such manner that the corresponding axes are perpendicular each to each, and containing an interior device.

A rotary churn formed of two equal-sized elliptic vessels, joined to form one reservoir, in such a manner that the corresponding axes shall be at right angles with each other, and with the usual cream-openings and ventilator, and equal axes of trunnions and crank, with which to rotate it, substantially as described.

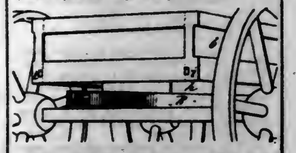


164,898. LAP-BOARDS. O. M. Merrick, Chillicothe, Ill. [Filed Feb. 3, 1875.]

1. The convertible metallic lap-board and kneading-board A, having a curved front, *b*, in combination with adjustable bars *f*, eyes or staples *i*, and stops *d*, substantially as and for the purposes described.

2. The combination of the metal board A, stops *d*, adjustable bars *f*, slotted at either end, the eyes or staples *i*, and the cord *g*, as described.

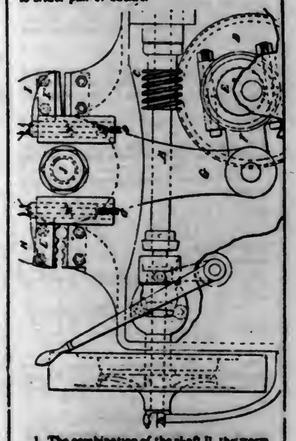
164,899. PAPER BAGS. Edwd. Mill, Cleveland, Ohio. [Filed May 18, 1875.]



1. A paper bag folded into a flat shape substantially as described, with two plications upon each of its edges, whereby the paper composing the bag is, in the operation of filling, distended into a cylindrical package with a hexagonal shaped bottom, substantially as and for the purpose described.

2. The process of forming a cylindrical paper bag with a hexagonal shaped bottom, consisting of first forming upon a sheet or tube of paper the lapels *a*, *c*, and *i*, then folding the said tube with two longitudinal plications upon each edge, and finally simultaneously pasting down the lapels, in the manner and for the purpose substantially as set forth.

164,900. TOY WAGONS. Fredk W Porter, Springfield, Vt. [Filed Apr. 10, 1875.]

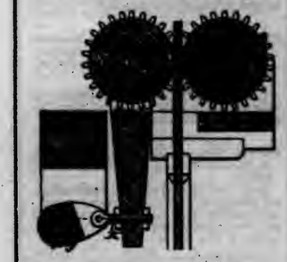


Brief.—A strip of wood, having the grooves on the inside near the lower edge, in which fits the floor of the wagon, has also a central outside and larger groove, which, when the side and end pieces are joined, forms end panels upon the wagon-body.

The combination, in a toy wagon, of the four side and end pieces, made from a strip provided with the grooves *b* and *i*, the bottom piece *n*, the intermediate piece *h*, and the panels B, all constructed and arranged substantially as described, and for the purpose set forth.

163,901. METAL-SHEARING MACHINES. F. A. Pratt, Hartford, Conn., assignor to the Pratt & Whitney Company, same place. [Filed Mar. 10, 1875.]

Brief.—The lever is pivoted, near its upper end, midway between the two horizontal arms, each carrying the moving blade of a pair of shears. The lever is oscillated, and the shears brought alternately into action, by a worm on the pulley-shaft gearing into a worm wheel on a shaft carrying an eccentric that connects through a pitman with the lever. Adjustable bars situated in front of the shears serve to prevent the bar from rising as it is cut. At the back of the machine is a gage, adjustable to either pair of shears.

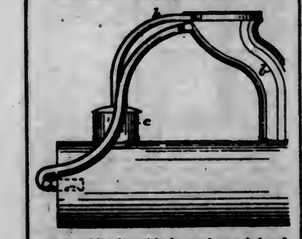


1. The combination of the shaft B, the worm C, the wheel D, the eccentric E, and the connecting-rod F with the arm G, and the shears H and I, substantially as described.

2. The gage L, with its sliding stem in the socket N, and the screw O, in combination with the cutting-shears, substantially as herein described.

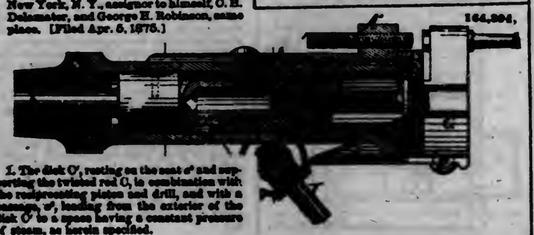
164,902. DROP-HAMMERS. F. A. Pratt, Hartford, Conn., assignor to the Pratt & Whitney Company, same place. [Filed Mar. 10, 1875.]

Brief.—The roller is carried in a rocking frame, and is caused to approach toward and recede from the strap by an eccentric connected adjustably with said frame. An arm projecting from the eccentric is connected with a lever which carries an adjustable dog, against which a lug on the hammer strikes in ascending, turns the eccentric, and draws the rocking frame and roll away from the strap.



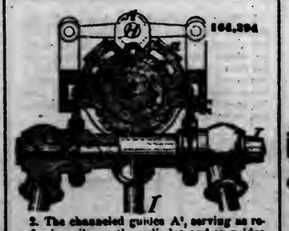
1. The combination of the eccentric I, adjustable connecting device J K, rocking frame H, and roller D, as herein shown and described.

2. The combination of the rod and dog M O with the eccentric I and the adjustable connecting device J K, for the purpose of operating the rocking frame, substantially in the manner described.



3. The combination of the treadle T with the rod M and the devices O I J K, for turning the rocking frame H and releasing the weight, substantially as described.

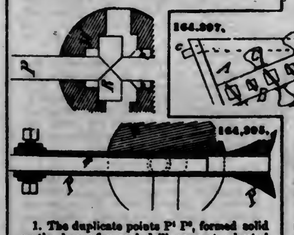
164,903. SPARK-ARRESTERS. David B. Proctor, Gloucester, Mass., assignor to the Proctor Spark-Arrester Company, same place. [Filed Apr. 28, 1875.]



In combination with the smoke-stack *b* and its screens *d* and *g*, the independent pipe *e*, leading from an aperture in the smoke-stack below the screen *d* to the furnace, and the independent pipe *h*, leading from an aperture in the smoke-stack below the screen *g* to the mud-box *c* or suitable receptacle, as and for the purpose herein set forth and described.

164,904. ROCK-DRILLS. Geo. H. Reynolds, New York, N. Y., assignor to himself, C. H. Delamater, and George H. Robinson, same place. [Filed Apr. 5, 1875.]

1. The disk O', resting on the seat *o'* and supporting the twisted rod O, in combination with the reciprocating piston and drill, and with a passage, *m'*, leading from the exterior of the disk O' to a space having a constant pressure of steam, as herein specified.



164,894.

2. The channeled guides A', serving as reinforcing ribs on the cylinder and as guides for the cylinder, in combination with the longitudinal bolts E, as herein specified.

3. In combination with the bolts E, extending from the lower end and taking hold of the flange of the cylinder, the head A', formed with recesses adapted to take hold of and confine the nuts *e* on said bolts, as herein specified.

164,905. TRIPODS FOR ROCK-DRILLS. Geo. H. Reynolds, New York, N. Y., assignor to himself, C. H. Delamater, and C. H. Robinson, same place. [Filed Apr. 13, 1875.]

164,905.

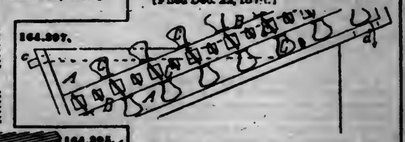
1. The duplicate points P' P', formed solid on the legs of a rock-drill support, adapted to allow of reversing in position, as and for the purposes specified.

2. The tripod-leg P E, in combination with the weight W, having grooves adapted to match thereon, substantially as and for the purposes herein specified.

3. A tripod-leg the outer end carrying the weight, and allowing the leg to be lengthened and shortened, while the weight remains undisturbed, as herein specified.

4. The rock-drill tripod with telescopic legs, arranged with the tubular or female part outermost, and provided with means for attaching steadying-weights thereon, as specified.

164,906. ROCK-DRILL TRIPODS. George H. Reynolds, New York, N. Y., assignor to himself, C. H. Delamater, and C. H. Robinson, same place. [Filed Apr. 7, 1875.]



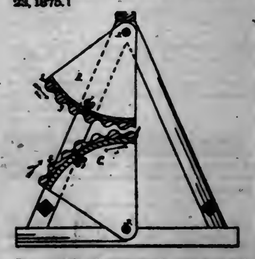
1. The frame or cradle G, made in two separate pieces, and adapted to be pinched or clamped by the legs, as specified.

2. The confining-bolt, in combination with the legs and cradle, the bolt performing the double office of holding the legs I J J and supporting the two sides of the cradle G, as specified.

3. The leg I, with its cross-piece I', adapted to serve as one of the legs of the tripod, and also as a support for the cheeks of the frame G, as herein specified.

164,906.

164,907.

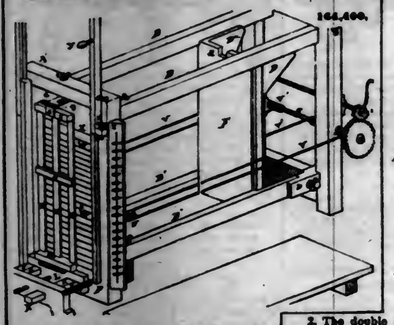


The inclined trough A, with an overflow, *c*, and a sand-drop, *d*, in combination with the inclined shaft B and blades C, substantially as and for the purpose shown and described.

164,908. SAFETY SWITCH-RODS. D. Rowe, Louisiana, Mo. [Filed May 13, 1875.]

The combination, in a railroad safety switch-rod, of the bifurcated rod E, provided with collars *b b'*, with the rod F, provided with washers *c c*, and spring *a*, substantially as described.

164,909. MACHINES FOR CORRUGATING SHEET METAL. Wm. B. Scaife and O. P. Scaife, Allegheny, Pa., assignors to Wm. B. Scaife & Sons, same place. [Filed Jan. 23, 1875.]

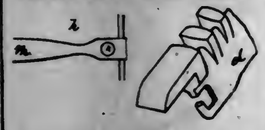


In a machine for corrugating sheet metal, the combination of the oscillating segmental sections B C, pivoted at D D, and having detachable corrugated face-plates *g g*, respectively, substantially as and for the purpose hereinbefore described and set forth.

164,910. SOAP-CUTTING MACHINES. Chas. F. Ehrhart, Harrisburg, assignor of one-half his right to Harrison Miller, Lancaster, Pa. [Filed May 20, 1875.]

Brief.—A follower feeds the block of soap against a fixed cutter-frame, composed of wires graduated to the width of the desired slabs. A hinged gage is graduated to admit of the slabs passing the fixed cutter-frame any desired distance, thus determining the width of the bars cut off the ends of the slabs by the vertically-sliding cutting frame, which plies in the grooved ways. A pin is withdrawn, the gage is swung down, and the bars are conveyed away, to admit of another operation of the machine.

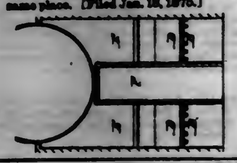
164,400.



1. In combination with a fixed frame, A', provided with the slotted side pieces Z and adjustable wires W, the combined gage M O F, hinged to the sliding base L, foot-block H, graduated connections J, and adjusting-screw I, and slide-arms K, substantially as and for the purpose specified.

2. In combination with the grooved ways p on the outer face of the fixed cutter-frame A', the vertically-sliding frame Y, with its single wire X, for cutting off a vertical series of bars of soap from the front of the mass, the whole constructed and operating substantially in the manner set forth.

3. In combination with the frames A A' and top and bottom rails B B' of the machine, the upright follower F, with its notch *d*, and rear guide-brackets D, above and below on each side, sliding on and between the upper rails B and lower fore-and-back rails B', operated back and forth by a single windlass or shaft, S, by means of the separate ropes V V' and gearing *e e*, the whole constructed substantially as and for the purpose specified.

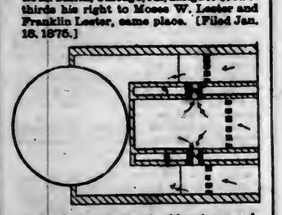


164,401. GRATE-BARS. James A. Sinclair, Bridgeport, Ohio, assignor to Abram Leah and A. D. Newland. [Filed Sept. 24, 1874.]

Brief.—The aperture in the shaker is placed over the leg on the bar. The projections from the sides of the shaker engage with the legs of the adjacent bars.

The bars, having bearings *d* and projecting legs *g*, in combination with the operating-lever A, having a handle, *w*, and aperture *h*, into which the legs *g* are inserted, as and for the purpose described.

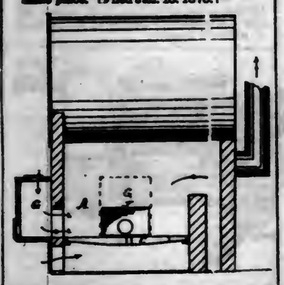
164,402. FURNACE. Horatio M. Smith, Chicago, Ill., assignor of two-thirds his right to M. W. Lester and Franklin Lester, same place. [Filed Jan. 18, 1875.]



1. The coking chamber or chambers E, constructed with a large in-draft air-supply opening, *f*, located at the upper part of the chamber above the coal, and communicating with the pure external air, and constructed with a downward discharge in the combustion chamber or chambers, in combination with said combustion chamber or chambers located below, as specified.

164,402.

2. The double furnace, consisting of the combustion-chambers D D, above which are the open-mouthed coking-chambers E E, in combination with the central air-chamber F, which admits air into both coking-chambers at or near the rear thereof, and which air-chamber receives air by a regulable opening, *f*, substantially as specified.



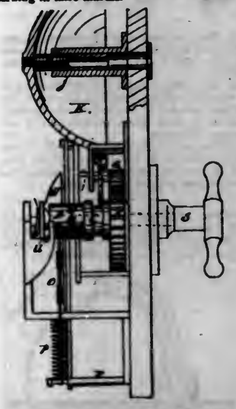
164,403. STEAM-BOILER FURNACES. Horatio M. Smith, Chicago, Ill., assignor of two-thirds his right to Moses W. Lester and Franklin Lester, same place. [Filed Jan. 18, 1875.]

1. In a furnace for burning bituminous coal, a close coking-chamber, provided with grates and with inlets for fresh air and outlets for the mixture of air and gases arising from the coal, substantially as specified.

2. The combination, with a grate-supplied coking-chamber, having inlets for air and outlets for the mixture of air and gas, of one or more combustion-chambers, into which said outlet debouches, substantially as specified.

164,404. FURNACES. Horatio M. Smith, Chicago, Ill., assignor of two-thirds his right to M. W. Lester and Franklin Lester, same place. [Filed Jan. 18, 1875.]

1. The external fuel pocket or pockets, constructed to receive fuel from above, provided with a downward draft from the top, and having an imperforate or gateless base, in combination with the independent combustion-chamber A, from which said pocket or pockets are separated by inverted bridge-walls J, as specified, producing separate and distinct coking and combustion chambers and the several results enumerated.



2. The combination of the combustion-chamber A and the four pockets G, arranged as shown, one at each side of the fire-door in front and one at each side at the sides of the furnace, substantially as specified.

164,405. COMPOSITIONS FOR COATING BLOCKS OF CAUSTIC ALKALI. T. Chalkley Taylor, Philadelphia, Pa. [Filed Oct. 14, 1874.]

A coating for blocks of caustic alkali, consisting of a fine earth and an oil mixed together in about the proportions specified.

164,406. FIRE-ALARM SIGNAL-BOXES. R. N. Toozer, Chicago, Ill. [Filed Mar. 12, 1875.]

Brief.—Bell or gong attached to signal-box, and sounded by mechanism actuated by turning the handle to unlatch the door. Designed to prevent maliciously-disposed persons from turning in false alarms.

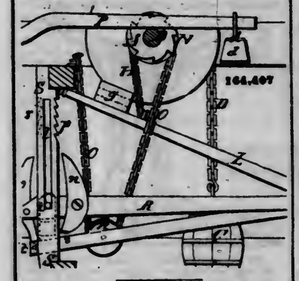
1. The combination, with a fire-alarm signal-box, of an alarm-bell or its equivalent located at the box and sounded by a mechanism which is set in motion by the operation of the device which allows the box to be opened, substantially as specified.

2. The combination, with the bell or gong, of the handle, the hammer *l*, and the intervening mechanism by which the motion of the handle is imparted to said hammer, substantially as specified.

3. The combination, with a fire-alarm box, of the handle, the shaft S, the arm U, and the curved catch *m*, substantially as specified.

4. The combination, with a fire-alarm box, of the arm U, the drum D, both being carried by the same shaft, the chain O, spiral spring P, (which is held at its anchor end,) catch *m*, upright spring P', provided with the shoulder *b*, and the lug *g*, substantially as specified, whereby the door is automatically latched.

5. The combination, with a fire-alarm signal-box, of the gong R, screw *f*, sleeve *j*, and aperture *n'*, substantially as specified.



164,407. MOTORS. Charles Van De Mark, Hillsdale, Mich. [Filed May 5, 1875.]

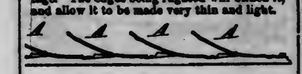
1. The combination of revolving driving-wheels G F on a driving-shaft, B, weight-platforms L M, and cords or chains H O, connecting the respective wheels and platforms, for producing a continuous revolving motion by the weight of a person or persons, substantially as and for the purpose herein specified.

2. In combination with an ascending and descending weight-platform, M, a lever, E, pawl or pawls *n o*, and ratchet-teeth *p r*, substantially as and for the purpose herein specified.

3. The combination of a revolving driving-wheel, N, a rope or chain, O, fixed at one end *e*, and a body-weight platform, M, provided with an anti-friction pulley, *h*, substantially as and for the purpose herein specified.

4. In combination with the shaft B, provided with a driving wheel or wheels, G M, operated by body-weight platforms L M, and pawl and ratchet-lever E, a brake-lever, P, provided with an adjustable weight, *d*, substantially as and for the purpose herein specified.

164,407



164,408. CHEMISES. Caroline Westcott, Chicago, Ill. [Filed Mar. 1, 1875.]

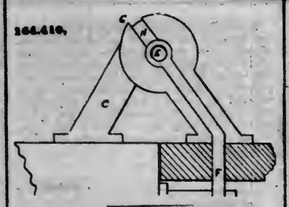
In a chemise composed of the waist A, skirt B, and belt C, having buttons E, the tabs D, attached to the under side of the belt, substantially as and for the purpose set forth.

164,409. WIND-WHEELS. L. D. Abrams, Tuscola, Ill. [Filed May 15, 1875.]

Brief.—The blade is concave transversely, and has rugated edges, whereby the wind will operate upon it to a much better advantage. The edges being rugated will stiffen it, and allow it to be made very thin and light.

A wind-wheel blade, A, which is concave transversely, and which is stiffened by rugating or crimping its edges, as and for the purpose set forth

---

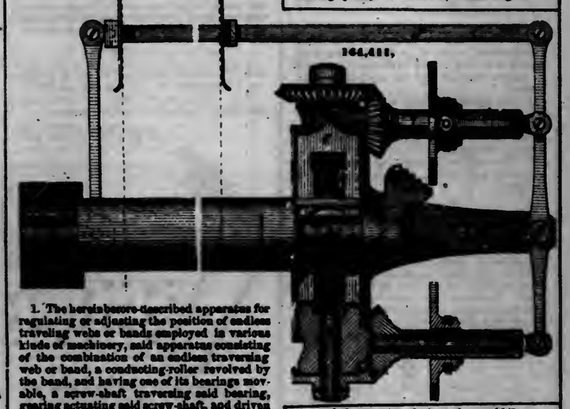


164,410. LOCK-HINGES. John Aikman, Norwich Township, Oxford County, Canada. [Filed May 5, 1875.]

Brief.—A detachable lever or latch interposed between the two parts of a shutter-hinge, one end passing over and working upon the pintle of the hinge, while the other projects through the shutter or door, engaging with a holder or catch on the inside, and likewise serving as a lifting device. There is also a slot in the lower part of the hinge, and a shoulder, so arranged that the lever or latch drops into the slot, and presses against the shoulder, to fasten the hinge when the shutter or door is wide open.

1. The detachable lever or latch F, working in the hinge on the pivot or pintle E, and fitting through the stile of the blind B, in combination with the holder or catch I on the window-frame, substantially as shown and described

2. The slot H in the lower part of the hinge C, in combination with the detachable lever or latch F and the shoulder O, all operating together substantially as and for the purposes above set forth.



164,410.

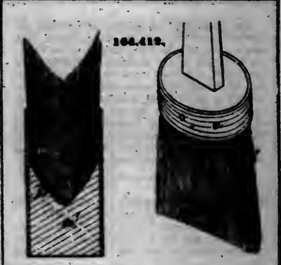
164,411. REGULATING AND ADJUSTING BANDS USED IN DRIVING MACHINERY. Charles Anderson, Fettykil, Leslie, North Britain, assignor of two-thirds his right to Pusey, Jones & Co., Wilmington, Del., and C. Hofmann, Carlsruhe, Germany. [Filed Apr. 29, 1875.]

Brief.—Any lateral movement of the band carries the guide-plates and the rocking lever and star-wheels with it, so that one of the latter would be brought within range of the crank-arm, and will be revolved by it, thereby revolving the screw-shaft and moving the bush longitwise of the box, thus moving one end of the guiding-roller laterally, and stretching the band on that side, which change not only prevents further lateral displacement of the band, but corrects the tendency to such displacements, and restores the band to its normal position.

164,411.

1. The herein-above-described apparatus for regulating or adjusting the position of endless traveling webs or bands employed in various kinds of machinery, said apparatus consisting of the combination of an endless traversing web or band, a conducting-roller revolved by the band, and having one of its bearings movable, a screw-shaft traversing said bearing, gearing actuating said screw-shaft, and driven by a rotating arm on the conducting-roller, and clutch mechanism operated by the lateral deflection of the web or band itself, to actuate the gearing, substantially as herein before set forth.

2. The combination of the endless traversing web or band, the conducting-roller, actuated thereby, the movable bearing of the conducting-roller, the screw-shaft traversing said bearing, a revolving arm or crank on the conducting-roller, gearing for actuating the screw-shaft on each end thereof, and clutch mechanism actuated by the lateral deflection of the guide itself, arranged on opposite sides of the revolving arm, whereby the screw-shaft is revolved in opposite directions, according as the web or band is deflected to one side or the other by means of a crank-arm revolving continuously in one direction.



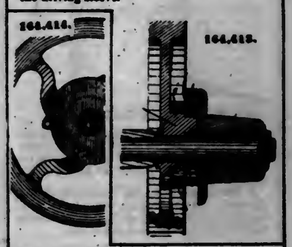
164,412. MECHANICAL MOVEMENTS. Wm. F. Barnes and John Barnes, Rockford, Ill. [Filed May 17, 1875.]

1. The driven-wheel, constructed as described, with a ratchet-hub and a smooth surfaced annulus for the traverse of a friction-roller, substantially as set forth.

2. The driving mechanism hereinbefore described, consisting of the combination of the sleeve or thimble, its annular rim or flange, the pawl pivoted thereon, and the friction-roller carried by the pawl.

3. The mechanical movement hereinbefore described, consisting of the combination of a shaft, a driven-wheel mounted thereon, a driving-pulley or thimble, consisting of a

164,412.



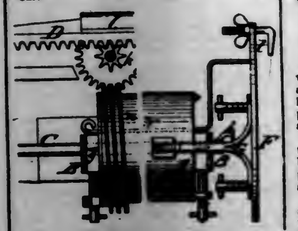
flanged sleeve, a pawl pivoted on said flange, and a friction arm or roller carried by the pawl.

4. The combination, substantially as herein-before set forth, of the driving pulley or sleeve, a pawl pivoted thereon, and a guide-way on the driven wheel, which throws the pawl out of gear on a backward movement of the driving-sleeve.

164,413. MECHANICAL MOVEMENTS. Wm. F. Barnes and John Barnes, Rockford, Ill. [Filed May 17, 1875.]

164,413.

164,414.

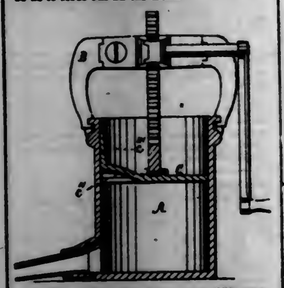


The mechanical movement hereinbefore described, consisting of the combination of a shaft, a driven wheel or pulley mounted thereon, a driving pulley or sleeve also mounted on said shaft, a pawl pivoted on the driving pulley or sleeve, and connected with and controlled by an idle ring mounted upon the extended hub portion of the wheel or pulley, these members being constructed to operate in combination, substantially as set forth, whereby an oscillating or treadle motion may be converted into a continuous rotary motion

---

164,415. HUB-BORERS. Austin Bascom, Norwalk, Ohio. [Filed Dec. 12, 1874.]

Brief.—The wheel is attached to a revolving frame, and the hub bored out by an adjustable cutter at the end of a reciprocating bar.



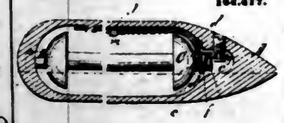
1. The hollow rotary drum E, carrying arms G and adjustable plate F, and having a worm-thread, *n*, on it, in combination with wheels *m k*, rack D, and cutter-carrying shaft C, substantially as and for the purposes described.

2. The stationary drum A, having pointers *g g*, and adjustable bearings B B, in combination with the rotary drum E, having face plate F and screws H, substantially as and for the purposes set forth.

3. The gage-rod N, formed as described, and combined with the machine, constructed as set forth.

164,416. SAUERKRAUT-MACHINES. J. H. Beam, Philadelphia, Pa. [Filed June 3, 1875.]

Brief.—When the follower is run up above the mouth of the receiver, it and the devices used for operating it can be pushed or slid back to allow the receiver to be filled with meat. Boxes on the receiver and yoke prevent the plunger, when slid back over the receiver, from being carried too far. The lower face of the plunger is recessed and flanged, so as to force out all the meat.



1. The combination, in a sausage-filling machine, substantially as described, of the sliding yoke B and plunger *c''* with the meat-receiving vessel A, as and for the purpose hereinbefore set forth.

2. The recess *c'* in the under side of the plunger C, in combination with the vertical flange *c''*, substantially as and for the purpose hereinbefore set forth and described.

164,417. SHUTTLES FOR SEWING-MACHINES. John Beaver and J. M. Talmage, Elon, N. Y. [Filed Apr. 17, 1875.]

Brief.—The shuttle is provided with a shallow recess at the forward end of the bobbin chamber, into which abuts the movable end of the tension spring. This spring, pivoted to the wall of the shuttle, and provided with apertures for passing the thread, including a channel for coarse thread, has a projection, which passes over the bobbin spindle, and a groove embracing the sides of a screw, by means of which the tension of the spring is regulated

164,417.

1. The shuttle-case having its point provided with the extended shallow recess *e* and shoulder *d*, in combination with the combined latch-tension spring D, provided with the parts *f* and *g*, as and for the purpose described.

2. The tension-spring D, constructed with the part *f*, adapted to extend across the bobbin-spindle, and the part *g*, adapted to be pressed or engaged by a screw, substantially as and for the purpose described.

3. The tension-spring, provided with suitable threading-eyes for fine thread, and with the coarse-thread channel *m*, which extends from the thread-hole *f* to the edge of the spring, substantially as and for the purpose described.

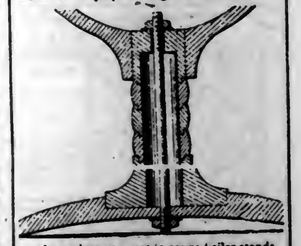
164,418. SHUTTERS FOR GRATES. F. S. Biesell, Pittsburg, Pa. [Filed Apr. 24, 1875.]

Brief.—The shutter is kept in place by the angle-piece wedged between the jambs.

1. In combination with the vertical sash-screen or shutter A, a flange projecting at an angle therefrom, and formed substantially as described, to wedge with the jambs and to brace and retain the screen in position.

2. In combination with the vertical sash-screen A, the guard-plate B, secured to the screen, substantially as described.

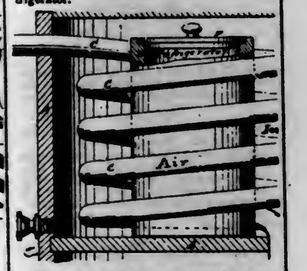
164,419. CAR-COUPLINGS. H. Blackmore, Pittsburg, Pa. [Filed Mar. 25, 1875.]



164,419.

The combination of buffer A, provided with pin-holder C, with pivoted trigger D, having weight *f*, projection *h*, and pendant *l*, with the link *j* and pin *g*, all substantially as and for the purpose set forth.

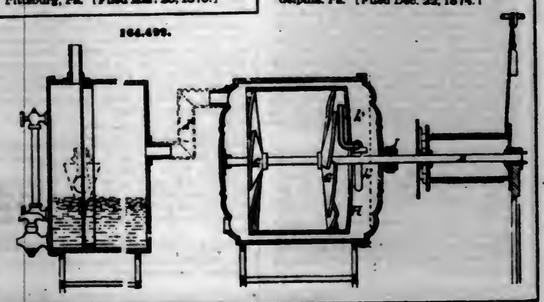
164,420. RANGE BOILER-STANDS. Ludwig Brandeis, Brooklyn, N. Y. [Filed Mar. 3 1875.]



Brief.—The removable sections furnish means for varying the height of the stand.

As an improvement in range boiler-stands, the leg, standard, or support, formed of hollow or perforated washers or sections, combined with a screw-threaded bolt, substantially as described and shown.

164,421. COOLING APPARATUS FOR ROOMS. Wm. Braeunlich, New York, N. Y. [Filed May 15, 1875.]



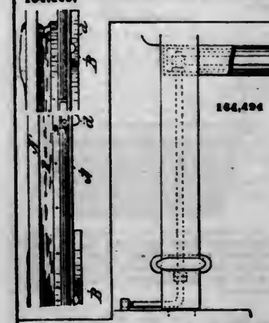
Brief.—A combined cooler for rooms and refrigerator.

The combination of outer tank A B for the freezing-agent, the intermediate coiled pipe C, inner preserving-tank D F, and a force-blast blower, substantially as and for the purpose specified.

164,422. MACHINES FOR MANUFACTURING VAPOR-GAS. George B. Caldwell, Philadelphia, Pa. [Filed Dec. 22, 1874.]

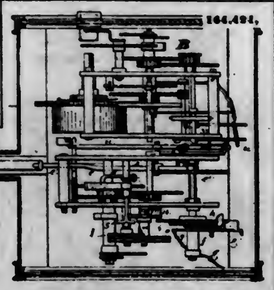
164,422.

The combination, with an air-forcing apparatus consisting of air-cylinder H, pipe G pipe A^1, and air-entry pipe A^2, of the horizontal cylinder F, provided with a series of vertical absorbing fibrous surfaces, K, the same being tightly drawn over and secured to metal hoops or rings *b*, fitting closely against the interior surface of the cylinder, substantially as and for the purpose set forth.



164,423. BATH-TUBS. Ephm. Chamberlain, Weymouth, Mass. [Filed May 12, 1875.]

Brief.—A portable bath-tub made of suitable flexible water-proof material, and having end, side, bottom, and top supports, as shown.



1. In combination with flexible waterproof bath-tub E, base A, upper frame-work A^1, flange D, attached in the form and manner substantially as described.

2. In combination with bath E, supporting-ends B B, auxiliary supports C C, hook *e*, pin *e'*, knobs *d*, constructed and arranged substantially in the form and manner and for the purposes described.

164,423.

164,424.

1. In combination with an electric signaling apparatus, a revolving pinion or gear-wheel, which is moved directly by a key or other winding device, in combination with a gear-wheel, sector, rack, or other shaped device, connected directly with the driving-weight, its support or shaft connected with a spring, for the purpose of raising the weight or winding the spring, substantially as hereinbefore described.

2. In combination with any automatic electric signal apparatus, a cog wheel, pinion, or equivalent device, revolving and sliding to and fro upon either a fixed or movable shaft, to be turned by means of a key or equivalent implement, the end of which engages in slots or obstacles provided therefor on the end of the said pinion, for the purpose of winding up weights or springs, substantially as hereinbefore described.

3. The combination of an independent pinion or equivalent device with a wheel, sector, or rack, and a key or equivalent implement which may pass through an orifice in a closed door, for the purpose of winding a spring or raising a weight.

4. The arrangement of ratchet-wheel or equivalent device in the closed door or cover, to prevent the key from being turned except in one direction, substantially in the manner and for the purposes hereinabove set forth.

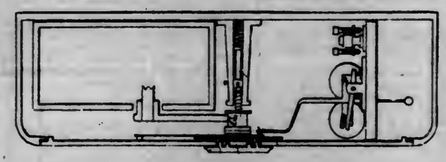
5. In combination with any inclosed rotating device to be operated by a key, the combination of a slotted movable shaft, F, spring or equivalent retaining-pin *e*, and slotted wheel R, to render a peculiarly-shaped key necessary to operate the combination, substantially in the manner and for the purposes hereinbefore described.

6. The combination of a swinging plate or equivalent device with a magnet placed within a closed box, to close and open a key-hole or orifice in said box at certain desired times, substantially in the manner and for the purposes as hereinbefore described.

7. The combination of magnet, armature-bar, and any device for closing the key-hole of the signal-box connected therewith, and to be moved thereby, with telegraph-line having connections with more than one series of batteries, so that when the apparatus is in circuit with the lesser battery the magnet shall be competent to hold the armature against its face, and retain the movable device in one fixed position so long as the circuit remains unbroken; but if the armature-bar be, by any cause, removed to its extreme reverse position, thus carrying with it the movable device to a second or third position, the magnet will not be competent to withdraw the armature-bar from said reverse position until the said lesser or normal battery be temporarily augmented by the addition of extra series of battery therefor provided.

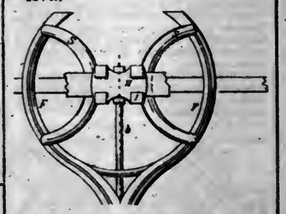
164,425. ROTARY MEASURES. Adam Chambers, Pueblo, Colo. [Filed Apr. 7, 1875.]

1. The two disks *a* and *d*, with their respective stops turning upon the shaft of the wheel A, in combination with the sleeve *f*, lever *g'*, stationary incline 25, second counting-wheel *l*, and its incline 40, substantially as and for the purposes set forth.



2. The combination, with the odometer, of a clock-movement and a stop, operated by the odometer so as to compute the period of time in which the vehicle is in motion, as set forth.

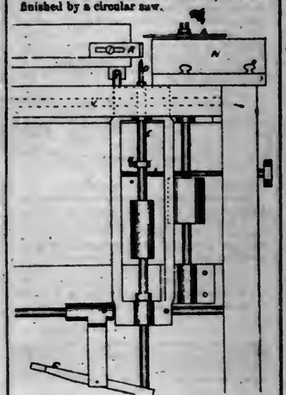
3. The fly-stop *t*, slide 34, and ejector 35, operated by the spring-lever *u*, that receives motion from the lever *c*, in combination with the clock-movement and odometer-register, substantially as set forth.



164,426. FIRE-ALARM SIGNAL-BOXES. Stephen Chester, Elizabeth, N. J. [Filed Dec. 21, 1874.]

Brief.—Weight attached to an arm of gear-sector, and raised by an independent pinion gearing with the sector, and operated by a key inserted through an aperture in the door of the box. A swinging plate on inside of door, normally held from in front of key-hole by an extension of armature-lever; but when circuit is broken by transmission of signal from any box, the armatures in all the boxes fall away from their magnets, and thus allow the swinging plates to cover the key-holes. Armatures fall away to such a distance that they can only be restored by the introduction of extra battery-force at central station after the signal is completed.

164,425.



164,426. FIFTH-WHEELS FOR CARRIAGES. John Chubb, Seneca, N. Y. [Filed Dec. 22, 1874.]

The combination of the upper half U of the fifth-wheel F, formed by halving an extension of the reach R, the head-block H, consisting of the segments S, united by the rectangular block B, and solid with the rim P, with the lower half F', clip *c''*, and brace *b*, all arranged for the purpose substantially as herein set forth.

164,427. RELISHING-MACHINES. Geo. W. Conlee, Oshkosh, Wis. assignor of one-third his right to H. H. Dyer, same place. [Filed Apr. 21, 1875.]

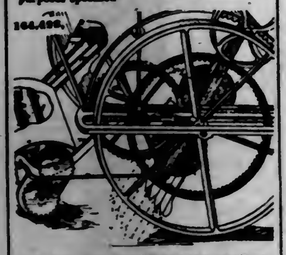
Brief.—A vertically reciprocating boring-tool cuts the shoulder of the tenon, which is finished by a circular saw.

The adjustable bit-shaft E, and adjusting-screw L with treadle G and adjustable collar H, the adjustable stops N and R, and the adjustable slitting-saw A, all combined substantially as shown and described, for the purpose specified.

164,428. ROTARY CULTIVATORS. James H. Coon, Des Moines, Iowa. [Filed Aug. 6, 1874.]

Brief.—By a series of gear and crank wheels a spading motion is given to a series of shovels placed in a nearly vertical position in a frame, which, by wheels and crank-pins, rise and fall eccentrically. From the main shaft arms and braces extend to the rear, and support a pair of rotary cutting-cylinders, operated by a belt, which pulverize the earth thrown upon them by the spades. A hand-wheel and gearing raise the spades and rotary cutters simultaneously.

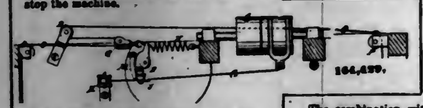
1. The auxiliary frame E, carrying the cog-wheels Nos. 1 and 3, and the crank-wheels *g*, in combination with the cog-wheels Nos. 2 and pinions *f*, substantially as described, to suspend and operate a series of spades.



2. The combination of the spade-carrying case F with the crank-wheels *g*, substantially as described, to alternately thrust down and raise up a series of spades.

3. The sliding frame G, carrying the series of spades *h*, in combination with the suspended case F, substantially as described.

4. The frame or forked bars a a, when pivoted to the fixed shaft d at their upper and front ends, and connected with pitmen or rods e e, extending from their lower and rear ends to the adjustable auxiliary frame E, for the purpose of carrying rotary cutting-cylinders and adjusting them relative to the cwiss of spokes b, substantially as and for the purposes specified.



5. The combination of the hand-wheel M, pinions f, shaft x, auxiliary frame E, and rack u, substantially as described, and for the purposes specified

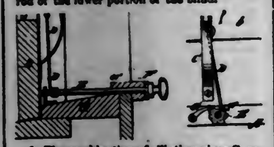
164,428.

164,429. STOPPING MECHANISMS FOR SPINNING-JACKS. Fredk. H. Crocker, Goulc, N. H. [Filed Apr. 3, 1875.]

Brief.—When the squaring-band breaks the extensions thereof become slack, and the spring vibrates the lever and the pawl, so that the latter throws the stop on the weighted cord out of the notch in the end of the lever, and the weighted cord draws the shipper, so as to transfer the belt to the loose pulley and stop the machine.

164,429.

The squaring-band, provided with the extensions O, in combination with the pulleys R Q, notched lever H, spring N, pawl M, the weighted cord G, provided with the stop J, and the shipper-lever D, all substantially as specified.



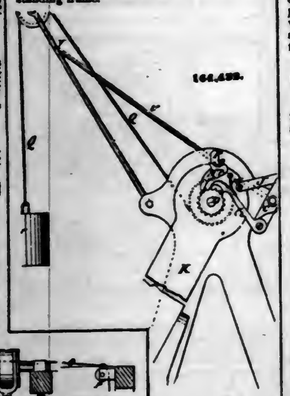
164,430. MAGIC-PENCIL CASES. A. T. Cross, Providence, R. I. [Filed Mar. 1, 1875.]

The spirally-formed feather F, attached to the screw-tube E in a magic-pencil case, in combination with the tube D, having the screw-slot *d*.

164,431. BLIND-STOPS. Thomas T. Duffy, Dubuque, Iowa. [Filed Nov. 30, 1874.]

Brief.—An elliptic spring attached at one end to the rod, and at the other to the frame, actuates the blind-slats, and detachably combined with this spring is a rod or shaft, ratchet-wheel and pawl, and a winding-cord, by means of which, when connected, the slats may be adjusted from the inside without raising the window. A similar spring on the upper half of the blind may be operated at the same time by a detachable cord-connection with the rod of the lower portion of the blind.

1. The combination of elliptic springs C, secured at one end to the rod and at the other end to the frame, with the slat-rods b' of a window-blind, to hold the slats b' closed, substantially as herein shown and described.



2. The combination of the cord D, rod or shaft E, ratchet-wheel F, and pawl G with the lower slat-rod b' and its spring C, substantially as herein shown and described.

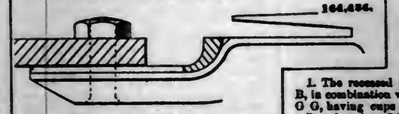
3. The combination of the connecting-cord H with the upper and lower slat-rods and their springs, and with the cord D, rod or shaft E, ratchet-wheel F, and pawl G, substantially as herein shown and described.

164,432. HOISTING-MACHINES. Victor Dubaniel, Easton, Pa. [Filed May 1, 1875.]

Brief.—A derrick-crane operated by a pendulum, ratchet, and pawl. The boom adapted, by detachment of its brace, to fold over the standing frame.

164,432.

The combination, with cord Q, for attachment to the weight, passing over a pulley, E, the shaft D, having drum and ratchet, and a pendulum, K, having pawl N, of the pawl G, lever H, and strap J, substantially as and for the purpose specified.



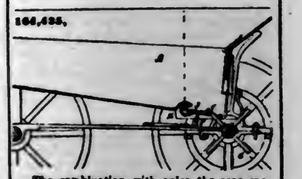
164,433. COMPOSITIONS FOR DENTIFRICE. Albert C. Dunn, New York, N. Y. [Filed Apr. 9, 1875.]

Brief.—The abrading materials consist of pumice-stone and carbonate of lime.

The composition of salicylic acid, orris root, and abrading material, substantially in the proportions specified.

164,434. HARVESTER-CUTTERS. R. Dutton, Yonkers, N. Y. [Filed Nov. 13, 1874.]

164,434.



1. A cross-bar constructed with rearwardly-projecting teeth, as herein set forth, and adapted to conform to the shoulders of the guard-fingers.

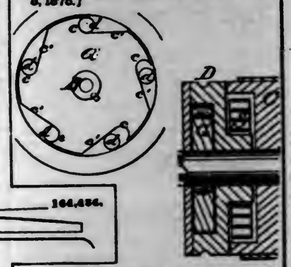
2. The combination, substantially as hereinbefore set forth, of the finger-beam, the guard-fingers, the cross-bar, having rearwardly-extending teeth, and the clamp bolts or rivets passing through said teeth, finger-bar, and guard-fingers.

164,435. FERTILIZER CRUSHERS AND DISTRIBUTERS. Wm. Moll. Dye, Cairo, Egypt. [Filed Feb. 20, 1875.]

Brief.—Upon axles, and inclining rearwardly, is secured a wagon-box having a hole cut in its bottom, and its rear end-board slotted, through which work arms secured to and revolving with the axle, for carrying out the fertilizer. The flow can be diminished by a double pivoted gate secured just in front of the axle.

164,435.

The combination, with axles, the rear one provided with arms O, of body A, inclined downwardly from front to rear, the slotted plates J K, supported on studs P, and the lever fulcrumed in slotted plate N, all constructed and arranged substantially as and for the purpose specified.



164,436. FLOUR-SIFTER. Geo. C. Eastman, Lewiston, Me. [Filed Feb. 27, 1875.]

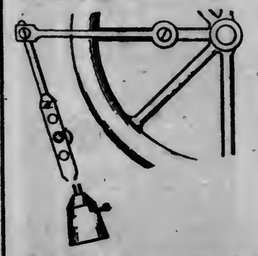
Brief.—Strengthening cross-ribs are arranged in the interior of the wire body of the sifter.

In a hand-sifter of the kind described, the combination of the woven-wire body A, the peripheral rim B, and the arched handle C with the supporting-cross E E', arranged in the said body and fastened to the rim, all as explained.

164,437. TREADLES. Sterling Elliott, New Haven, Conn., assignor to the Sterling Treadle Company, same place. [Filed May 8, 1875.]

1. The recessed drum C, applied on shaft B, in combination with the pulleys D D, cams O O, having cups *c* and inclined planes *c'*, rollers *d*, springs S S, and clamp J, having set-screw *k*, whereby the tension of the springs S S may be varied at pleasure, substantially as described.

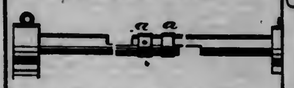
2. The stationary shaft L, provided with eccentric sleeves *l l'*, rotating on said shaft, in combination with the pin *n*, treadles K K', arms *n n'*, and pulleys D D, substantially as described, and for the purpose set forth.



164,438. MOLDS FOR SHAPING WAX COMB-GUIDES FOR HIVES. John F. Ervin, Vinton, Iowa. [Filed Apr. 10, 1875.]

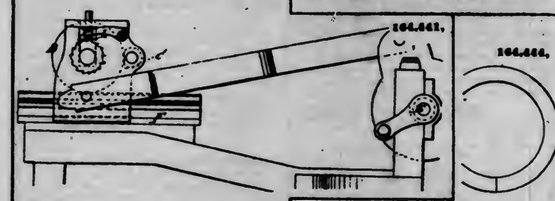
Brief.—A mold with flaring top is pressed against the walls, and retained until the wax has been poured in and cooled.

The mold C, having funnel end D and end plate E, as and for the purpose specified.



164,439. MOTORS FOR SEWING-MACHINES. Geo. R. Everson, Cincinnati, Ohio. [Filed Jan. 25, 1875.]

In a motor for a sewing-machine, the arrangement of the pawls I and J, shaped as shown, and working in their line of operation across each other, both being on the same side of the motor ratchet-wheel Q, in combination with a support, K, upholding both pawls, substantially as and for the purpose set forth.



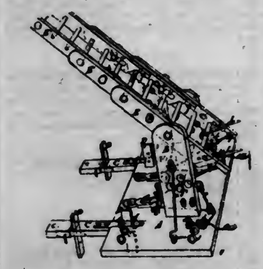
164,440. EXTENSION CURTAIN-ROLLERS. Oliver P. Furman, Corning, N. Y. [Filed Feb. 10, 1875.]

Brief.—The semi-cylindrical portions of the roller are spliced together by means of metal bands attached to the ends thereof.

A certain roller composed of adjustable halved sections connected together by means of bands *a a*, substantially as described.

164,441. IRONING APPARATUS. J. W. Gardner, Troy, N. Y. [Filed May 15, 1875.]

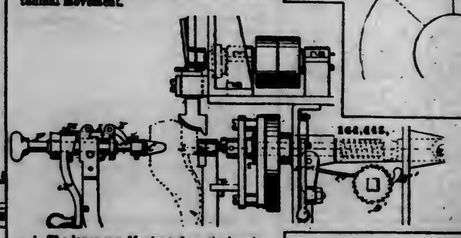
The carrier C of a reciprocating iron, B, mounted on ways F, substantially as specified.



164,442. REFRIGERATOR-LADDERS. Robt. Gilchrist, Louisville, Ky. [Filed Mar. 13, 1875.]

Brief.—The lower section is pivoted to two upright posts, and the ladder is raised to its proper inclination by drawing the base of the same down and forward by means of ropes and pulleys. The several sections are pivoted together by a cross-bar, which also serves as a round. The sections are held rigid by means of thumb-bolts.

1. Two or more ladders, E E', pivoted together and applied one within the other, the pivot-bolts serving as stepping-rounds and bearings, in combination with finger bolts h, having pieces h' pivoted to them, substantially as described.



2. Pulleys O O, with their ropes combined with eyes j, and ladders which are pivoted to standards B, and which are also pivoted together, substantially as described.

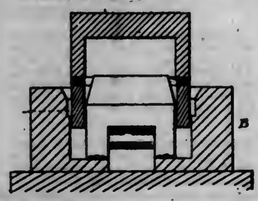
164,443.

164,443. HEEL-POLISHING MACHINES. Leopold Graf, Newark, N. J. [Filed May 15, 1875.]

Brief.—The shoe-supporting yoke is pivoted to a shaft provided with vertical and longitudinal movement.

1. The lever-cam M, pivoted on the bearing G, in combination with the yoke A, dog L, pawl K, and the clamp C F, substantially as specified.

2. The combination of the eccentrically-rotating plate E with the yoke-holder, substantially as specified.



3. The ratchet-wheel D' and holding-pawl E', combined with the lifting-spring O' of the yoke-holder, substantially as specified.

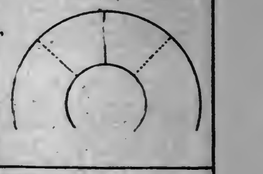
164,444.

164,444. LEATHER WASHERS. C. T. Grilley, Boston, Mass. [Filed Apr. 7, 1875.]

As a new article of manufacture, a leather washer formed of a strip of leather of single thickness, connected directly end to end, and presenting the grain or edge of the leather for the working-surface, as set forth.

164,445. MECHANISMS FOR FORMING LEATHER WASHERS. C. T. Grilley, Boston, Mass. [Filed Apr. 14, 1875.]

1. The mechanism for forming leather washers, consisting of the die B, core, and plunger, constructed and operating substantially as described.



2. The combination, with the dies and core, of the follower and spring, substantially as described.

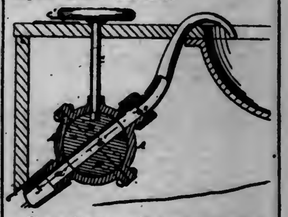
3. The process of forming leather washers composed of a single layer or thickness of leather, consisting in cutting the strip into the desired length and thickness, then bending the strip into annular form and completing it in dies under pressure, substantially as described.

164,446. LEATHER WASHERS. C. T. Grilley, Boston, Mass. [Filed May 15, 1875.]

A washer composed of superimposed layers of leather, united by means of cement, and with the abutting or free ends of each piece or layer placed opposite a solid or unbroken portion of its adjacent layer, all substantially as described.

164,446.

164,445.

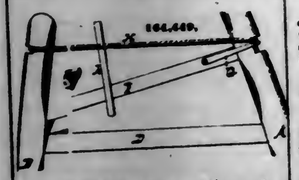


164,447. SHOE-TIPS. C. T. Grilley, Boston, Mass. [Filed May 18, 1875.]

A shoe-tip composed of layers of india-rubber compound, the outer layer at the end of the tip being softer than the inner or stiffening layer, substantially as described.

164,448. FAUCETS. Robert L. Hallett, Brooklyn, N. Y. [Filed Apr. 22, 1875.]

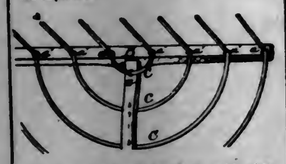
Brief.—Hot and cold water, or two kinds of liquid, either at the same time and mixed, or separately, may be drawn from their reservoirs, and discharged through the same discharge-pipe by the operation of the valve provided with a single passage, and its shell having two inlets and one outlet.



The combination, with the case A, having inlets *a'* and *a''* and a single outlet, *a'''*, of the spherical valve B, having a passage, *b'*, the stem C, and the hand-wheel D, substantially as described.

164,449. SAW-FRAMES. William Hankin, Scalyville, Pa. [Filed May 21, 1875.]

Brief.—A diagonal brace is detachably secured to a hack-saw frame by a pivoted clip or bow at the upper end, a strut-pin connecting the lower end to the horizontal bar by the projecting part of the pin fitting in sockets in the brace and bar. The ends of the brace are tapered, and fit in suitable mortises in each of the side pieces of the frame.



164,449.

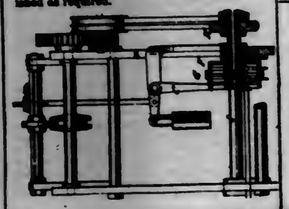
The combination of the brace F, having the pivoted bow or clip G, side pieces A B, socket f, horizontal bar D, having the stud or pin E, and twisted rope H and lever A, or their equivalents, when constructed to operate as and for the purpose set forth.

164,450. RAKE. Frederick W. Hawkins, Ypsilanti, Mich. [Filed Oct. 1, 1874.]

Brief.—The bows and each pair of teeth are composed of one piece of wire, and are secured to the handle and head by staples embracing the wire at the points of contact. A part of the bows are below and a part above the handle, thus giving additional strength to the implement.

In combination with handle A, and head B, the braces C C, bent as described, and secured by means of staples a a', the braces nearest the head being secured to the under side of the handle, while the remaining ones are fastened to the upper side thereof, thus rigidly binding the parts together, and guarding the handle from the strain to which it is subjected, substantially as herein set forth.

164,451. LIQUOR TESTERS, FILTERERS, AND SPITTERS COMBINED. William F. Heiler, Baltimore, Md., assignor to himself and Charles McCann, same place. [Filed Apr. 26, 1875.]



Brief.—A tube having a curved emptying-spout flap-valve falling upon a ledge or flange, and a gauze filter at the bottom.

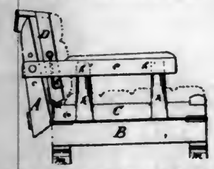
The tubular tester A, with its curved emptying-spout C at top, valve-lid D, flange E, and filtering-sleeve G below, constructed, combined, and operating as herein described, and for the purposes set forth.

164,452. REGULATORS FOR HEMP-SPINNING MACHINES. Christopher Herschaft, Brooklyn, N. Y. [Filed May 8, 1875.]

Brief.—The rise and fall of the upper condensing-roll, caused by variations in the size of the sliver, shifts the belt to one or the other of the drivers, so that the gill-bars will be driven by one or the other of the differential pulleys, and their speed increased or diminished as required.

The differential pulleys K L and their drivers F G on the counter-shaft, in combination with the driver M for the gill-bars, and the automatic belt-shifter, substantially as specified.

164,453. WRENCHES. Isaac W Reysinger, Philadelphia, Pa. [Filed Aug. 26, 1874.]



Brief.—The movable jaw is connected to the stationary jaw by means of a T shaped projection and a clamping screw arranged at its opposite ends.

1. The combination of the slotted toothed bar A, the movable toothed bar B, provided with the button F, and lug H, and the clamping-screw C, substantially as described.

2. The clamping-screw C, passing through a slot in the main bar A, into the lug H, and the rear portion of the movable bar B, substantially as described.

164,454. SOFA-BEDSTEADS. Axel Holmers, Boston, Mass. [Filed Dec. 5, 1874.]

1. The head part A, having two arms, e e, on a common connecting-rod, f, and the section C, having braces h, each hinged to an opposite side of the section B, as and for the purpose described.

2. The part D, having hooks k, hinged to a section, C, having buttons i, and folding back against head A, as and for the purpose set forth.

164,455. CAR-STARTERS. George Hunter, Payson, Ill. [Filed May 22, 1875.]

Brief.—Transverse shaft carrying coiled spring is alternately connected, by hinged arms having pinions at their ends, with the wheels. One wheel winds; the other receives the force of expansion, starting the car; also, detaining-pawl and ratchet, and levers for operating the same, and hinged ends of shaft.

The combination of the gear-wheels D H and E I, the jointed shaft F, the ratchet-wheel, pawl, and spring N O P, and the three levers J K Q, and the three catch-bars L M R, with each other and with the frame, the axle and the wheels of a car, substantially as herein shown and described.

164,456. STEAM-ENGINE VALVE-GEARS. James A. Hutchison and John W. Govier, Pittsburg, Pa.; said Govier assignor to said Hutchison. [Filed May 11, 1875.]

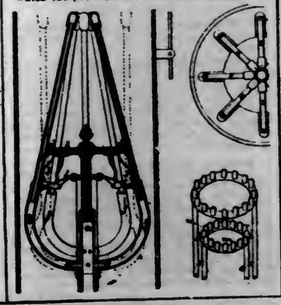
164,456.

1. The combination of an auxiliary plunger or piston, the entire stroke of which is effected by steam alone, a single D-valve for opening and closing the steam and exhaust ports, and a pinion or equivalent intermediate mechanism for causing the valve to move in a reverse direction from the piston by which it is operated, substantially as specified.

2. In combination with piston F, two or more ports or passages at each end of the auxiliary cylinder or steam-chest, arranged so that one of each set is alternately opened and closed by the travel of the piston, substantially as and for the purpose specified.

3. In combination with the auxiliary valve-chamber, having port e', which communicates with the live-steam chamber, and ports e e, which communicate with the cylinder G and the exhaust-port, a solid valve and independent tappet for operating the valve, substantially as and for the purpose specified.

164,457. DISSOLVING TRIBASIC PHOSPHATE OF LIME IN WATER CONTAINING CARBONIC ACID. Auguste Jas, New Orleans, La. [Filed Feb. 6, 1875.]



Brief.—Uses water impregnated with carbonic-acid gas as a solvent for tribasic phosphate of lime.

The mode or process above set forth and described of dissolving tribasic phosphate of lime in water containing carbonic acid

---

164,458. PYROPHONES. O. E. F. Kastner, Paris, France. [Filed Dec. 24, 1874.]

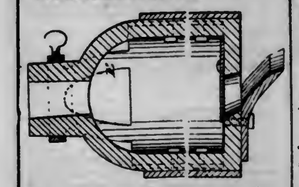
Brief.—The flame-jet is placed within a keyed tube to obtain different sounds. The jets are also arranged two or more in a tube, and made adjustable with each other, by connection with a piano action, to make and break the correspondence of position, upon which the production of the tone depends.

1. A musical instrument, composed of a tube, A, and of two or more burners, arranged thereon, one or more of said burners being movable, substantially as and for the purpose herein shown and described.

2. The musical instrument, composed of the tube A, perforated, and of one or more burners within said tube, substantially as specified.

164,459. MACHINES FOR UPSETTING METALLIC BARS AND RODS. Edwd Kaylor, Pittsburg, Pa. [Filed Feb. 17, 1873.]

Brief.—The gripping die is actuated by a toggle-bar and a chain—the former through the medium of a rack and pinion to close the die, and the latter by winding upon the pulley-shaft when turning to raise the rack and bar to withdraw it. The several dies on the blocks are dissimilar, and designed for different purposes, and the upsetting is effected by the direct action of a steam engine.

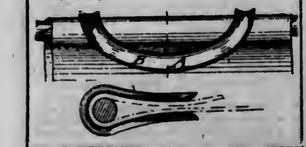


1. The reversible dies R R, supported in a suitable frame, in combination with plunger h, arranged in line with said dies, supported in guides, and operated by the direct thrust of a steam-piston, substantially as specified.

2. In combination with the movable die of a pair of gripping dies, a toggle-arm, i, and chain o', and suitable devices for raising and lowering the former, and winding and unwinding the latter, substantially as set forth.

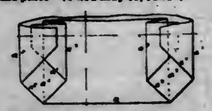
3. The reversible dies R R, having the cavities a a' a' a', substantially as and for the purpose specified.

164,460. EARTH-AUGERS. John T. Kemper, Hannibal, Mo. [Filed Apr. 24, 1875.]



Brief.—An earth-auger consisting of a body with a socket, parallel sides, and bottom, made of one piece, with flat steel reaming face-plates and detachable cap-sections, applied by supporting-arms, and top collar, and set-screw, to close the sides of the bucket.

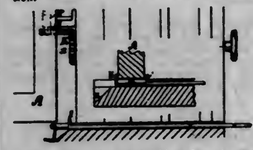
1. An earth-auger for boring wells, &c., constructed of a pot or body with sockets, parallel sides, and bottom made of one piece casting, and having steel-reaming face-plates attached to the sides, substantially in the manner and for the purpose set forth.



2. The combination of the auger body with the detachable cap-section applied by supporting-arms, top collar, and set-screw, to close open side parts of auger, substantially for the purpose set forth.

164,461. CLOTHES-PINS. E. F. Kreiwitz, Humboldt, Mich., assignor to himself and Joseph Mitchell, same place. [Filed May 1, 1875.]

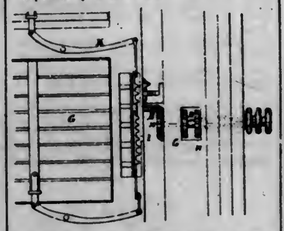
A clothes-pin made of one continuous strip of sheet metal, being bent and corrugated to at the line at the yoke parts, and form side spring clamps or jaws below the same, substantially as and for the purpose set forth.



164,462. PAPER BAGS. Emil Langgasser, Atlanta, Ga., assignor to Elsas, May & Co same place. [Filed May 10, 1875.]

A paper bag made in one piece, with a common satchel bottom, which is folded on the lines a', a', a', a', and a', as shown and described.

164,463. SHUTTER-WORKERS. William M Lanphere, Waterloo, Iowa. [Filed Apr 3, 1875.]

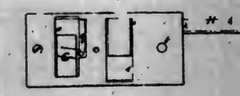


Brief.—A hinged angle-plate, carried by a push-rod, is employed in indirect combination with the ordinary bevel-gear shutter worker, for starting or unlocking the shutter when bound by frost or other slight obstructions, the construction of the hinged plate being such as to let it fall when the blind or shutter opens, and to swing it up again when it closes, so that it may engage with the lower edge of the shutter, and fasten it firmly in closed position.

The combination of the hinged angle-plate K and rod N with the shutter A and casing B, as and for the purpose set forth.

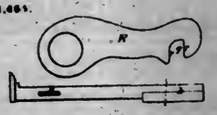
164,464. BLIND-SLAT ADJUSTERS. William M. Lanphere, Waterloo, Iowa. [Filed Apr 3, 1875.]

Brief.—The tubular shafts are arranged on the main shaft of an ordinary bevel-gear shutter-worker, and these tubular shafts carry toothed wheels at their outer ends, which gear with and engage toothed racks on the blinds, there being suitable levers and connecting-rods. One set of these devices is provided each for the upper and lower sections, that the blind-slats may work and be adjusted independently of each other.



The combination of toothed racks I J on the blind, connected to the upper and lower slats for operating them, with toothed wheels G H on tubular shafts D F in the window-frame for working it, substantially as specified.

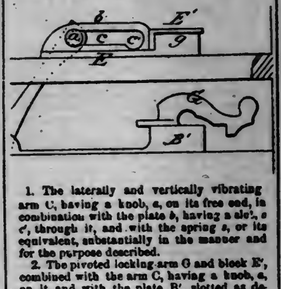
164,465. SASH-FASTENERS. Alfred C. Manning, Hartford, Conn. [Filed June 5, 1875.]



Brief.—As an improvement on the double-lock sash-fastener heretofore patented, (No. 104,974, July 5, 1870.) The operating-shaft is now made with parallel sides, forming a keyseat for a peculiarly shaped notched detachable key, which is introduced through a narrow slot made in the inner guide-strip of the side of the window-frame.

164,466. CYLINDERS FOR PAPER-MAKING MACHINES. Robert McMurray, Brooklyn, N. Y. [Filed Dec. 1, 1874.]

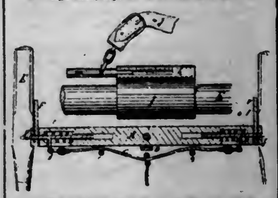
The wire-cloth cylinder A, in combination with the adjustable and removable stiffening-frame E, substantially as set forth.



164,461.

The tumbler or operating shaft D, having an extension, h, or key seat provided with parallel sides, and arranged to extend across and at right angles with the key-slot i, in combination with the plate-key R, having the notch g, with parallel sides, substantially as specified.

164,466. VENTILATING-FASTENERS FOR SASHES. Alfred C. Manning, Hartford, Conn. [Filed June 5, 1875.]

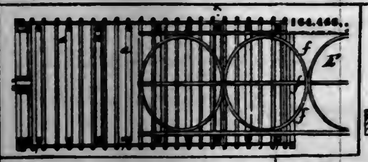


Brief.—A long arm upon one sash carries a button at one end which passes into a slotted plate upon the meeting rail of the other sash. The slot has a circular opening at one end, into which the button can only pass when both the sashes are entirely closed. With this fastening both sashes may be slightly opened, with no possibility of being opened to their full extent from the outside.

1. The laterally and vertically vibrating arm C, having a knob, c, on its free end, in combination with the plate b, having a slot, c c', through it, and with the spring c, or its equivalent, substantially in the manner and for the purpose described.

2. The pivoted locking-arm G and block E', combined with the arm C, having a knob, c, on it, and with the plate B', slotted as described.

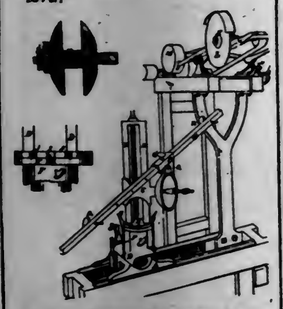
164,467. HORSE-DETACHERS. Jos. A. Mase, Owingsville, Ky. [Filed Oct. 20, 1874.]



1. The combination, in a whiffletree, of the recess l, the disk f, the pin e, the coil-spring b, the arm d, the strap G, the staples g and g', anti-friction rollers, strap H, having anti-friction connection with the strap G, all substantially as set forth.

2. The combination of the shaft E, the clamp I, the socket k, the bolt m, with its staple n, and the holdback-strap J, all substantially as and for the purpose set forth.

164,468. CYLINDERS FOR PAPER-MAKING MACHINES. Robert McMurray, Brooklyn, N. Y. [Filed Dec. 1, 1874.]



The wire-cloth cylinder A, in combination with the adjustable and removable stiffening-frame E, substantially as set forth.

164,469. PAINT COMPOUNDS. I. L. Morrell, San Francisco, Cal. [Filed Aug. 7, 1874.]

A paint composed consisting of steatite, oxided lime, dry lead, varnish, oil, and liquid isinglass, in about the proportions set forth.

164,470. SAW-SHARPENING MACHINES. J. A. Miller, Oshkosh, Wis. [Filed Sept. 4, 1874.]

1. The combination of the horizontal carrier A, transverse carriers B, and vertical carrier C, substantially as shown, for the purposes specified.

2. The combination of the disks E E', constructed with slots I I' and J J', substantially as described, for the purpose specified.

3. The arm O and thimble P, constructed substantially as shown, with set-screws Q and Q', E and E', for the purposes specified.

4. The independent reversible collar W V, constructed substantially as shown, for the purpose of reversing the grinding-wheel of a saw-sharpening machine.

5. The sliding cam c, constructed substantially as shown, in combination with the angular or bay-coated rod c, lifting-bar d, movable collar h, and slotted plate g, substantially as and for the purposes set forth.

164,471. PLOWS. Christian Myers, Marysville, Cal., assignor of one-half his right to Geo. B. Horsish, same place. [Filed Apr. 21, 1875.]

Brief.—The share, with a section of the land-side, slips into place, and is held by a dovetailed groove.

The plowshare G, having the land-side wing L and mold-board wing F, beveled upon their upper edges, and the latter wing provided with the tongue H, in combination with the mold-board A, beveled upon its lower edge, the land-side B, cut away to receive the wing L, and the frog D, having the lip or projection I upon its lower mold-board edge, the several parts being constructed and operating substantially as and for the purpose hereinbefore described.

164,472. CORAL-BEEDS. Jabez B. Norton, Worcester, Mass., assignor to Taylor & Farley Organ Company, same place. [Filed Feb. 20, 1875.]

Brief.—A curved metallic shell or roof to the reed-block. It may also be detached and slid into grooves in the sides of the reed-cell.

164,473.

1. The combination, with the reed-chamber c, of the metallic lining h, arranged to be supported by the sides of the said chamber, substantially in the manner and for the purpose above set forth.

2. In combination with the reed-block c, the metallic lining h', secured to, or formed with, said block, substantially as described.

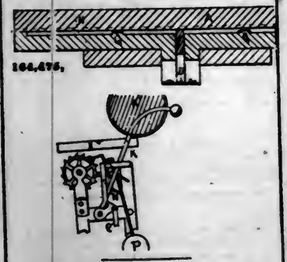
164,473. HORSE-POWER LINKS. B. L. Olds, Highgate, Vt. [Filed May 1, 1875.]

The horse-power link composed of the cast-iron body and wrought-iron back, the latter terminating at each end in a curve, forming a bearing for a journal within it, as shown and described.

164,474. PORTABLE FENCES. S. Olmstead, Brooks, Ind. [Filed Apr. 3, 1875.]

Brief.—The posts are extended at one end of panel above and at the other below the rails, to receive the upper rail of one adjacent panel, and the lower one of the other.

A fence-panel having a pair of posts, B B, at each end of panel, the pair at one end projecting above and at the other end below the rails, as and for the purpose specified.

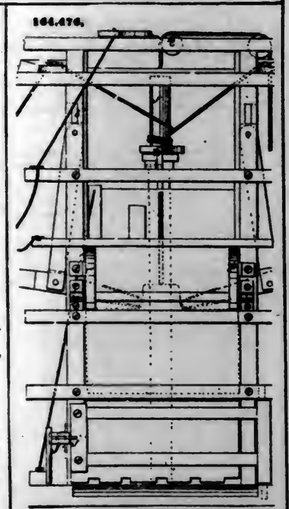


164,476. RAILWAY TIME-SIGNALS. John C. Paige, Stoneham, Mass. [Filed May 12, 1874.]

Brief.—The rail has rigid bearings at the ends of the chair, while the recesses under the rail allow the latter to spring down when a train passes over, whereby the lever is operated which sets the signal.

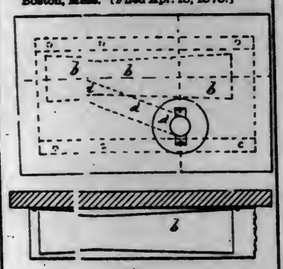
1. The combination of the long chair B, provided with the rail-bearings F and F', the recesses H H', and the positive resting-point G G, with the rail A, operating substantially as described, and for the purpose set forth.

2. The combination of the rail A, chair B, positive resting-points G G, pintle C, and the lever D, operating together substantially as described, and for the purpose set forth.



164,475.

164,476. HAY-PRESSES. Wm. H. Pennington, Fox, Mo. [Filed Mar. 20, 1875.]



Brief.—A horse-power shaft is, at top, connected by bracing to the top of the press. Levers on the press, with ropes leading to the power, operate the follower. Doors fastened by projections on a revolving bar.

164,476.

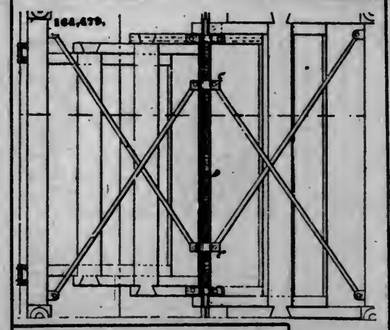
A hay-press provided with loose baling-box H', supported by shaft J' and inclined bar N', as shown and described, for the purpose specified.

164,477. DEVICES FOR AUTOMATICALLY DISCHARGING WATER FROM SHIPS, &c. William D. Peters and George H. Holt, Boston, Mass. [Filed Apr. 15, 1875.]

The combination, with a pipe or tube, b, arranged beneath the bottom of a vessel, of the conductor or pipe d, the said pipes b and d being connected at an acute angle, as shown, and the pipe b extending in both directions beyond the point where the said pipes are connected, substantially as herein specified.

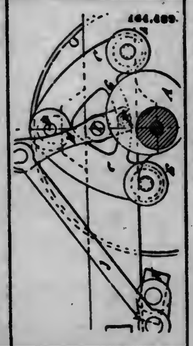
164,478. PERMANENT FLOUR OF CAMPHOR. Ira M. Phelps, Philadelphia, Pa., assignor of one-half his right to John H. Scott, Jr., same place. [Filed Apr. 24, 1875.]

Brief.—The glycerinated camphor may be compressed into blocks, so as to retard evaporation.



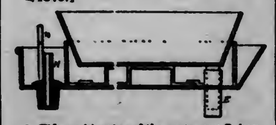
1. The process of making pulverulent camphor, consisting in subliming crude camphor, in combination with glycerine, substantially as described.

2. As a new article of manufacture, glycerinated camphor condensed in blocks, substantially as described.



164,479. EXTENSION-TABLES. J. Poolman, Providence, R. I. [Filed Apr. 24, 1875.]

The combination of two pairs of toggles with a median screw, D, and travelling nuts C, arranged in connection with table, as shown and described.



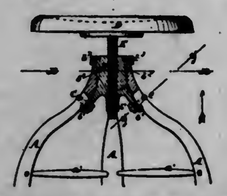
164,479.

164,480.

164,480. MILK-COOLERS. Perry Read and John H. Allen, Hinesburg, Vt. [Filed May 1, 1875.]

1. The combination of the water-vat B, having outlets E and I, with the removable outlet-tube H, provided with handle n, substantially as described and for the purpose set forth.

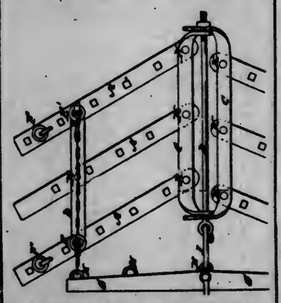
2. The water-vat B, constructed as set forth, in combination with the milk-pan A, removable corrugated supports D, and cleats c, substantially as described and for the purpose set forth.



164,481. SCREW-CUTTING DIES. Virginius J. Reece, Greenfield, Mass. [Filed Feb. 20, 1875.]

Brief.—Two semicircular dies in a circular holder, and four screws passing through said holder—two with conical points passing between the dies to hold them apart, and the other two intermediate with the first, to keep them together.

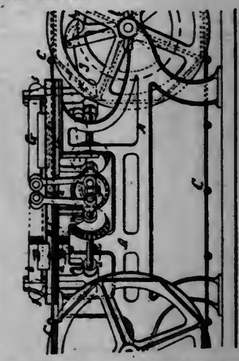
The combination, substantially as shown and described, of the die-sections A, with holder B, screw C, and wedge-pointed screws D, the screws passing through the holder at right angles to the axis of the die, and the wedge-points between the edges of the die-sections, as and for the purpose set forth.



164,482. ROTARY STOOLS. Aaron Rice, Fitchburg, Mass., assignor to Walter Heywood Chair Company, same place. [Filed May 8, 1875.]

The socket B, provided with the grooved arms b', the ribs or grooves b', and the recessed flange b', to adapt it to receive the legs A, and the screw or pivot of the seat D, substantially as herein shown and described.

164,483. HARROWS. Joseph Rioth, Mount Sterling, Ill. [Filed May 8, 1875.]

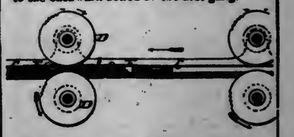


Brief.—The harrow is formed by the combination with each other of two sets of parallel bars carrying the teeth, two connecting-bars turned up at both ends for the reception of a coupling rod, which also forms a center draft-rod, and a draft-bar connected by chains to the ends of the teeth-bars.

An improved harrow, formed by the combination, with each other, of the two sets of parallel bars A, the connecting-bars B, the connecting and coupling bars C, the coupling-rod D, the two sets of rings E E' F, the draft-bar G, provided with five staples or eyebolts, H, the draft-rod I, and the two draft-chains J, substantially as herein shown and described.

164,484. SUGAR-CUTTING MACHINES. F. Rochow, Brooklyn, N. Y. [Filed May 26, 1875.]

Brief.—A perforated carrier receives intermittent motion from two large drums. The sugar block, placed within the carrier, moves along a fixed table, coming to the first set of knives. These knives, through a slot in the table, by eccentric and cam attachments, are made to come close together, thus cutting the blocks into prisms. The width of the prisms is regulated by the action of the carrier. The intermittent motion is secured by a pawl and ratchet-wheel. When the carrier delivers the cut prisms to the second set of knives, placed at right angles to the first, they come together as in the first case, and divide the prisms into cubes.



1. In a sugar-cutting machine, the combination of a perforated sugar-carrier, C, with two cutting or clipping tools, between which said carrier passes, substantially as herein shown and described.

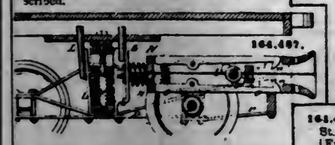
2. The perforated sugar-carrier C, combined with a stationary slotted table, a, and with the cutting or clipping tools D D, placed, respectively, above and below the table and carrier, substantially as herein shown and described.

3. The combination of the perforated sugar-carrier C with two several series of cutting or clipping tools, by which the sugar slabs held in and fed by the carrier are first reduced into bars by one set of cutters, and the bars into cubes by the second set of cutters, all without removing the sugar from or changing the motion of the carrier, substantially as specified.

164,485. SUGAR-CUTTING MACHINES. F. Rochow, Brooklyn, N. Y. [Filed May 26, 1875.]

Brief.—The carrier, perforated to receive the sugar block, passes continuously between two double gangs of parallel saws; each gang being in sets, one above, the other below, the stationary table, slotted to admit of the action of the saws. The carrier is provided with disks or turn-table plates, which admit of the sugar block's quarter-revolution after having been cut into bars. This device secures the cutting of the bars into cubes by the advance of the carrier; or the second gang of saws may be dispensed with, and the bars submitted to the backward action of the first gang.

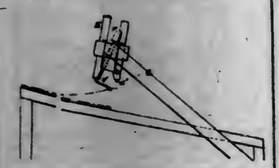
1. In combination with the carrier C, which is perforated to receive a slab or slabs of sugar, and continuously moving in one direction, the two double gangs of saws D D and E E, all parallel to each other, substantially as described.



2. The carrier C, provided with a rotary disk, F, which is perforated to receive a slab of sugar, and turn the same after it has passed between a pair of cutting-tools, substantially as and for the purpose specified.

3. In combination with a double gang of circular saws, D D, a reciprocating carrier, C, containing the perforated turn table F, substantially as herein shown and described.

4. The spring catches *d d*, attached to the carrier C, and combined with the projecting pin *e* of the turn-table F, substantially as and for the purpose specified.

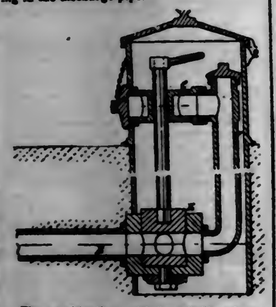


164,487. CAR-COUPLINGS. John G. Rogers, Victoria, Mo. [Filed Apr. 3, 1875.]

The combination of the bumper N and U bar L with the front cross bar E and the central stationary cross bar F of the truck-frame, substantially as herein shown and described.

164,487.

164,488. PAPER-FEEDING MACHINES. Socrates Scholfield, Providence, R. I., and C. E. Baker, Mont Clair, N. J. [Filed Mar. 13, 1876.]



1. The combination of a lifting-pin, *c'*, and a cutter, *c*, with each other in such a way that the cutter may first make a hole and rise to allow the lifting-pin to enter and raise the edge of the sheet, substantially as described.

2. The combination of a holder, F, with the cutter *c* and the inclined lifting-pin *c'*, substantially as described.

164,489. HYDRANTS. Walter Scott, Passaic, assignor to Joseph Chadwick, Boiling Spring, N. J., and Henry Dale, New York city. [Filed Mar. 29, 1875.]

Brief.—The hydrant has a three-way cock provided with a stem having its upper bearing in the discharge-pipe.

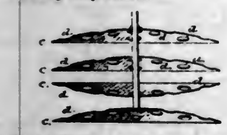
The combination, with branch B and escape I, of three-way cock B, provided with stem F, having its upper bearing in pipe G, as and for the purpose specified.

164,490. BROOM-BRACES. Joseph B. Sharp, Vineland, N. J. [Filed May 26, 1875.]

Brief.—The side straps are capable of adjustment to fit the brace to all sizes of brooms, and the upper eyes are obtained upon opposite sides of the broom by a link connecting their lower edges, whereby the brace is made to clamp the broom.

1. In a broom-brace, the arched or yoke pieces A, constructed with the inward bent spiral eyes *g'*, combined with the hooks C C and cross-rods B *b*, the hook C holding the eye at its lower or single part, as and for the purpose set forth.

2. In combination with a broom brace, and with the rods B B and hooks C C, the adjusting-straps D D, substantially as and for the purpose set forth.



3. The broom brace described, consisting essentially of the parts A A, B B, C C C, and the adjusting straps, constructed and connected substantially as set forth.

164,490.

164,491. CHURN-DASHERS. Wm. H. Silver, St. Louis, Mo., assignor to Ann Silver. [Filed Mar. 26, 1875.]

Brief.—Consisting of four concave disks attached to a dasher-shaft, the two extreme ones having their concavities facing downward, the two middle ones having their concavities facing each other, and separated sufficiently to admit of being easily cleansed.

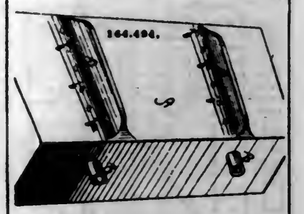
A churn-dasher, composed of the four independent and separate disks *c*, the upper and lower having their concavities facing in the same direction, while the concavities of the middle ones face each other, and the disks separated a short distance from each other, and all attached to a central solid rod. *b*, as and for the purposes described.

164,492. SPINNING-RINGS. W. W. Stearns, Norwich, Conn. [Filed Oct. 21, 1874.]

Brief.—An improvement in class of rings shown in Potter's Patent No. 64,104. The slot enables the traveler to be inserted without removing the top flange of the ring.

A spinning-ring of the character shown and described, provided with the slot D through its inner part, substantially as and for the purposes herein set forth.

164,493. LOOM-SHUTTLES. E. M. Stevens, Boston, Mass. [Filed Mar. 13, 1876.]

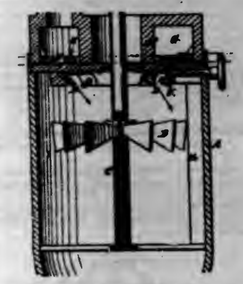


1. The swinging heel-plate A, provided with the projecting lugs *h h*, constructed to receive the yielding spindle, as described, in combination with the spring-catches *g g*, attached to the shuttle, for engaging with one of the lugs on the heel-plate, as and for the purpose specified.

2. In combination with a swinging heel-plate, a spring or springs arranged to allow the spindle to yield in both directions of its length, as and for the purpose set forth.

164,494. FIRE-BRICKS FOR FURNACES. P. Strattner, Wilmington, Del. [Filed Dec. 10, 1874.]

Brief.—Perforations in the brick correspond with the openings in the tubes.



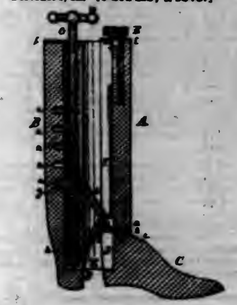
164,494.

1. A fire-brick, in combination with a perforated metallic frame incased within said brick, and having channels or passages corresponding with the perforations in the frame, substantially as and for the purpose specified.

2. The combination of the fire brick A, having ledges D D and channels or passages *b b*, and the hollow metallic frame B C, provided with perforations *a a*, all substantially as and for the purposes herein set forth.

164,495. WATER-WHEELS. Chas. H. Sturgee, Saratoga Springs, N. Y. [Filed May 6, 1875.]

Brief.—In combination with this water-wheel, two reverse series of jets and a gate contrived to open the jets of either series, and successively close the others in the same manner.



1. The combination of a series of jets, D, and a gate contrived to open and close them in succession, with a wheel, B C, substantially as specified.

2. The combination of two reverse series of jets with a wheel, B C, substantially as specified.

3. The combination, with two reverse series of jets, of a gate contrived to open the jets of either series, and successively close the others in the same manner, substantially as specified.

4. The reservoir G, gate H, jets D, wheel B C, and case A, substantially as specified.

164,496. BOOT-TREES. Robert Turnesure, Belvidere, Ill. [Filed May 1, 1875.]

1. The detachable hinge-joint and locking device, in combination with the shin A and foot C, substantially as and for the purpose set forth.

2. The combination of the toggle-jointed levers, screw-rod G, and ratchet-plate F, for the purpose of expanding a boot-tree, and forcing the shin A and foot C upward during the expansion, substantially as set forth.

3. The combination of the screw-rod G and toggle-levers, one of which is adapted to engage with the teeth of the ratchet-plate F, by means of which both screw-rod and levers are made vertically adjustable, substantially as shown and described.

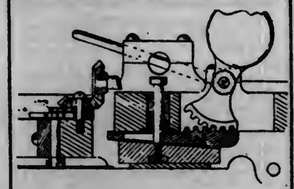
4. The combination of the screw E, ratchet slide-plate F, and toggle levers, substantially as described, for the purpose of forcing the shin A and the foot upward, or relieving the upper pressure exerted on the shin portion of the tree by the expanding device, as set forth.

164,497. MANUFACTURE OF METAL-TUBING. William L. McNair, Allegheny, Pa. [Filed Mar. 20, 1876.]

The method described of forming pipes by taking a blank the length of the pipe to be formed, rolling grooves in its edges, bending it into a circular form, and passing it through suitable welding-rolls, the joint being perfectly straight, so as to run with the plane of motion in welding, substantially as specified.

164,498. FOUNTAIN-BRUSHES. Robert S. Van Zandt, Williamsburg, N. Y. [Filed Apr. 24, 1875.]

Brief.—The handle of the brush is the reservoir, and it slides within the part that holds the brush, whereby the flow of liquid is regulated by an open conical end fitting into a closed conical receptacle.

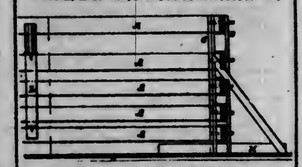


1. A fountain-brush, constructed with a reservoir-tube, G, provided with a valve, *i*, and passage *f'*, and adapted to slide within a tube, A, formed at its lower end with a tube, *h*, and brush K, and having a perforated plate or support, *d*, extending across its lower end, and supporting a funnel-shaped vessel, *c*, to position to receive the nozzle *i*, substantially as shown and described.

2. In a fountain-brush the combination, with a tube or cylinder, A, provided with a tube or nozzle, *h*, and brush K, and having a vessel, *c*, supported at the lower end thereof, of a reservoir-tube, G, adapted to slide within the tube A, and provided with a mouth or funnel, *j*, and a nozzle, *i*, adapted to be received and have its opening *i* closed and regulated by a vessel, *c*, in the manner and for the purpose described.

164,499. PRINTING-PRESSES. Chas Wells, Cincinnati, Ohio. [Filed Aug. 10, 1874.]

Brief.—The back of the vertical bed-plate is inclined, and is spring-pressed against a sliding wedge, which, acted on by a hand-lever, enables the form to be withdrawn and clear from contact with the plates and inking-rollers, the bearers for the latter being stationary. A vertically-reciprocating bar carries the inking-rollers over the form, and, by a rack on its rear side, gears with a wheel, from which extend crank-arms to oscillate the plates. The square ink plate receives a quarter-revolution after each impression.



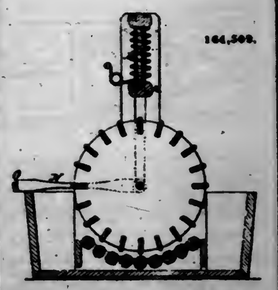
1. The combination of slotted disk *i* and crank *j*, with its pin working in the slots of the disk, as shown and described, for turning the ink-table a quarter-revolution after each rolling.

2. The combination, in a printing-press in which the roller-bearers are stationary, of a movable type-bed, with a lever and a wedge for operating the same, so that the bed may be withdrawn from the rolling or impression at the will of the operator, substantially as described.

3. The combination of crank-wheel A, pitman B, reciprocating rack C, and ink-rollers D attached to the rack, as shown and described.

164,500. PORTABLE FENCES. Jos. L. Welcham, Aullville, Mo. [Filed Mar. 13, 1875.]

A portable fence-panel, composed of rails A, pivoted in the posts B B', and secured in a central clamp, L, which is tied near top and bottom, and the braces H I, all combined substantially as shown and described, for the purpose specified.



164,501. TRACE-BUCKLES. Benj. F. Winey, Donahoe, Iowa. [Filed Mar. 27, 1875.]

Brief.—The buckle is constructed upon the principle of a key-hasp, and when closed it clamps the strap.

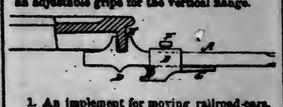
1. The combination of the pivoted and jointed plates A A', and plates B, and intermediate pressure-plate F, having tongue *f* and hook *h*, substantially as specified.

2. The jointed and pivoted side plates A A', in combination with transverse connecting-plates B, to form gripping-jaws at the ends of a buckle, substantially as specified.

164,502. WASHING-MACHINES. James Wise and Peter Lane, Elwood, Ind. [Filed Nov. 14, 1874.]

164,502.

The combination of the swinging lever or supplementary handle frame N O, with the constant-actuated rubbing-cylinder, adapted to be locked to and unlocked from said frame, as and for the purpose specified.

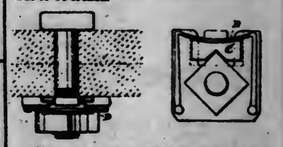


164,503. WEATHER-THRESHOLDS. Wm. H. Wood, Trenton, N. J. [Filed Apr. 6, 1876.]

The groove G in the bottom of a door, in combination with water-trough E and the diagonal water-ways O O O O, substantially as specified.

164,504. CAR-MOVERS. Milton Woodworth and Jerome B. Fredricks, Conneaut, Ohio. [Filed May 8, 1875.]

Brief.—For the purpose of rotating the wheel, one side of the lever has jaws adapted to pass onto the rim, and the other side has an adjustable gripe for the vertical flange.

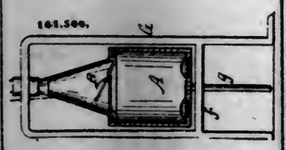


1. An implement for moving railroad-cars, consisting of a lever, A, having a projection, D, and the adjustable gripe B C, substantially as shown and described.

2. The lever A, having the jaw E, as shown and described.

164,505. NUT-LOCKS. Jos. C. Wright, Monocacy Station, Pa. [Filed Apr. 24, 1875.]

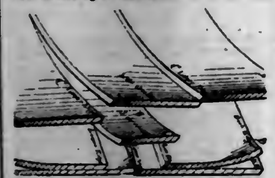
Brief.—A clevis-shaped spring is riveted at its extremities to the upper surface of the washer, and holds a dovetail slide against the nut to be locked.



The combination of the sliding locking-block C and spring D with the washer and nut, substantially as specified.

164,506. PUMPS. Eugene F. Adsitt, Waterloo, N. Y., assignee of two-thirds his right to A. H. Terwilliger and S. R. Van Hyck, same place. [Filed Apr. 2, 1875.]

Brief.—The reciprocating bucket or cylinder is guided in its movement by a rod attached to its bottom, and passing through a cross-bar forming part of the main frame.

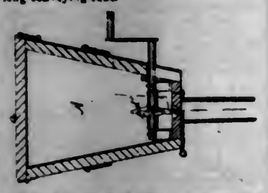


164,506.

In combination with the bucket A, and piston B, the inclosing-frame C, sustaining the said parts, and provided with the cross-bar *f*, through which runs the guide-rod *g*, attached to the bottom of the bucket, as shown and described, and for the purpose specified.

164,507. LEATHER BELTING. C. H. Alexander, H. W. Alexander, and E. P. Alexander, Philadelphia, Pa. [Filed May 1, 1875.]

Brief.—The firmer part of the leather is placed at the outer edges of the belt, and the yielding part in the center, so as to conform to the curved face of the pulley, and to prevent stretching of the belt.



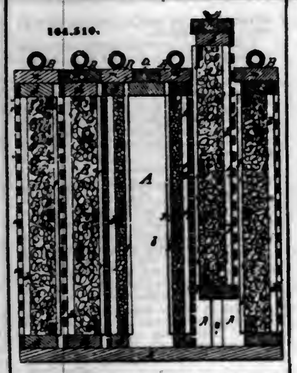
A belt made of middle hide-strips, having the firm edges B on the outside, and the yielding ones C on the inside, as and for the purpose specified.

164,508. PLAYING-CARDS. Phillip D. Aub, New York, N. Y., assignor of one-half his right to A. Heinemann, same place. [Filed Nov. 30, 1874.]

As a new article of manufacture, a playing-card, constructed of two or more layers of muslin, or other textile fabric, combined and united together by means of glue, starch, spermaceti, or such other suitable sizing material, and having the symbols or characters printed or painted thereon, substantially as described, for the purpose set forth.

164,509. FERTILISER-DISTRIBUTERS. C. Bailey, Kinston, N. C., assignor to himself, T. A. Harvey, and J. P. Bryan, same place. [Filed May 18, 1875.]

Brief.—A hand fertilizer provided with a revolving shaft, upon which are obliquely-arranged blades, (just over the adjustable delivery hole,) that force the material into the long conveying-tube.



A hand sower for fertilizers, consisting of hopper A, having bottom slot *a'*, and crank-shaft D, having obliquely-arranged blades *d* and the long tube B, all in combination, as shown and described.

164,510. WATER-FILTERS. Phinehas Ball, Worcester, Mass. [Filed Feb 25, 1875.]

Brief.—An outer case with open ends and top, and with vertical guiding-grooves in its sides, to receive slatted filtering-sections filled with "excelsior," or other known agents. Said sections can be removed to be refilled without stopping the flow of water.

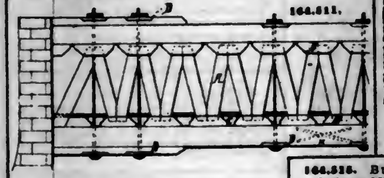
164,510.

1. A filter constructed with open ends a and c, and provided with shavings or the woody fiber known as excelsior, for the purpose set forth.

2. A filter constructed with open ends a and c, and provided with one or more boxes, B, filled with shavings or the woody fiber known as excelsior, for the mechanical purification of the water, and with one or more other boxes filled with known agents for the chemical purification of the water, substantially as set forth.

3. A filter-box, A, constructed with an open top, and with open entrance and exit ends c and e, in combination with two or more separate and independent sections, B, through which the water has uninterrupted or free access from the one to the other, and each capable of being separately removed from the filter without shutting off the flow of water or stopping the filtering process through the other, substantially as and for the purpose set forth.

4. A removable filtering-box, B, consisting of a slatted frame, *d*, and cap-piece *m*, substantially as set forth.



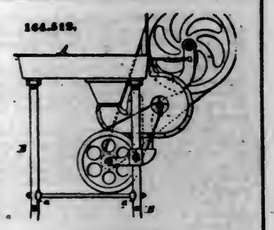
5. A removable filtering-box, B, consisting of frame-head *d*, slatted on one side, and provided with a removable slatted cover, *g*, substantially as and for the purpose set forth.

6. The combination of a filter-box, A, provided with recesses *c*, with one or more removable filter-boxes, B, constructed and arranged substantially as and for the purpose set forth.

164,511. TRUSS-BRIDGES. Henry Barton, Washington, D. C. [Filed June 5, 1875.]

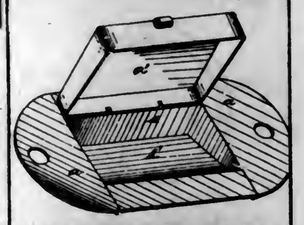
Brief.—A bridge constructed of angular beveled end uprights, which fit into flanged boxes above and below, with cross-ties between each box, and held together by flanged plates and stay-rods.

164,511.



The combination of the angular and beveled end uprights A, fitting into their angular and flanged boxes B above and below, with their cross-ties C between each box, and flanged plates D supporting the stay-rods G, as herein described, and for the purposes set forth.

164,512. PORTABLE FORGES. De Witt C. Baxter, Philadelphia, Pa., assignor to himself, Charles C. Torr, and Cochran Forbes, same place. [Filed Nov. 1, 1871.]



The combination, in a portable forge, of the hearth-plate A and tubular legs B B B B, connected to each other, and extending into and secured to the hearth-plate, substantially as set forth.

164,512.

164,513. SAD-IRON HEATERS. Jas. S. Bitler, Delaware, Ohio. [Filed Feb. 12, 1875.]

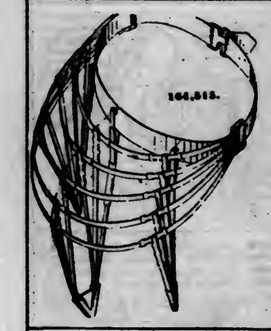
Brief.—The bottom is inclined to receive a more direct impact of the rearwardly-drawn products of combustion, and the top is made nearly parallel.

An improved sad-iron heater, consisting of the receptacle A, having the inclined bottom A' and supporting-flange *a*, constructed as shown and described, in combination with the inclined topped cover *a'*, substantially as specified.

164,514. SIGNS. Henry J. Blowney, South Bend, Ind. [Filed Apr. 6, 1875.]

The combination of the glass front B, back C, frame F, metallic molding E, and cement D, substantially as described.

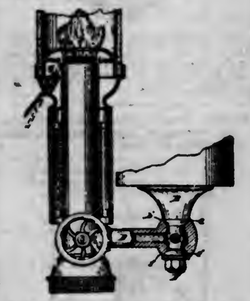
164,514.



164,515. BUSTLES. Moses K. Bortree, Jackson, Mich. [Filed Mar. 6, 1875.]

1. In a bustle, a series of elastic bows, B, having their ends secured to buckles C, arranged to slide on the waist-belt, substantially as described.

2. The combination, in a bustle, of a series of elastic bows, each supported at intervals by a brace, which in turn is suspended from a waist-belt by a hanger, which has a limited movement in the direction of its length, independently of said waist-belt, substantially as described.

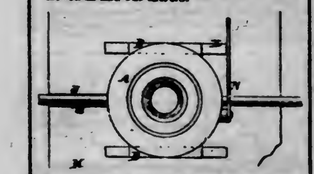


3. The combination, in a bustle, of the elastic bows, two or more separate or independent braces for each bow, a clip-casket to receive each group of braces, and a hanger to suspend them from the waist-belt, which hangers are arranged to move or yield in the direction of their length, substantially as described.

164,515.

164,516. LOCOMOTIVE HEAD-LIGHTS. Wm. H. Briggs, Chicago, Ill., and A. B. Briggs, Cincinnati, Ohio, assignors, by mesne assignments, to Jos. Briggs and Post & Co., Cincinnati, Ohio. [Filed Mar. 6, 1875.]

Brief.—The hinged match-plate closes the aperture automatically on the withdrawal of the match.



1. The combination of shank B and pipe D, the former having tapering joint-face *b* and tapering nut F *f*, and the latter two tapering seats, *c c'*, to match, substantially as and for the purpose specified.

2. The match-striking plate G, hinged angularly behind aperture *e*, substantially as and for the purpose specified.

164,517. MOLDS FOR GLASS, &c. Aries P. Brooks, Bayonne, N. J., assignor to James M. Brookfield, New York city. [Filed May 12, 1875.]

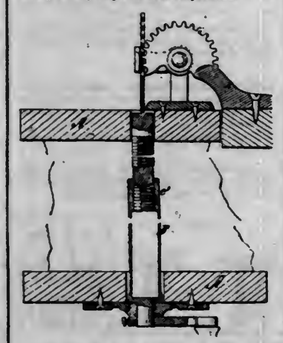
Brief.—The bottom part of the mold is divided from its main body in a horizontal plane, and the dies are arranged between them, resting on the lower part, and guided thereon in the recess, which extends through the bottom mold from side to side, so that the dies can be moved in and out therein.

1. The glass-mold, constructed of the solid upper and lower sections A A', in combination with the dies B, arranged between said sections, substantially as and for the purpose described.

2. The mold A, having its lower edge rabbeted, as at D, in combination with the lower section A', having the curved rims E, horizontal pins G for connecting the sections together, and the dies B arranged between the latter, as and for the purpose described.

164,518. ORGAN-STOP KNOBS. Riley Burdett, Erie, Pa. [Filed May 27, 1875.]

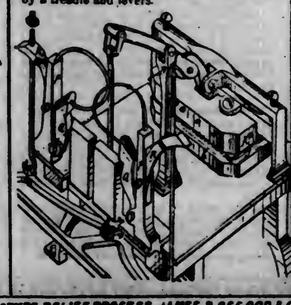
Brief.—To prevent the tangling of the porcelain name-plate from its handle, the plate is clamped to a wood, paper, or other backing, by means of which it is firmly secured to the back of the recess in which it is placed.



In combination with the recessed stop-rod, register-handle, or knob, A, the porcelain name-plate or scalp B, provided with a paper, pasteboard, or other suitable backing, D, and the metal rim or banding C, substantially as described, and for the purpose set forth.

164,515. B

164,519. SHUTTER-WORKERS. Thomas J. Carroll, Bridgeport, Conn., assignor to F. Armstrong. [Filed May 20, 1875.]



Brief.—A suitable tube, having at its inner end a female screw, and operated by a crank-handle, is secured within the casing. A male screw formed on an iron bar connects with this cylinder, while the outer end of the bar is formed into a flattened plate, having rectangular perforations, which mesh with and engage the cogged teeth of a sector or half-wheel attached to the shutter; the construction allowing the rack-plate to slide or work within the tube, as well as to hold the shutter firmly at any angle in desired position.

The tube B, having a screw-head, as at *c'*, in combination with the bar D, rack E, and toothed wheel *f*, substantially as and for the purpose described.

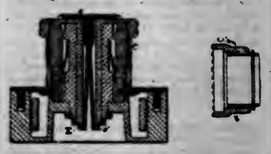
164,520. PAN-FORMING MACHINES. Wm. Chalmers, Detroit, Mich. [Filed Sept. 18, 1874.]

Brief.—Hinged jaws operating in connection with supporting-blocks for lapping over the corners of pans. The jaws are operated by a treadle and levers.

The adjustable plates N N, blocks O O, standards P P, forming jaws Q Q, levers R R, and rods S S, in combination with the table and treadle, substantially as and for the purpose set forth.

164,521. TOY PISTOLS. Robt. W. Churchill, Bridgeport, Conn., assignor of one-third his right to David J. Walters, same place. [Filed Apr. 12, 1875.]

1. The combination, in a toy pistol, of the spring C, the follower E, the rack F, the hammer G, and rod *d*, with a trigger, to disengage the said rod *d*, substantially as described.



2. The combination, in a toy pistol, of the spring C, the follower E, the rack F, and pawl L, with a trigger, to disengage the said pawl, substantially as described.

3. The combination, in a toy pistol, of the spring C, the follower E, the rack F, the rod *d*, and the pawl L, with a trigger, to release the said pawl, substantially as described.

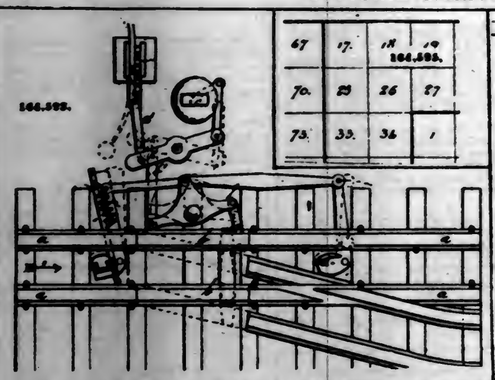
4. In a toy pistol, the follower E, provided with an elastic device, substantially such as described, to hold the torpedo.

5. In a toy pistol, the follower E, provided with a cushion, R, upon its outer end, substantially as and for the purpose described.

164,522. COMBINATION SEAL-LOCKS. Henry Clarke, Baltimore, Md. [Filed Dec 16, 1874.]

1. The seal-holding plate *c*, having its circumferential limit indented for the entrance of a portion of each tumbler, as shown, thus enabling the said plate to hold down the seal while it is being punctured by the tumblers, in combination with the dial D, perforated for the occupancy and movement therein of the said tumblers, the said plate and dial being incorporated in a seal-lock, substantially in the manner herein specified.

2. The indented seal-holding plate and bolt *c c'*, in combination with the dial D, perforated for the tumblers, said dial having as a part thereof the hollow bolt E, relatively arranged as parts of a seal-lock, substantially as and for the purposes herein specified.



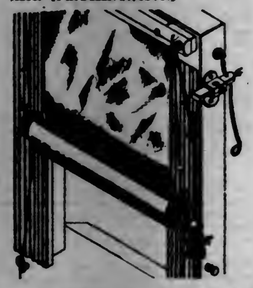
3. The combination of the band C, compensating lining *c'*, slotted as set forth, and sleeve B, provided with the projecting stop *a*, relatively arranged within the lock, substantially as and for the purpose specified.

4. The lock-case recessed at the back, as shown, in combination with the dial-bolt E, said bolt tying or holding together the lock-case and dial, substantially as specified.

164,523. RAILWAY-SWITCHES. William W. Colley, Philadelphia, Pa. [Filed Apr 26, 1875.]

Brief.—A railroad switch in which a cam rigidly attached to the short arm of an angular lever is employed, in combination with a hinged cam on a similar lever. A train approaching the siding on main line, in case the switch is set for the siding, will shift the switch to main line by wheels acting on hinged cam; but if desired to go onto siding the cam is turned over in its hinge by means of a hand attachment, which frees it from contact with the passing wheels, and the switch-rails are not actuated. In coming in the opposite direction, if the switch is wrongly set, the wheels act upon the stationary cam on the vibrating angle-arm, and shift the rails into line. The hinged cam is returned to its normal position by a spring.

164,502.



1. The cam *g*, movable in its bearings, arranged, with relation to the main track, as shown, in combination with the hand-lever *e*, whereby the position of said cam with relation to the rail is changed, and cars are allowed to pass onto the siding without affecting the levers employed to operate the switch, substantially as set forth.

2. The combination of the main track *a*, the cam *d*, fixed in its bearing, the movable cam *g*, the switch *b*, and a system of levers for connecting said cams with said switch, whereby the switch is automatically or by hand brought into direct line with the main track, whether the car approaches from one or the other direction on said main track, substantially as set forth.

3. The combination of the main track *a*, the cam *d*, fixed in its bearings, the switch *b*, and a system of levers for connecting said cam *d* with said switch, whereby the switch is automatically or by hand brought into direct line with the main track when the car approaches the switch from the direction of said cam *d*, substantially as set forth.

164,504. CURTAIN-FIXTURES. Henry M. Converse, Waterloo, Canada, assignor of one-half his right to George S. Codd, same place. [Filed Mar. 17, 1875.]

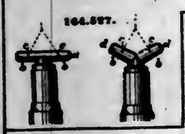
The combination, with a curtain attached permanently to the frame at its upper end, of the roller D, with pulleys D' and journals *c*, the bars *b*, cords *d*, with tassel K, and the bands *h*, with weighted tassels G, and a device attached to the window-frame, which automatically holds the curtain at any desired point, all substantially as and for the purposes herein set forth.

164,505. TARGETS. Thomas B. Connery, New York, N. Y., assignor to J. G. Bennett, same place. [Filed May 10, 1875.]

The improved target herein described, having its surface subdivided into minute squares, or other shaped divisions, which are each provided with a specific number or sign to adapt the same to be speedily read and reported, substantially as described, and for the purpose set forth.

164,506. MACHINES FOR MAKING WOODEN PINS. George W. Conies, Oshkosh, Wis., assignor of one-third his right to Hiram M. Dyer, same place. [Filed Mar. 23, 1875.]

Brief.—The pins are formed by passing the material through the saws twice, so as to make cuts at right angles to each other.



In combination with saws B B and slitting saws A A the adjusting-washers J J, substantially as specified.

164,507. GAS-BURNERS. Isaac Cook, St. Louis, Mo., assignor of one-half his right to Jacob R. Sprague, same place. [Filed Mar. 1, 1875.]

Brief.—Removable plugs in the horns of the burner.

The removable stoppers or plugs *d*, in combination with a gas-burner having horns *b*, and gas-vents *c*, substantially as described.

164,507.

164,508.

164,509. GAS-BURNERS. Isaac Cook, St. Louis, Mo., assignor of one-half his right to Jacob R. Sprague, same place. [Filed Jan. 18, 1875.]

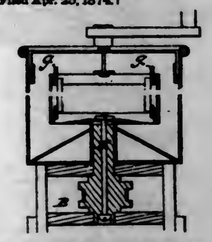
As a new article of manufacture, the duplex gas-burner provided with the thin adjustable necks or branches B B, as and for the purpose set forth.

164,509. SEWING-MACHINES. C. S. Cushman, Philadelphia, Pa., assignor to N. D. Stoops, same place. [Filed Apr. 14, 1875.]

Brief.—The cam-shaft that gives the usual motion to the feed has pins near its end that strike the pattern-cam, which, through gear-wheels, turns the shaft carrying a sleeve that imparts lateral movement to the feed through a cam-groove on the shaft and pin on the sleeve.

1. The combination of the wheel J, having teeth *i* and *i'*, teeth-wheels K and K', spur-wheels K'' and K''', and the cylinder M, having a curvilinear cam-groove, *r*, with the sleeve N, having pins for giving a reciprocal lateral movement to the feed-surface P, for producing ornamental stitching, substantially as set forth.

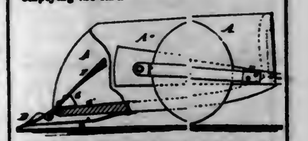
2. The wheel J, having teeth *i* and *i'*, in combination with teeth-wheels K and K', constructed as described, for giving an intermittent rotary motion to the pattern-cam of a sewing-machine, substantially as described.



164,510. COFFEE-STEEPERS. R. R. Daken, Coldwater, Mich. [Filed Jan. 22, 1875.]

Brief.—The alcohol to be consumed is poured in through the opening *d*.

The combination of the base *A*, provided with a fire-cup, B, with the cup D, supported by the perforated shield C, which is provided with an opening, *d*, substantially as and for the purpose set forth.



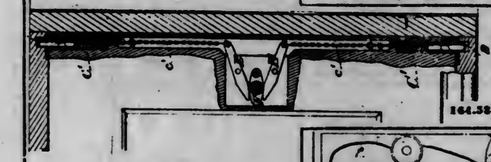
164,511. CENTRIFUGAL HORSE-RETRACTORS. Absalom W. Dawley, Mankato, Minn. [Filed Apr. 26, 1874.]

The removable racks *g g*, having slots *g' g'* projecting inward to secure the proper transverse location and spacing of the comb-frames, and at the same time to facilitate their removal, in combination with the rotary basket D and the outer stationary vessel A, provided with the cock K, substantially as and for the purpose set forth.

164,512. SCRAPERS. Elbridge Dickinson, Marshall, Mo. [Filed May 1, 1875.]

Brief.—The body is provided with a scraper-plate, with upper and lower supporting-bars to brace it. Parallel inclined bars connected to a cross-bar are pivoted to the scraper-plate by a hinge-bolt, so as to turn out of the way when emptying the cart.

1. The scraper-plate D and its upper and lower supporting-bars *d' d'*, in combination with the bottom of the body or box A of the scraper, substantially as herein shown and described.

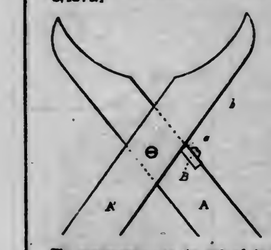


2. The combination of the parallel inclined bars F, the cross-bar G, and the hinge-bolt H with the scraper-plate D, the supporting-bars *d' d'*, and the bottom of the body or box A, substantially as herein shown and described.

164,522. INSECT DESTROYING COMPOSITIONS. Jos. B. Douglass and E. S. Green, Columbia, Mo. [Filed Mar. 20, 1875.]

The improved compound herein described for protecting trees from boring insects, consisting of sugar of lead, alcohol, spirits of turpentine, aqua ammonia, and gum arabic and camphor, in about the proportions specified.

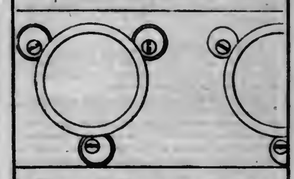
164,524. CAR-WINDOWS. J. L. M. Du Four, Boundbrook, N. J. [Filed Apr. 28, 1875.]



Brief.—The window is provided at each side with spring-bolts and keepers, as shown, the bolts being operated by cam and lever attachments. When one side is swung open, the other acts as a pivot. The lower casing has guide and lock mechanism.

1. The combination of window A, pairs of spring-bolts C *c* C', keepers D, chains *c'*, levers E, and cams F, substantially as and for the purpose specified.

2. The horizontally-swinging window A *g g*, in combination with the slotted arms G *g'*, one of which has an angular notched leaf, G' *g''*, and spring-catch H *h*, substantially as and for the purpose specified.

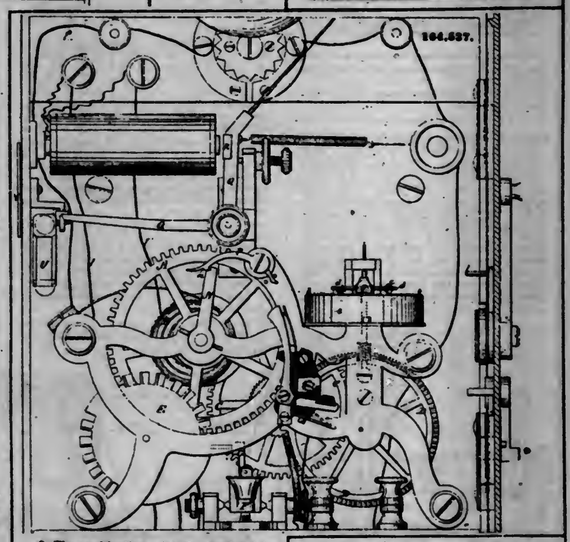


164,525. STANDS FOR BARREL-CHURNS. J. H. Dunbar, Philadelphia, Pa. [Filed Feb. 3, 1874.]

The projections *a a* on the ends of the bar B, in combination with the edges *b b* of the outer legs A' A', to form steps for the same, substantially in the manner and for the purpose above described.

164,526. HOLDING AND ADJUSTING DEVICES FOR SPINNING-RINGS. Frank J. Dutcher, Hopedale, Mass. [Filed May 22, 1875.]

Brief.—The grooves or flanges of the eccentrics receive a flange projecting from the ring, and confine the latter to the rail, and by turning the eccentrics on their screws the rings may be adjusted.



The grooved or flanged eccentrics and their clamp-screws, combined with and applied to a spinning-frame ring and its support-rail, substantially as specified.

164,527. FIRE-ALARM SIGNAL-BOXES. W. H. Facer, Toronto, Canada. [Filed Apr. 20, 1875.]

Brief.—Transmitting-key operated by the motion of notched die in one direction only. Current shunted momentarily from bell-magnet on depression of winding-arm. A pivoted double stop prevents the operation of winding-arm a second time, until transmitting mechanism has returned to starting-point. Doors of all boxes but that from which signal is sent are locked by means of a pivoted segment and a mercury-balance, operated by an extension of armature-lever on breaking of circuit.

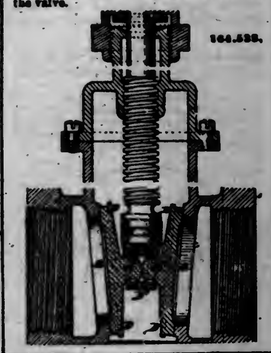
1. The disk E, having its notches arranged diagonally, so as to form cams, in combination with the transmitting-key F and the elbow-lever G, having a pin, *h*, substantially as and for the purpose described.

164,527.

2. The combination, with the insulated lever K and spring L, having contact-points, of the crank N, substantially as and for the purpose described.

3. The combination, with the notched disk E, the main driving-spring, and the intervening train of gear-wheels, of the friction-governor, consisting of a disk, *a*, having pivoted segments *b*, springs *c*, and an adjusting-bar, *d*, all contained within the frame *e*, substantially as and for the purpose described.

4. The combination, with the crank N and the setting-crank O, carrying a spring and a stud, *i*, of a pivoted double stop, P, substantially as and for the purpose described.



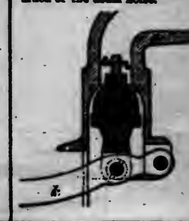
5. The combination of the pivoted locking-segment V and the mercury-balance U with the armature of the magnets, and the stud *o* upon the door-bolt, as and for the purpose described.

6. The combination of the locking-segment V, carrying stud X, with the spring-metal lever-catch W upon the inside of the outer case, and the stud Y upon the door, substantially as and for the purpose described.

164,528. STOP-COCKS. John L. Frisbie, New York, N. Y., assignor to himself and Thomas J. Nottingham, Cincinnati, Ohio. [Filed May 19, 1875.]

Brief.—The stem is swiveled to concave-headed projections formed upon the backs of the valve.

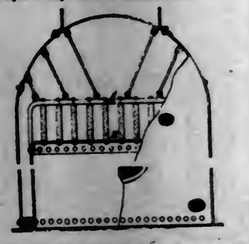
164,528.



164,527.

In combination with the inclined faces a a and carrier F, the valves D D, having swiveling projections *d d'*, with convex ends in contact, substantially as and for the purpose specified.

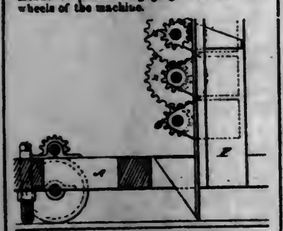
164,529. TANK-REGULATORS. Alva Fuller, Brooklyn, N. Y. [Filed May 17, 1875.]



Brief.—The conical rubber valve is pressed to its seat by the lever rising with the float. The guide-arms steady the valve and prevent much of the usual noise.

The conical rubber valve *f* with the guide-arms *e* upon the valve-stem, in combination with the parallel water-way *b* valve-seat *c*, lever *k*, and float *m*, substantially as set forth.

164,540. CROWN-SHEETS FOR STEAM-BOILERS. Solomon B. Gance, Columbus, Ohio. [Filed Dec. 4, 1874.]



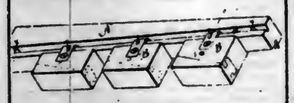
Brief.—A subsidiary crown-sheet is located some distance above the crown-sheet proper, between which a continuous circulation of water takes place, by which the crown-sheet proper is kept clear of sediment.

The shield or secondary crown-sheet A, solid over the entire extent of its horizontal area, in combination with the crown-sheet B of a boiler-furnace, substantially as and for the purpose specified.

164,541. DRIVERS FOR SHEET-PILING. E. Gardner, New York, N. Y., assignor to E. Howe, same place. [Filed May 31, 1875.]

Brief.—A machine for forcing sheet-piles into the ground by mechanical pressure exerted through gearing. Upon a four-wheeled frame is mounted a vertical sliding-rack pressbar, with a laterally-projecting arm, which rests upon the top of the slab to be forced down; said slab and arm being guided between vertical uprights. A cutting-edge is attached to the press-bar at one side. The frame is moved along upon a track or way by means of pinions engaging with the front wheels of the machine.

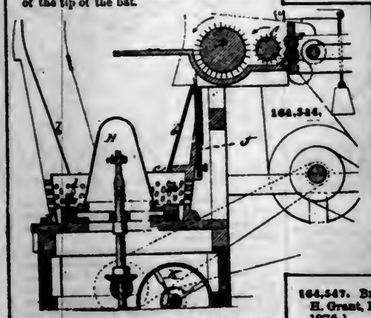
The carriage A A A A, in connection with the press-bar G, and the gearing for operating it, arranged and connected with the uprights F F, substantially as described and illustrated, and for the purpose specified.



164,542. VENTILATING-BASSINET. Elijah B. Georgia, Clifton, Va., assignor to himself and Margaret Hotsel, same place. [Filed Apr. 6, 1874.]

1. A fruit keg or barrel having longitudinal apertures in the body of the stave, and at a distance from the joint of any two, as and for the purpose described.

2. The within-described barrel, made tight at and near the middle, where it has the largest diameter, and having openings where the barrel is reduced in diameter, all as set forth.



164,543. PRINTERS' SIDE-STICKS AND QUOINS. William Gilbert, Catskill, N. Y. [Filed Oct. 27, 1874.]

The combination of the two-part quoin B C, one part having a tongue and the other a groove, the pin *i*, L-shaped pieces *b*, and the stick A, with grooves *a*, all substantially as and for the purposes herein set forth.

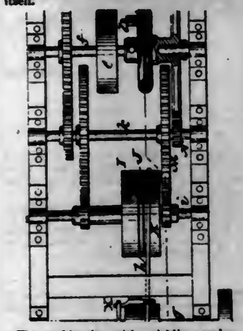
164,544. MACHINES FOR FORMING HAT-BODIES. John Gill, Orange, N. J. [Filed July 6, 1874.]

Brief.—The present invention is an improvement on applicant's patent, granted January 13, 1857; and consists in providing inlet air-openings around the lower part of the chamber surrounding the perilous cone or former, whereby the brim portion of the hat-body is caused to receive less fur than the middle portion thereof. The lower part of the chamber in which the perforations are formed is constructed of larger internal diameter than the inverted conical portion immediately above, to form a cavity wherein the jets of air entering through the openings are broken up and diffused, and a better distribution of the non-fur-bearing air around the lower part of the cone or former is obtained, and also preventing the fur from lodging in the lower part of the chamber. By reason of the cut-off board, over which the fur is supplied to the chamber, and a slide and air-inlet arranged in the upper side of the chamber and beneath said cut-off board, the quantity of fur to be deposited upon the cone or former is regulated, and caused to pass farther over and lower down on the same, thereby reducing the thickness of the tip of the hat.

1. The perforated lower portion of the chamber G, of larger diameter than the lower part of the inverted conical portion *b* above said perforated portion, substantially as and for the purpose herein specified.

2. The slide J, applied to the inlet air-opening under the cut-off board E, in combination with the cone H and chamber G, essentially as and for the purpose herein set forth.

164,545. FAUCETS. Henry Gneelli, Detroit, Mich. [Filed May 4, 1875.]



1. The combination, with the faucet A A', of the valve-case C, air-valve E, consisting of the hollow stem *e*, having the openings *c' c''*, opened by the faucet and closed by a spring, the tube D, and check-valve *c*, substantially as described and shown.

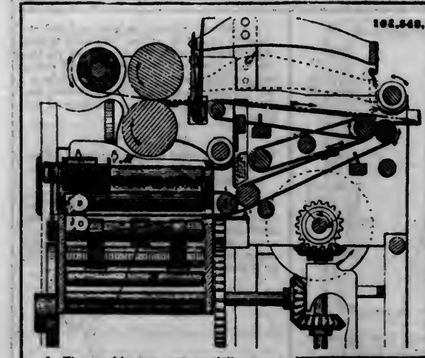
2. The combination, with the faucet A A', of the air-valve E, having the spring *f*, tube D, check-valve *c*, plug B, having the cam *e*, and the rod F, having the head *i* and spring G, substantially as described and shown.

164,546. REGULATORS FOR HEMP-DRAWING AND SPINNING MACHINES. John Good, Brooklyn, N. Y. [Filed May 3, 1875.]

Brief.—For varying the velocity and stopping the motion of the gill-belt, which feeds the slivers to the flier of the twisting mechanism, by variations in the position of the condenser, through which the sliver passes, caused by irregularity in the size of the sliver itself.

The combination, with a yielding condenser, of a slip-clutch, Q R, the shaft *f*, the loose and fast pulleys I J K, the band *h*, a belt-shifter, X, and differential gear for communicating the power from said band to actuate the shaft *f* at different velocities, essentially as described.

164,547. BLACKBOARD-ERASERS. George H. Grant, Richmond, Ind. [Filed Apr. 29, 1875.]



Brief.—The pressure upon the handle while in use is sufficient to prevent the rotation of the brush.

1. The cylindrical rubber or brush A B, handle C, and frictional end bars D D, combined and arranged to operate substantially as and for the purpose specified.

2. The combination of the oval or eccentrically-pivoted handle C with the cylindrical rubber or brush A B, end bars D D, and pivotal bolts or screws *d d*, all arranged to operate substantially as and for the purpose specified.

164,548. PAPER-BAG MACHINES. Thomas W. Grinter, Cincinnati, Ohio, assignor to himself and Joseph F. Jewett, same place. [Filed Feb. 23, 1874.]

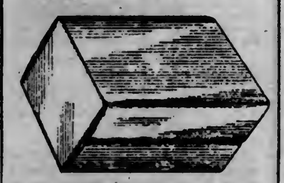
1. The combination, substantially as set forth, of intermittently-moving feed-rolls, a fixed cutter, a movable cutter, a holding-clamp or bearer moving with said movable cutter, and bridge-springs interposed between the roller and cutters, whereby the paper web, while being cut, is clamped upon the springs and its front end presented in proper relation to the carrying-apron when the feed is resumed.

2. The combination, substantially as set forth, of feed-rollers holding clamps, cutters, and a pasting and creasing knife, all moving intermittently, with continuously-and rapidly moving feed-tapes and pressing-rollers, whereby each blank, after being severed from the web, gains on the following one the distance necessary for the proper performance of the successive operation.

3. The combination of feed-rollers, cutters, and first and second pasters and creasers, all moving intermittently, with continuously-moving carrying-tapes and pressing-rollers, these members being constructed to operate in combination, substantially as set forth, whereby the blank is pasted on one side, folded, reversed, and then pasted on the opposite side of its bottom folds.

4. The combination of the cam-wheel G, its slide-bar and cross-head, the movable cutter, the first and second creasers and pasters, and their paste-applying rollers, these members being constructed and operating substantially as set forth.

5. The combination, substantially as set forth, of the first and second creasers and pasters, forming the bottom folds of the bag, and their carrying-tapes and pressing-rolls, with the third creaser and paster, and its carrying-tapes and pressing-rollers, whereby the bottom is twice pasted at proper points, twice folded upon the body, again pasted, and the body folded longitudinally.



6. The combination of the third and fourth creasers and pasters, mounted upon a common support, and actuated by a single cam, and the paste-rollers M O', substantially as set forth.

7. The combination of the first and second creasers and pasters, operating in parallel planes, with the third and fourth creasers and pasters, likewise operating in parallel planes transverse to and during the pause in the movement of the first two, these members being constructed and operating substantially as set forth.

8. The combination, substantially as set forth, of a cutter and two creasers, moving in parallel planes, and operating simultaneously, with creasers moving transversely thereto, and acting in unison during the pause in the operation of the cutter and first creaser, whereby a series of blanks are simultaneously subjected to successive stages of manipulation, as set forth.

164,549. CLOTH BAGS. Thomas W. Grinter, Cincinnati, Ohio, assignor to himself and Joseph F. Jewett, same place. [Filed May 1, 1875.]

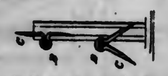
A satchel-bottomed cloth bag, made from a tubular blank by doubling over diagonally a lap on each side of the bottom of the bag, and securing the laps by stitching across the bag near its bottom, substantially as hereinbefore set forth.

164,550. CLOTH BAGS. Thomas W. Grinter, Cincinnati, Ohio, assignor to himself and Joseph F. Jewett, same place. [Filed May 1, 1875.]

A bellows-fold satchel-bottomed cloth bag constructed by doubling the cloth strip or blank upon itself, folding over a lap at the bottom, and stitching the lap and the sides of the bag together, substantially as hereinbefore set forth.

164,551. HOLDERS OR FASTENERS FOR HALTER-STRAPS. A. Hagny and S. L. Hagny, Keokuk, Iowa. [Filed Apr. 10, 1875.]

Brief.—The holder has a rigid metal loop at one end and a ring at the other. The ring is secured around a bolt, which is constructed with flanges to prevent wear. The strap is slotted and fastened by slipping it over the loop, and is held in place by passing the end of the staple through the loop above it.



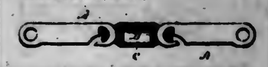
1. The holder having the staple A, the ring M, and the loop E, arranged to operate substantially as set forth.

2. The combination of the loop E, having the rigid projection F, the staple A, the flexible tongue I, and the part V, substantially as set forth.

3. The bolt L with the projections L' to hold the ring M, substantially as set forth.

164,552. WIRE FENCES. Jacob Hauk, De Kalb, Ill. [Filed May 27, 1875.]

Brief.—A wire, pointed at both ends, is doubled, and each leg is then bent at right angle outwardly, leaving a nearly complete circle at one side, into which circle the long wire enters when the loop is pressed close upon it.

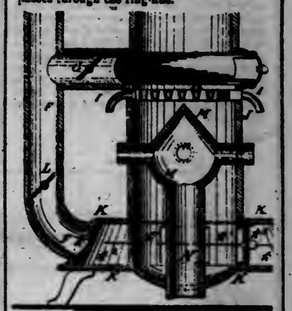


In a wire-fence, the combination of the staple wires B B, and the pointed wires or barbs C C, bent into the loops or eyes *a' a''*, and mounted on the wires B B, substantially as and for the purposes specified.

164,553. MANUFACTURE OF TILING. F. H. Hall, Zanesville, Ohio. [Filed Mar. 16, 1875.]

1. In a process for making tiling, preparing the clay by dissolving it to a consistency about equal to that of cream, then passing the same through a sieve, and then boiling the same until the gases are expelled, substantially as set forth.

2. A process for making a tiling, consisting of purifying the clay in the manner described, evaporating the same to dryness, then crushing and grinding the same to a fine powder, then dampening it, and then pressing the same into molds and burning it, either with or without a flux mixed therewith, substantially as set forth.

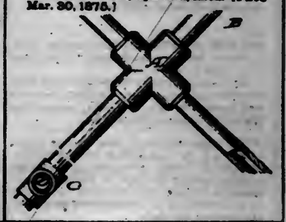


164,554. BRIDLE-BITS. La Fayette Harteon and James W. Bronson, Wyoming, Iowa. [Filed May 15, 1875.]

A bridle-bit consisting of the hollow center-piece, provided with perforations and opening U, in connection with the hook-ed end pieces, all constructed and arranged as herein shown and set forth.

164,555. BASE-BURNING STOVES. Melville C. Hawley and William Lennox, Mattoon, Ill. [Filed May 3, 1875.]

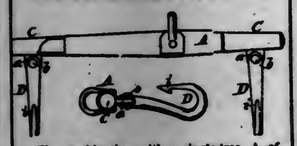
Brief.—The hollow arms are inclined alternately upwardly and downwardly, to promote circulation of air. The indirect draft passes through the ring-flue.



1. The hollow grate H, provided with tubular arms I, to allow the air to circulate through the bars of said grate, in combination with the walls of the stove, substantially as herein shown and described.

2. The combination of the conical chamber M, the inlet pipe or flue N, and the outlet pipes or flues O with the grate H, the lower fire-chamber J, and the base K of the stove, substantially as herein shown and described.

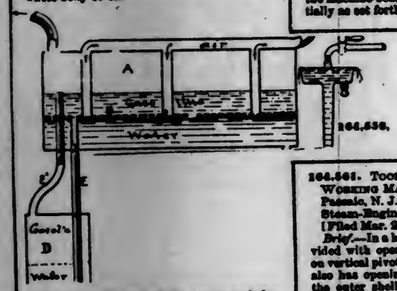
3. The ring-flue K^2, formed in the base K around the ash-chamber K^1, without the diameter of the stove, and connected with the ash-chamber K^1 and the pipe P by openings in its opposite sides, substantially as herein shown and described.



164,556. SAW-BUCKS. Rob C. Hayton and Chas. A. Herbert, Ypsilanti, Mich. [Filed Mar. 30, 1875.]

Brief.—The saw-back is formed of sections of metal tubing, which are secured in place by two hollow metal crosses, forming sockets for the reception of the ends of the sections, and a foot-brace of the same attached to the legs of the back by a T-shaped socket-joint.

The combination of the cross A, arms B, T-joints C, and foot-brace D, all substantially as and for the purposes herein set forth.



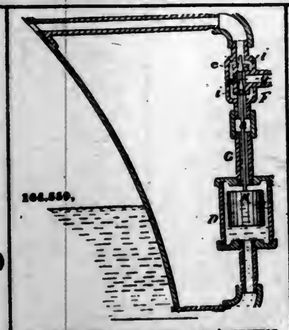
164,547. WRENCH-STRIPPER. Wm. G. Hearn, Dyer's Station, Tenn., assignor of two-thirds his right to James L. Berry and M. Hutchison. [Filed May 6, 1875.]

The combination, with a single-tree, A, of the ferrule C, provided with a lug, *a*, on its front side, and the hook D, formed with a spur, *b*, and having its rear or shank end slotted or forked horizontally, and pivoted to the lug *a* by a pin, *b*, all substantially as and for the purposes herein set forth.

164,548. CARBURETTERS. John C. Henderson, San Francisco, Cal., assignor to the Carbureted-Gas-Machine Company, same place. [Filed Mar. 13, 1875.]

Brief.—Water passes from the supply-vessel by a siphon until it reaches the level of the perforated diaphragm, when it overflows by a pipe leading to the bottom of the oil-supply tank, and displaces the oil which passes by a pipe opening in the carburetor at a higher level than the overflow. The water and oil in the carburetor balances the water in the supply-tank. The diaphragm compels the air admitted beneath it to bubble up through the whole body of oil.

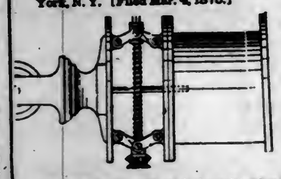
1. The supply-tank D, having water-induction pipe E and ejection-pipe E', in combination with a carburetor, wherein layers of water and of volatile hydrocarbon oil or fluid are used, as before specified.



2. The water-tank F, with its siphon-pipe *g*, in combination with a carburetor-tank or casing, A, constructed and operating substantially as herein before described.

3. In a casing or tank, A, the perforated diaphragm or partition B, in combination with pipes E and E' and supply-tank D, for the purpose as hereinbefore fully described.

164,549. FEED-WATER REGULATORS. Geo. HENRY, Lonsdale, Canada. [Filed May 11, 1875.]

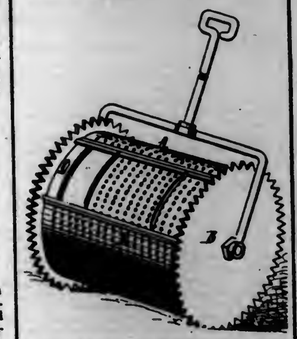


Brief.—As the water in the boiler and float-chamber becomes lower, the float descends and opens the valves, allowing steam from the boiler to pass to the pump.

The water-chamber D, float E, stem *c*, and valves *a a*, in combination with the valve-chamber F, having steam-passage *d*, communicating openly by pipe G with the water-chamber D, and provided with valve-seats *f f* and branch *g*, all substantially as and for the purpose specified.

164,550.

164,550. MECHANISMS FOR ADJUSTING LATHE-BEDS TO DIFFERENT HEIGHTS. W. H. Hoffman, Passaic, N. J., assignor to the New York Steam-Engine Company, New York, N. Y. [Filed Mar. 4, 1875.]



The combination, with the bed or table of an engine-lathe or other machinery, of knuckle-jointed levers, interposed between the bed and the support upon which it rests, connected together in pairs or sets by screw adjusting-shafts, by which the said levers are operated to effect the lifting or lowering of the machine-bed, as the case may be, substantially as set forth.

A combined machine-support and tool-receptacle consisting of two concentric shells, one of which is capable of rotation on the common axis of the two shells, the said shells being formed with corresponding openings, and the inner shell provided with shelves, under the arrangement and for operation as set forth.

164,552. DEVICES FOR DISTRIBUTING ASHES ON ICY SIDEWALKS. William W. Hughes, Philadelphia, Pa. [Filed May 18, 1875.]

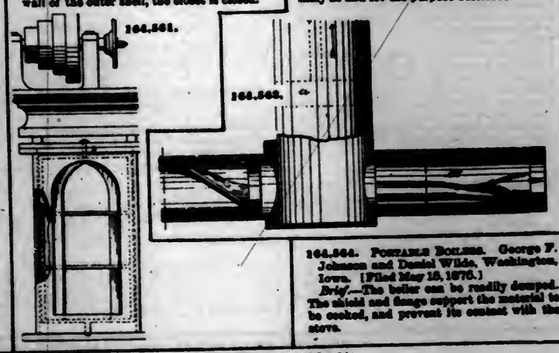
Brief.—A perforated hollow cylinder with door, furnished with toothed wheels at the ends, and a handle, by which it can be drawn over the pavement so as to revolve. Sifted ashes are placed inside, which are by this means equally distributed over icy sidewalks, to prevent slipping.

The combination, substantially as described, of the perforated or wire-gauze cylinder A with the toothed plates B and appliances for drawing the same over the ground.

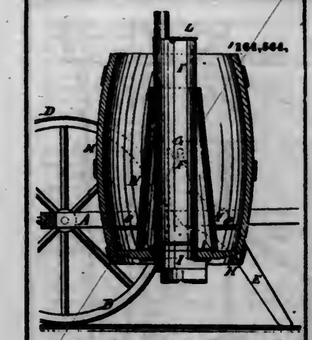
164,553. PUMP AND CHECK VALVE. Abm. W. Johnson and Hermon A. Matteson, New Haven, Conn.; said Matteson assignor to said Johnson, and said Johnson assignor of one-half his right to John Matthewman, same place. [Filed Nov. 14, 1874.]

Brief.—The tubular valve is caused to collapse by the action of the piston of the pump. A hinged guard-plate is arranged in the pipe in such a manner as to protect the end of the elastic valve, and prevent it from being forced out of the cylinder containing it.

1. In a pump, the tubular collapsible valves B, folded down and secured at one end within cylinders in the inlet and outlet tubes of such pump, and operating substantially as and for the purpose described.



2. In combination with tubular elastic valves arranged within a pump, the hinged metallic guard-plates F, interconnected with said valves, but operating in concert therewith, substantially as and for the purpose described.



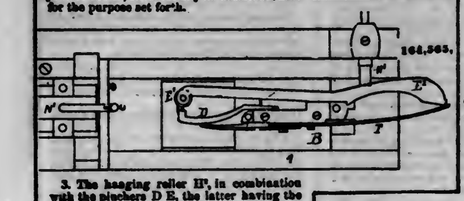
164,554. PORTABLE BOILERS. George F. Johnson and Daniel Wilde, Washington, Iowa. [Filed May 15, 1875.]

Brief.—The boiler can be readily dumped. The shield and flange support the material to be cooked, and prevent its contact with the stove.

164,561. TOOL-RECEPTACLES FOR METAL-WORKING MACHINES. Wm. H. Hoffman, Passaic, N. J., assignor to the New York Steam-Engine Company, New York, N. Y. [Filed Mar. 2, 1875.]

Brief.—In a hollow cylindrical support, provided with openings on opposite sides, rests, on vertical pivots, a secondary cylinder, which also has openings corresponding to those in the outer shell. The inner cylinder is provided with shelves, and by turning it upon its axis until the openings are opposite the solid wall of the outer shell, the closet is closed.

1. The combination of the side bars A, the cross-bars B C, the wheels D, the legs E, the standards F, the barrel H, provided with gudgeons G, and the cylindrical stove I, with each other, substantially as herein shown and described.



2. The combination of the perforated conical shield N and the perforated flange O with the stove I, the barrel H, the frame-work A B C E F, and the wheels D, substantially as herein shown and described.

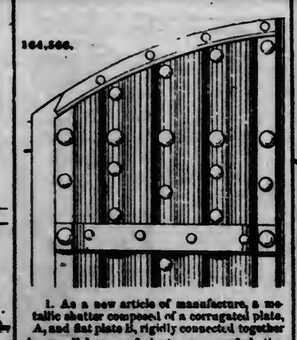
164,565. HAIR-WEAVING LOOMS. Martin R. Kenyon, Providence, R. I., assignor of thirteen-twentieths his right to Nathan B. Hall and Edwd. J. Bicknall, same place. [Filed Nov. 14, 1874.]

Brief.—One of the jaws of the hair-inserting nippers is provided with a loose wheel, adapted, when pressed upon a narrow bead, to seize a single hair. The other jaw carries a pin for holding some of the hairs in position to be taken by the nippers, which are opened by coming against a pendent roller, so arranged as to yield when the nippers are to be closed. The bunch of hair is held in an adjustable clamp, which carries a standard with an elastic strap for supporting the end of the bunch, and preventing the hairs from spreading.

1. In a hair-weaving loom, the combination of the loose wheel E' with the jaws E and D, operating substantially as described, and for the purpose set forth.

2. The combination of the pin F with the jaws E and D, substantially as described, and for the purpose set forth.

3. The hanging roller H', in combination with the pinchers D E, the latter having the curved part E', substantially as described, and for the purpose set forth.

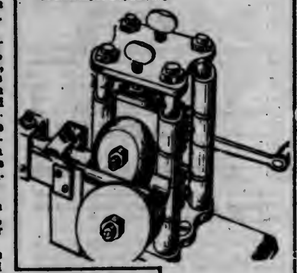


4. The vertically-adjustable jaw N' N', provided with A-shaped opening, in combination with the lower jaw M M', provided with V-shaped opening, substantially as and for the purpose set forth.

5. The combination of the hair-holding device M M' N' N' N' N' with the standard K and elastic strap K', all operating substantially as described, and for the purpose set forth.

164,566. FIRE-PROOF SHUTTERS. George F. Kiesam, New York, N. Y., assignor to J. D. Kiesam, same place. [Filed May 22, 1875.]

Brief.—A shutter composed of one plain sheet of metal, to which is riveted a corrugated sheet. The openings at the top are closed by an angle-bar, while the lower end of the flat plate is bent over to cover the openings at the lower edge. The access of moisture is thus prevented.



164,566.

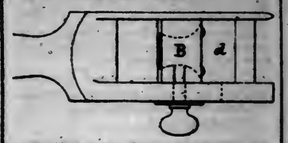
1. As a new article of manufacture, a metallic shutter composed of a corrugated plate, A, and flat plate B, rigidly connected together by parallel rows of rivets, as specified, the openings formed by the corrugations being closed at both top and bottom, substantially as and for the purpose set forth.

2. The shutter herein described, consisting of the corrugated plate A and the flat plate B, the latter having a flange, *b*, turned thereon, and an angle-bar, *c*, secured thereto, for closing the openings in the corrugated plate, for the purpose specified.

164,567. MACHINES FOR MAKING EAVES-TROUGHS. Walter W. Laing, Holley, Mich. [Filed Apr. 27, 1875.]

In a machine for forming eaves-trough, substantially as herein described, the combination of the forming-rolls geared together, the guide-trough and block, and one or more pairs of rollers for flanging the edges of the eaves-trough, substantially as described.

164,568. BREECH-LOADING ORDNANCE. P. B. Lawson, Cold Spring, N. Y., assignor to G. Paulding, same place. [Filed Mar. 4, 1875.]



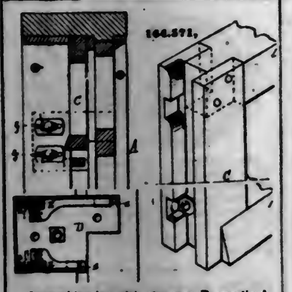
164,569.

The combination, in breech-loading ordnance, of the hollow plug B, provided with the external screw-thread *b* and the internal longitudinal grooves *b'*, with the wing-headed breech-pin C, and the carrier D, having a cavity for the reception of the head of the breech-pin, substantially as described, for the purpose specified.

164,569. SHOE-SOLE-EDGE TRIMMERS. J. W. Lafferty, Baltimore, Md., assignor of one-half his right to John H. Baer, same place. [Filed June 2, 1875.]

In a device for shaving or trimming the edges of the soles of shoes, &c., the adjustable block B and knife *d*, in combination with the slotted plate *b*, and thumb-screw *c*, substantially as and for the purpose set forth.

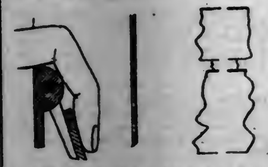
164,570. CAR-WHEELS. Geo. G. Lobdell, Wilmington, Del. [Filed May 26, 1875.]



Brief.—Wrought iron bars connect the rim with the hollow part of the web next to the hub.

The within-described car-wheel, in which are combined the hollow portion I of the web, the rim D, and radial braces H, or a plate of wrought iron or steel, attached to the rim, and hollow portion I of the web, all as set forth.

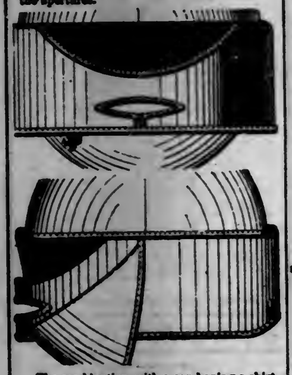
164,571. SASH-FASTENERS. Aaron Long, Ann Arbor, Mich., assignor of one-half his right to George W. Bailey, same place. [Filed Jan. 22, 1875.]



Brief.—The bent head of the two bolts, one for each sash, working in the grooves, serve as friction-holders, while notches in the grooves lock the device in desired position.

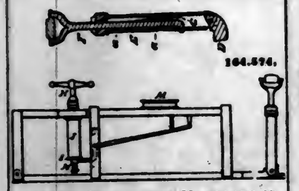
164,571.

In combination with the case D, mortised within the window-casing, and provided with the bolts E E, each having a head, *e*, bent outward at right angles, and playing through the slot *d*, the springs *c c*, and knobs *f*, the window sash sides, having vertical groove C, in which the bent head of the bolt moves, and notches *i*, all substantially as described and shown, for the purpose set forth.



164,572. MORTISE-LOCKS FOR SLIDING DOORS. B. Mallory, New Haven, Conn. [Filed June 2, 1875.]

In combination with the face-plate *c* of a lock or pull for sliding doors, constructed with a finger opening and recess in rear of said plate, a self-closing flap for said opening, substantially as described.



164,573. MASK-CAPS. Marcus Marks, New York, N. Y. [Filed May 19, 1875.]

Brief.—To the lower edge of the crown is attached a circular skirt, provided, with eye and mouth apertures, the former being covered by foraminous flexible material. The skirt, in turn, has a throat-piece attached to it, which folds up flush with the skirt and over the apertures.

The combination, with a cap having a skirt constructed with a mouth and eye openings, and a foraminous shield for covering the eye-openings and protecting the eyes, of a chin and throat protector attached to the skirt of the cap, and constructed to be turned up to conceal the mouth and eye openings and shield, when the cap is to be used as an ordinary head-covering, as set forth.

164,574.

164,575. EXERCISING-MACHINES OR HEALTH-LIFTS. James P. Marsh, Chicago, Ill. [Filed Apr. 24, 1875.]

1. The combination, substantially as specified, of the yielding post or bar H, adjustable collar I, mounted on the said post, spring J, confined at one end by the said collar, and by a fixed stop at the other, and the lifting-lever, for the purposes set forth.

2. The combination, substantially as specified, of the yielding post or bar H, adjustable collar I, mounted on the said post, spring J, confined at one end by the said collar, and by a fixed stop at the other, the lifting-lever, and the gage M having its operating lever connected to the collar I, for the purposes set forth.

3. The combination of the lifting-lever of a health-lift, the tubular and perforated parts B B, and the hook-shaped and yield-rods F F, provided with handles, substantially as and for the purposes specified.

164,576. WIRE FENCES. Luther Merrill and John C. Merrill, Turkey River Station, Iowa. [Filed Mar. 19, 1875.]

Brief.—By means of weighted linked couplings or connections suspended between high posts, and to which are secured the ends of the sectional horizontal wires, the expansion or contraction of said wires due to changes of temperature is compensated for.

The combination, with a sectional suspended wire fence, of flexible couplings between the sections, consisting of links and rings, substantially as described, and one or more weights suspended from each coupling, for the purposes herein set forth.

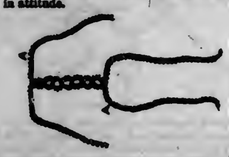
164,577. GRAIN-ELEVATORS. J. S. Metcalf, Indianapolis, Ind. [Filed May 1, 1875.]

Brief.—Grain is elevated into a weighing-hopper located at the terminus of the elevating-chain, from whence it passes into any of the series of bins arranged in the lower portion of the building, from either of which the stored grain can be run out through spouts connecting said bins with the lower weighing-hopper, distributing it to any desired place through the sliding and adjustable bifurcated spout.

1. The combination and arrangement of the weighing-hopper B and the storage-bins placed above it, so that the grain may be drawn from them, weighed, and loaded without re-elevating.

2. The bin D', provided with an opening, *d*, in one side, so placed that all the grain above it may be run into the weighing-hopper B, as and for the purpose set forth.

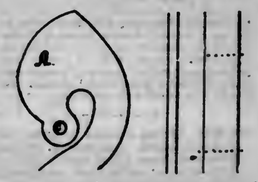
3. The sliding bifurcated spout H, provided with the hinged ends *g*, in combination with the ways I and hopper B, substantially as and for the purpose specified.



4. The bifurcated spout H, having a reciprocating and lateral motion, as set forth.

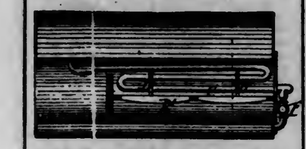
5. The looking-hook *a*, in combination with the lever *e'* and sliding valve *f'* of the hopper B, as and for the purpose specified.

6. The rope *d*, in combination with the spout H and lever *e'*, for the purpose of operating the valve *f'*, as set forth.



164,578. AUGER-BITS. Wesley Miller, New York, N. Y., assignor of his right to Jos. Banigan, same place. [Filed Dec. 14, 1874.]

Brief.—The rubber doll is made with a soft metal or spring skeleton, to admit of change in attitude.



As a new article of manufacture, a hollow flexible rubber doll, provided with the wire frame A, substantially as and for the purpose set forth.

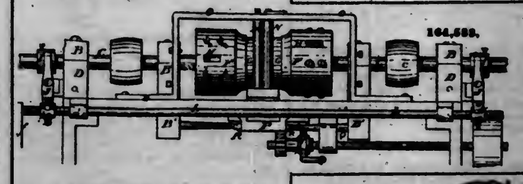
164,579. MANUFACTURE OF PRUNING-SHEARS. Stephen S. Miles, Rome, N. Y. [Filed Feb. 10, 1875.]

The improvements in the art of fabricating pruning-shears hands described, consisting in commencing the fabrication of the cutting-blade, with its shank and pivotal portion, from a bar of steel of suitable size for the said shanks, upsetting and spreading the same to form the blade A, making the apertures for the pivot *c* in the end *b* of the bar, bending the bar thus fashioned into the form shown in Fig. 5, and uniting the same to the other half of the shears, thus forming the instrument shown in Fig. 6, substantially as specified.

164,580. CIRCULATION IN STEAM-GENERATORS. Richard Mill, Island of Jersey, England. [Filed Jan. 9, 1874.]

The combination, with an ordinary boiler, A, having a flue, B, and a furnace, B', of the coiled pipes C C and the arched bridge D, supporting said coiled pipes beneath the crown of the furnace, and directly above the grate of the furnace, the said coiled pipes communicating with the upper water-space of the boiler at its rear end, and at the front end of the same below the water-level, and provided with circulation-cocks F, all substantially as and for the object specified.

164,581. PROCESSES OF PRODUCING PLATES FOR PRINTING. Leonard H. Miller, Crawfordsville, Ind., assignor of one-half his right to Frank Seaman, Savannah, Ga. [Filed Apr. 4, 1874.]



1. In the process of producing designs, drawings, writings, &c., in high relief on paper or card-board, the employment of a field consisting essentially of glycerine, and sifting thereon first an adhesive powder, and above that a mineral powder, substantially as specified.

2. The process of producing a plate or block for printing, embossing, or stamping, consisting of first protecting the design in high relief on paper or card-board, by means of a field consisting essentially of glycerine and an adhesive powder, and then taking a cast direct therefrom in suitable metal, substantially as specified.

164,582. GRINDING-MACHINES. Eli Morris, New Haven, Conn. [Filed May 23, 1874.]

Brief.—Annular stones arranged in cylindrical heads mounted on hollow shafts operate on either side of the saw or other article. Water is supplied to the stones through the hollow shafts. The stones are supported on pivoted frames, said frames being controlled in their movement by a pattern arranged on the feeding mechanism.

164,583.

1. The combination, with the cylindrical head F of the cylindrical-chambered grindstone G, constructed and operating substantially in the manner described and specified.

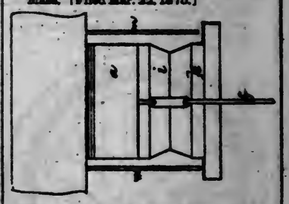
2. The combination, with the cylindrical head F and cylindrical-chambered grindstone G, of the hollow shaft C for supplying the stones with water at their center, constructed and operating substantially in the manner described and specified.

3. The combination, with the pivoted bearings B B', of the pattern E, for operating the stones in grinding different gages in saws, &c., constructed and operating substantially in the manner described and specified.

4. The combination, with the shaft C, forked arms J, and right and left hand screw-shaft L, for setting the stones, of the adjustable collar I, constructed and operating substantially in the manner described.

5. The combination, with the feed-rolls and grinding-stones, of the pattern E secured to the rest P, operating the feed-rolls, whereby the gaging of the article ground is made dependent on its feeding, substantially in the manner described and specified.

164,584. WEATHER-BOARD GAGES. David Neff, Indianapolis, Ind. [Filed Nov. 21, 1874.]

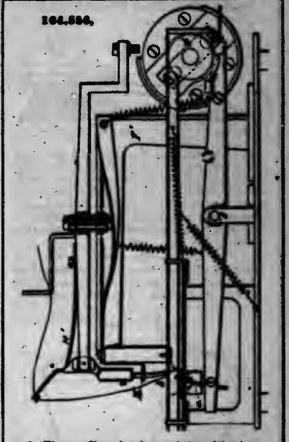


Brief.—The body of the gage has a lever pivoted to it, the front end of which is forked for engaging with a notch upon the fastening-nail, so that the nail can be withdrawn without injury.

1. A weather-board gage, A, provided with a perforated leg, B, and lever E, having a notch, *f*, in combination with the nail U, having lateral notches *e'*, with rounded upper and lower edges, substantially as and for the purpose set forth.

2. The nail C, having the lateral notches *e'*, with rounded upper and lower edges and shoulder *e*, substantially as and for the purpose set forth.

164,585. ORGAN-VALVES. Gustavus V. Nordstrom and Geo. S. Hutchings, Boston, Mass. [Filed Mar. 22, 1875.]

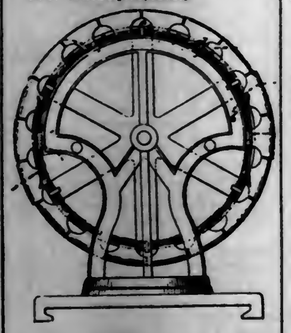


The improvement in organ-valves, as herein described and shown, consisting of the valve *a*, perforations *b b*, flexible bag *f*, bottom *h*, and the operating rods *n n*, as and for the purpose set forth.

164,586. CROCHET-MACHINES. S. L. Otis, Birmingham, Conn. [Filed Apr. 12, 1875.]

Brief.—For finishing or stitching the edge of stockings.

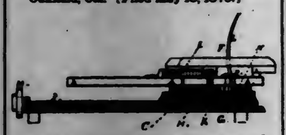
164,587.



1. The needle *a*, having an intermittent vertical and transverse movement, and the thread-carrier *b*, having a corresponding transverse movement, combined with a work-plate, feed, and presser-foot, substantially as set forth.

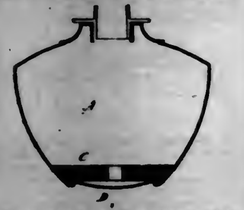
2. In combination with a work-plate, feed, and presser-foot, substantially such as described, the needle *a*, having an intermittent vertical and transverse movement, the thread-carrier *b*, having a corresponding transverse movement, the guard H, and the spring H', substantially as described.

3. In combination with a work-plate, feed, and presser-foot, substantially such as described, the needle *a*, having an intermittent vertical and transverse movement, the thread-carrier *b*, having a corresponding transverse movement, the shoulder *d* on the needle, and the finger P, substantially as described.



4. In combination with a work-plate, feed, and presser-foot, substantially such as described, the needle *a*, having an intermittent vertical and transverse movement, the thread-carrier *b*, having a corresponding transverse movement, and the finger *f*.

161,387. MACHINES FOR TENTERING CLOTH. Wm. H. Palmer, Jr., Middletown, Conn., assignor to Herbert F. Palmer, New York, N. Y. [Filed Apr. 3, 1875.]

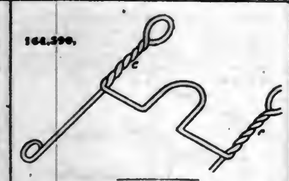


The combination, with a selvage-carrying wheel, having its axis parallel with the fabric, of the series of radially-arranged spring-jaws attached around the rim of the wheel, and each jaw constructed to clamp over the peripheral portion of the wheel, as and for the purpose described.

164,388. HORSE-POWERS. H. Parkhurst, Oakland, Cal. [Filed May 18, 1875.]

The lever-frame A, the combined bed-plate and master-wheel B, the pinion C, the spur-wheel E, the pinion F, the shaft S, the bevel-wheel G, the pinion H, the shaft J, the sliding frame P, attached to the lever-frame A, and having the pinion N operated by the lever L, the whole being combined and operated as set forth.

164,389. OILERS. Russell B. Perkins, West Meriden, Conn., assignor to Edward Miller & Co., same place. [Filed May 4, 1875.]



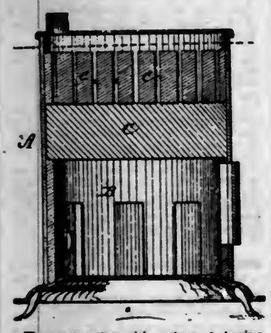
The combination of the perforated weight C and the convex-convex elastic disk D with it, and so as to form the bottom of, an oil-flask, A, substantially as described.

164,390. BRIDLE-BITS. Jacob G. Peterson, Morganton, N. C. [Filed Mar. 22, 1875.]

A bridle-bit, constructed of a single piece of steel wire, by bending and doubling the same at right angles with the bar, and twisting the doubled portions *c* together, substantially as specified.

164,390.

164,391. ARTIFICIAL PALATES. Jacob Peyer, Berne, Switzerland. [Filed Apr 3, 1875.]

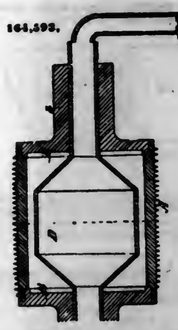


Brief.—A hard rubber valve has a sheath, and sliding plate arranged in said sheath, and wings pivoted upon each side, and held apart by coil-spring. This device is placed in a congenital opening of the palate, and is intended to act as a palate and uvula.

The valve constructed of the oval plate *e*, having a sheath, *d*, in combination with the sliding plate *e*, arranged in said sheath, the wings *d*, pivoted to the said oval plate *e*, and the spring *f*, for pressing said wings outward, all substantially as and for the object specified.

164,392. HEATING-STOVES. Marvin Pierce, Minneapolis, Minn. [Filed Dec. 14, 1874.]

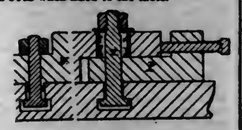
Brief.—Slabs of soapstone, or similar material, are placed within the stove, to absorb and retain the heat.



The combination, with a stove, A, having fire-chamber B, of the sectional filling C of brick, stone, or other suitable material, arranged above the fire-chamber, and in layers to form the flues *a a* through and around the same, substantially as set forth.

164,393. CYLINDERS FOR WOOL CARDING AND COMBING MACHINES. Josiah K. Procter, Philadelphia, Pa., assignee of one-half his right to James Smith & Co., same place. [Filed Nov. 26, 1874.]

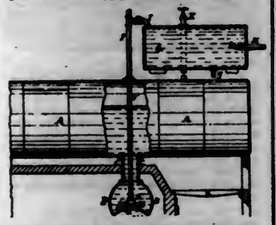
Brief.—The steam-chest inside the cylinder is stationary, or does not revolve with it, thereby obviating the necessity of stuffing-boxes for the pipes which pass through the journals, and avoiding the jarring which would result from carrying the water of condensation around with the cylinder in its revolution.



164,393.

In combination with a close cylinder, A, having a movable head or heads, B B, constructed with tubular journals *b b*, a stationary tight metallic steam-chest, D, having inlet and outlet pipes C C passing through said journals without being stuffed therein, substantially as shown and described.

164,394. WORK-HOLDING DEVICES FOR METAL-PLANERS. Augustus B. Prouty, Worcester, Mass. [Filed Sept. 9, 1874.]



Brief.—The jaw and bed-piece are both adjustable around the bolt, which also clamps them both when fixed to the table.

The improved device, consisting of the parts O P, screw-bolt T, nut Y, and screw R, constructed and combined substantially as herein shown and described.

164,395. BOILER-FURNACE. Thomas Reese, St. Louis, Mo. [Filed May 17, 1875.]

Brief.—The boiler is supplied with water through a pipe in the mud-drum; said pipe having side openings, and connected to a reservoir by means of a pipe passing vertically through the boiler. The reservoir is provided with supply and discharge pipes.

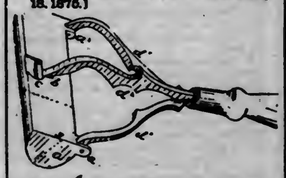
1. The discharge-pipe D, having a number of side discharge-openings, *d*, in combination with boiler A and mud-drum B, substantially as set forth.

2. The discharge-pipe D, having discharge-openings *d*, in combination with the mud-drum B, having blow-off pipes E, arranged substantially as described.

3. The discharge-pipe D, having discharge-openings *d*, in combination with mud-drum B and vertical supply-pipe F, substantially as set forth.

4. The discharge-pipe D and vertical pipe F, in combination with settling-chamber G, discharge-pipe I, and supply-pipe H, having side discharges *h*, substantially as set forth.

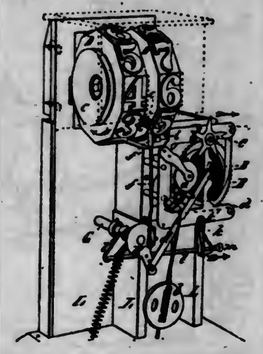
5. The chamber G, having blow-off pipes *g*, in combination with the steam-pipe K, discharge-pipe I, and supply-pipe H, having side discharges *h*, substantially as set forth.



164,396. RAILWAY-RAIL CHAIRS. Geo. O. Ross, Marion, Ohio. [Filed May 10, 1875.]

Brief.—A rail-chair in which the base-plate and tread-plate are of one piece, and are combined with a detachable fish-plate, which is held in place by a separate flat key passing through the fish-plate, tread-plate, and rails, and secured by a spike which passes through it and the chair-base.

The railroad-chair herein described, consisting of the base-plate B, with stationary flange C, formed in one piece, and loose flange D, all constructed as described, in combination with the rails A A, having slots *a* and elongated bolt-holes *b*, the independent and removable key E, and spike G, all substantially as and for the purposes set forth.



164,397. POLISHING OR SAD IRONS. Wm. B. Sanders, Look Haven, Pa. [Filed May 18, 1875.]

The improved polishing-iron composed of the iron *a*, having legs *a*¹, mortise *b*, and button *c*, and the handle *d*, having the arms *d*¹, constructed as described, and arm *d*², having the extension *d*³, all arranged to operate as and for the purpose specified.

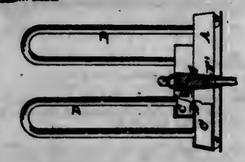
164,398. FIRE-ALARM REGISTERS. Willard W. Sawyer, Springfield, Mass., assignor to himself and Geo. M. Stebbins. [Filed Feb. 6, 1875.]

Brief.—For registering upon indicating-wheels the number of the box announced by the bell in engine-houses.

1. The combination of the stop-wheel *c*, having prongs or projections thereon, with the push-rod *d* as a means of determining or changing the position of the tripping-rod, substantially as described.

2. The combination of the push-bar *d*, the stop-wheel *c*, the rack and pinion *i*, as equivalent connection, and the tripping-rod *f*, whereby the desired combination of numerals or characters is made upon two or more wheels, D, substantially as set forth.

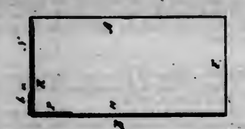
164,399. CLAMPS FOR CANDLE-HOLDERS. F. A. Schroeder, Jersey City Heights, N. J. [Filed May 10, 1875.]



Brief.—A single wire, both ends of which are soldered to the holder, forming two parallel loops, bent so that a light in the wire will embrace the loops.

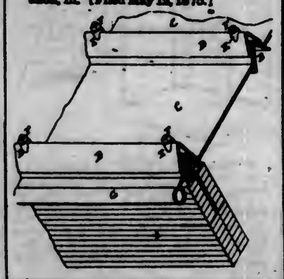
The wire clasp B, composed of the loops C E, held together by means of the light D, substantially as described.

164,400. STEAM-RADIATORS. J. Shackleton, Rahway, N. J. [Filed June 2, 1875.]



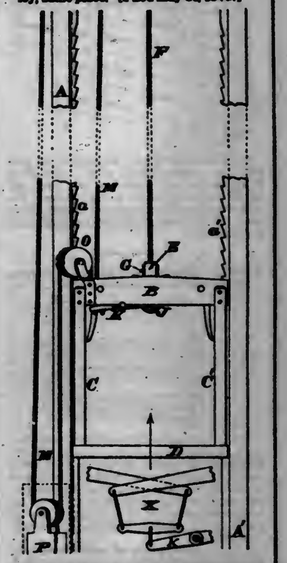
Brief.—The cock opens and closes the steam-inlet, and the outlet for condensed water at same time.

1. The bent connecting-pipes D, in combination with the base A, divided into an upper and lower chamber, C C′, for the inlet and outlet of steam, substantially as described.



2. In combination with the base A, divided into an upper and lower chamber, C C′, as set forth, the double two-way cock E, communicating with the upper and lower chambers, substantially as described.

164,401. PAPER BOXES. R. De F. Shelton, Birmingham, Conn., assignor to Cornell & Shelton, same place. [Filed May 20, 1875.]

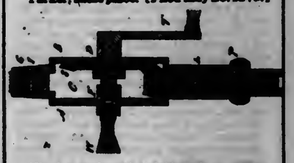


In paper boxes, the combination of the folding slitted end N and tuck P upon the extreme of one side, combined with the tuck L upon the extreme of the opposite side, to overlap the tuck P and enter the slit in the end N, substantially as described.

164,402. HOOPS. Merrill A. Shepard, Lebanon, Ill. [Filed May 13, 1875.]

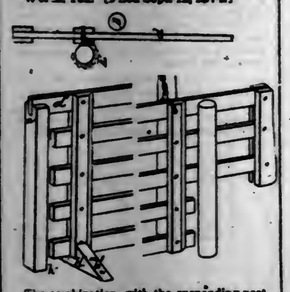
The angular or A-shaped iron rafter or beam B connected by an anchor, H, to the wall of the building, the roof-plates C, the clamp-piece D, bolts or rivets F, washers E, cornice G, the connecting-block I, the splice-bar J, all combined as shown, and for the purpose hereinbefore set forth.

164,403. AUTOMATIC BRAKES FOR ELEVATORS. Samuel B. Smith and Edwd. Myers, Cincinnati, Ohio, assignors to Lane & Bodley, same place. [Filed May 31, 1875.]



1. The combination, with an elevator-platform, of a weight, P, so arranged as to remain quiescent in the ordinary condition of the elevator, and to move in the same direction as the platform on the precipitation of the latter by cessation of the cable-action, said weight being connected, by suitable rope M, with the described brake mechanism K J I H H′ *a a′*, substantially as set forth.

2. The combination of loaded sheave P in the bight of a rope, M, whose extremities pass over sheaves N O on the hatch and platform, respectively, and are both attached to the tripping-lever K of the represented brake K J I H H′ *a a′*.



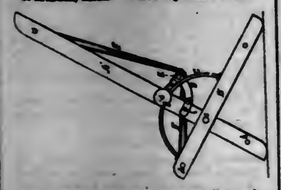
3. In combination with a pair of brake-levers, H H′, having the equalising-cord I and sheave J, the trip bar or lever K.

164,404. DRILLS FOR DRILLING METAL. H. Smith, Meriden, Conn., assignor to Chas. Parker, same place. [Filed May 20, 1875.]

The herein-described drill-stock, consisting of the inclining-case A B, constructed with bearings F D, for the driving-shaft, with the sleeve G upon the upper side to receive the head, and sleeve L upon the lower side to form a bearing for and hold the spindle N, the said case constructed in two parts secured together, substantially as described, and combined with the driving-shaft E, crank T, gear and pinion S E, substantially as set forth.

164,605. FARM-GATES. Tunis Snider, Fort Worth, Tex. [Filed Sept. 12, 1874.]

The combination, with the suspending-post and the counterweighted gate, of the chain E, suspending said gate from said post, and having sufficient length to twine around the post as the gate is opened, and untwining to close the latter automatically, substantially as specified.

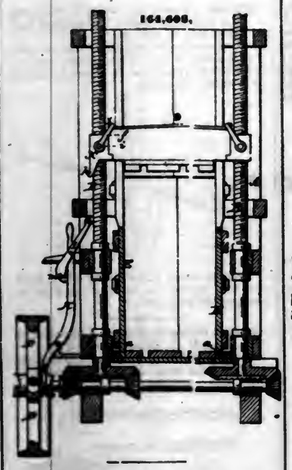


164,606. TRANSPARENT SOAPS. S. SPERR, Pittsburg, Pa. [Filed June 1, 1875.]

1. The process herein described of manufacturing transparent ornamental soap with different-colored names, stripes, or other ornaments, by printing or impressing them on part of the cake of soap, and coating the transparent coat around it, and, finally, coating the finishing coat around it, so as to give it the appearance of a picture in a frame, substantially as specified.

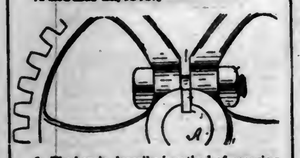
2. As a new article of manufacture, the transparent ornamental soap herein described, representing names, stripes, letters, or ornaments, to give it the appearance of a picture in a frame, arranged substantially as herein shown and described.

164,607. RECLINING CHAIRS. J. H. SWEENY, Waltham, Mass. [Filed Apr. 20, 1875.]



The reclining chair, substantially as described, composed of the footboard apron or seat and back-piece F, two sets of bars, A A' B D, rod E, perforated sectoral arms D D, arched rods C C, and their clamping screws or devices d' f g, all arranged, connected, and combined essentially as explained and represented.

164,608. COTTON AND HAY PRESSES. WM. H. TOPPEY, Alexander Steel, and CHAS. J. BEASLEY, Petersburg, Va.; said Beasley assignor to said Toppey and Steel. [Filed Apr. 17, 1875.]

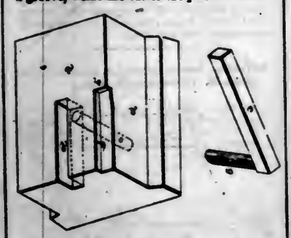


Brief.—In the descent of the follower, a projection on the same comes in contact with a pivoted arm on the end of a clutch-lever, with the effect of stopping further descent.

The combination, with the shifting-lever B, of the finger I, pivoted thereto and forked at its upper end, and the projection h, formed on the nut K, substantially as and for the purpose herein set forth.

164,609.

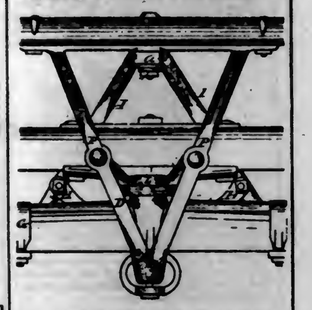
164,609. FASTENING WHEELS AND PULLEYS TO SHAFTS. John F. Thomas, Ilion, N. Y. [Filed May 22, 1875.]



1. The herein-described method of securing wheels, pulleys, &c., upon their shafts—that is to say, by means of a key held in a slit in the hub or disk, and a bolt arranged to draw the parts together, substantially as described.

2. The combination of the notched key, with the shaft A, and wheel or plate having a slit and a tightening-bolt, all constructed to operate substantially as and for the purpose set forth.

164,610. DIES FOR WELDING CULTIVATOR-AXLES. Chas. H. Thompson, Chicago, Ill. [Filed May 14, 1875.]



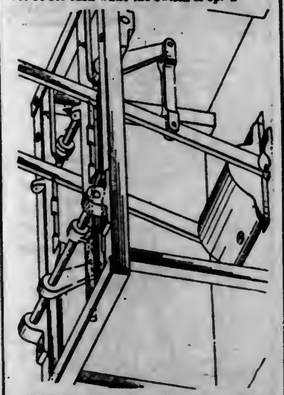
Brief.—The square bar has first its end flattened and broadened in the die, and it is then placed in groove d, with its broadened end resting on the top of a pin previously placed upright in hole. The counter-die is then dropped, and a tongue upon its face, entering a groove, welds the bar to the pin.

1. The blocks a A, having the recesses b i d, hole e at right angles to the recess d, and flange f, substantially as shown and described.

2. The block a, having the recess d and hole e at right angles thereto, in combination with the block A, having the flange f, the flange serving both to weld the bars c g together, and to straighten the upset end of the bar c, substantially as set forth.

164,611. FIFTH-WHEELS. Orrin B. Thompson, White Ash, assignor to the Dexter Spring Company, Hulton, Pa. [Filed Apr. 3, 1875.]

1. A fifth-wheel for vehicles, constructed to form three centers or pivots, A, D L, and a, on which the axle turns, substantially as set forth.



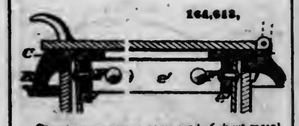
2. The combination of friction-plates D and L, provided, respectively, with the arms H H and R R, substantially as and for the purposes set forth.

3. The combination of the lower friction-plate D with arms H H, braces I I, clips G G, and hub a, all constructed substantially as and purposes set forth.

4. The combination of the upper friction-plate L with arms R R, braces P P, plate J, and hub A, all constructed substantially as and for the purposes set forth.

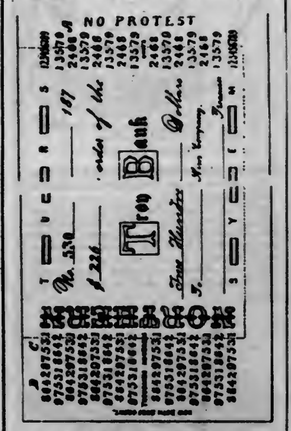
164,612. SWITCH-SIGNALING APPARATUS. John M. Toncey and Wm. H. Smith, New York, and Wm. Buchanan, Yonkers, N. Y. [Filed Jan. 7, 1875.]

Brief.—The switch-lever is securely locked when the signal denotes safety, and the switch cannot be opened without first setting the signal. The movement of the signal-lever unlocks the switch-lever, which may then be operated to open the switch, and the movement of the switch-lever to open the switch locks the signal-lever, so that the signal cannot be set back while the switch is open.



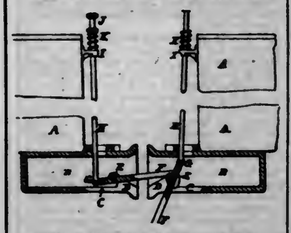
The combination of switch and signal levers, locking-bars A E, and shafts carrying collars or stops, being constructed to operate substantially as and for the purpose above set forth.

164,613. STOVE-RESERVOIRS. Chas. Tressdale, Cincinnati, Ohio, assignor to William Razor & Co., same place. [Filed May 5, 1875.]



Brief.—The inner horizontal flange of the rim affords a means of raising the reservoir when the outer flange rests in the rabbet.

164,614.

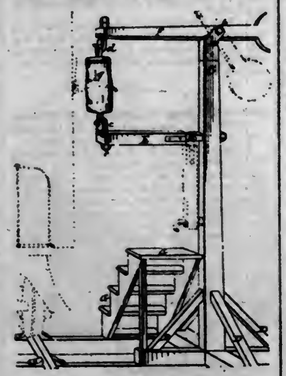


The stove-reservoir composed of sheet-metal body D and cast rim E e e', formed and constructed as described, in combination with a casing, B, having a rabbet, C, of a cooking-stove.

164,614. BANK-CHECKS, &c. I. P. TURNER, Troy, N. Y. [Filed Mar. 1, 1875.]

A draft, check, bill of exchange, or other paper used in monetary transactions, provided at each end with a duplicate series of alternating odd and even numbers, and at the bottom with a duplicate series of alternating lines or marks, arranged substantially as herein shown and described, for the purpose specified.

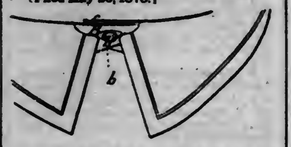
164,615. CAR-COUPLINGS. Hugo B. B. Von Elsner, St. Louis, Mo. [Filed May 1, 1875.]



1. The combination of draw-head B, horizontal pivot and draft-pin E and coupler, having forked end with down-turned hooks F, all substantially as set forth.

2. The combination of the coupler F G, rod H, bearing I, and spring K, all constructed and arranged substantially as and for the purpose set forth.

3. In combination with the coupler F G, rod H and spring K, the draw-head having an opening or gap, C, substantially as and for the purpose set forth.



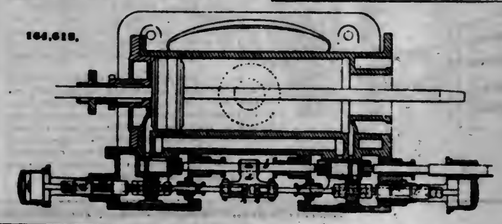
4. In combination with the coupler F G, and draw-head B, with bottom opening C, and draft-pin E, the inclines D D, at the sides of the opening, to carry up the hooks F F onto the pin E, substantially as set forth.

164,616. MAIL-BAG CATCHES. Benjamin Uncles, Baltimore, Md., assignor of one-half his right to Charles Kelly, same place. [Filed May 1, 1875.]

In combination with the two hinged arms E F, the hooks e d, having spring-tongues, and studs c that move in V-shaped recesses in their respective arms, all substantially as and for the purpose set forth.

164,617. SHIRT-COLLARS. John C. Wall and Cola Ludington, Washington, D. C. [Filed May 26, 1875.]

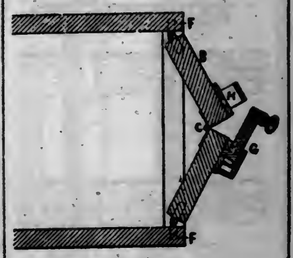
A collar having its outside or turn-down lap cut at the inner corners of both ends to form an opening, B, that will allow an unconfined movement of the collar ends upon their pivot-fastening b, substantially as and for the purposes set forth.



164,618. VALVE-GEARS. Friedrich Wannieck and Hermann Koeppner, Brunn, Austro-Hungarian Empire. [Filed Mar 23, 1875.]

Brief.—The cut-off valves are moved in one direction by and with the main valve, tripped by the governing device, and driven back by steam-pressure from the inside of the chest, operating on small pistons.

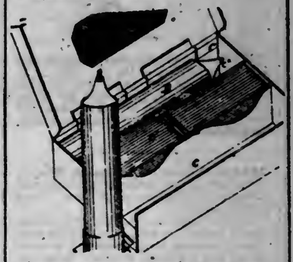
1. The combination of the movable buttpins or stops e e', the main valve-rod cross-head d, and latches g g', with the expansion valves c, pistons f, and boxes m, in direct communication with the steam-chest, said parts being constructed and arranged for joint operation, as shown and described.



2. In combination with the expansion-valve, and piston connected therewith, and operated on by steam-pressure to return said valve to its normal position, the means herein shown and described, whereby the back stroke of said expansion-valve and piston is regulated.

164,618.

164,619. BURIAL-CASKET CASES. Jos. S. Waterman, Boston, Mass. [Filed Oct. 27, 1874.]

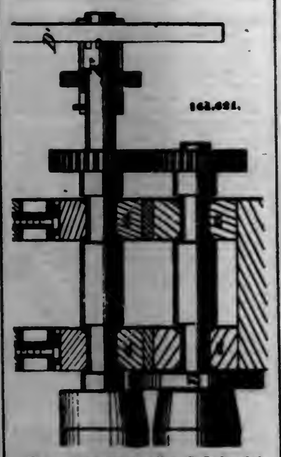


Brief.—The case is closed save at one end, and this is provided with a door hinged at its center, and held in the coffin end by dowel pins. When the door is forced in position, a central fastening prevents it from opening, and thus locking the dowels.

As a new article of manufacture, a casket-case, A, provided with a removable end piece, consisting of two pieces, B B, hinged together by butt-hinges C C, their outer edges being provided with dowels E E, which enter the holes F F in the end of the case A when placed in position, the said pieces B B being connected rigidly together by the catch G B, all being constructed and arranged substantially in the manner described, as and for the purposes set forth.

164,620. PORTABLE LIGHTERS. John A. Watson, Lexington, Miss. [Filed May 13, 1875.]

Brief.—The inner walls are flexible, to facilitate handling the candle.



The combination, in a match-box, of three cells, c c' c'', of which the middle one is movable at its center, as shown and described, for the purpose of holding matches, a candle, and a hinged candlestick, in separate compartments.

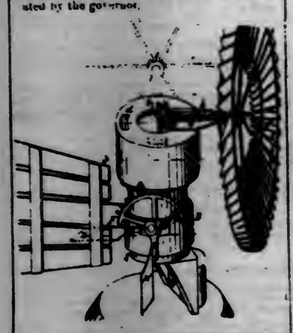
164,621. ROLLS FOR WELDING PLOW-IRONS. William Madd Watson, Tonica, Ill. [Filed May 1, 1875.]

Brief.—Two overhanging rolls, one having the beveled portion only partially around, and the other having the beveled portion all the way around.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

163,681.

The combination of rollers C C', beveled, substantially as described, with a collar, D, for the purpose set forth.



164,682. LAMP-BURNER SPRINGS. William N. Weeder, Waterbury, Conn., assignor to Benedict & Burnham Manufacturing Company, same place. [Filed Jan. 7, 1875.]

In a lamp-burner, the spring securing the chimney, consisting of the two parts A B, both elastic, the outer ends of the two parts secured together, and the inner end of the part A secured to the burner, the inner end of the part B turned up over the chimney-rest, substantially as described.

164,683. WINDMILLS. Benedict Weirich, Middlebury, Ind., assignor to himself and Jacob J. Hochstetter, same place. [Filed Mar. 6, 1875.]

Brief.—Wind-wheel so constructed as to be turned partially or entirely out of the wind when it increases beyond a given force or velocity; and it consists, generally, in the combination of a governing-sail geared with the turn-table, and hung on the sleeve which rotates on the standard, the turn-table being so sleeved on the latter as to be susceptible of an axial rotation thereon, derived from or actuated by the governor.

1. The combination of the tubular standard A, sleeve B, carrying a guide-vane, and turn table C, carrying the wind wheel, with the geared quadrant F, segment G, and governor-vane H, substantially as and for the purpose set forth.

2. The combination of the standard A, having the ring c, with the sleeve B, having the slot E, turn-table C, having the slot d, and friction-rollers a b, substantially as described.

164,684. CORN-PLANTERS. J. K. Welter, Chicago, Ill., assignor to Jas. Rayburn and Robert W. King. [Filed Apr. 9, 1875.]

Brief.—Flexible cut-off made from a slotted block, having spring standards with lower ends turned in, to form rests. Adjustable coverers pivoted to rear of openers. Machine raised bodily by wheels on adjustable standards. Pivoted tongue, rear end moving vertically in flanged gateway; dropper and driver's seat upon the same beam, secured to the rear of tongue.

1. The flexible cut-off, consisting of the slotted block K, and curved spring J, having its extreme ends curved inward, in combination with the slotted plate I, slide I, with holes a b, and the box or hopper D, with hole e in its bottom, all substantially as and for the purposes herein set forth.

2. The covering-plate L, provided with the inclined top flanges f f, forked at its front end, and pivoted to the conductor O, and adjusted by means of the adjustable braces k k, substantially as and for the purposes herein set forth.

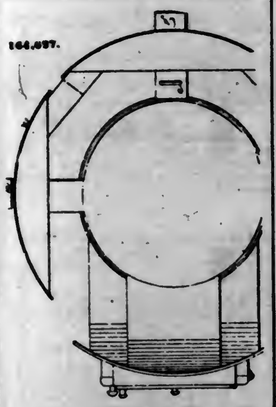
3. The combination of the corn-planter frame with adjustable stands N N and wheels O O, the pivoted tongue P, flanged casting m, arm R, with seats S S', and pivoted notched lever T, all substantially as and for the purposes herein set forth.

164,685. LUBRICATORS FOR PHOTOGRAPHS. Emile B. Wesson, Bangor, Me., assignor to Joseph P. Bass, same place. [Filed Apr. 14, 1875.]

The within-described lubricator for photographs, consisting of a mixture of castile-soap and alcohol, in about the proportions herein specified.

164,686. NAPPED FABRICS. L. W. Whipple, New York, N. Y. [Filed May 27, 1875.]

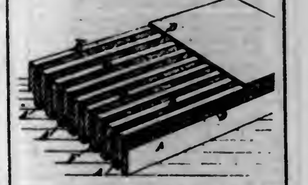
The improved fabric described, consisting of a body of woven or textile goods, into or through which the fibers of a bat are incorporated, substantially in the manner set forth.



[redacted]

164,687. HOT-AIR FURNACES. G. W. White, Malden, Mass. [Filed Apr. 15, 1875.]

Brief.—The direct exit being closed, the products pass into the side radiators at the top, and out at the bottom, thus reaching the exit after passing through the radiator at the rear.



An air-heating furnace or stove provided with radiators, constructed substantially as described, and connected with the combustion chamber, and with each other, and with the smoke outlet, whereby the products of combustion pass into the radiators at the sides of the combustion chamber, and then downward into the intermediate radiator, and into the smoke outlet, as set forth.

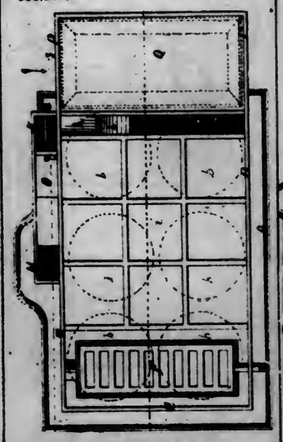
164,688.

164,688. CONSTRUCTION OF WALLS OF BUILDINGS. John Wingrave, Chicago, Ill. [Filed June 3, 1875.]

Brief.—Walls of buildings formed of boards or laths nailed together side to side, so as to form alternate projections and recesses on both sides, which sides are then covered with a composite mortar. The edges of the projecting strips have nails driven through them, passing into the recesses, to assist in retaining the mortar.

1. The culls, boards, planks, or laths A C, nailed together side to side to form alternate projections and recesses, or tongues and grooves, on both sides, coated with composite mortar, substantially as and for the purpose set forth.

2. In combination with the sheet-flue K, descending flue H, and direct-draft flue N, the horizontal flue-strip h, placed between the rear part of said flue H and the lower side of said flue K, and operating to prevent the current of heated gases from entering said descending flue at such point when the direct draft is employed, and to cause the heat to be evenly distributed beneath the boiler holes, substantially as shown.



3. The culls, boards, planks, or laths A C, nailed together side by side to form the projections or tongues F, and recesses or grooves F, said projections F having the nails D driven through them near their edges, so as to traverse the recesses or grooves F, either wholly or partially, substantially as and for the purpose set forth.

164,689. REGENERATIVE COOKING-STOVES. Gurdon G. Wolfe, Troy, N. Y. [Filed Feb. 27, 1875.]

Brief.—By the use of the damper the current of smoke, in its passage to the exit-flue, may be directed down the rear flue, and under the oven.

1. In combination with the descending flue H and exit-flue M', the direct-draft flue N, leading from the rear upper portion of said descending flue to said exit flue, by means of which the heated escaping products of combustion are caused to pass beneath all of the sheet-flue I descending flue N, ascending flue O, and flue-strip M, by means of which the heated escaping products of combustion pass beneath each boiler-hole before entering said flues, when the reverse draft is employed, substantially as and for the purpose set forth.

161,699.

3. In combination with the sheet-flue K, descending flue H, and exit-flue N, the inclined flue-strip h', which extends downward from the upper end of said descending flue H, and compels the heated escaping products of combustion to descend in front of said flue-strip before passing into said exit-flue N, substantially as and for the purpose set forth.

4. In combination with the descending flue H and direct-draft flue N, the damper O, operating to control the course of the heated escaping products of combustion, and cause the same to pass beneath the oven, or to escape from said descending flue directly into said direct-draft flue N, substantially as and for the purpose shown and described.

5. A water-reservoir chamber, Q, located outside of and combined with a descending flue, H, which at its rear upper portion communicates with the direct-draft flue N, substantially as and for the purpose specified.

6. A water-reservoir chamber, Q, located beside and combined with a descending flue, H, which at its rear side and upper end is separated from the top oven-flue by means of a horizontal flue-strip, h, substantially as and for the purpose shown.

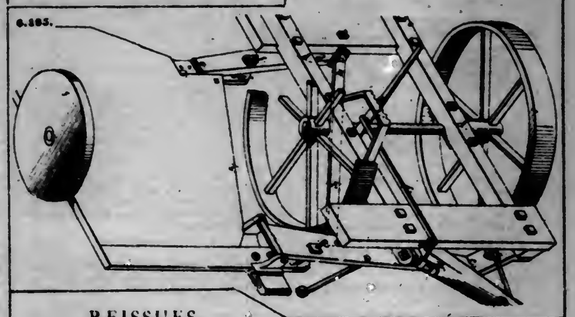
7. A water-reservoir chamber, Q, located beside and combined with a descending flue, H, which has at its rear upper portion an inclined flue-strip, h', beneath which the heated escaping products of combustion are compelled to pass before passing into the direct-draft flue N, substantially as and for the purpose set forth.

164,690. PORTABLE RANGES. Gurdon G. Wolfe, Troy, N. Y. [Filed Feb. 20, 1875.]

Brief.—Smoke may be sent directly to the exit at the side, or to the diving-flue, and thence either around the oven or into the reservoir-space, which communicates by a side flue with the exit. The dust-flue is without the wall of the stove, and connects the ash-pit and exit-flue.

1. In combination with the reservoir-chamber R, the descending flue N and the ascending flue O, constructed as described, a dampered opening, a, formed in and through the wall which separates said parts, substantially as and for the purpose shown.

2. In combination with the chamber R, reservoir S, and flue N, the inclined dampered portion a' of the partition which separates said chamber and flue, substantially as and for the purpose shown and described.



3. In combination with the ash-pit G and exit-flue K', the dust-flue T, extending between said parts, located outside of the back plate F, and provided with a damper, U, by means of which communication between said parts may be cut off when desired, substantially as and for the purpose specified.

4. In a portable range having a fuel-chamber at one end, descending and ascending flues at its opposite end, and an exit-flue at the center of its rear side, the combination of the

161,630.

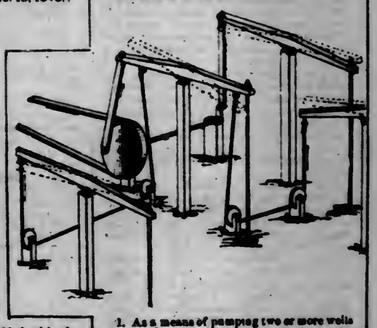
6,485.

REISSUES.

6,484. ROLLS FOR UTILIZING THE FAG-ENDS OF RAILROAD-RAILS. Henry Chisholm, Cleveland, Ohio. Patent No. 124,116, dated Feb. 27, 1872. [Filed Feb. 15, 1875.]

6,481.

1. The rolls A B, having a series of irregular-shaped and graduated grooves of the form in construction shown at e e d, operating essentially as and for the purpose substantially as described.



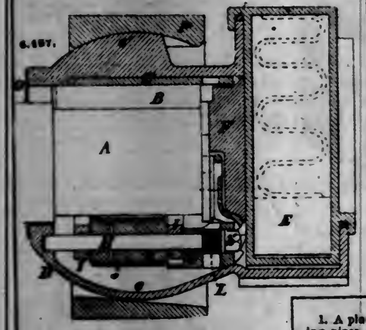
2. The manufacture of bars of steel homogeneous in texture, from old rails, butts, or fag-ends by a process or method substantially such as that hereinbefore described—that is to say: rerolling said old rails, butts, or fag-ends, by means of rollers having grooves so constructed that the body of the rail, butt, or fag end shall, by this operation upon it, be gradually contracted transversely and increasingly extended longitudinally without violent rupture and without plication of the surface.

6,483. HARVESTERS. Lewis Miller and Jacob Miller, Canton, Ohio, assignors to C. Aultman & Co. Patent No. 24,700, dated July 5, 1859. [Filed May 19, 1875.]

1. In a two-wheeled harvesting-machine, having a double-hinged connection, an extension of the finger-bar or platform or arm to a point of suspension outside of the inner hinge, for the purpose of carrying the point of vibration of said bar between the two wheels.

2. In a two-wheeled harvesting-machine, having a finger-beam, with a double-hinged connection to the main frame, a suspending device for controlling the action of the hinge nearest the finger-beam, whereby said hinge is made flexible in an upward direction, and is prevented from being flexed in the direction of the ground.

6,486. MEANS FOR PUMPING WELLS. Aibt. E. Nickerson and Levi C. Streeter, Allegheny Township, Venango County, Pa. Patent No. 162,406, dated Apr. 20, 1875. [Filed May 31, 1875.]



1. As a means of pumping two or more wells simultaneously by a single motor, the combination of a wheel, A, or equivalent, and connecting-levers, walking-beams, and ropes or chains, substantially as described, whereby the walking-beams move in different directions from each other, to equalize the strain on the motor, for the purpose set forth.

2. The combination, with the wheel A, operated by a suitable motor, of the crank shaft C, connected by pitmen with two independent walking beams, and one of said walking beams connected by ropes or chains passing around suitable pulleys, with two other independent walking-beams, substantially as and for the purposes herein set forth.

6,487. RAILWAY-AXLE BOXES. J. N. Smith, Jersey City, N. J. Patent No. 161,069, dated Mar. 23, 1875. [Filed Apr. 20, 1875.]

Brief.—A housing incloses the bearing-axle, and stopping-bar, and lubricating devices. The housing and slide have a ball-and-socket connection, so that the housing is allowed to move in the slide, and insure a true bearing on the axle.

6,487.

1. In a railroad-car truck, in combination with the ball-jointed housing D, the slide F, substantially as and for the purposes set forth.

2. In a railroad-car truck, the ball-jointed housing D, having flat sides, to prevent its turning around in its seat, substantially as and for the purpose set forth.

3. In a railroad-car truck, the housing D, having vertical cylindrical swells *b' b'* on its sides, to permit it to turn or swivel in its seat on a vertical axis, while it is prevented from turning on a horizontal axis by the said vertical sides, substantially as and for the purpose set forth.

4. In a railroad-car truck, in combination with the ball-jointed housing D and journal A, the stopping-bar F, substantially as and for the purpose set forth.

5. In a railroad-car truck, in combination with the housing and axle, a stopping-bar, having an opening extending across the center of the axle, substantially as and for the purpose set forth.

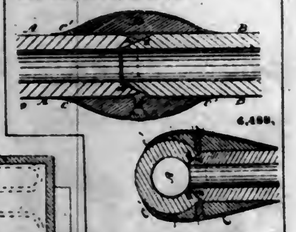
6. In a railroad-car truck, in combination with the stopping-bar F, having a recess in its bearing-face, through which to supply oil to the bearing and oiling-wick a, the counterweight or tumbler m, substantially as and for the purpose set forth.

7. The combination with the stopping-bar, having a recess in its bearing-face extending beyond the center of the axle, of the web S, tumbler m, roller L, and bolt H, substantially as and for the purpose set forth.

8. The combination of the bolt H, roller K, tumbler I, web J, and oil-well *s*, for oiling the journal, substantially as and for the purpose set forth.

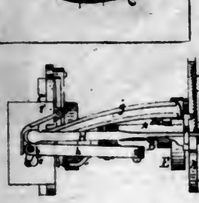
9. In a railroad-car truck, in combination with the housing D, the oil-tank E, in which the oil is held by atmospheric pressure, and fed out automatically, so as to maintain the oil in the oil-well *s* at a given height, substantially as and for the purpose set forth.

10. In combination with the oil-tank E and housing D, the valve *h* and spring *i*, substantially as and for the purpose set forth.



11. The combination, with the oil-tank E and housing D, of the packing *h*, and hinge *f*, for excluding dust from the housing, substantially as set forth.

12. The combination of the stops *i*, with the housing D and stopping-bar F, substantially as and for the purpose set forth.



13. In combination with the ball-jointed housing D and axle A, the sliding cover O, for excluding dust, &c., substantially as set forth.

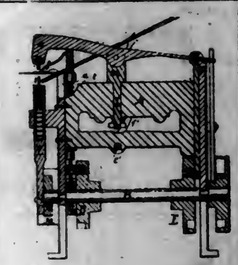
6,488. PLUMBERS' JOINTS. I. F. Van Duser, Middletown, N. Y. Patent No. 150,100, dated Apr. 21, 1874. [Filed Oct. 16, 1874.]

Brief.—The body or stiffening of the joint is constituted by a block of lead of suitable form, loosely fitting upon the parts. Molten solder is then "wiped" over all into the crevices, solidly uniting all the parts.

6,488.

1. A plumbers' joint, constructed by uniting pipes A B within a coupler, D, forming the base or body of the joint, and coating or covering and uniting the parts by means of a layer of solder, C, applied externally of the coupler D, in the manner and for the purpose described.

2. A coupler, D, for forming the base or body of a plumbers' joint, constructed with lips or extensions *d*, channel or groove D', and opening *d'*, substantially as and for the purpose described.



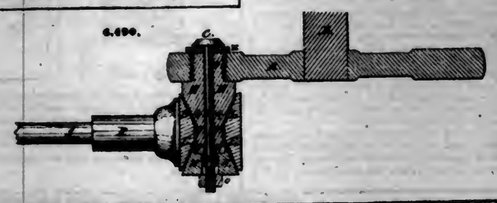
3. The combination, with a pipe, A, formed with a conical seating, *a*, and a pipe, B, having a conical end, *b*, of a coupling, D, substantially as and for the purpose described.

4. The combination, with a pipe, A, and a branch pipe, B, placed at an angle thereto, of the coupler D, having a groove or channel, D', to receive the pipe A, and aperture *d'* to receive the pipe B, as and for the purpose described.

6,489. EYELETING-MACHINE. J. H. Wiggin, Stoneham, Mass., assignor to H. H. Mawhinney, same place. Patent No. 126,016, dated May 21, 1872. [Filed Apr. 20, 1875.]

Brief.—The entire operation is automatic. An eyelet is deposited upon a receiving-pin rising from the end of the vertical compressor. The stock resting upon the bed in position is perforated by the descent of the punch, when the punch and upsetting-anvil receive a simultaneous lateral movement, bringing the anvil over the perforation; the anvil then descends, and by a simultaneous lateral movement in the opposite direction of both anvil and punch the stock is fed, bringing the perforation directly over the eyelet. The compressor rises, forcing the anvil up through the perforation and against the anvil, securing it in position, the punch being left in position for continuous operation.

6,489.



1. In an eyelet-setting machine the upsetting-anvil *e*, operating from above the work-supporting platform, in combination with its actuating mechanism, whereby it is adapted to automatically feed the stock after the eyelet hole has been punched, and to set the eyelet, substantially as described.

2. The combination of the punch *b*, bed *c*, and anvil *e*, with their actuating mechanism, whereby they are given a simultaneous lateral reciprocating movement, and caused to automatically punch and feed forward the stock, substantially as set forth.

3. The combination, with the stock-feeding and eyelet-setting anvil *e*, of the presser *f*, all substantially as and for the purpose set forth.

6,490. HARVESTER CRANES AND PINS. Jacob Kline, Camp Hill, Pa., assignor, by mesne assignments, to himself, Wilson Bear, J. A. Moore, and M. N. Grove. Patent No. 101,194, dated Mar. 22, 1870. [Filed Feb. 9, 1870.]

6,490.

1. In a compensating wrist-pin, journal, or axle, the device of a removable screw-bolt, whereby a follower-cone, N, may be fed up closer to or upon a butt-cone, Q, to compensate for the wear of the journal and its bearings in hub L L', without jamming and sticking the parts, substantially as set forth.

2. The wrist-pin, journal, or axle proper, composed of bolt H, butt-cone Q, round arm F, and square tip *b*, in combination with the follower-cone N, recessed roundly at its focal end to admit therein said arm F, and perforated squarely at its butt-end to admit therein said tip *b*, as described.

3. The wrist-pin or journal body, constructed with attaching-shank D, butt-cone Q, arm F, and tip *b*, with reference to attaching it, and mounting thereon the hub L L' and the follower-cone N by means of a removable screw-bolt, H, substantially as set forth.

COMMISSIONER'S DECISIONS.

GEORGE RICHARDSON.—*Appeal.*

[*Appeal from the decision of the Examiners-in-Chief in the matter of the application of George Richardson for Letters Patent for* "IMPROVEMENT IN SPINDLE-BOLSTERS FOR SPINNING MACHINES." *Decided April* 23, 1875.]

A reissued patent cannot be overlooked if matter be found in it the same as that claimed in a subsequent application, even though the subject-matter referred to had been improperly introduced into the patent upon reissue.

Parts essential to the completeness of a structure, if omitted in the terms of a claim, must be understood, if the specification by which the claim is to be interpreted will justify it.

SPEAR, *Acting Commissioner:*

Of the references cited by the Examiner in this case, two appear to be most relied upon, and are those which alone merit serious consideration. These are the patent of Pearl, reissued September 1, 1874, No. 6,036, and that of Sawyer, No. 113,575. The patent of Pearl is given as anticipating the first claim, and that of Sawyer as mainly anticipating the second.

It was held by the Board that the bobbin shown and claimed in this application is also shown in the reissued patent of Pearl, which has been cited, and specifically claimed in the second clause of his claims. Some question was raised as to the propriety of this claim, by reason of the subject-matter not having been shown in the original application upon which this patent was founded.

I agree with the Board that the reissued patent could not be overlooked, if matter were found in it the same as that claimed in an application made subsequent to that patent, even though the subject-matter referred to had been improperly introduced into the patent upon reissue.

It remains, therefore, to examine this reissued patent of Pearl, in order to discover whether or not the precise thing claimed by this applicant in the first clause of claim is to be found in that patent.

The first claim of Richardson is as follows:

The ring-spinning bobbin constructed with a middle adhesive spindle-bearing, D, and the two chambers *c d*, open at their outer ends, without having at either of such ends an adhesive spindle-bearing, all being substantially as specified.

It appears that this bobbin relies for its support against crushing at the ends only upon the strength of the shell itself, and that the bearing at the central part is made sufficient to maintain the bobbin in place upon the spindle, and furnish sufficient adhesive friction for the purpose of its operation. Now, I do not find precisely this in the patent of Pearl. In that patent there are two bearings, *k i*, one at the lower extremity, and the other at the middle, or a little above the middle, and, besides, the upper end is plugged for additional strength. Nowhere in the specification is there any hint that the central bearing would be sufficient, as the bobbin is organized and proportioned to the length of the bearing, to maintain the bobbin in its position during the operation of the machine. It is not stated anywhere that the lower bearing may be omitted.

I do not assert that the mere omission of the lower bearing, without any other change in the parts or proportions, without any change or extension of the central bearing or thickening of the shell, would be sufficient to maintain a valid patent; but I must suppose that Richardson has done something more than this mere omission, for Pearl had not found, as far as appears from his specification, that the middle bearing *i* could be made sufficient for his purpose, or thought of making a bobbin strengthened only by the central bearing. He represents the two as necessary to set the bobbin upon the spindle. But Richardson appears to have so proportioned the parts, and made the central bearing of such length, compared with the length of the bobbin, as of itself to hold the bobbin in place.

The extension of the central bearing *i*, after the discovery that such extension would serve the purpose, and with the new and improved result, is unquestionably a patentable invention.

That an improved result is attained appears to be

made out. As compared with Pearl's bobbin, this is of simpler construction, and admits the upper end of the bolster. As compared with Sawyer's, it is lighter, and makes it possible to use a shorter spindle.

Referring to the second claim of Pearl, which appears to have been most relied upon, both by the Examiner and the Board, as covering the invention, I do not find that it necessarily includes such a bobbin as Richardson describes and claims. Certainly no foundation is laid in the specification for such an interpretation, nor is such an interpretation made necessary by the terms in the claim itself. It is true that the lower bearing is not specified. The claim is for—

The combination of the bobbin, the intermediate adhesive bearing *i*, and the blade of the spindle, made shorter than the bobbin from the bolster D, substantially as described.

A careful analysis of this claim, and reference to the specification, shows that the invention here referred to, and evidently intended to be covered, is the relative length of the blade of the spindle as compared with the bobbin and its central bearing. In order to express this construction and combination, it was unnecessary to refer to the lower bearing. The reference to the bolster, the blade of the spindle, and the bearing *i* is all that was needed.

I find nothing, therefore, in Pearl's patent to indicate that he contemplated a central bearing sufficient of itself to maintain the bobbin on the spindle, or such a construction of the bobbin that the end pieces could be dispensed with.

A claim must always be interpreted by the specification, and parts of the structure essential to its completeness, or some known equivalent of those parts, must be understood, if omitted in the terms of the claim. Such an interpretation is not unnecessarily to be put on a claim as would render the alleged invention useless without reorganization.

In the present case the claim in Pearl's patent omits the lower bearing. But the patentee has distinctly specified that these plugs or bushings *k* and *l* serve to strengthen the shell, otherwise made so thin as to be liable to be crushed, and that the lower is a part of the bearing of the bobbin.

It follows, then, that, as organized by Pearl, this bobbin is not operative and perfect with the central bearing alone. It needs no forced construction of the language to make the claim consistent and intelligible. It refers evidently, as before remarked, to that new arrangement of the parts specified—the bolster D, bearing *i*, and spindle—in distinction from the old form shown in Fig. 2, in which the spindle extends all the way through the bobbin.

The second claim of Richardson includes, as one of the elements, an element shown by Sawyer. If this element were at all modified by the others, I should not think this claim fairly anticipated; but, so far as I can see, the chamber in the bobbin and the stationary bearings are precisely the same in Sawyer's patent as in this application, so far as concerns the admission of the upper end of the bolster. The operation is the same, and it is not affected in applicant's device by the other parts specified in the claim in any way whatever different from the operation of the apparatus shown in the patent.

I have no objection to the admission of the claim proposed instead of the one acted on by the Board of Examiners-in-Chief, and have considered the argument filed with the new claim. It does not, however, in my judgment, place the matter in materially different light. It is a mere aggregation that is claimed, and the effects of the whole are the sum of the effects of the other parts.

Richardson admits his bolster into the spindle for precisely the same purpose as Sawyer, and, so far as appears, with precisely the same effect.

I must, therefore, affirm the decision of the Examiners-in-Chief upon the second claim, but reverse it upon the first.

SEELEY M. SHERMAN.—*Interlocutory Appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Seeley M. Sherman for Letters Patent for* "IMPROVEMENT IN MACHINES FOR CUTTING WINDOW BLINDS, SLATS, &C."—*Decided May* 21, 1875.]

The question considered of collocation and co-operation of different parts or machines as distinguished from mere aggregation.

SPEAR, *Acting Commissioner:*

This appeal is taken on the requirement made by the Examiner that applicant divide the application, or eliminate from it that part held not to be a part of the leading invention set forth in the specification.

Upon examination, I find the machine, or leading feature of it, to be only for the purpose of forming the metallic tips or clasps, which hold the ends of the blind-slats. This somewhat complicated mechanism is located upon a stand or table, and moved by a shaft placed beneath it. The subordinate invention, alleged to be independent, and to have no necessary connection with this leading invention, as shown in the drawing, and described in the specification, consists of a knife, or chisel rather, located on one edge of the table, sliding longitudinally, with its sharpened edge arranged vertically, and passing by the end in such a manner as to cut a slat placed at right angles thereto in guides located upon the side adjoining this upon which the knife slides. The knife is moved by a lever, which is connected with some moving part of the other mechanism located upon the table. Further, there is a spring on that side where the slat is placed, which, when the cutting operation has been performed, is made to throw out the slat and give place to another.

The position taken by the Examiner in respect to the apparatus described above is, that the device for making the metallic bearings is all that may be properly called the machine; that the knife is simply a tool attached for convenience, perhaps, to the machine. He insists that the tool and the machine do not co-operate in any patentable sense. This lack of co-operation in the action of the parts is too plain to require discussion; and if appellant's case rested upon this alone, I should, without hesitation, decide against him. But there are cases where invention may be exercised, and useful results accomplished, in the collocation of machines or devices which do not in any sense co-operate in what may be strictly called their action. Cases of such mere aggregation have been heretofore fully discussed, as in

the Commissioner's decision upon the application of Linus Yale, 1869, and that in the case of Lehmann, 1870, and of Abel Combs, 1871. An exception, however, was referred to by the Commissioner, in considering the Lehmann case, in relation to—

Combined implements which use certain parts in common, and so save the expense of duplicating such parts.

The Commissioner was of the opinion that such inventions are useful, and, if new, undoubtedly patentable. Exactly of this nature appears to me to be the structure shown and described by this appellant.

The sixth and seventh claims cover precisely the arrangement of parts shown in the drawings. This arrangement is such that upon the same table, without interfering with the devices which form the metallic bearings, the knife and the device for holding the slat to be cut are all conveniently located, both for receiving motive power from the main machine, and for approach and easy manipulation by the attendant. This is something more than mere aggregation. The combination is such that the same table which supports the central machine is made without any enlargement to support the auxiliary machine.

Had the appellant simply made a table of double size required for the central machine, and upon one-half located that, and upon the other the slat-cutting machine, or tool, as the Examiner calls it, there would have been no exercise of invention, nor, so far as I can see, any useful result. There are, however, manifestly useful results in the construction now shown, saving in expense of table and shop-room, and a compactness and accessibility in the machine.

The particular construction and combination which accomplishes this are claimed in the sixth and seventh clauses of claim, which I think should be allowed to stand in the application, and be examined upon their merits.

The second claim, however, is not limited to this particular construction and arrangement of parts, wherein, as I have indicated, all that is material, in my judgment, is included. It is broadly for an aggregation of two independent machines, without any limitation such as I have discussed above; and I agree with the Examiner, that this claim should be erased.

The case is remanded to the Examiner for such further action as may be necessary.

DECISIONS OF THE COURTS.

SUPREME COURT OF THE UNITED STATES.

CHARLES M. TREMAIN AND WILLIAM B. TREMAIN, APPELLANTS, *vs.* ALONZO HITCHCOCK, GEORGE G. SAXE, AND JAMES H. ROBERTSON, AND ALONZO HITCHCOCK *et al.*, APPELLANTS, *vs.* CHARLES M. TREMAIN *et al.*

[*In equity.—Appeals from the Circuit Court of the United States for the Southern District of New York.—October Term*, 1874.]

An amendment which changes the character of a bill ought not, generally, to be allowed after a case has been set for a hearing, and still less after it has been heard. The answer might become inapplicable if such an amendment were permitted.

Where the original bill set up only the first reissue of a patent that had been twice reissued, but the proofs, both for final hearing and before the master on the accounting had reference to the second reissue, as also the proceedings upon the master's report, an order of court directing that the record be amended by inserting in the bill an averment of the second reissue was properly made, even after the final decree.

Where defendants were dealers in musical instruments, and some of the instruments bought and sold by them contained a tremolo attachment which infringed complainants' patent, and others not, defendants were properly allowed, in the ascertainment of the profits made by them from the sales, to prove the general expenses of their business incurred in effecting the sales of all musical instruments, and deduct a ratable proportion from the gross profits made by the sale of the attachments.

[This was a suit under a reissue of letters patent for a tremolo attachment for musical instruments granted to R. W. Carpenter, June 27, 1865, the complainants being Alonzo Hitchcock, George G. Saxe, and James H. Robertson.

The case as decided in the court below is reported in 9 Blatchf., 385; also in 4 Fisher, 508, and 5 Fisher, 310.]

[*F. H. Betts*, for complainants.
B. F. Valentine, for defendants.]

STRONG, *J.:*

The bill filed by the complainants in the court below set forth that a patent for a "tremolo attachment" to musical instruments was granted on the 27th day of June, 1865, to R. W. Carpenter; that subsequently the patentee assigned the letters patent to the complainants; that on the 18th day of May, 1869, they surrendered the patent, and obtained a reissue to themselves, (numbered 3,444,) and that the defendants had been guilty of infringing their rights under the patent.

To the complaint thus exhibited, the defendants answered admitting the grant of the letters to Carpenter, but denying all knowledge as to the truth of the allegations that Carpenter had at any time assigned his interest to the complainants, or to any one or more of them, and, *therefore*, denying that the complainant had any interest in the said letters patent or to the "*reissues*" of the same as set forth in the bill of complaint.

The answer further averred that Carpenter was not the original inventor of the tremolo attachment, but that it was known and was in use before his alleged invention was made. Still further, the answer denied that the defendants had infringed upon the rights and privileges granted by the patent dated June 27, 1865, "*or by any of the reissues of the same.*"

To this answer a general replication was put in, and the parties went to trial, when the complainants gave in evidence, without objection, reissued Letters Patent No. 3,665, dated October 5, 1869, which had been granted on the surrender of the first reissue No. 3,444. This second reissue was not set out in the bill; but it is plain both parties supposed it was through all the progress of the trial. As we have noticed, the answer denied infringement, not of the single reissue mentioned in the bill, but of any of the reissues. No other than No. 3,665 was put in evidence. The decretal order to account expressly mentioned it. The evidence taken by the master under the order of reference related solely to attachments sold by the defendants after the second reissue was granted. In the exceptions taken by them to the master's report no intimation was made that the rights of the complainants under the reissue 3,665 were not on trial, and not even when the final decree was made was it suggested that the parties had been trying the case on an issue not made by the pleadings. Prac-

tically, indeed, the rights of the complainants under the second reissue, and the defendants' infringement thereof, were in issue under the answer and the replication.

We think, therefore, the order of the court directing that the record be amended by inserting in the bill an averment of the second reissue was properly made under the circumstances of the case, though made after the final decree. It deprived the defendants of no rights which they had not enjoyed during all the progress of the trial. It may well be denominated only an amendment of form, because it introduced no other cause of action than that which had been tried. It is true that an amendment which changes the character of the bill ought not generally to be allowed after a case has been set for a hearing, and still less after it has been heard. The reason is that the answer may become inapplicable if such an amendment be permitted. But in this case the defendants were not prejudiced. They had every advantage they could have had if the bill had originally averred the second reissue. The case is undoubtedly anomalous, but we think justice would not be subserved by denying to the circuit court the power to order such an amendment as was made after the cause was tried precisely as it must have been tried if the bill had originally contained the averment inserted by the amendment.

We come then to the errors assigned by complainants. They relate to the estimate of profits reported by the master and confirmed by the court. The defendants were vendors of musical instruments, including organs and melodeons, which they purchased from the manufacturers. Some of these instruments contained the tremolo attachment, and others did not. For those containing such attachments they paid an additional price, and they sold them also for an increased price. In the ascertainment of the profits made by them from the sales, they were allowed to prove the general expenses of their business incurred in effecting the sales of all musical instruments, and deduct a ratable proportion from the profits made by the sale of tremolo attachments. It is of this allowance the complainants now complain.

It is said the patent infringed was not for the tremolo itself, but for the combination of the organ and tremolo, and it is argued that if the defendants obtained an extra price for the organ combined with the tremolo without incurring any additional expense, the whole of that extra price was obtained from the addition of the combination; and it is further insisted that the true rule in cases like the present is, that, if the infringing device is an integral part of the whole instrument, without which it is incapable of use, and for which a single charge is made, then in ascertaining profits on a part of the organization general expenses are to be apportioned according to the cost, or by some other equitable rule; but when the infringing device is an optional one, used or not at pleasure, and an extra price is charged and received for it when used, the true profit made is the extra sum received for the addition, deducting only such expenses as are incurred by reason of the addition. We think such a rule, even if it may sometimes be just, is inapplicable to the present case. We cannot see why the general expenses incurred by the defendants in carrying on their business, such expenses as store rent, clerk hire, fuel, gas, porterage, &c., do not concern one part of their business as much as another. It may be said that the selling a tremolo attachment did not add to their expenses, and, therefore, that no part of those expenses should be deducted from the price obtained for such an attachment. This is, however, but a partial view. The store rent, the clerk hire, &c., may, it is true, have been the same if that single attachment had never been bought or sold. So it is true that the general expenses of their business would have been the same, if, instead of buying and selling one hundred organs, they had bought and sold only ninety-nine; but will it be contended that because buying and selling an additional organ involved no increase in the general expenses, the price obtained for that organ above the price paid was all profit? Can any part of the whole number sold be singled out as justly chargeable with all the expenses of the business? Assuredly no. The organ with a tremolo attachment is a single piece of mechanism, though composed of many parts. It was bought and sold as a whole by the defendants. It may be said the general expenses of the business would have been the same if any one of these parts had been absent from the instrument sold. If, therefore, in estimating profits, every part is not chargeable with a proportionate share of the expenses, no part can be. But such a result would be an injustice that no one would defend. We think it very plain, therefore, that there was no error in the rule adopted for the ascertainment of the profits made by the defendants out of their infringement of the complainants' patent.

We think also the master's report, confirmed by the court, was correct in its ascertainment of the general expenses. At least there is nothing before us to show that it did not conform to the second decretal order. The defendants submitted analyses of their books, from which it is to be presumed the master distinguished general from particular expenses.

It follows that neither the appeal of the defendants nor the cross appeal of the complainants can be sustained.

The decree of the circuit court is affirmed, and it is ordered that the costs of each appeal be paid by the appellants.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date June 22, 1875.]

8,406 to **8,408**, inclusive.—**Breastpin.**—LEONARD S. BEALS, Astoria, New York.—Cases A', B', and C'. Applications filed June 2, 1875. Term of patents 3½ years.

8,409.—Scarf-Ring.—LEONARD S. BEALS, Astoria, N. Y. Application filed June 2, 1875. Term of patent 3½ years.

8,410.—Picture-Frame.—EDWARD BECK and STEPHEN BIRD, of Lockport, N. Y. Application filed June 5, 1875. Term of patent 3½ years.

8,411 and **8,412.—Embroidery-Pattern.**—EMIL CRISAND, New Haven, Conn., assignor to HENRY ST. JOHN, same place. Cases DD and EE. Applications filed June 11, 1875. Term of patents 3½ years.

8,413.—Comb.—GEORGE G. MILLER, Philadelphia, Pa. Application filed June 9, 1875. Term of patent 3½ years.

8,414.—Ornamental Border for Silver-Ware.—CHARLES OSBORNE, of North Attleborough, Mass., assignor to THE WHITING MANUFACTURING COMPANY. Application filed May 28, 1875. Term of patent 7 years.

8,415.—Vase.—CHARLES F. PIKE, Philadelphia, Pa. Application filed May 13, 1875. Term of patent 3½ years.

8,416.—Desks.—CHARLES RICHTER, Dedham, assignor to ALDEN BATCHELDER, Reading, Mass. Application filed May 11, 1875. Term of patent 7 years.

8,417.—Bottles.—JOB TRUAX, Mt. Union, Pa. Application filed June 9, 1875. Term of patent 7 years.

8,418.—Cassimeres.—EDWARD C. CLARK, Rockville, Conn. Application filed June 8, 1875. Term of patent 7 years.

8,419.—Printing-Type.—JAMES M. CONNER, Greenville, N. J. Application filed May 24, 1875. Term of patent 14 years.

8,420.—Font of Printing-Type.—PETER A. JORDAN, Philadelphia, Pa., assignor to MACKELLAR, SMITHS & JORDAN, same place. Application filed June 14, 1875.

8,421.—Thermometers.—CHARLES KITSCHELT, New York, N. Y., assignor to NICHOLAS MULLER'S SONS, same place. Application filed May 14, 1875. Term of patent 7 years.

8,422 to **8,425**, inclusive.—**Oil-Cloths.**—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Applications filed June 17, 1875. Term of patents 3½ years.

8,426.—Ornamentation of Stove-Doors.—JASPER VAN WORMER and MICHAEL MCGARVEY, Albany, N. Y. Application filed May 20, 1875. Term of patent 7 years.

8,427.—Bird-Houses.—JOSEPH WHITE, Philadelphia, Pa. Application filed May 17, 1875. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date June 22, 1875.]

2,691.—Cordials, Sirups, and Preserves.—G. W. DUNBAR & SONS, New Orleans, La. Application filed May 31, 1875.

"a monogram formed by a combination of the letters 'G,' 'W,' 'D,' and 'S,' printed within a circle about the center of the label. Around the upper part of this circle we print in one line the name of the firm, viz., 'G. W. Dunbar and Sons,' while below the said circle we print in one line 'French Cordials,' 'Sirups,' and 'Preserves,' and below this the name of our city, 'New Orleans.' On either side of the circle surrounding the monogram, and filling the spaces between the ends of the upper and lower lines of the lettering, we print fac-similes of the gold medal awarded us by the Louisiana State fair association."

2,692.—Agricultural Forks.—FRANKLIN P. SHUMWAY, Leominster, Mass. (Re-registration.) Application filed March 20, 1872.

"words 'The Partridge Fork.'

2,693.—Gin.—THOMAS L. SMITH, Boston, Mass. (Re-registration.) Application filed October 30, 1871.

"the design of a strawberry or a cluster of strawberries, with or without the leaves and stems."

2,694.—Castor-Oil.—STOCKDALE, SMITH & CO., Baltimore, Md. Application filed June 17, 1875.

"word 'KASTROYLE.'"

2,695.—Commercial Fertilizers.—WALTON, WHANN & CO., Wilmington, Del. (Re-registration.) Application filed November 1, 1871.

"words 'Carolina Peanut Guano.'"

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., May 19, 1875.

On the petition of ANN JENNETTE HATHAWAY, of Milwaukee, Wis., executrix of JOSHUA HATHAWAY, deceased, authorized by act of Congress approved February 18, 1875, praying for the extension of a patent granted to the said JOSHUA HATHAWAY, on the 3d day of April, 1860, for an Improvement in Devices for Converting Reciprocating into Rotary Motion,

It is ordered that the testimony in the case be closed on the 20th day of July next; that the time for filing arguments and the Examiner's report be limited to the 30th day of July next; and that said petition be heard on the 4th day of August next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

INDEX OF INVENTIONS PATENTED JUNE 22, 1875.

	Class No.	No. of Patent.
Alarm, burglar, J. A. Weed	24	164,888
Bale tie, Dn Bose and Charles	7	164,817
Bale tie, A. Eichholz	7	164,821
Bale tie, J. H. Hardman	7	164,835
Bath tubs, showering attachment for, W. H. Rowe	8	164,768
Battery, galvanic, T. Chutaux	50	164,807
Bed bottom, spring, J. A. Reeds	62	164,693
Bedstead fastening, G. Suppert	62	164,883
Bedstead, invalid, G. Pence	62	164,760
Bee hive, E. Gerry, (reissue)	9	6,499
Bell pull, W. Richardson	24	164,874
Belt fastener, J. B. McElroy	81	164,855
Belt shifter, W. H. H. Sisum, (reissue)	87	6,496
Belt twisting apparatus, M. P. Wilmarth	81	164,702
Billiard register, electrical, Russell and Sax	143	164,661
Blank book, I. Reynolds	146	164,873
Body brace, H. R. Allen	156	164,706
Boiler plates, machine for punching, Carroll, Rogers, and Foster	119	164,673
Boiler, steam, M. W. Shapley, (reissue)	148	6,501
Boiler, wash, J. Rieth	91	164,875
Boilers, feed water heater for steam, S. W. France	149	164,826
Book clasp, N. Harlan	146	164,646
Boot and shoe, Meyer and Freiburg	16	164,860
Boot and shoe crimper, C. Heller	16	164,859
Boring apparatus, earth, O. Martin	51	164,689
Bottle stopper or cork, J. Schrink	1	164,879
Box girdor, compound, A. Hay	4	164,734
Boxes, machine for making, J. W. Bowers	30	164,798
Bridge fastening, draw, C. J. Atkins	21	164,708
Brush, fountain, F. McDaniel	22	164,853
Building purposes, composition for, A. T. Lyon	4	164,850
Burner, Argand gas, E. P. Gleason, (reissue)	64	6,491
Burner, hydrocarbon, J. W. Neeley	149	164,655
Butter tubs, fastening for, H. C. Carter	45	164,717
Cake cutter, J. H. Winslow	88	164,667
Calves from sucking, instrument to prevent, S. Tilton	144	164,665
Can vent and stopple, E. M. Crandal	107	164,813
Canal boats, construction of, W. Ball	137	164,709
Car coupling, C. Bowman	122	164,671
Car coupling, W. S. Burton	122	164,803
Car coupling, J. Jacobson	122	164,841
Car coupling, Misso and Warner	122	164,753
Car coupling, N. Nilson	122	164,866
Car coupling, J. B. Stamour	122	164,698
Car truck, C. W. Manafield	122	164,651
Carding machine, Blamires and Marsden	28	164,796
Carpet cleaner, D. B. Scofield	62	164,773
Carriage and chair for children, combined, Tenney and Hobbs	31	164,782
Cartridge box, M. V. B. White	32	164,890
Cartridge, shot, B. D. Wilson	32	164,894
Casket handle, C. Strong, (reissue)	39	6,497
Chair, spring, A. W. Coates	62	164,811
Chuck, C. H. Powers	100	164,658
Cigars, case for freshing, Chandler and King	160	164,806
Cloth steaming machine, J. Shinn	37	164,697
Clothes drier, C. Hauser	91	164,733
Clutch for power presses, A. H. Merriman	87	164,690
Coffin handle, M. H. Crane	39	164,812
Comb cutting machine, J. W. and I. S. Hyatt	161	164,648
Cooler and condenser or heater, C. H. North	47	164,757
Cotton gin, W. Koehl	41	164,844
Cradle and bedstead, combined, C. W. Chamberlain	62	164,639
Curtain fixture, W. H. Sparks	62	164,882
Dental forceps, A. Engel	46	164,820
Dental rubber dams, clamp for, D. Palmer	46	164,870
Dominoes, machine for spotting, I. S., J. W., and C. M. Hyatt	143	164,840
Door check, W. H. Willis	24	164,701
Door securer, L. Marks	24	164,688
Drill, ratchett, J. M. Koeberle	100	164,666
Drilling mechanism, rock, A. E. Allen	124	164,705
Drop lights, friction slide for, J. T. Bruen	64	164,802
Electrical apparatus for timing races, R. J. Sheehy	50	164,696
Elevator, water, W. Walter	118	164,887
Embroidering machine, Michalet and Bourget	134	164,751
Engine governor, steam, F. M. Merrill	69	164,859
Engine, pneumatic, P. M. Conolly	2	164,809
Engine, steam, H. P. Case	150	164,804
Engine, steam fire, W. Knaust	118	164,843
Engines, valve gear for steam, J. L. Hewes	152	164,736
Envelope, A. N. Lewis	146	164,847
Escutcheon, seal, E. J. Brooks	93	164,600
Etchings on glass, producing, E. Dallienne	54	164,720
Excavating apparatus, C. G. Force, Jr	51	164,643
Excavator, J. W. Gonce	51	164,829
Fan leaves, machine for cutting, P. Hufeland	165	164,838
Fans, manufacture of, P. Hufeland	165	164,839
Fare box, A. E. Hovey	42	164,685
Fats for rendering, machine for cutting, P. L. McDowell	25	164,854
Faucet, L. Chaize	167	164,805
Fence, farm, L. M. Wheelock	52	164,788
Fence, iron, P. Hafta	52	164,830
Fifth wheel, J. Hodge	31	164,738

	Class No.	No. of Patent.
File blanks, machine for bending circular, Beyer and Heunsch	53	164,710
Files, apparatus for tempering, W. T. Nicholson	85	164,656
Fire arm, breech loading, B. Fasoldt	18	164,642
Fire extinguisher, chemical, A. E. Hughes	35	164,837
Fishing rod, J. L. Graves	143	164,828
Flooring clamp, J. T. and G. J. Moss	29	164,754
Foot power laster, F. J. Davis	16	164,722
Fruit can, S. W. McOmber	136	164,857
Fruit jar, Stevens and Lumley	58	164,663
Fuel, &c., machinery for the compression of, F. J. Hamel	61	164,834
Furnace, W. E. Haxton, (reissue)	149	6,503
Furnaces, apparatus for supplying gas as a fuel to metallurgic, W. Rogers	99	164,876
Game apparatus, musical, E. Draper	143	164,641
Game table, N. W. Moulton	143	164,654
Gas and air, apparatus for carbureting and purifying, L. E. Fish	27	164,825
Gas as a fuel to metallurgic furnaces, apparatus for supplying, W. Rogers	99	164,876
Gas extinguisher for street lamps, L. Boore	64	164,711
Gas, manufacture of illuminating, F. H. Eichbaum	66	164,822
Gate, automatic, H. Hammond	52	164,831
Gate, lifting, W. Lundy	52	164,849
Glass annealing oven, T. B. Atterbury	68	164,632
Governor, W. D. Marks	69	164,745
Grain conveyer, H. W. Caldwell	79	164,715
Graining wood, G. F. Mehling	107	164,858
Grate bar, hollow, W. L. Gregg	149	164,729
Grate for cooking ranges, drop, J. E. Baum	154	164,670
Grinding wheel, Putnam and Esty	70	164,692
Hame fastener, H. J. Wilson	72	164,893
Harrow, C. Brodrick	73	164,713
Harvester, H. H. Bridenthall, Jr	75	164,799
Harvester finger bar, V. N. Collins	74	164,676
Harvester reel, J. F. Black	74	164,795
Hay rack, J. Hall	31	164,731
Heater for steam boilers, feed water, S. W. France	148	164,826
Heel shave, N. A. Sweet	16	164,885
Hinge, sheet metal, S. Scott	24	164,774
Hog catching implement, W. R. Ames	144	164,707
Horseshoes, die for forming spurs on toe calks for, Clarke and Chase	60	164,908
Horseshoes, machine for bending, H. Levy	60	164 649
Hose coupling, E. Dayton	81	164,816
Hydrant, G. Hillegass	167	164,737
Hydrant, W. H. McMillan	167	164,856
Hydrant, J. G. Murdock	167	164,864
Hydrocarbon burner, J. W. Neeley	149	164,655
Ice breaking attachment for vessels, J. T. Martin	137	164,746
Incubator, A. Corbett	116	164,810
Inkstand, S. Darling	146	164,721
Ironing apparatus, N. Hall	91	164,832
Knife, shoe, H. S. Cushman	16	164,675
Knife, tobacco, E. T. Shelton	160	164,890
Ladder, fire escape, D. Sanford	30	164,769
Ladder, step, E. G. Hildreth	90	164,683
Lamp, J. S. and T. B. Atterbury	90	164,669
Lamp and oil can, combined, W. Roberts	90	164,766
Lamp, street, J. Henrich	64	164,681
Lamps, gas extinguisher for street, L. Boore	64	164,711
Laster, foot power, F. J. Davis	16	164,722
Latch for doors, O. W. Stow	93	164,780
Leather, bronze dressing for, E. H. Fennessy	92	164,678
Life preserving apparatus, H. A. Duc, Jr	138	164,818
Limekiln, W. S. Sampson, (reissue)	153	6,494
Limekiln, W. S. Sampson, (reissue)	153	6,495
Links, machine for forming, J. H. Helm	60	164,682
Liquids, preserving effervescent, J. G. L. Boettcher	1	164,797
Lock, bag, F. W. Mix	93	164,752
Locomotives, device for increasing traction of, J. W. Murphy	94	164,863
Loom harness, J. Staddin	95	164,777
Mail bag catch, H. M. Dick	162	164,677
Measure, speed, S. F. Minton	42	164,861
Medical compound, J. Cooper	98	164,674
Meter, liquid, E. Marsland	167	164,892
Mill, cider, Galt and Tracy	10	164,644
Mill, cider, S. Males, (reissue)	19	6,504
Mill, rolling, I. Habo	125	164,679
Mill spindle, J. A. Hafner, (reissue)	67	6,492
Molding machine, J. R. Locke	73	164,650
Monument, J. Sharkey, (design reissue)	54	6,507
Motion, device for converting, G. Turner	67	164,783
Musical game apparatus, E. Draper	143	164,641
Nut lock, O. B. Latham	14	164,846
Nut lock, W. F. Marthens	14	164,747
Nut lock, W. P. Olden	14	164,868
Oils, refining, A. T. Schmidt	47	164,694
Organ tremolo, W. D. Parker	106	164,871
Organ tremolo, reed, R. W. Pain	106	164,869
Paint compound, A. T. Lyon	107	164,851
Paper barrels, centrifugal machine for making, W. G. Pennypacker	109	164,761
Paper boards, manufacture of, B. F. Field, (reissue)	108	6,502
Paper box, L. A. Kettle	109	164,742
Paper clip, Pack and Vanhorn	146	164,657
Paper, compound for sizing, J. Hogben	108	164,684
Paper cutting machine, W. I. Reid	109	164,660
Paper machine, C. L. Crum	109	164,814
Paper, machine for cutting and delivering printed, W. Scott	117	164,695
Parafline, &c., apparatus for purifying, F. X. Byerly	47	164 672
Photographic dark trunk, F. Robbins	111	164,765
Photometer, portable or hand, W. W. Goodwin	157	164,728
Piano tuning pin lock, G. P. Reeves	112	164,763
Pianos, stringing, A. Moeller	112	164,862
Pickles, preparing, Reckhow and Stafford	58	164,659
Pipes to buildings, application of steam, C. C. Walworth	154	164,700
Plane, bench, L. Bailey, (reissue)	29	6,498
Planing machine, E. Benjamin	173	164,634
Planing machine, H. C. Holloway	173	164,739
Planing machine, C. R. Tompkins	173	164,666
Planking set for ship carpenters, E. Sloan	137	164,881
Plow, O. J. Glasoe	114	164,727
Plow, A. Griggs	114	164,730
Plow colter cleaner, Wallis and Case	114	164,784
Plows, die for making landsides for, C. H. Thompson	114	164,664
Polishing wheel, H. Hard	70	164,732
Postage stamp holder, P. W. Hall	146	164,833
Press, baling, J. C. Stokes	7	164,779
Press, hay, cotton, and wool, W. H. McBurney	7	164,748
Press, screw, J. H. Clapp	119	161,637
Presses, clutch for power, A. H. Merriman	87	164,690
Printing in colors, W. H. Holmes	117	164,647
Propeller, chain, E. R. Austin	139	164,633
Pulleys, machine for grinding, A. Wood	67	164,897
Pump, Arndt and Ayres	118	164,611
Punching boiler plates, machine for, Carroll, Rogers, and Foster	119	164,673
Races, electrical apparatus for timing, R. J. Sheehy	50	164,696
Railway crossing, E. J. Patterson	120	164,759
Railway rails, joint support for street, C. B. Sheldon	120	164,776
Railway signal, electric, H. W. Spang	50	164,778
Railway switch, J. Walker	120	164,886
Railway track, R. Bañolas	120	164,793
Ranges, drop grate for cooking, J. E. Baum	154	164,670
Refrigerator, Mason and Sinclair	58	164,653
Refrigerator building, T. Krausch	58	164,744
Regulator and alarm, automatic heat, S. A. Day	154	164,815
Road rammer, A. Q. Ross	110	164,877
Roofing material, D. McDaniel	126	164,749
Saddle, harness, A. V. Sargeant	72	164,772
Sash fastener, C. B. Gardiner	24	164,827
Sash fastener, P. Meyer	24	164,750
Sash fastener, W. B. Swallow	24	164,884
Sausage machine, D. J. Howenstine	25	164,741
Saw jointer and gage, R. E. Poindexter	30	164,762
Sawing machine, Scroll, Wescott, and McGregor	130	164,787
Scaffold, J. E. Sanders	30	164,771
Screw driver, I. C. Cowles	29	164,638
Screw heads, die for forming, F. Rhind	14	164,764
Seed drill, J. R. Symmes	133	164,781
Seeding machine, J. B. Bushnell	133	164,635
Sewing machine binder, G. Wissler	134	164,895
Sewing machine binder attachment, G. Wissler	134	164,896
Shawl strap handle, L. Loeser	102	164,848
Sheet metal rings, making, S. R. Wilmot	136	164 892
Ship carpenters, planking set for, E. Sloan	137	164,881
Shoe knife, H. S. Cushman	16	164,675
Shoe nail, H. F. Whidden	16	164,839
Signal, electric railway, H. W. Spang	50	164,778
Signal operating device, F. Culham	120	164,719
Sled, bob, J. J. Sandgren	31	164,770
Smoke drum, J. Bowman	154	164,712
Smoke stack, J. L. Mason	94	164,652
Soap holder, J. P. Bryan	91	164,801
Spark arrester, W. Stamp	94	164,662
Speed measure, S. F. Minton	42	164,861
Spike, G. N. Sanders	103	164,878
Spinning machines, &c., top roll for, E. Card	142	164,716
Spoke tenoning machine, Coleman and Myers	31	164,718
Stamp canceler, M. Lewis	146	164,687
Stone, manufacture of artificial, Osborn, Merriam, and Doty	153	164,758
Stove, A. Hamilton, (reissue)	154	6,500
Stove, H. J. Wintherlich	154	164,789
Stove, camp, H. L. Dunckloe	154	164,725
Stove, coal oil, J. L. Sharp	154	164,775
Stove pipe elbow, J. F. Piehl	154	164,872
Stove, reservoir cooking, R. M. Hermance	154	164,735
Sugar cutting machine, F. Rochow	155	164,767
Swing, child's, G. A. Fanjoy	143	164,726
Table, folding work, B. Fairchild	62	164,824
Table, ironing and kitchen, A. Aitken	91	164,704
Tanning hides, Baldwin and Holcombe	92	164,792
Telegraph and circuit therefor, duplex, J. B. Stearns, (reissue)	158	6,508
Thill coupling, G. W. Ladd	31	164,845
Tobacco knife, E. T. Shelton	63	164,880
Toy, C. A. Bailey	143	164,791
Toy, bell, F. Arnold	143	164,790
Toy, electric, W. J. Decker	50	164,723
Transom for doors, J. Berndt	30	164,794
Trap, fly, J. M. Harper, (reissue)	143	6,493
Trap, hog, J. M. Kimball	144	164,743
Type casting machine, J. A. T. Overend, (reissue)	117	6,505
Type casting machine, J. A. T. Overend, (reissue)	117	6,506
Valve for water tanks, J. Hadfield	118	164,645
Valve gear, W. L. Newsham	152	164 865
Vehicle bodies, corner for, Acker and Robinson	31	164,703
Veneer cutting machine, G. W. Swan	174	164,699
Ventilator, side wall, W. G. Creamor	166	164,636
Vessels, ice breaking attachment for, J. T. Martin	137	164,746
Wagons, brake block for, Wieterhold and Oak	31	164,891
Wardrobe, M. B. Coburn	62	164,640
Warp holder, piercing, H. S. Houghton	95	164,740
Washing machine, M. Newton	91	164,755
Washing machine, cylinder, S. and A. F. Wekey	91	164,785
Watch key, J. C. Duebor	36	164,819
Watch, wheels, tool for pivoting, F. R. Bucklin	36	164,714
Water closets, apparatus for disinfecting, G. Jennings	8	164,842
Water tank valve, J. Hadfield	118	164,645
Water wheel, J. Erikson	168	164,823
Water wheel, turbine, G. Arrowsmith	168	164,668
Water wheel turbine, J. M. Denson	168	164,724
Wells, pumping, Nickerson and Streeter	124	164,756
Window sash, L. P. Haradon	30	164,836
Window screen, S. Parker	30	164,691
Wood preserving compound, P. Werni	35	164,786
Wrench, J. Norton	100	164,867

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JUNE 22, 1875.

	Patent No.
Acker, S., and N. L. Robinson, Corner for vehicle bodies	164,703
Ahrens, B., assignee	164,661
Aitken, J., assignee	164,822
Aitken, A., Ironing and kitchen table	164,704
Allen, A. E., Rock drilling mechanism	164,705
Allen, H. R., Body brace	164,706
Ames, W. R., Hog catching implement	164,707
Arndt, S., and W. S. Ayres, Pump	164,631
Arnold, F., Bell toy	164,790
Arrowsmith, G., Turbine water wheel	164,668
Atkins, C. J., Draw bridge fastening	164,708
Atterbury, J. S. and T. B., Lamp	164,669
Atterbury, T. B., Glass annealing oven	164,632
Austin, E. R., Chain propeller	164,633
Ayres and Arndt	164,631
Bailey, C. A., Toy	164,791
Bailey, L., Bench plane, (reissue)	6,498
Baldwin, E. A., and C. A. Holcombe, Tanning hides	164,792
Ball, W., Construction of canal boats	164,709
Bañolas, R., Railway track	164,793
Battioher, P. G., assignee	164,734
Baum, J. E., Drop grate for cooking ranges	164,670
Beadle, A., assignee, (reissue)	6,500
Beardsley, H. S., assignee, (reissue)	6,494, 6,495
Benjamin, E., Planing machine	164,634
Berndt, J., Transom for doors	164,794
Beyer, L., and R. Heunsch, Machine for bending circular file blanks	164,710
Black, J. F., Harvester reel	164,795
Blamires, T. H. and H., and H. Marsden, Card machine	164,796
Boettcher, J. G. L., Preserving effervescent liquids	164,797
Boore, L., Gas extinguisher for street lamps	164,711
Borden, B., assignee	164,716
Bourget and Michalet	164,751
Bowers, J. W., Machine for making boxes	164,798
Bowman, C., Car coupling	164,671
Bowman, J., Smoke drum	164,712
Bradlee, D. H., assignee	164,697
Bridenthall, H. H., Jr., Harvester	164,799
Bristol Brass and Clock Company, assignee	164,764
Brodrick, C., Harrow	164,713
Brooks, E. J., Seal escutcheon	164,800
Bruen, J. T., Friction slide for drop lights	164,802
Bryan, J. P., Soap holder	164,801
Bucklin, F. R., Tool for pivoting watch wheels	164,714
Burchfield, T. J., assignee	164,876
Burdge, J. M., assignee	164,857
Burton, W. S., Car coupling	164,803
Bushnell, J. B., Seeding machine	164,635
Byerly, F. X., Apparatus for purifying parafline, &c	164,672
Caldwell, H. W., Grain conveyer	164,715
Card, E., Top roll for spinning machines, &c	164,716
Carroll, D. C., D. Rogers, and A. W. Foster, Jr., Machine for punching boiler plates	164,673
Carter, H. C., Fastening for butter tubs	164,717
Case, H. F., Steam engine	164,804
Case and Wallis	164,784
Cavender, J. W., assignee	164,779
Chaize, L., Faucet	164,805
Chamberlain, C. W., Combined cradle and bedstead	164,639
Chandler, W. E., and E. H. King, Case for freshing cigars	164,806
Charles and Du Bose	164,817
Chase and Clarke	164,909
Chutaux, T., Galvanic battery	164,807
Clapp, J. H., Screw press	164,637
Clarke, T. M., and D. B. Chase, Die for forming spurs on toe-calks for horseshoes	164,808
Coates, A. W., Spring chair	164,811
Coburn, M. B., Wardrobe	164,640
Coleman, J. R., and S. Myers, Machine for tenoning spokes	164,718
Collins, V. N., Harvester finger bar	164,676
Connet, A. T., assignee	164,884
Connolly, P. M., Pneumatic engine	164,809
Cooper, J., Medical compound	164,674
Corbett, A., Incubator	164,810
Corwine, Q., assignee	164,768
Coulston, T. D., assignee	164,882
Cowles, I. C., Screw driver	164,638
Crandal, E. M., Can vent and stopple	164,813
Crane, Breed & Co., assignees	164,812
Crane, M. H., Coffin handle	164,812
Creamer, W. G., Side wall ventilator	164,636
Cross, J. B., assignee	164,675
Crum, C. L., Paper machine	164,814
Culham, F., Signal operating device	164,719
Cushman, H. S., Shoe knife	164,675
Dallienne, E., Producing etchings on glass	164,720
Darling, S., Inkstand	164,721
Davis, J., & Son, assignees	164,702
Davis, F. J., Foot power laster	164,722
Day, S. A., Automatic heat regulator and alarm	164,815
Dayton, E., Hose coupling	164,816
Decker, W. J., Electric toy	164,723
Denson, J. M., Turbine water wheel	164,724
Dick, H. M., Mail bag catch	164,677
Dodge, W. A., assignee	164,774
Doty, Osborn, and Merriam	164,758
Doubleday, H. H., assignee	164,888
Draper, E., Musical game apparatus	164,641
Dubose, H. K., and E. W. Charles, Jr., Bale tie	164,817
Duc, H. A., Jr., Life preserving apparatus	164,818
Duebor, J. C., Watch key	164,819
Dunckloe, H. L., Camp stove	164,725
Eagle Lock Company, assignee	164,752
Eichbaum, F. H., Process for the manufacture of illuminating gas	164,822
Eichholz, A., Bale tie	164,821
Elliott, G. N., assignee	164,741
Embossing Company, assignee	164,840
Engel, A., Dental forcep	164,820
Erikson, J., Water wheel	164,823
Esty and Putnam	164,692
Fairchild, B., Folding work table	164,824
Falce, A. B., assignee	164,735
Fanjoy, G. A., Child's swing	164,726
Fasoldt, B., Breech loading fire arm	164,642
Fennessy, E. H., Bronze dressing for leather	164,678
Field, B. F., Manufacture of paper boards, (reissue)	6,502
Fish, L. E., Apparatus for carbureting and purifying gas and air	164,825
Force, C. G., Jr., Excavating apparatus	164,643
Foster, Carroll, and Rogers	164,673
France, S. W., Feed water heater for steam boilers	164,826
Freiburg and Meyer	164,860
Galt, T. A., and G. S. Tracy, Cider mill	164,644
Gardiner, C. B., Sash fastener	164,827
Gerry, E., Bee hive, (reissue)	6,499
Glasoe, O. J., Plow	164,727
Gleason, E. P., Argand gas burner, (reissue)	6,491
Gonce, J. W., Excavator	164,829
Goodwin, W. W., Portable or hand photometer	164,728
Graves, J. L., Fishing rod	164,828
Great American Fire Extinguisher Company, assignee	164,837
Gregg, W. L., Hollow grate bar	164,729
Griggs, A., Plow	164,730
Gruver Automatic Car Coupling Company, assignee	164,698
Hadfield, J., Valve for water tanks	164,645
Haffa, P., Iron fence	164,830
Hafner, J. A., Mill spindle, (reissue)	6,492
Hahu, I., Rolling mill	164,679
Hall, J., Hay rack	164,731
Hall, N., Ironing apparatus	164,832
Hall, P. W., Postage stamp holder	164,833
Hamel, F. J., Machinery for the compression of blocks of fuel, &c	164,834
Hamilton, A., Stove (reissue)	6,500
Hammond, H., Automatic gate	164,831
Haradon, L. P., Window sash	164,836
Harbison, J. S., assignee	164,739
Hard, H., Polishing wheel	164,732
Hardman, J. H., Bale tie	164,835
Harlan, N., Book clasp	164,646
Harper, J. M., Fly trap, (reissue)	6,493
Hauser, C., Clothes drier	164,733
Haxtun, W. F., Furnace, (reissue)	6,503
Hay, A., Compound box girder	164,744
Heller, C., Boot and shoe crimper	164,680
Helm, J. H., Machine for forming links	164,682
Henrich, J., Street lamp	164,681
Hermance, R. M., Reservoir cooking stove	164,735
Heunsch and Beyer	164,710
Howes, J. L., Valve gear for steam engines	164,736
Hildreth, B. G., Step ladder	164,683
Hillegass, G., Hydrant	164,737
Hobbs and Tenney	164,782
Hodge, J., Fifth wheel	164,738
Hogben, J., Compound for sizing paper	164,684
Holcomb and Baldwin	164,792
Holloway, H C., Planing machine	164,739
Holmes, W. H., Printing in colors	164,647
Horton, W. W., assignee	164,822
Houghton, H. S., Piercing warp holders	164,740
Hovey, A. E., Fare box	164,685
Howenstine, D. J., Sausage machine	164,741
Hufeland, P., Machine for cutting fan leaves	164,838
Hufeland, P., Manufacture of fans	164,839
Hughes, A. E., Chemical fire extinguisher	164,837
Hund, B., assignee	164,832

	Patent No.
Huntting, B., assignee, (reissue)	6,500
Hyatt, I. S., J. W., and C. M., Machine for spotting dominoes	164,840
Hyatt, J. W. and I. S., Comb cutting machine	164,648
Indestructible Building Material Co., assignee...	164,850, 164,851
Ingalls, G. W., assignee	164,871
Jacobson, J., Car coupling	164,841
Jennings, G., Apparatus for disinfecting water-closets	164,842
Kettle, L. A., Paper box	164,742
Kimball, J. M., Hog trap	164,743
King and Chandler	164,806
Knaust, W., Steam fire engine	164,843
Koeberle, J. M., Ratchet drill	164,686
Koehl, W., Cotton gin	164,844
Krick, G., assignee	164,872
Krausch, T., Refrigerator building	164,744
Ladd, G. W., Thill coupling	164,845
Latham, O. B., Nut lock	164,846
Lawrence, J. S., assignee	164,803
Lehman, G. W., assignee	164,697
Levy, H., Machine for bending horseshoes	164,649
Lewis, A. N., Envelope	164,847
Lewis, M., Stamp canceler	164,687
Lindsley, I., assignee	164,716
Locke, J. R., Molding machine	164,650
Loeser, L., Shawl strap handle	164,848
Lumley and Stevens	164 663
Lundy, W., Lifting gate	164,849
Lyon, A. T., Composition for building purposes	164,850
Lyon, A. T., Paint compound	164,851
Males, S., Cider mill, (reissue)	6,504
Mansfield, C. W., Car truck	164,651
Marcus, W. N., assignee	164,697
Marks, L., Door securer	164,688
Marks, W. D., Governor	164,745
Marsden and Blamires	164,796
Marsland, E., Liquid meter	164,852
Marthens, W. F., Nut lock	164,747
Martin, J., assignee	164,890
Martin, J. T., Ice breaking attachment for vessels	164,746
Martin, O., Earth boring apparatus	164,689
Mason, J. L., Smoke stack	164,652
Mason, J. L., and A. and J. M. Sinclair, Refrigerator	164,653
May and Withey, assignees	164,667
McBurney, W. H., Hay, cotton, and wool press	164,748
McDaniel, D., Roofing material	164,749
McDaniel, F., Fountain brush	164 853
McDowell, P. L., Machine for cutting fats for rendering	164,854
McElroy, J. B., Belt fastener	164,855
McGregor and Wescott	164,787
McIntyre, J. H., assignee	164,872
McMillan, W. H., Hydrant	164,856
McOmber, S. W., Fruit can	164,857
Mehling, G. F., Grafting wood	164,858
Merriam, Doty, and Osborn	164,758
Merrill, F. M., Governor for steam engines	164,859
Merriman, A. H., Clutch for power presses	164,690
Meyer, P., Sash fastener	164,750
Meyer, W., and H. Freiburg, Boot and shoe	164,860
Michalet, F., and P. Bourget, Embroidering machine	164,751
Minton, S. F., Speed measurer	164,861
Misso, R., and B. J. Warner, Car coupling	164,753
Mix, F. W., Bag lock	164,752
Moehler, A., Stringing pianos	164,862
Moss, J. T. and G. J., Flooring clamp	164,754
Moulton, N. W., Game table	164,654
Murdock, J. G., Hydrant	164,864
Murphy, J. W., Device for increasing traction of locomotive tires	164,863
Myers and Colman	164,718
Nagler, H. M., assignee	164,805
Needham, E. P., & Son, assignees	164,869

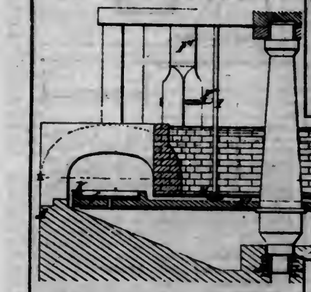
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED JUNE 22, 1875.

164,631. PUMPS. Samuel Arndt and Wallace S. Ayres, Easton, Pa. [Filed May 20, 1873.]

Brief.—Provides a small air-passage, with or without a valve, in the pipe or chamber, on the receiving side of the inlet-valve, by which a small quantity of air is admitted, and minutely subdivided, rendering the water in a degree elastic. The valve, when employed, is secured as to its movement by a slot and pin.



1. The combination, with the supply-pipe or chamber of feed-water and force-pumps, of an air-passage or an air-valve on the receiving side of the induction-valve, substantially as and for the purposes set forth.

2. The combination, with a tap-plug, of an air-passage or an air-valve, as K, Fig. 3, substantially as and for the purposes set forth.

3. The combination, with a tap-plug and the air-valve K, of the slot S and pin P, substantially as and for the purposes set forth.

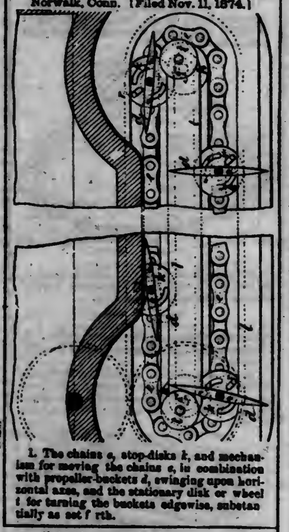
164,632. GLASS-ANNEALING OVENS. Thos. B. Atterbury, Pittsburg, Pa., assignor of one-half his right to James S. Atterbury, same place. [Filed May 24, 1875.]

1. The circular oven, provided with a fire-chamber and passages for introducing and withdrawing the glass-ware, and a tunnel within its inner wall, one side of the top of the tunnel resting on a suspended plate, in combination with a pan fastened to a central revolving shaft, substantially as and for the purposes described.

2. The oven, with the openings for introducing and withdrawing the glass-ware, in combination with the transverse partition Q and the fire-chamber C, substantially as described.

3. The partition, with a space below its edge and a gate hung at its bottom, in combination with the oven, having the form of a circular tunnel, whereby the fire is diffused over the glass, substantially as described.

4. The revolving pan K, having a lining of clay to hasten the heat at the bottom of the pan, in the process of annealing glass, substantially as described.



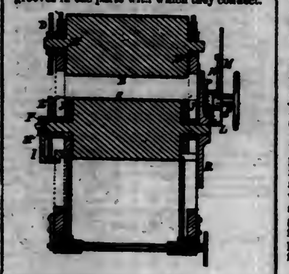
5. The fire-chamber, located in the specified relation to the receiving-passage B', for the purpose of heating the clay-pan preparatory to placing the glass upon the pan, substantially as described.

6. The hinged gate E, for preventing the air passing upon the heated glass in the direction of the motion of the pan, substantially as described.

7. The chimney F', in combination with the chimney F and the oven and fire-chamber, substantially as described.

8. The revolving shaft with its pan, substantially as and for the purposes described.

164,633. CHAIN-PROPELLERS. E. B. Austin, Norwalk, Conn. [Filed Nov. 11, 1874.]

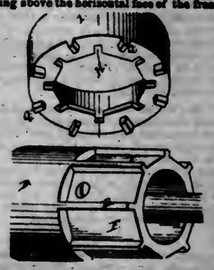


1. The chains a, stop-disks b, and mechanism for moving the chains a, in combination with propeller-buckets d, swinging upon horizontal axes, and the stationary disk or wheel f for turning the buckets edgewise, substantially as set forth.

2. The disk b, made to turn upon the same axes as the buckets, and provided with stops for such buckets, in combination with the chain c, secondary chain f, and arms r, for turning said stop-disks b, substantially as set forth.

164,634. PLANING-MACHINES. R. Benjamin, Chicago, Ill., assignor of one-half his right to Samuel W. Pease, same place. [Filed Apr. 19, 1875.]

Brief.—The wear of the joints of the expansion-gear, except in the adjustment of the rollers, is obviated by means of connecting-bars provided with annular projections on their inner faces, which fit in corresponding grooves in the parts with which they connect.



1. The bar F, provided with annular bearing H H, in combination with the bar f, bridge I, gearing D Z X E, and rollers B C, as set forth.

2. The lever M I, carrying the pinions P S, in combination with the bridge I, carriage J, spur-wheel E, rollers B C, and rack N, as and for the purpose specified.

164,635. SEEDING-MACHINES. J. R. Rushnell, Fond du Lac, Wis. [Filed May 13, 1875.]

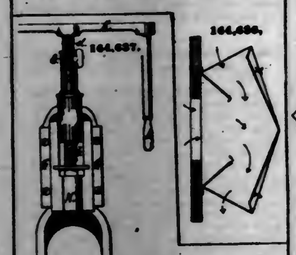
Brief.—The feeding-cylinder is made of two different diameters, the larger one being provided with vertical radial flanges upon its grain face, and the smaller portion with horizontal flanges, upon a portion of its exterior surface, with recesses between said flanges. The lower portion of the seed-cup is provided with a shoulder, that converges inwardly and laterally from its center to the point where the seed is discharged, and also having its concave interior converging from the upper inner edge downwardly to its longitudinal center. The semicircular dial-plate is provided with a finger secured to the frame parallel with the driving-shaft, and has its straight edge projecting above the horizontal face of the frame.

1. In a seeding-machine, a combined horizontal and vertical force-feed, consisting of a cylinder of two different diameters, the larger portion being provided with vertical radial flanges or projections upon its grain-face, and the smaller portion being provided, with horizontal flanges upon a portion of its exterior surface, with recesses between said flanges, substantially as and for the purpose set forth.

2. The cylinder D, provided with the horizontal flanges E and recesses F, and adapted to be adjusted longitudinally with the driving-shaft C, in combination with the annular rim or hollow cylinder I, having the radial flanges or projections Q and recesses H, substantially as and for the purposes set forth.

3. The lower portion of the seed cup or case K, having the shoulder R, which converges inwardly and laterally from its center or point S to the point where the seed is discharged, and also having its concave interior surface converging from the upper inner edge downwardly to its longitudinal center, or in line with the point S, in combination with the cylinder D and hollow cylinder I, substantially as and for the purposes set forth.

4. The dial-plate b, secured to the frame A parallel with the driving-shaft C, and having its upper edge adapted to form a guide for the adjusting-arm U, in combination with the adjusting-arm U, adjustably secured to the frame A and connected to the driving-shaft C, substantially as and for the purposes set forth.



5. The semicircular dial-plate b, provided with the finger a and secured to the frame A parallel with the driving-shaft C, and having its straight edge projecting above the horizontal face of that portion of the frame to which it is attached, in combination with the adjusting-arm U, provided with the slot X, groove W, yoke Y, and rib Z, secured to the frame A, connected to the driving-shaft C, and provided with the lever f, substantially as and for the purposes set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

164,636. SIDE-WALL VENTILATORS. Wm. G. Cressmer, Brooklyn, N. Y. [Filed Nov. 17, 1874.]

Brief.—This ventilator is stationary in all its parts, and by the movement of the car or boat to which it is attached, and the passage of a current of air through the apertures in either direction, or when the car is stationary, and the wind blowing at right angles with the side of the car or boat, shall produce an outward current from the inside of the car or boat.

The two side deflectors, with the covering-top and bottom, in connection with outer deflecting covering, substantially as shown.

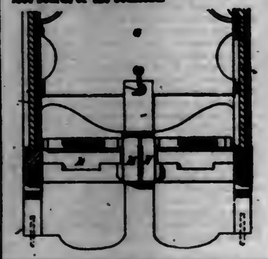
164,637. SCREW-PRESSES. Jos. H. Clapp, Providence, R. I. [Filed May 6, 1875.]

Brief.—The screw of a fly-press is provided at its upper end with a fine screw-thread than that which operates the die, upon which is placed an open nut, threaded to correspond, and clamped at any point by a set-screw, said nut acting as a stop.

1. The combination of the screw-spindle, having a screw-thread of the usual pitch for screw die-presses, and above the same a screw, either right or left handed, having less pitch, with the concentric sleeve-stop O and the clamp E F, as and for the purposes set forth.

2. In combination with the screw-spindle b, the nut-barrel A, the stop C, the fine screw-thread d, and cross-head F, the adjustable slides g g, substantially as described.

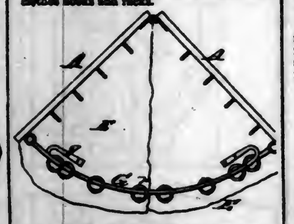
164,638. SCREW-DRIVERS. I. C. Cowles, Syracuse, N. Y. [Filed Oct. 21, 1874.]



Brief.—The blade of a screw-driver is provided with two curved cutting-edges for tipping screws and cutting thread.

The screw-driver herein described, consisting of a blade provided upon each of its sides with the cutting-edges A A, when constructed to operate as shown, and for the purposes set forth.

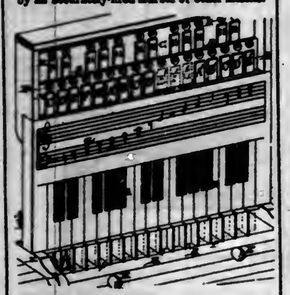
164,639. COMBINED CRADLES AND BEDSTEADS. Curtis W. Chamberlain, Denver, Colo. [Filed May 14, 1875.]



Brief.—By the removal of the end pieces and rockers, the end rails can be extended to form the side rails of the bedstead, the side pieces of the cradle becoming the head and foot boards of the bedstead.

A combined cradle and bedstead, composed of the side pieces A A, end rails H H, end pieces G G, and anchor-shaped rockers I I, constructed to permit the removal of the end pieces G G and anchor-shaped rockers I I, and the extension of the hinged end rails H H, substantially as and for the purposes set forth.

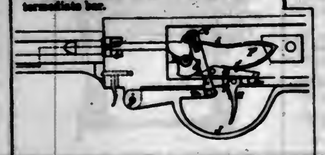
164,640. WARDROBES. Melville B. Coburn, Bull's Dale, Pa. [Filed Oct. 3, 1874.]



Brief.—Two hinged arms provided with pivoted detachable curtain-bows, having hooked or looped ends. Said arms are provided with clothes hooks and racks.

A wardrobe consisting of hinged arms A A, pivoted bows G G, and curtains E, combined substantially as described.

164,641. MUSICAL-GAME APPARATUS. E. Deagre, London, Canada. [Filed Dec. 22, 1874.]

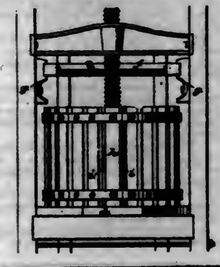


Brief.—A series of spring-sliders answering to the keys of a piano are arranged in a vertical frame, and each slider may be disengaged by an accurately-fired marble or other missile.

The apparatus described and shown, consisting of the slides B B, with the letters of the musical scale placed thereon, and the springs I I attached thereto, the tuned bells D D, or their equivalents, the balls E E, the guards F F, the cross-bars H H, and the supports L L, in combination with a musical staff and key-board, as shown, when constructed and arranged substantially as described, and for the purpose set forth.

164,642. BREECH-LOADING FIRE-ARMS. Bernard Fraenkl, Albany, N. Y. [Filed Dec. 4, 1874.]

Brief.—The firing-pin is provided at its front end with an enlarged head, which works in a recess in the frame of the breech. The force of the exploding cap upon this head forces the firing-pin back against the hammer, and cocks the same. The gun may also be cocked by throwing down the guard-lever, which is connected to the hammer by an intermediate bar.



1. The combination, with the car A and the movable platform B, of a portable trestle, whereby the device is adapted to the carrying forward of an excavation, such as sewers, cuts, laying of pipes, &c., substantially as and for the purpose described.

2. The combination, with the movable platform B' and the standards D, of the slits E, extending across the excavation at the bottom of each standard, and uniting the base of the said standards, whereby the gage of the tracks C' is maintained, substantially as and for the purpose described.

3. The combination, with the movable platform B' and the standards D, of the slits D' and braces F, substantially as and for the purpose described

164,644. CHEESE-MILLS. Thos. A. Galt and George S. Tracy, Sterling, Ill. [Filed Apr. 20, 1875.]

Brief.—The follower and screw-nut detachably connected by buttons on the former overlapping a flange on the latter. A strong casting on each front post receives in a recess the side beams, and is curved inwardly to hold down in its place the receiver.

1. The clamps l l, constructed substantially as and for the purpose described.

2. The brackets g g, substantially as and for the purpose specified.

3. The receiver h, follower i, clamps l l, brackets g g in combination with the press-screw, substantially as and for the purpose mentioned.

164,645. VALVES FOR WATER-TANKS. Jos. Hadfield, New York, N. Y. [Filed Apr. 9, 1875.]

Brief.—When the water in the tank falls below the desired point, the float descends, carrying with it the valve on the end of the rod attached to it. Water from the reservoir raises the leather disk, and discharges through the orifices beneath it. When the water reaches the proper height in the tank, the small valve is closed, water passes through the small hole in the disk, fills the space above it, presses the same upon the orifices beneath it, and cuts off the supply of water.

The combination, with the float F, valve-rod f, and valve h, of the upper-piece C, having waste-outlets c, and the leather disk D, with central opening e, and plate A, having openings a, and supply-pipe B, substantially as and for the purpose set forth.

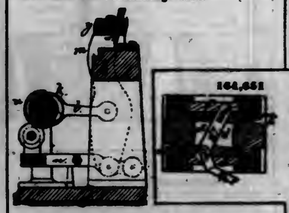
164,646. BOOK-CLASPS. Newton Marion, Washington, D. C. [Filed Nov. 20, 1874.]

Brief.—The hasp is made in two sections, each screw-threaded, the upper one being adjustable within the lower one, and connecting with a lock secured to one of the covers, while the lower section is pivoted to a plate connected to the opposite cover. When the book is unlocked the hasp can be folded down parallel with the cover, so as to not obstruct the manipulation of the leaves.

1. In a book-locking clasp, the combination of the extensible stem D with its screw-threaded receiving-sleeve A, whereby the fastening-stem is inclosed, braced, and made adjustable within said receiving-sleeve to suit books of different thicknesses, constructed and arranged substantially as described, for the purpose specified.

2. In a book-locking clasp, the hasp A, pivoted to its attaching-plate, whereby it may be folded down parallel with the book-cover, so as not to obstruct the manipulation of the leaves, substantially as described.

3. The combination, in a book-locking clasp, of the extensible stem D and pivoted receiving-sleeve A with the lock B, all constructed and arranged substantially as described, for the purpose specified.



164,647. PROCESSES FOR PRINTING IN COLORS. Winslow H. Holmes, Hastings, Mich. [Filed Jan. 20, 1874.]

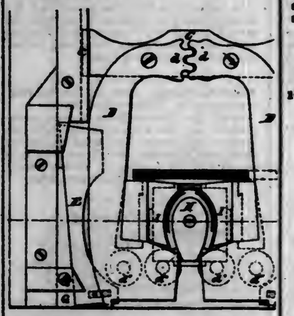
Brief.—For printing two or more colors from one plate or form. Impression in first color is taken from the whole form upon the surface of sheets secured to the platen, from which are then cut out such parts of the design as are to be printed in another color; the sheets or cards in printing them receiving no impression over the cut-out portions of the platen. For the second color, from new platen-sheets the parts printed in the first color are cut out.

The within-described process of printing in two or more colors from one plate, block, or form by cutting away certain parts of the plate-sheets, so as to prevent any impression from being taken of the corresponding parts of the plate, block, or form, substantially as herein set forth.

164,648. COMB-CUTTING MACHINES. John W. Hyatt and Isaiah Smith Hyatt, Newark, N. J. [Filed Nov. 11, 1874.]

Brief.—The teeth of the comb are cut by tools held in an oscillating frame.

1. In a comb-cutting machine, a series of engraving-tools contained within a head, in combination with a rest for the comb and mechanism for giving motion to the tools and head, substantially as set forth.

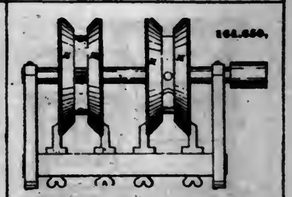


2. The combination of the engraving tools or cutters w, head y, frames m e, screw sectional cone u, and eccentrics b, connecting the vibrating frame with the main shaft, substantially as set forth.

3. The arrangement in a comb-cutting machine of two sets of engraving-tools in reverse positions, in combination with a rest for holding two combs in similar positions, substantially as and for the purposes set forth.

4. In a comb-cutting machine a series of engraving-tools in a head that swings upon centers located at the opposite side of the comb to the cutters, substantially as set forth.

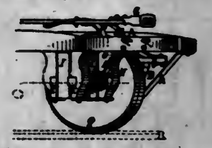
164,649. MACHINES FOR BENDING HORSE-SHOES. Harrison Levy, Millesburg, Pa. [Filed Feb. 18, 1875.]



Brief.—Pivoted to a reciprocating bar are two arms, toothed at their lower ends, which carry the rollers that bend the bar around the former. Removable dies for clamping and holding the bent shoe around the former, while it is being swaged and punched, are also carried by said arms.

In a horseshoe-machine, the combination, as herein described and shown, of the cross-bar C, pivoted arms D D, provided with teeth at d, and carrying rollers d' d'', removable dies I I, die H, and adjustable guides E E, said parts being constructed for joint operation, as set forth.

164,650. MOLDING-MACHINES. J. B. Locke, Amesbury, Mass. [Filed May 7, 1872.]

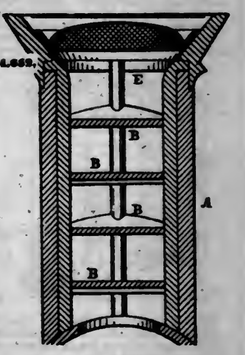


Brief.—Two adjustable rings surround the cutter-head upon its opposite ends, so that a greater or less width of its cutting-edge may be exposed.

The circular adjustable rests M M, operated in slot O by means of thumb-screws N N, substantially as described.

164,651. CAR-TRUCKS. C. W. Mansfield, Braintree, Mass. [Filed May 26, 1875.]

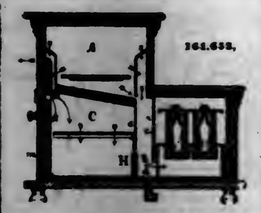
Brief.—The draw-bar is connected with tapering sliding pieces, and by pulling them forces the bearing-blocks sidewise, so as to turn the inner ends of the divided axle, and accommodate the wheel to the curvature of the track.



1. In combination with the wheel Q, mounted upon an independent axle, the swiveling box F, sliding boxes I I, key-bars K K', lever d, arms O P, and draw-bar G, combined to operate substantially as set forth.

2. The auxiliary lever R, in combination with the bar G and swiveling box F, substantially as set forth and specified.

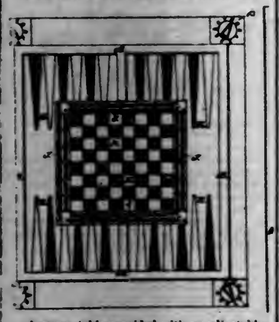
164,652. SMOKE-STACKS. John L. Mason, New Brunswick, N. J. [Filed Oct. 31, 1874.]



1. The combination, with the smoke-stack A of a locomotive engine, of the series of shelves B, projecting inwardly and overhanging one another and inclined toward the bottom of the stack, substantially as and for the purpose set forth.

2. The shelves B and uprights E, connected to each other and made removable from the stack A, substantially as and for the purpose set forth.

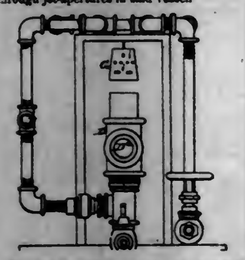
164,653. REFRIGERATORS. John L. Mason, New Brunswick, and Andw. Sinclair and J. M. Sinclair, Camden, assignors to John L. Mason, New Brunswick, N. J. [Filed July 27, 1874.]



Brief.—Both food-chambers receive cool air from a common ice-box, and may be cleaned by use of the side door and a central bottom passage between them.

164,653.

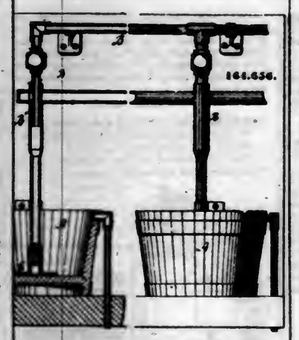
The ice-chamber A, the two receiving-chambers C D, and the partition c, with a space, d, below it, in combination with the partition e, having a door, H, at its bottom, in line with the door m of the chamber, and the space d below the partition e, substantially as and for the purpose set forth.



164,654. GAME-TABLES. N. W. Moulton, New York, N. Y. [Filed Apr. 27, 1875.]

A game-table provided with an adjustable border, A, backgammon-board E, checker-board K, counters G, and cribbage-counters J, the whole constructed and arranged to operate substantially as and for the purpose specified.

164,655. HYDROCARBON-BURNERS. John W. Neeley, Petrolia, Pa. [Filed July 26, 1874.]

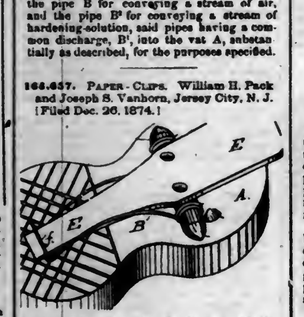


Brief.—A perforated bell-shaped inverted vessel is suspended over superheated steam, air, and oil nozzle, whereby the gas emanating from the nozzles is disseminated in the furnace through jet-apertures in said vessel.

The bell-shaped generator and burner G, provided with apertures f, in combination with the oil, steam, and air pipes, as described, and for the purposes set forth.

164,656. APPARATUS FOR TEMPERING FILES. Wm. T. Nicholson, Providence, R. I., assignor to the Nicholson File Company, same place. [Filed May 17, 1875.]

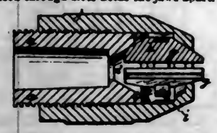
Brief.—Injects cool air into the incoming stream of tempering material, and through a distributer (which may be a perforated bulb) at the bottom of the vat.



164,656.

1. The combination of an air-pipe, B, whether with or without a distributer, C, and a vat, A, containing a hardening-solution, whereby the particles of the solution are kept in constant agitation to produce uniformity of temperature and quality, substantially as described.

2. The combination of a vat, A, for containing a bath for hardening heated steel articles, the pipe B for conveying a stream of air, and the pipe B^1 for conveying a stream of hardening-solution, said pipes having a common discharge, B^1, into the vat A, substantially as described, for the purposes specified.

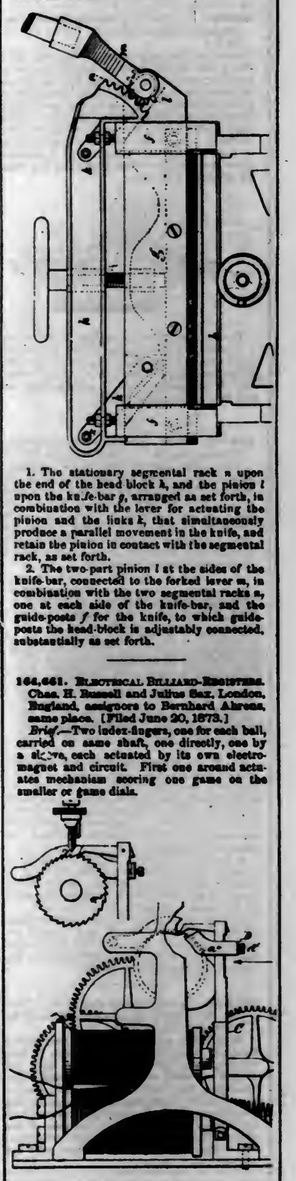


164,657. PAPER-CLIPS. William H. Pack and Joseph S. Vanhorn, Jersey City, N. J. [Filed Dec. 26, 1874.]

In combination with the base A and the doubled spring B, fastened to such base, the lever E, having its forward end projecting beneath the double *f* of the spring, and its rear end serving as its lifting-handle.

164,658. CHUCKS. Chas. H. Powers, Philadelphia, Pa. [Filed Jan. 4, 1875.]

Brief.—The jaws are forced forward by the plunger, and held from revolving with it by grooves in the outer shell, being guided at their inner ends by a slotted piece, which is swiveled in the plunger. A circular spring passed through slots holds the jaws apart.



The plunger a, provided with a seat, b, and a conical recess, d, the back-guide e, the jaws f, spring i, and the nut or sleeve j, provided with radial slots s, in combination, as and for the purpose set forth.

164,659. PROCESSES OF PREPARING PICKLES. Isaac Beckhow and William H. Stafford, Brooklyn, N. Y. [Filed May 17, 1875.]

The process of preparing pickles by first salting and washing them, then soaking them in alum solution, and finally coloring by saccharine matter in vinegar, substantially as described.

164,660. PAPER-CUTTING MACHINES. Wm. I. Reid, Palmyra, N. Y., assignor to W. B. Smith, Omaha, Nebr. [Filed Oct. 8, 1874.]

Brief.—The knife is operated through the medium of a lever and twin pinions having the same axis, and attached to one end of the knife-bar. The pinions mesh into a twin segmental rack attached to or forming a part of the head-block.

1. The stationary segmental rack n upon the end of the head-block h, and the pinion l upon the knife-bar g, arranged as set forth, in combination with the lever for actuating the pinion and the links k, that simultaneously produce a parallel movement in the knife, and retain the pinion in contact with the segmental rack, as set forth.

2. The two-part pinion l at the sides of the knife-bar, connected to the forked lever m, in combination with the two segmental racks n, one at each side of the knife-bar, and the guide-posts f for the knife, to which guide-posts the head-block is adjustably connected, substantially as set forth.

164,661. ELECTRICAL BILLIARD-REGISTERS. Chas. H. Russell and Julius Sax, London, England, assignors to Bernhard Ahrens, same place. [Filed June 20, 1873.]

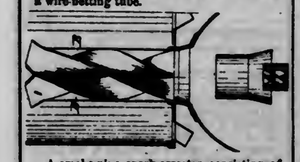
Brief.—Two index-fingers, one for each ball, carried on same shaft, one directly, one by a sleeve, each actuated by its own electro-magnet and circuit. First one around actuates mechanism scoring one game on the smaller or game dials.

1. The combination of the armature-levers C G, the intermediate gearing c^1 c^2, and the index-hands, substantially as described.

2. The combination of the armature-levers, the intermediate gearing, and the index-hands, with the game-recording mechanism, consisting, essentially, of the loose pulley M with its disks and stops, the intermediate gearing, and the recording dial and index, as described.

3. The combination of the pusher-lever C, and the stop d^3 for limiting its backward movement, as described.

4. The combination of the pusher-lever C, and the stop d^3 for limiting its forward movement, substantially as described.

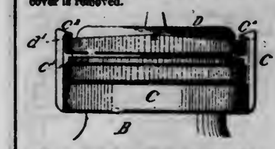


5. The combination of the pusher-lever C, and the stops d^3 d^4 for limiting its forward and backward movement.

6. The combination of the index-hands c^1 c^2, and the gearing c^1 c^2, having the weight E, as described.

7. The combination of the studs N, the spring-stops n^1, the loose pinion M, and the connecting-gearing, as described.

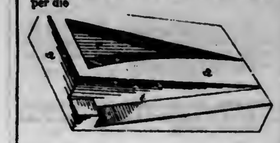
164,662. SPARK-ARRESTERS. Wm. Stamp, Susquehanna Depot, Pa. [Filed Nov. 21, 1874.]



Brief.—A spirally-partitioned pipe is placed in the uptake of a boiler-furnace, whereby the sparks and cinders are given a rotary motion, and are trapped at the sides of the stack by a wire-netting tube.

A smoke-pipe spark-arrester, consisting of the spirally-channeled inside pipe B, outside pipe or case C, and outlet-tube D, combined as and for the purpose set forth.

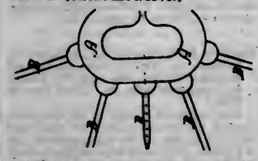
164,663. FRUIT-JARS. David B. Stevens and Richard F. Lumley, Newark, Ohio. [Filed Mar. 12, 1875.]



Brief.—A spring-clamp or spanner, with upwardly-projecting lugs, is attached to the neck of the jar below the rim, so as to turn about the neck, and remain in place when the cover is removed.

The combination of lid D, provided with inclined portion *d*, slots d^1, and handle d^2, and clamp C^2 C^3, securely attached to the neck B of the jar A, and a permanent fixture thereof, as and for the purposes described.

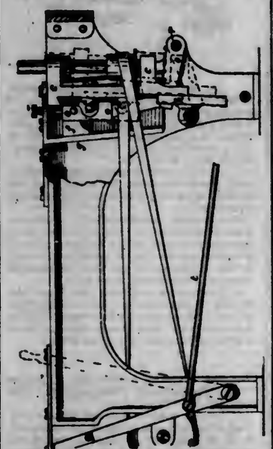
164,664. DIES FOR MAKING LAND-SIDES FOR PLOWS. Charles H. Thompson, Moline, Ill. [Filed June 3, 1874.]



Brief.—The lower die is formed with a wedge-shaped recess, which gradually deepens until near the sharp end, where it suddenly deepens, so as to form the point of the land-side. The bottom of the recess is made with a triangular groove, in which is formed the ridge upon the upper inner edge of the land-side. In the side of the said die is another recess, corresponding to the shape of the land-side, in which the share and land-side are welded together by the action of the upper die

1. Dies for forming land-sides, constructed with the herein-described recess for making the land-side and the recess and raised ridge upon the die and die-head, respectively, for welding the land-side formed in the first-named recess to the share, substantially as shown and set forth.

2. The die *a*, having the recess *c* and triangular groove *g*, extending along the curved side of said recess *c* for forming a raised flange on the side of the land-side, substantially as herein shown and specified.

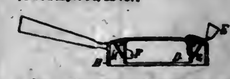


164,665. INSTRUMENTS TO PREVENT CALVES FROM SUCKING. Emilie Tilton, Atlantic, Iowa. [Filed June 1, 1875.]

A clasp or instrument, A, composed of an elastic material, and having pointed projections B B elastically embedded therein, substantially as and for the purpose herein specified.

164,666. PLANING-MACHINES. Charles R. Tompkins, Rochester, N. Y. [Filed Apr. 13, 1875.]

Brief.—The matcher heads are made vertically adjustable, for the purpose of changing the machine from a matcher to a surfacing-machine, and vice versa, without altering the position of the matcher-heads with reference to the width of the material being operated upon, stopping the machine or removing the belts.



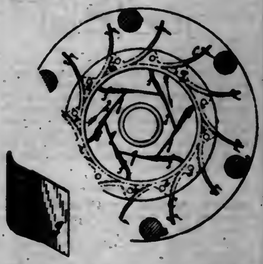
1. The bar *e*, provided with the projecting points *e*, in combination with the adjusting-screws *w*, for regulating the vertical movement of the matcher-heads, substantially as and for the purposes shown and described.

2. The oblique slides *g* and pivoted blocks *f*, in combination with the bar *e*, oscillating slides *h*, and spindle carriers *e*, substantially as shown and described.

3. The combination and arrangement of the yoke *n*, screw *j*, gears *k k*, shaft *l*, and pivotal box *m*, as and for the purpose specified.

4. The combination, with the bar *e*, carrying the matching cutter-heads of a planing and matching machine, of the rock-shaft *r*, provided with arms *o o*, the arm *u*, rod *t*, and lever *s*, substantially as shown and described, for the purpose set forth.

164,667. CAKE-CUTTERS. James H. Winslow, Lynn, Mass., assignor of two-thirds his right to May & Withey, same place. [Filed Apr. 14, 1875.]



1. In a cake-cutter, substantially such as described, the knife D, provided with the handle E, arranged to operate substantially as and for the purpose specified.

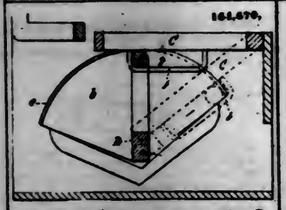
2. In a cake-cutter, substantially such as described, the pin F, in combination with the knife D, and handle E, substantially as and for the purpose set forth.

3. In a cake-cutter, substantially such as described, the knives B D and presser C, combined to operate substantially as and for the purpose stated.

164,668. TURBINE WATER-WHEELS. Geo. Arrowsmith, Buffalo, N. Y. [Filed Apr. 20, 1875.]

Brief.—Each bucket is provided with an auxiliary spring, which projects forward, and when the latter are in position in the wheel they are converted into spring-buckets, which, projecting forward from the main buckets, meet or almost meet the back of the adjacent buckets, whereby a back action of the water is secured, and when the pressure of water is too great, the spring auxiliary buckets will open and permit the passage of the surplus water, and when the pressure which effects this has been removed the auxiliary buckets resume their position.

The buckets *f*, provided with the springs *g*, projecting forwardly from and beyond the ends of the buckets, substantially as described, whereby, when the buckets are in position in the wheel, the said springs will form auxiliary buckets, and, projecting forward, will meet, or almost meet, the back of the adjacent bucket, for the object herein stated.

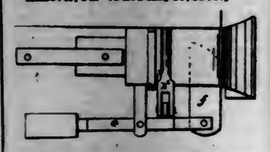


164,669. LAMPS. James S. Atterbury and Thos. S. Atterbury, Pittsburg, Pa. [Filed Apr. 19, 1875.]

The article of glassware having a pressed glass foot or standard terminated with a rounded convex form at its upper end, and a glass bowl blown upon said rounded end of the foot, the article thus produced being solely of glass, and the requisite tight joint formed by a union of the glass, as set forth.

164,670. DROP-GRATES FOR COOKING-RANGES. John B. Baum, Freeland, Pa. [Filed Apr. 8, 1875.]

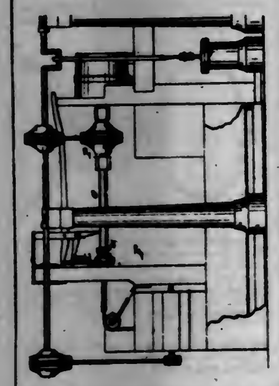
164,670.



1. The combination of the crank-bar D, (shown in Figs. 2, 3, 4, and 5,) having elbows or stops *b b* and pins *d d*, with the grate C, substantially as and for the purpose set forth.

2. The side plates B B, having recesses *e e*, in combination with the elbows *b b* of the crank-bar D, whereby the elbows are cut of the way, and the jamming of coal or cinders between them and the side plates is avoided, substantially as set forth.

3. The yoke *f*, forming slots or openings *g*, in combination with the crank-bar D, substantially in the manner and for the purpose set forth.

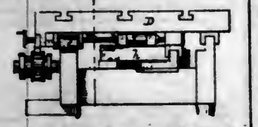


164,671. CAR-COUPLINGS. Chas. Bowman, Hanover, Pa. [Filed May 10, 1875.]

The herein-described self-coupling and self-uncoupling device, constructed with a lever-bar, *c*, carrying at one end the key *f*, and at the other a weight, arranged to rest upon the truck-frame, as described, whereby the said lever may be operated for the purpose of uncoupling cars either by arms *h h'* or by an upward tilt of the truck-frame; substantially as shown and specified.

164,672. APPARATUS FOR PURIFYING PARAFFINE, &c. Francis X. Byerley, Cleveland, Ohio. [Filed Sept. 14, 1874.]

Brief.—Each crystallizing-cylinder has a removable solid bottom, below which is a strainer. After crystallization the solid bottom is removed by a cord passing out at the top of the cylinder, and the liquid is allowed to drain off. The shaft, bearing the knife for cutting crystallized paraffine, has a screw-thread where it passes through a divided nut, which causes the shaft to advance as it turns. The divided nut is automatically opened, and allows the shaft to be drawn back by a cord and weight.



1. In an apparatus for crystallizing and purifying paraffine and the like, the crystallizing-tank F, provided with a perforated bottom, in combination with straining-cylinders L, provided with removable bottoms, substantially as and for the purpose described.

2. The within-described method of purifying and crystallizing paraffine and the like, consisting in crystallizing the substance in closed cylinders by heat or cold, and straining off the waste, then purifying such crystallized substance in a receiver having a filter-bottom, with the proper solvents, substantially as specified.

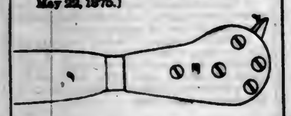
3. The shaft G, knife H, divided nut *k*, tongs I, jointed lever *l*, spring *t*, worm-screw stop *m*, and right angle lever *n*, weight and cord O, and pulley P, all combined, and operating as and for the purpose set forth.

164,673. MACHINES FOR PUNCHING BOILER-PLATES. De Witt C. Carroll and David Rogers, Pittsburg, and Alex. W. Foster, Jr., Temperanceville, Pa. [Filed Apr. 16, 1875.]

Brief.—Table, supported by the side pieces through the medium of swiveled blocks and rolls, has a rack on one edge, meshing with box-pinion, which latter is spined to the shaft, and is free to slide thereon as it may be impelled by the rack when the bed is moving in a circle. Table is guided by the parallel way, and an adjustable way placed oblique thereto, and the point at which the table is arrested for the descent of the punch is indicated by a rack-bar oblique to the ways, and a long pawl that co-operates therewith; and in order that the rack-bar and pawl may be made to indicate different orders of intervals between the holes to be punched, the pawl is made long and capable of adjustment to different angles to the rack-bar, it being hinged to the end of an arm, which at the other end is swiveled to an adjusting-screw.

The feed-table D and the driving mechanism for imparting to the table a forward motion on the main guide-rail, in combination with a guide attached to said table, and playing on an inclined guide-rail for giving the table a swinging motion in its forward travel, substantially as set forth.

2. A pinion, moving laterally on its driving-shaft, in combination with a toothed rack and horizontally-swinging feed-table, substantially as set forth.



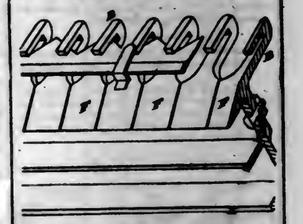
3. A toothed rack-bar, fixedly secured in place, in combination with a pivoted pawl, whereby the angle of the engaging edge of the pawl with the line of the rack-teeth may, by the adjustment of the pawl, be varied at pleasure, substantially as set forth.

4. The vertically-swinging pawl A, attached to, and in combination with, a horizontally-swinging block, *g*, and with suitable devices for setting the latter at any desired point of adjustment, substantially as set forth.

164,674. MEDICAL COMPOUNDS. J. Cooper, San Francisco, Cal. [Filed Sept. 30, 1874.]

A medical compound consisting of an extract from the leaves of the yerba santa, procured by boiling them in diluted alcohol, and an alcoholic extract from the buds or flowers of the *Grindelia robusta*, mixed in equal proportions, substantially as and for the purpose set forth.

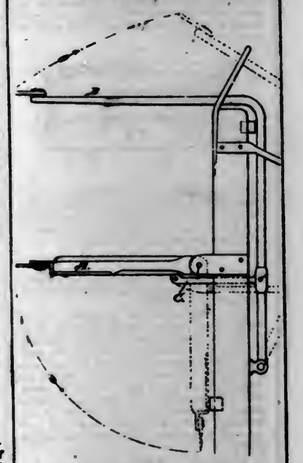
164,675. SHIPS-KNEES. Henry S. Cushman, Milford, Mass., assignor to himself and James B. Cross, same place. [Filed May 22, 1875.]



1. A shoe-knife composed of the handle D, and plate-jaws B C, and a blade, A, secured between such jaws, near their outer ends, by screws, as described, and arranged obliquely with reference to the jaws, all essentially as represented.

2. The plate-jaws B C, rounded or molded to serve as a cutting guide or gage, and provided with a handle, D, as set forth, in combination with the blade A, arranged obliquely between such jaws, and secured to them by clamp-screws, all as specified.

164,676. FINGER-BARS FOR HARVESTERS. Victor N. Collins, Nordhoff, Cal. [Filed Apr. 27, 1875.]

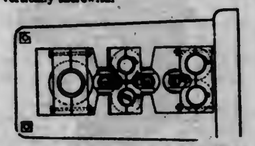


Brief.—Improvement in construction on Patent No. 146,804; separately detachable guard-fingers having a rearward extension projecting beyond the bar, to form the wall of the guide for the carrier-belt.

The guard or finger B, having formed with it the projection F, which serves to secure the position of the fingers on the bar, and acts as a wall for the carrier-guide, and the projecting lugs C, by which it is secured to the finger-bar, substantially as herein described.

164,677. MAIL-BAG CATCHER. Herman M. Dick, Shelby, Ohio. [Filed July 7, 1874.]

Brief.—Removal of bag destroys balance of parts, when lower arm drops down in front and upper arm slides over behind. Thus the apparatus is removed by its own gravity out of reach of passing trains.



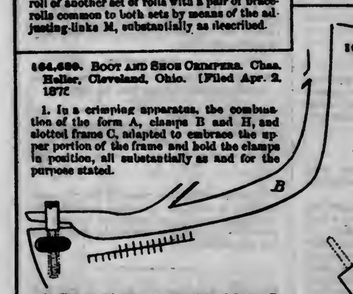
The mail-bag discharger, composed of the hinged arms A B and the toggle-arm C, the whole constructed to operate in the manner substantially as described.

164,678. BROOM-DRESSINGS FOR LEATHER. Edwd. H. Fennessy, Newton, Mass. [Filed May 21, 1875.]

A bronze leather-dressing, consisting of one or more aniline colors and gelatine or other suitable gum compounded with acid, substantially as described.

164,679. ROLLING-MILLS. Ignatius Hahn, Pittsburg, Pa. [Filed Apr. 6, 1875.]

Brief.—Two work-rolls connected by an adjustable link cause one roll to properly impinge against the brace-rolls, and be adjusted vertically therewith.



1. The combination, with the two brace-rolls, of a work-roll suspended by adjusting-links, whereby the work-roll will at all times align itself properly, and be held in contact with the brace-rolls, substantially as specified.

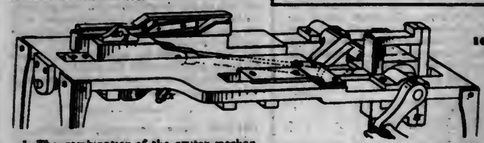
2. The combination of the upper working-roll of one set of rolls and the lower working-roll of another set of rolls with a pair of brace-rolls common to both sets by means of the adjusting-links M, substantially as described.

164,680. BOOT AND SHOE CRIMPERS. Chas. Heller, Cleveland, Ohio. [Filed Apr. 2, 1875.]

1. In a crimping apparatus, the combination of the form A, clamps B and H, and slotted frame C, adapted to embrace the upper portion of the frame and hold the clamps in position, all substantially as and for the purpose stated.

2. The combination of the slotted frame C, pivoted to the forward clamp, and holding the rear clamp by means of a thumb-screw, with the clamps B and H, as shown and described.

164,681. STREET-LAMPS. John Henrich, Buffalo, N. Y. [Filed June 7, 1875.]

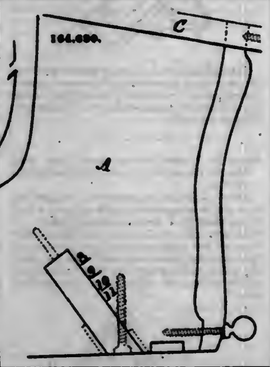


1. The combination, with a lamp-body, A, of the perforated dome B, perforated inner chamber D, annular space F, and the duct G, all arranged and constructed substantially as described, and for the use and purpose set forth.

2. The combination, with the dome B, of the annular space F and a series of conduits, I, arranged within the lamp-body A, substantially in the manner and for the use and purpose as set forth and described.

3. The combination, with the lamp-body A, of the perforated dome B, provided with the conduits I, inner perforated shell D, arranged to produce the annular space F, conduits I, deflector K, and the upper dome-extension H, provided with the duct G, the whole when constructed and arranged substantially as described, for the use and purpose set forth.

164,682. MACHINES FOR FORMING LIPS. John Henry Helm, Allegheny, Pa. [Filed May 12, 1875.]

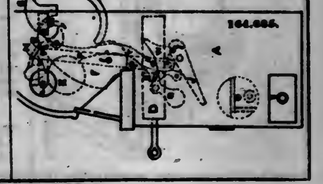


Brief.—A mandrel in the carrier D is reciprocated by cranks, and is projected below the lower face of the machine (all the bending and cutting devices being on said lower face) on its forward movement, in order to bend the blank supported by the bending-levers, and withdrawn on its back stroke, to pass over the next blank by means of pin riding over and under the cam or switch.

164,683.

1. The combination of the switch mechanism with the traversing die B and its carrier, for the purpose of raising said die in its carrier on its rearward movement, to pass over the blank which was previously fed in and is to form the next succeeding link, substantially as described and represented.

2. The combination of the cutters *e f*, guide and gage *g*, traversing die B, and bending-levers K K, as and for the purpose described and represented.



3. The combination of the traversing die B, the bend-die L, and the double-hinged dies L L, as at *a a*, with their spurs and recesses, for lapping the beveled ends of the blank, as and for the purpose described and represented.

4. The combination of the yielding holder 9 with the reciprocating and rising and falling die B, as and for the purpose described and represented.

164,684. STEP-LADDERS. R. G. Hildreth, Wilmington, Del. [Filed Dec. 29, 1874.]

Brief.—The metallic bands that unite the upper section to the lower section are formed so as to permit the lower end of the upper section, when retracted, to be thrown out, to form a brace prop for the ladder. The spring-catches hold the parts extended by engaging on the upper edge of the metallic bands.

164,685.

1. The combination of the L-irons B' with sections A' and A', for holding the sections together, guiding them in the expansion and contraction of said sections, and holding section A' in the position seen in Figs. 1 and 2, substantially as set forth.

2. The combination and arrangement of the spring-catches C and C', respectively, with the sections A' and A', and the clasping-irons B and B', whereby, when either section is brought to its elevated position, its spring-catches are caused to rest upon the upper edges of the clasping-irons of the next section beneath it, to hold it in its elevated position, substantially as set forth.

3. The combination of section A', having pins *a' a'*, with section A', having irons B' B', provided with flanges *c c*, constructed and arranged substantially as set forth, whereby the ladder is held firmly in a secure position.

164,686. COMPOUNDS FOR SIZING PAPER. James Hogben, Cleveland, Ohio. [Filed Apr. 14, 1875.]

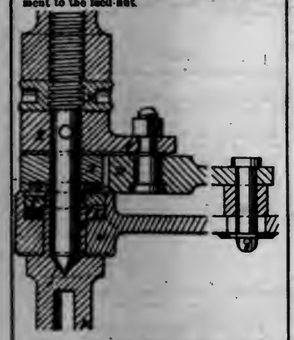
Brief.—Soda-ash, three hundred pounds; salt, five pounds; linseed-oil, two gallons; silicate soda, thirty-six gallons; resin, twelve hundred pounds.

The herein-described compound for sizing paper, consisting of the ingredients specified, viz., soda-ash, carbonate of soda, resin, chloride of sodium, linseed-oil, and silicate of soda, or their equivalents, in about the proportions set forth, and compounded in the manner substantially as described, and for the purpose specified.

164,687. FARE-BOXES. Asa B. Hovey, San Francisco, Cal. [Filed Mar. 13, 1875.]

Brief.—The passenger depresses the counter, sounding a gong, when the driver, operating the inspection-plate, drops the previous fare onto the second inspection-plate, and, throwing back the apron, opens the passage to the first inspection-plate, and closes the one to the second. If the fare is incorrect, the passenger may pass his hand over the counter and remove the fare from the first inspection-plate. If the driver does not operate the apron, the fare will fall onto the curved tray before the passenger, who can recover it. All having paid, the driver operates the second inspection-plate, depositing the fares into the locked drawer.

1. The fare-box A, provided with a sliding tray, D, counter G, and apron F, operating together in the manner described, for the purpose of receiving fares.



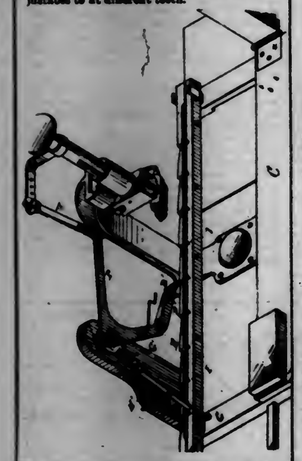
2. The swinging cover J, with its pin *j*, in combination with the arms T and W, operating together, for the purpose of closing the passage to deposited fares when the apron is thrown back, substantially as described.

3. The combination of the hooked lever P, depended from the frame N of the counter G, latch Q, attached to the side of the sliding tray D, and arm T from side of apron, as a means of opening the box to receive a fare, substantially as described.

164,688.

164,686. RATCHET-DRILLS. J. M. Koeberle, Philadelphia, Pa. (Filed Feb. 19, 1875.)

Brief.—The stock or socket-piece terminates at the top surface of lever, and upon its upper end, in a chamber in the bob of the lever, is a disk with teeth on its upper and lower surfaces, that is turned alternately, but in the same direction, by two pawls, one attached to a lever, and the other to a gear that is operated by a toothed arm loosely connected at its outer end to a lever. The lower end of the feed screw, here denuded of threads, is stepped into stock, and extends upward within a stationary sleeve, through which is effected the pressure upon the drill, it serving as an abutment to the feed-nut.



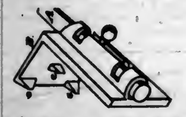
1. In a ratchet-drill, the stationary barrel-stock I, provided with a frog, J, or equivalent device for holding it in a fixed position, and a screw-rod, C, for the longitudinal movement of the bit-stock, substantially as set forth.

2. The bit-stock A, having a double ratchet-wheel, F, in combination with the stationary barrel I and feed-screw rod C, having an adjustable nut, H, substantially as and for the purpose set forth.

3. The combination of the levers B and B', wheels D D', spring-pawls G G', and double ratchet-wheel F, for giving a continuous rotary movement to the bit-stock A, substantially as set forth.

164,687. STAMP-CANCELLERS. Myer Lewis, San Francisco, Cal. (Filed May 4, 1875.)

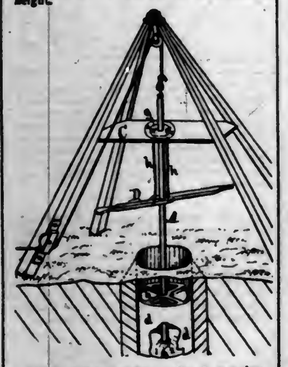
Brief.—A sheet of stamps may be clamped upon the table, and will be fed forward one tooth of the rack with each stroke of the plunger. The ratchet-bar which feeds the table is interchangeable, and the pawl is adjustable to fit different teeth.



1. The combination, with a table, C, provided with a ratchet-bar having stops I for each notch, of an ordinary hand-stamp, an arm, U', connected with the plunger of the stamp, the link V, the lever P, carrying the pawl E', and the stop-bar H' for engaging the stops I, to limit the forward movement of the ratchet-bar, all substantially as described.

2. The combination, substantially as described, of the interchangeable ratchet-bars, provided with stops I, a pawl connected with the plunger of a hand-stamp for moving the ratchet-bar forward, and an adjustable stop-bar connected with the said plunger, for successively engaging with the stops I, to limit the ratchet-bar in its forward movement, all substantially as described.

164,688. DOOR-SECURERS. Louis Marks, San Francisco, Cal. (Filed May 6, 1875.)

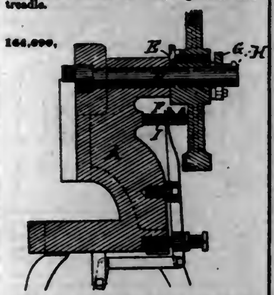


Brief.—A small sliding door-bolt is provided with a right-angled flange, having teeth or spurs for temporary attachment, and pierced with screw-holes for permanently attaching it to the door when desired, thus serving interchangeably for a fixture or a portable door-securer.

The sliding bolt A, in combination with the flange or plate B, provided with spurs *e e*, and with means for permanently attaching it to the door, if desired, substantially as and for the purpose set forth.

164,689. EARTH-BORING APPARATUS. Orin Martin, Bloomfield, Iowa. (Filed Apr. 19, 1875.)

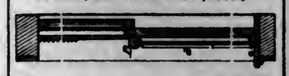
Brief.—The bucket has inclined twisted cutters, and is secured on a shaft carrying a centering-point by a skeleton sliding collar and set-screw. The shaft passes through a collar rotating in a fixed platform, and is operated by a clamping-lever suspended from the rotating collar, which guides the shaft by cords, by which it may be adjusted to the required height.



1. The skeleton sliding collar *b*, carrying set-screw *c* and the bucket *d d*, having two inclined edges at its bottom in twisted positions relative to each other, when combined with the shaft A, carrying cutters 1 and 2 and a centering-point, *a*, substantially as and for the purposes shown and described.

2. The rotating collar *g* in the elevated fixed platform O, the horizontal lever D, suspended by cords *h*, and the shaft A, passing through the collar *g* and lever D, when arranged and combined as and for the purposes shown and described.

164,690. OLOTURES FOR POWER-PRESSES. A. H. Merriman, West Meriden, Conn. (Filed May 10, 1875.)



Brief.—A shaft having thereon a fly-wheel and clutch-collar, the fly-wheel loose and the clutch-collar keyed to the shaft. A pin passing through the hub of the fly-wheel, to connect it with the clutch-collar, is operated to and from said collar by a guide suitably grooved by means of a spring-lever and treadle.

164,690.

In a press, substantially as herein described, the wheel D, sliding pin E, collar G, key H, guide-plate F, bracket I, plate J, and spring-treadle, all combined to operate substantially as herein set forth.

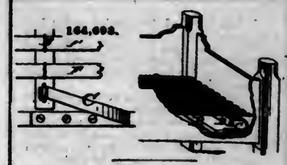
164,691. WINDOW-SCREENS. S. Parker, Sheffield, Ind. (Filed Feb. 19, 1875.)

In combination with screen B, the rib *a* and cleats *d d*, covering the space between the screen and casing, and arranged to form the grooves *c c*, adapted to receive the ends of the rib, as specified.

164,692. GRINDING-WHEELS. H. Marshall Putnam and Wm. Esty, Fitchburg, Mass. (Filed Mar. 31, 1875.)

1. An emery-wheel provided with a central water-supply, whereby the water introduced into the center of the wheel will, by reason of capillary attraction and centrifugal force, percolate through the same and moisten its outer surface, substantially as specified.

2. In an emery grinding-wheel, an inclosed water-chamber, in combination with a hollow shaft for supplying water thereto, whereby the outer surface of the wheel is moistened by the percolation of water from the chamber through the wheel, substantially in the manner described.



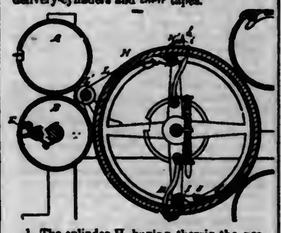
3. In an emery-wheel, the combination of the spindle B, tube *a*, and chambers *b d*, connected by the holes *c*, all constructed substantially as and for the purpose set forth.

164,693. SPRING BED-BOTTOMS. John A. Reeds, Lawrence, Kans. (Filed Feb. 23, 1875.)

Brief.—The springs are secured to a supporting-frame within the bedstead, and the bars are suspended from the hooked ends thereof by staples, the slats also passing through staples on the bars

The vibrating bars D, provided with staples *a* E, in combination with the slats F and twisted springs C, provided with hook ends, substantially as and for the purposes set forth.

164,694.



164,694. REFINING OILS. A. T. Schmidt, Pittsburg, Pa. (Filed Jan. 4, 1875.)

1. In refining oils, the process of subjecting the oils to distillation in the presence of a sulphite or hyposulphite, substantially as and for the purpose specified.

2. In treating oils, the process of washing the distillate in a bath of water holding a hyposulphite or hypophosphite in solution, substantially as and for the purpose specified.

164,695. MACHINES FOR CUTTING AND DELIVERING PRINTED PAPER. Walter Scott, Chicago, Ill. (Filed Dec. 4, 1874.)

Brief.—The printed web is perforated between two cylinders, and thence passes to grippers on a cylinder having projections on its surface, which, meeting a yielding bleged section of the female cylinder, tear off the sheets, which are thence passed alternately to two delivery-cylinders and their tapes.

1. The cylinder H, having therein the projecting parts or web-breakers H' H', either with or without the blades *h h*, in combination with the cylinder B, having therein the movable or receding part or section E, substantially as described, the cylinder H being also provided with means for seizing the previously-perforated web and delivering it to a subsequent cylinder, for the purposes set forth.

2. The combination, of the cylinder A provided with a cutting-blade, the cylinder B, having therein the receding section E, and of the cylinder H, having an increased periphery H' and carrying the gripers *i i*, all substantially as and for the purposes specified.

3. The combination, substantially as specified, of the cylinder B, having therein the receding section E, the cylinder H carrying the web-breakers H' H' and the gripers *i i*, and of the tapes L L, arranged substantially as described, with relation to the cylinders H and B, for the purpose of thereby operating upon the previously-perforated web, in the manner set forth.

164,696. ELECTRICAL APPARATUS FOR TIMING RACES. R. J. Sheehy, Boston, Mass. (Filed Apr. 20, 1875.)

Brief.—Projection carried by vehicle strikes an overhead wire at starting-post, causing closure of an electric circuit to a magnet controlling starting of time-piece. On passing quarter-posts causes closures to magnets controlling alarms, and to one acting as switch to throw circuit from starting-magnet to one controlling stoppage of time-piece. Main time-piece controls, by proper circuits, a secondary one carrying a dial, on which marks are caused to be made indicating time of events of the race.

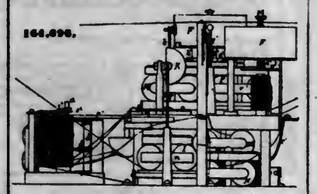
1. In combination with a time-piece or stop-watch, mechanism, substantially as described, for moving, through the agency of electricity, the starting and stopping stud or device of said time-piece or watch, for the purpose of starting the watch at the commencement of a race-heat, and stopping it at the termination thereof, such mechanism consisting of the perforated arm *b*, the two electro-magnets G H, their circuit-wires, switch *o*, key, and actuator *f*, all to operate essentially as specified.

2. The combination of the auxiliary electro magnet I, its circuit-wires, armature *n*, and the lever *y* thereof, essentially as described, with the furcated arm *b*, the two electro magnets G H, their circuits, the switch *o*, the key, and actuator *f*, all being to operate, in connection with the stop watch and race-course, substantially as specified.

3. The combination of the alarm or bell K with the auxiliary magnet I, its circuit-wire, armature, and the lever thereof, combined with the main magnets G H, their circuits, the furcated arm *b*, the switch *o*, the key, and the actuator *f*, all substantially as described.

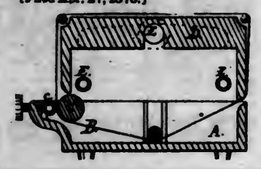
4. The combination of the alarm or bell L, its hammer *v*, spring armature *w*, and electro-magnet M, with the above-described mechanism, for starting the watch at the commencement of a race-heat, and stopping it at the termination thereof

5 In combination with the mechanism for starting the watch at the commencement of the heat, and stopping it at the termination thereof, the spring *f'*, wire *g'*, and the electro-magnet alarm or apparatus applied to the distance-posts E E', such consisting of the electro-magnet N, with its circuit or circuit-wires *x y*, armature *b'*, hammer *z*, and bell *a'*, all being to operate essentially as specified.



6. The flag lever O and curved arm or catch *c'*, in combination with the spring *f'* and line *g'*, and the electro-magnetic alarm applied to the distance-posts, and with the mechanism for starting the watch at the commencement of a race-heat, and stopping it at the termination thereof, all as explained.

7. In combination with the mechanism for starting the watch at the commencement of a race-heat, and stopping it at the termination thereof, the mechanism for actuating the setting slide or knob *p'* of the stop watch, in order to cause the second-hand to be thrown back to zero or the starting-point of the dial, such last-mentioned mechanism being the electro magnet P, armature *r'*, and lever *q'*, such magnet P being in circuit with the wires of the distance-posts, as described.

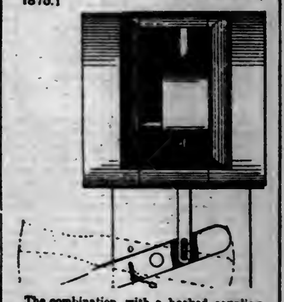


8. In combination with the stop-watch, and mechanism for starting it at the commencement of a race-heat, and stopping it at the termination thereof, as set forth, the apparatus for recording the time or times of the heat or race, such consisting in the electro-magnet R, the disk-armature w^2, rod w', spring v^2, and the pencil or marker w^3, and spring x', applied to said stop-watch, or to an auxiliary stop-watch, F', as described.

9. In combination with the stop-watch, and the electro-magnetic mechanism for starting it at the commencement of a race-heat, and stopping at the termination thereof, recording mechanism, consisting of the arbor b^2 c^2 d^2, as described, the hard-rubber annulus or disk c^3, spring g^3, wires f^3 k^3, electro-magnet *s*, armature i^3, escapement-lever m^3, toothed wheel n^3, shaft o^3, table p^3, springs q^3 r^3, electro-magnet T, armature s^3, spring t^3, and marker u^3, such electro-magnets having circuit-wires, and all being to operate substantially as specified.

164,696.

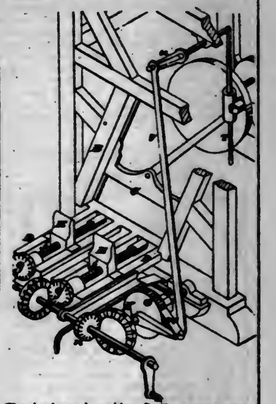
164,697. CLOTH-STEAMING MACHINES. John Shinn, Philadelphia, Pa., assignor to himself, Geo. W. Lehman, Wm. N. Marcus, and Dudley E. Bradlee, same place. (Filed Apr. 27, 1875.)



1. A steaming apparatus, combined of the following parts: a tank, A, endless cloth B, and heating-box D, as above described.

2. In combination with endless cloth B and tank A, the wringing-rollers *c c'*, as and for the above-described purposes.

3. The combination of the pipe F, corrugated box D, and tubular smoothing-iron F, as described, box for the above purpose.



164,698. CAR-COUPLINGS. J. B. Stamour, Philadelphia, Pa., assignor of one-half his right to Gruver Automatic Car-Coupling Company, Baltimore, Md. (Filed May 20, 1875.)

The combination, with a hooked coupling-bar and an uncoupling-lever constructed to be locked in position when the couplings are coupled, of a slotted or notched link or arm connected with the coupling-bar and the said lever, and constructed to limit the lateral play of the coupling-bar in either direction, as and for the purpose described.

164,699. VENEER-CUTTING MACHINES. G. W. Swan, San Francisco, Cal. (Filed Apr. 27, 1875.)

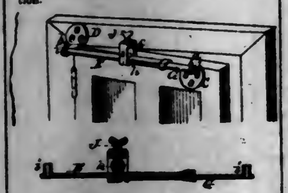
Brief.—A shearing cut across the entire length of the bolt is obtained by securing the cutter to an angular frame operating between inclined guides, the edge of the cutter always maintaining a horizontal position. The bolts are fed to the cutter by feeding-screws automatically operated by suitable gearing, and to which are secured slides or dogs working in horizontal guides.

The horizontal guides D D, having the slides or dogs E operated by screws *f*, with their pinions *g* and shaft H provided with the toothed wheels I I and pinion *a* in combination with the shaft K with its ratchet-wheel O, loosely-attached sleeve *r*, with its tube S, rock-shaft T, with its slotted crank *u*, connecting rod V, and pawl holder W, all combined and arranged to operate as and for the purpose described.

164,700. APPLICATION OF STEAM-PIPES TO BUILDINGS. Caleb C Walworth, Boston, Mass. [Filed Apr 23, 1875.]

Brief.—The flanged thimble and flanged screw-cap embrace the plastering between their flanges. The cap-plate and screw-cap make a close joint with the ends of the packing tube.

1. The combination, with a steam-pipe passing up through a ceiling and contiguous floor of a building, of a protecting sleeve, packed as described, and having each of its ends provided with a flanged fastening cap, the lower one having a screw-cap, *g*, screwing into its inferior end and against the plastering, the whole being constructed and applied in manner as shown, and for the purpose set forth



2. The combination, with a steam-pipe passing up through a ceiling and a contiguous floor of a building, of a sectional sleeve or two sleeves, each provided with a packing-chamber and packed as described, the upper one of such sleeves being provided with a fastening-flange and a screw-cap, and the lower one having a fastening-flange and a screw-cap to screw into the inferior end of the sleeve and against the outer face of the plastering, the whole being substantially as and for the purpose set forth.

3. The combination, with a steam-conducting pipe, of a circumscribing sleeve packed with asbestos or other non-combustible material, such packing impinging against the pipe, and filling the space between the latter and the sleeve, as and for the purposes set forth.

4. The combination with a steam-pipe, D, of the tube or thimble *d*, provided with a flange, *e*, and the screw-cap *f*, provided with a flange, *g*, the said flanges being, respectively, applied to the under surface of the furring and the lower face of the plastering, substantially as shown and described.

164,701. DOOR-CHECKS. Wm. H. Willis, Forest City, Mo. [Filed May 5, 1875.]

Brief.—Two straight bars, sliding one upon the other, are impinged upon by an elastic roller carried in a stirrup, and regulated by a set-screw. This device is attached near the top of the door by suitable plates and swiveled pins or studs passing through short vertical tubes on the ends of the bars, and, being secured jointly to the door and door frame, serves to regulate the movement of the door, prevent slamming, or hold it in desired position.

1. In a door-check, the combination of the bars E G, sliding one upon the other, and the pressure-roller *h*, arranged thereon by any suitable mechanism, substantially as and for the purposes herein set forth.

2. The combination of the sliding bars E G, stirrup I, set-screw J, frame *c*, and rubber roller *h*, substantially as and for the purposes herein set forth.

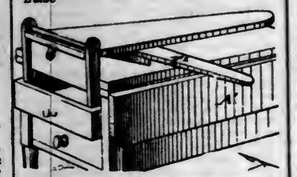
3. The combination of the sliding bars E G and their pressure-roller *h*, arranged thereon as described, the plates *d d*, and the plates O D, with their pins or studs *a b*, all substantially as and for the purposes herein set forth.

164,702. BELT-TWISTING APPARATUS. M P. Wilmarth, Pawtucket, R. I., assignor to James Davis & Son, same place. [Filed May 10, 1875.]

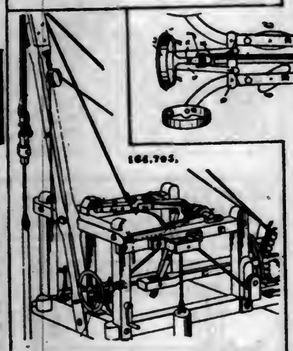
In belt-twisting apparatus or machines for twisting belts, the combination of the revolving rack *c*, provided with the reel *e*, tubular projection *g*, and inserted spindle *k*, with the receiving-drum *r*, all substantially as shown, and for the purpose describ

164,702.

164,702. CORNERS FOR VEHICLE-BODIES. Stephen Acker and N L. Robinson, Batchellerville, N. Y. [Filed Apr 23 1875.]



The metal corner A, with dovetail grooves *a a*, and ribs *b b*, substantially as and for the purpose set forth.



In testimony that we claim the above we have hereunto subscribed our names in the presence of two witnesses.

164,704. IRONING AND KITCHEN TABLES. Andrew Aitken, Wells River, Vt. [Filed Apr. 24, 1875.]

Brief.—A kitchen table with a frame pivoted to fold in a drawer, to which an ironing-board is attached, to rest on the table and frame

The combination of a table and a swinging frame pivoted for folding into a sliding drawer, with an ironing-board supported on frame and table, substantially in the manner and for the purpose set forth.

164,705.

164,705. ROCK-DRILLING MECHANISMS. Addis B. Allen, Perch River, N. Y. [Filed Mar. 6, 1876.]

1. The described combination, in the drilling-machine, of the sand-pump reel and mechanism, substantially as shown and described, to throw said reel into or out of gear at pleasure with the driving mechanism of the drilling-machine.

2. In feed mechanism of drilling machines, the combination, with the feed-drum, to which is attached the feed or drop rope, of a worm-wheel and worm, by which said drum is rotated to effect the feed of the drill, substantially as and for the purposes set forth

3. The worm-wheel and worm, in combination with the feed drum, connected with the worm-wheel by a ratchet-and-pawl connection, as described, which permits the drum to be rotated by a crank-handle or otherwise independently of the worm-wheel, to effect the winding up of the feed-rope.

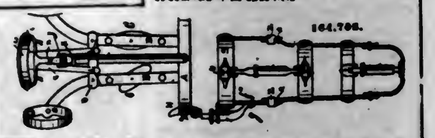
4. In combination with the feed-drum and feed rope, the capstan on the angle lever shaft, interposed between the feed drum and the drop, to take the strain from the feed works, substantially as set forth

5. In combination with the angle-lever shaft, the feed-rope capstan loose thereon, and the lever, pawl, and ratchet mechanism, for holding said capstan in place, and taking up slack in the drop-rope, as set forth.

6. The combination, with the vibratory angle-lever, of the feed or drop rope, operated by said lever, as described, and the feed mechanism, whereby said rope can be let out or taken up during the movement of said lever, and without stoppage of the machine, substantially as set forth.

7. The feed-rope, the feed mechanism for taking up and letting out the same while the machine is in motion, and the drop mechanism by which said rope is operated to raise and let fall the drill, as described, in combination with the main rope attached to the drill, and normally loose on its capstan when the machine is in operation, as set forth.

8. The combination, in a drilling-machine, of a drop-rope, by which the drill is intermittently operated, and a main rope connected with the drill, but normally loose on its capstan during the working of the drill, substantially as and for the purposes set forth.



164,706. BOOT-REACHS. Horace R. Allen, Indianapolis, Ind. [Filed Feb. 24, 1875.]

Brief.—The head-rest is sustained upon a forked bearing, which latter is swiveled to the body of the brace. The main uprights of the brace are curved to rest behind each shoulder. Swiveled joints connect the upper and lower parts of the brace. A peculiar adjustment is used for the foot-rest.

1. The swiveled joint J, in combination with the fork H H, adjusting-screw *a*, head-supporter G, and elastic band M, substantially as specified.

2. The rotating pivoted pads C C, in combination with the upright bars B B, substantially as described.

3. The curved bars B B, in combination with the lower cross-bar A and upper cross-bar D, substantially as specified.

164,706.

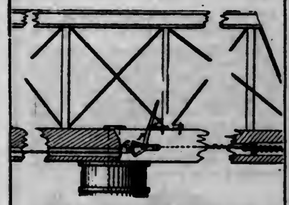
4. The combination of the cross shoulder bars E E and straps F F with the curved ends of the bars B B, substantially as specified

5. The angle-plate *f*", riveted to the bar B and provided with a hole to receive the tube Q, substantially as specified.

6. The sliding band Z on the joints *a a'*, constructed and operated substantially as specified.

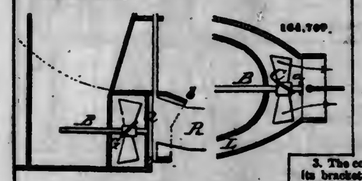
164,707. HOG-CATCHING IMPLEMENTS. W. R. Ames, Nebraska City, Nebr. [Filed Aug. 14, 1874.]

Brief.—The leg of the animal is seized with forceps, which form an ellipse when closed, the grasping parts of which are fortified by exterior ridges of metal, and the impinging parts of which, at closing, have chisel-formed shoulders, to admit of tighter closing by pressure.



164,707.

The jaws A B, provided with tapering points overlapping each other, and meeting at the shoulders *c c'*, and forming an elliptical opening for receiving the leg of the animal, the stay-ribs *b b*, the handle C with eye *d*, and handle D' with eye *d'*, and socket E, all substantially as described, and herein set forth.



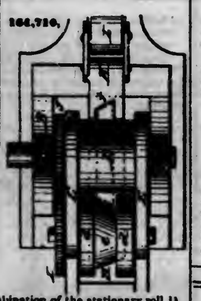
164,708. DRAW-BRIDGE FASTENINGS. C. J. Atkins, Louisiana, Mo. [Filed Mar. 20, 1875.]

Brief.—The draw of the bridge is secured in place by spring-actuated lock-bolts, connected by chains with a winding-shaft, and operated by a lever.

The combination, with draw A and rests C C, of spring-actuated lock-bolts D D, connected by chains with a winding-shaft, G, as shown and described, whereby the bolts automatically lock the draw to the rests as the chain slackens.

164,709. CONSTRUCTION OF CANAL-BOATS. William Ball, New Vienna, Ohio. [Filed Aug. 15, 1874.]

164,709.



The propeller-jacket herein described, having the funnel-shaped induction-branches L L, extending forward along the sides of the boat beyond the point where said sides become parallel, the tops of said branches extending upward above the water-line in front, and gradually descending to the propeller-tube, terminating in the deflecting-hood *h*, as shown and described

164,710. MACHINES FOR BENDING CIRCULAR FILE-BLANKS. L. Beyer and R. Heunsch, Washington, D. C. [Filed May 15, 1875.]

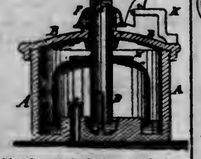
Brief.—A former-roll, stationary; a rotatable bending-roll, articulated to and revolvable around the former-roll by means of gears and a stirrup prolonged into a handle; and a clamp actuated by a cam. In use the bending-roll is swung around, so that the blank may be passed between the rolls, and its end projected into the notch of the clamp, when it is made fast, and the roll H is then carried by the handle around in the opposite direction.

1. The combination of the stationary roll D and the roll H, formed with the conical enlargement *e* and flanges *d d*, and having a twofold motion—viz., one around its own axis, and the other around the roll D—substantially as and for the purposes herein set forth.

164,710.

2. The combination of the stationary roll D and stationary cog-wheel J with the lever G E, rotating roll H, and cog-wheel I, substantially as and for the purposes herein set forth.

3. The combination of the rolls D H, slide K, with die *f*, and lever L, as and for the purpose described.



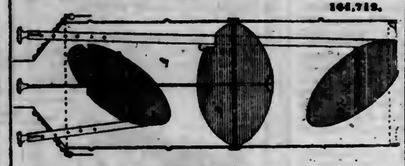
164,711. GAS-EXTINGUISHERS FOR STREET-LAMPS. Lewis Boore, Buffalo, N. Y. [Filed May 26, 1875.]

Brief.—When the right pressure of the gas is turned on, the cover is raised out of the liquid, and the gas passes to the burner. When the right pressure is turned off, the cover settles into the liquid, and the ordinary pressure is not sufficient to lift it.

1. The combination of the case A, provided with a grooved and recessed bottom, and an inlet-pipe, I, the cover B, provided with outwardly and inwardly projecting flanges *b' b'*, around a hole formed through its center, the inverted cap C, provided with an outlet-tube, D, and the burner-tip E, substantially as herein shown and described.

2. The combination of the inclined ring-flange F with the outlet-tube D of the device, and with the outer flange of the cover *b'*, substantially as herein shown and described.

164,711.



3. The combination of the look-catch J and its bracket K with the cover B and with the inclined flange F, formed upon the outlet-tube D of the device, substantially as herein shown and described.

164,712. SMOKE-DRUMS. Jacob Bowman, Harrisburg, Canada. [Filed Nov. 7, 1874.]

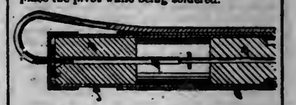
Brief.—Soot is removed or air admitted through the registered openings.

164,712.

1. In a smoke-drum in which the products of combustion pass from the stove into the said drum for increasing and utilizing the heat, the combination of the series of dampers mounted upon transverse shafts journaled in the drum, and each damper being provided with a vertical rod passing through the top of the drum, which is provided with a series of openings and with a pin for supporting it at its adjusted position, substantially as described.

2. The combination, with the drum A, having the opening or openings K, of the bottom plate P and slide L, substantially as and for the purpose described.

164,713. HARROWS. Charles Brodrick, Champaign County, Ill. [Filed Mar. 12, 1875.]

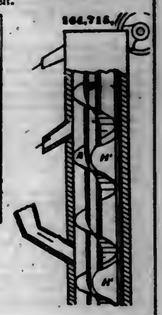


Brief.—The teeth are secured in single wooden beam. A series of these are connected together by two sets of perforated bars rigidly fixed to the top side of the beams, and connected by links of flat iron bars having two sets of holes, so that by using two bolts the coupling may be made rigid, or rendered flexible by removing the inner bolts.

The coupling or connecting links, provided with a series of holes and bolts, as shown in Figs. 2 and 3, for flexible or rigid connection of the teeth-bars, in combination with the said bars, as shown and described.

164,714. TOOLS FOR PIVOTING WATCH-WHEELS. Frank E. Bucklin, East Tilton, N. H. [Filed May 6, 1875.]

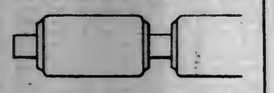
Brief.—A plunger or piston is provided in its outer end with a seat to receive the pivot and post of a wheel to be repaired, the wheel being held in place by a retaining-cap, through which the post to be repaired projects. Above the cap is a retaining-socket, in line with the socket in the plunger, to contain and hold in place the pivot while being soldered.



The combination of the handled tube A, plug B, centering-spindle E, centering copper rod F, cap H, and tube G, substantially as specified.

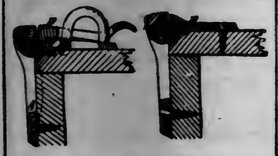
164,715. GRAIN-CONVEYERS. Henry W. Caldwell, Indianapolis, Ind. [Filed Apr. 13, 1876.]

Brief.—The conveyer-shaft is hollow and vertical, the screw-blade being formed of disks with a central hole and one radial cut, to permit of their being drawn out to the full pitch. Vertical followers intersect the screw, traveling on an endless belt.



164,715.

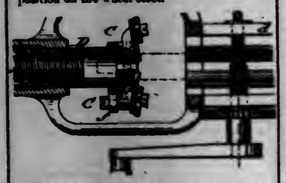
1. The conveyer-screw arranged in an upright position in a tight box, in combination with the followers H' H', operated substantially as specified.



2. The flights A, constructed and applied to the hollow shaft C, substantially as described.

164,716. TOP ROLLS FOR SPINNING-MACHINES, &c. Edward Card, Pawtucket, assignor to himself, Isaac Lindsley, and B. Borden, same place, and S. Schofield, Providence, R. I. [Filed May 11, 1870.]

A top roll covered with the outer bark of the white birch, as a new article of manufacture.

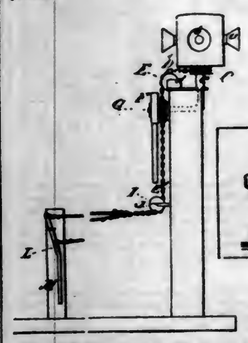


164,717. FASTENINGS FOR BUTTER-TUBS. Henry C. Carter, New York, N. Y. [Filed Jan. 18, 1875.]

The combination of the plate C, having elongated recesses c' c', the hook D, provided with gudgeons d' d', and the slotted ear A, with the body and cover of a butter-tub, substantially as herein described.

164,718. MACHINES FOR TENONING SPOKES. Joshua R. Coleman and Samuel Myers, Galion, Ohio. [Filed Mar. 1, 1875.]

Brief.—The clamping and cutting mechanisms are coincidently adjustable in the main supporting-frame. The tubular stem of the cutter-head and the shaft operating the same are locked together during the operation of cutting the tenon, and the length of the tenon is determined by a burr or screw-collar adjustable on the threaded portion of the crank-shaft which operates the cutter-head; the purpose of the aforesaid devices being to accurately tenon all the spokes of a wheel without handling the same or changing its position on the wheel-stool.

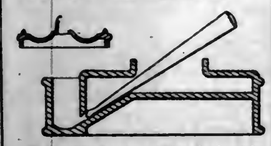


1. In the tenoning-machine herein described, the combination, with the tubular guide-stock A, of screw-threaded shaft D^1, the tubular stem D, carrying cutter-head C, and threaded internally, as specified, and the burr d, adjustable on the threaded portion of said shaft, all constructed and arranged as shown and described, whereby the parts D^1 and D are locked together during the operation of cutting the tenon, and the length of the latter is determined by their relative adjustment, as set forth.

2. In the improved tenoning-machine herein described, the angular clamping-plates B B, right-and-left screw-shafts a a, and meshing-gears f', in combination with the angular jaws E E, bolts f^2, tubular stem D, screw-shaft D^1, and burr d, all constructed and arranged to operate as shown and described, whereby the clamping and cutting mechanisms are coincidently adjustable in the frame A, as and for the purpose specified.

164,719. SIGNAL-OPERATING DEVICES. Francis Oulham, Thedford, Canada, assignor of one-half his right to R. A. Rounds, Grand Rapids, Mich. [Filed Mar. 13, 1875.]

Brief.—When the operating-lever, by which the lantern is turned, is released, a weighted lever or arm returns the lantern to its normal position.



The shaft B, a, having keyed thereon the lantern a, grooved wheel C, grooved pulley F, and weighted lever H, in combination with the chains D, E, and E', the rods K and K', and actuating-lever L.

164,720. METHODS OF PRODUCING ETCHINGS ON GLASS. Ernest Dalleinne, New York, N. Y. [Filed May 22, 1875.]

The method herein described of producing etched glass plates, consisting mainly in transferring the design from the original or positive plate to a second or negative plate, coated with varnish and bichromate of potash, then removing the ground by means of turpentine, then using the negative to produce the ornaments, in similar manner, on any number of glass plates, and finally etching the same with fluoric acid, substantially in the manner and for the purpose set forth.

164,721. INKSTANDS. Saml. Darling, Providence, R. I. [Filed Mar. 20, 1875.]

The combination, in an inkstand, of an ink-reservoir, a dipping-cup, which is made outside of but in the same piece with the reservoir, and extending below the bottom thereof, and a cap, provided with a vent, for the free circulation of air to and from the interior of the reservoir, causing the ink to stand at its natural level, substantially as described, and for the purpose herein set forth.

164,722. FOOT-POWER LASTERS. Fredk. J. Davis, Newport, Vt. [Filed June 7, 1875.]

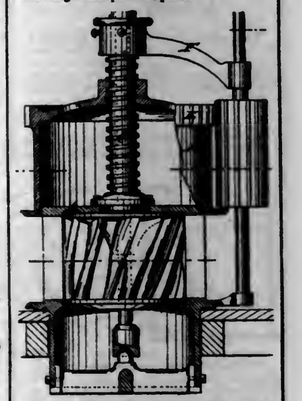
Brief.—The lever-handles are adapted to receive a strap, so that the griping power shall be applied by the foot.

164,722.

The jawed jaws A C, provided with slotted lever-handles B D, in combination with strap E, all substantially as and for the purpose specified.

164,723. ELECTRIC TOYS. Wm. J. Decker, New York, N. Y. [Filed May 12, 1875.]

Brief.—Electrical excitation in the glass, resulting from rubbing, causes the figures to dance and execute various gymnastic feats.

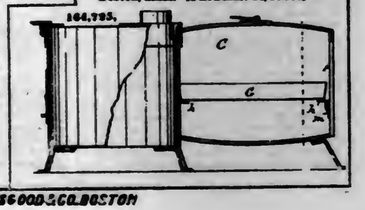


The electric toy composed of the glass plate A, which is supported on legs B, and of the rubber C, combined to affect the figures D D, which are placed beneath the glass, substantially in the manner herein shown and described.

164,723.

164,724. TURBINE WATER-WHEELS. Jas. M. Denson, Columbus, Ga. [Filed Apr. 9, 1875.]

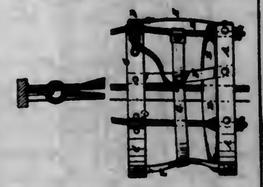
Brief.—The gate is made of cylindrical shape, covering the entire wheel and wheel-case to a point below the chutes, and moves by an internally-threaded hub on the hollow screw-column. An outer gearing of the gate meshes with an actuating-pinion of equal height, whose shaft turns in bearings of the casing, and of a top arm attached to the end of the column. The gate may be raised or lowered to any desired height along the wheel, according to the power required



1. A turbine water-wheel provided with a rotary upwardly-movable gate, inclosing and covering the chutes or water-ways, substantially as shown and described.

2. The combination, with gate E, having circumferential spur-wheel E^1, and adjustable on a central screw, C, of a hand-shaft provided with pinion E^2, as and for the purpose specified.

164,725. CAMP-STOVES. H. L. Dunckles, Boston, Mass. [Filed Mar. 31, 1875.]

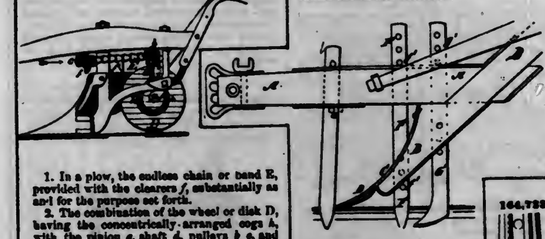


164,725.

1. The combination, with a camp-stove having a removable top or bottom, of an oven hinged to the exterior of the stove, and constructed to have a swinging motion for removing or detaching it, and adapted to be arranged, after removal, within the said stove, as and for the purpose described.

2. The combination, in a camp-stove provided with the oven C, having the flanges m, of the removable flanges k, for supporting the shelf or pan G, substantially as described.

164,726. CHILDREN'S SWINGS. G. A. Fanjoy, Williamsburg, N. Y. [Filed May 22, 1875.]

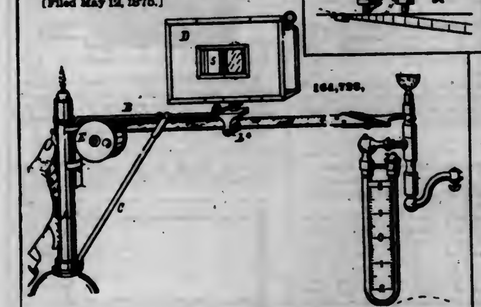


1. An elastic back, C, for a swing-seat, made of a strip of hard elastic wood, bent into proper form, and having a strip of metal attached to its outer side, substantially as herein shown and described.

2. The combination of the straps D E with the ends of the elastic back C, and with the forward edge of the seat A, substantially as herein shown and described.

3. The combination of the straps F G with the elastic back C, and with the side and rear edge of the seat A, substantially as herein shown and described.

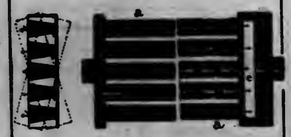
164,727. PLOWS. Ole J. Glasoe, Lanesborough, Minn. [Filed Mar. 26, 1875.]



Brief.—A belt or endless chain is operated by an oblique land-side wheel. The chain carries cutter-blades or cleavers projecting downward.

1. In a plow, the endless chain or band E, provided with the cleavers f, substantially as and for the purpose set forth.

2. The combination of the wheel or disk D, having the concentrically-arranged cogs A, with the pinion g, shaft d, pulleys b c, and chain E, having cutters F, substantially as and for the purpose set forth.



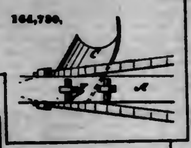
164,728. PORTABLE OR HAND PHOTOMETERS. Wm. Wallace Goodwin, Philadelphia, Pa. [Filed May 12, 1875.]

In a portable or hand photometer, substantially as described, the flexible steel scale F, the take-up spring-cylinder E, and the sight-box supporter b'' and friction-roller b', permanently secured together, as described, in combination with the detachable candle-stand A, arm B, supporting-brace C, and sight box D, the said fixed and detachable parts being constructed and arranged to be carried and operated in hand, in connection with a gas-burner, for the purpose set forth.

164,729. HOLLOW GRATE-BARS. Wm. L. Gregg, Chicago, Ill. [Filed Feb. 20, 1875.]

Brief.—The grate is made in sections of hollow perforated bars, at the end of which is formed an air-chamber having a hollow journal, by which means the sections are rocked and air supplied to the bars.

1. In grate-bars, the section a, consisting of a number of hollow perforated bars, an air-chamber, and journals, substantially as shown.

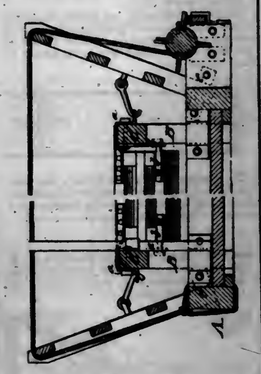


2. A section of hollow grate-bars, having an air-chamber in one end communicating with all the bars, substantially as set forth.

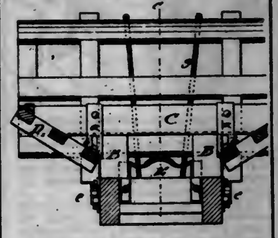
164,730. PLOWS. Augustus Griggs, La Fayette, Tenn. [Filed May 1, 1875.]

Brief.—A bar passes downward through the plow-beam and mold-board, serving both as a brace for the standard and a colter for the subsoiler.

The combination of the standard B, made with a concaved shoulder or offset upon the forward side of its lower part, the mold-board C, the point D, and the cutter and brace F, with the beam A, in substantially the manner herein shown and described.



164,730.



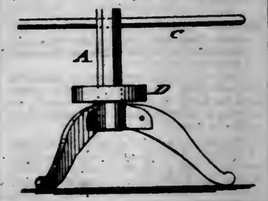
164,731.

164,731. HAT-RACKS. Joseph Hall, Riverside, Nebr. [Filed May 1, 1872.]

The combination of bed-frame A, having standards B and side sockets a, the cross-beams C C, having slotted heads c, and the frames D D', having fasteners, substantially as and for the purpose specified.

164,732. POLISHING-WHEELS. H. Hard, Wadsworth, Ohio. [Filed Dec. 16, 1872.]

Brief.—The strip of polishing material is connected to a roller arranged in the body of the wheel, to tighten and secure it.

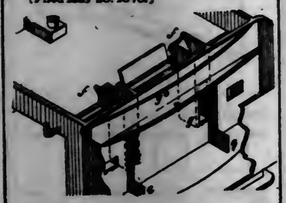


1. The combination of a roller with a wheel or drum or cylinder, for the purpose of holding and tightening the sand-paper, in the manner already described.

2. The combination of the disk G, roller E, plates C C', and bolt D, substantially as and for the purpose hereinbefore expressed.

164,733. CLOTHES-DRIERS. Conrad Hauser, New York, N. Y. [Filed May 26, 1875.]

The combination, with standard A, of the socket-plate D and fastener E to hold detachable arms C, in the manner described.



164,726. COMPOUND BOX-GIRDER. Adam Hay, Newark, N. J., assignor of one-half his right to Paul G. Batticher, same place. [Filed June 8, 1875.]

Brief.—A compound box-girder, consisting of cast-iron base with transverse ribs cast on the same, or fitting into dovetail tenons on the base, and wrought-iron sides united by bolts to the ribs.

The compound girder embracing the cast-iron base B, and ribs C, and the wrought-iron sides A, united by the bolts D, substantially as and for the purposes specified.

164,735. RESERVOIR COOKING-STOVES. R. M. Hermance, Half Moon, assignor of one-half his right to A. E. Fales, Troy, N. Y. [Filed May 20, 1875.]

1. The combination, substantially as before set forth, of an air-flue passing through the center of the top sheet-flue, a reservoir located in rear of the ordinary pipe-collar, and a reservoir-casing provided with outlets for the heated air, which are located beneath the plane of the top plate of the stove.

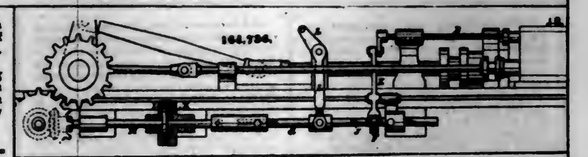
2. The combination, substantially as before set forth, of an air-flue passing through the center of the top sheet-flue, a reservoir-casing situated in rear of the rear flues, and the descending flue, into which the air escapes after imparting its heat to the reservoir.

3. The combination, substantially as before set forth, of an air-flue passing through the center of the top sheet-flue, a reservoir-casing located in rear of the rear flues and provided with division-strips, and the descending flues, into which the heated air escapes.

4. The combination, substantially as before set forth, of an air-flue passing through the center of the top sheet-flue, a reservoir-casing located in the rear of the rear flues and provided with division-strips, and a port or ports leading from said casing, and permitting the air to escape at a point below the top plate of the stove.

5. The combination, substantially as before set forth, of the bridge or part D and its subjacent hot-air flue.

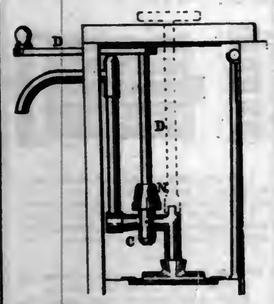
6. The combination, substantially as before set forth, of the air-flue passing through the center of the top sheet-flue, carrying heated air to the reservoir-casing, and the protecting-chamber located between the oven O and fire-box G.



7. The combination, substantially as before set forth, of the reservoir-casing and the bifurcated air-flue leading from the front of the stove to said casing, and passing the draft-damper, as described.

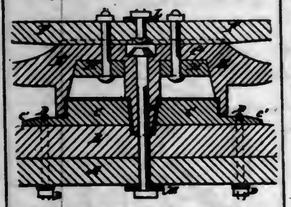
8. The combination, substantially as before set forth, of the flues *e e' e''*, casing B, and flue *f*, formed by the strips *q q*.

164,736. VALVE-GEARS FOR STEAM-ENGINES. Margaret V. Hewes, Newark, N. J., administratrix of Jos. L. Hewes, deceased. [Filed Mar. 6, 1875.]



Brief.—The valve-movement is geared to the main shaft. The small shaft that transmits the motion is divided into two parts, revolving in different planes, and connected together by a pin.

The combination of the independent shafts H G, placed out of line with each other, and connected by a crank-pin, J, and slotted disk K, with the cam F, lever E, rock-shaft D, and cut-off valve, substantially as herein shown, for the purpose set forth.

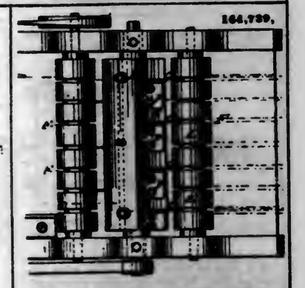


164,737. HYDRANTS. George Hillegass, Philadelphia, Pa. [Filed July 31, 1874.]

Brief.—A cap sliding on the key covers the supply-cock, and prevents dirt, dust, &c., reaching the same and affecting the joint thereof.

The cap N, sliding on the key D, and covering the supply-cock C, substantially as and for the purpose set forth.

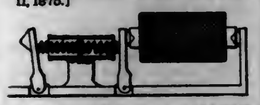
164,738. FLUTE-WHEELS. Jacob Hodge, Springfield, Ill. [Filed Apr. 24, 1875.]



1. The fifth-wheel C, having a slightly convex face, a central hole, and the side lugs *c'*, and the head-block E, made with a recess, having a slightly convexed face to receive the said fifth-wheel C, the hub *c'*, the grooved transverse rib *c''*, the flanges *c²*, the rear flanged projection *c³*, and the forward projection *c⁴* in combination with each other, and with the axle A B, the spring F, the reach I, and the king-bolt R, substantially as herein shown and described.

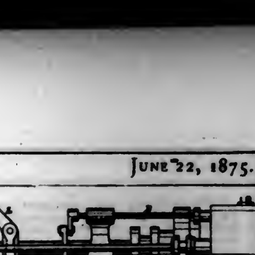
2. The combination of the straps K L M, and the bolts N O Q, with the fifth-wheel C, the head-block E, the spring F, the reach I, and the axle A B, substantially as herein shown and described.

3. The combination of the wooden blocks H with the recessed head-block E, and with the bolts G that secure the said head-block to the spring F, substantially as herein shown and described.



164,739. PLANING-MACHINES. Henry C. Holloway, San Diego, Cal., assignor to himself and John S. Harbison, same place. [Filed Mar. 1, 1875.]

Brief.—The radial saws are attached to the planing-cylinder by means of right-angled plates and T-head cover-bolts, the heads of which are inserted in dovetail or undercut grooves formed in the sides of the cylinder, and extending from end to end of the same, for the purpose of slitting the stuff into pieces of any desired width simultaneously with the planing or surfacing operation.



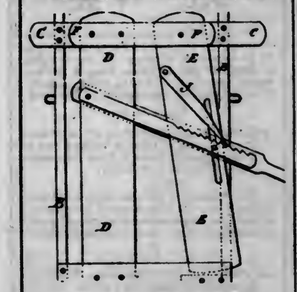
The angle-plates F, in combination with the slitting-saws C, bolts D, and grooved plane-carrying cylinder, all constructed and arranged as and for the purpose specified.

164,740. PIECING-WARP HOLDERS. H. S. Houghton, Smithville, Mass. [Filed May 11, 1875.]

A piecing-warp holder consisting of projections to center and support spools or bobbins, and to produce tension thereon, and adapted to operate in connection with warps being unwound from a warp-beam in a loom, to piece the warps when broken, substantially as described.

164,741. SAUSAGE-MACHINES. David J. Howenstine, Canal Fulton, Ohio, assignor of one-half his right to George N. Elliott, same place. [Filed Feb. 3, 1875.]

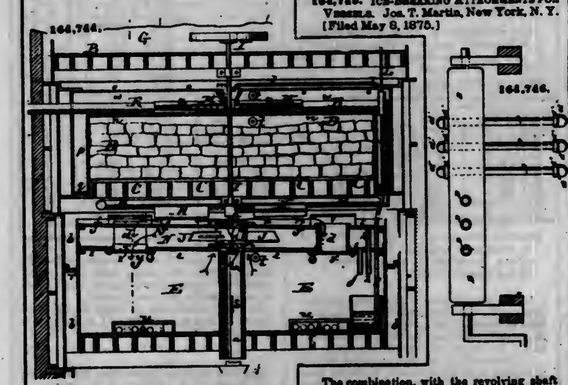
A sausage-filling machine, consisting of the external hollow cylinder, A, and the eccentrically-pivoted internal cylinder, B, provided with the ribs *r r r r*, scrapers *e e e e*, and rods *s s*, arranged and operated as set forth.



164,742. PAPER BOXES. Louis A. Kettle, Philadelphia, Pa. [Filed Dec. 12, 1874.]

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

The lid D, formed with tongues E, which lock with inwardly-projecting rims of the body of the box, substantially as and for the purpose set forth.



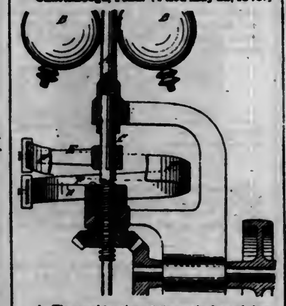
164,743. HOG-TRAPS. John M. Kimball, Wyoming, Iowa. [Filed May 22, 1875.]

The combination of the base A, posts B, cross-bars C F G H, stationary board D, pivoted and slotted board E, lever I, and pawl J, with each other to adapt them for use in catching and holding hogs, substantially as herein shown and described.

164,744. REFRIGERATOR-BUILDINGS. Theodore Kranech, New York, N. Y. [Filed Aug. 29, 1874.]

Brief.—One fan draws warm air from the lowermost cooling-chamber upward through a central flue, and spreads it laterally against the bottom of the ice, whence, cooled, it descends into both the middle and the lowest cooling-chambers. Another fan makes an air-circuit from the middle cooling-chamber centrally upward against and along the under side of the drip-floor, and downward into the same chamber. A third fan above the ice-chamber receives the drip-water from a pump, and sprays it to cool the air over the ice-chamber.

1. The combination of the drip-floor *f*, separated from the bottom C of the ice-chamber, with the ceiling *e* and the sides of the cooling-chamber E, whereby an air-chamber, N, is formed, substantially as shown and described.



2. The combination of the fan J with the drip-floor *f*, ceiling *e*, and with the sides of the chamber E, forming the chamber N, for operation substantially as specified.

3. The air-passages *d* and *g* in the drip-floor *f* and ceiling *e*, combined with the fans H and J, whereby cool air is circulated from the central flue to the air-chamber under the ice, and to cool the air-space N under the drip-floor, and thence back into the cooling-chamber, as described.

4. The hollow fan N, having perforated tubes *r* secured in its blades, and connecting with a central opening of said fan, substantially as and for the purpose herein shown and described.

5. The drip-tub *i* of the ice-house, combined with the pump L and hollow fan N, as set forth.

164,745. GOVERNORS. William D Marks, Chattanooga, Tenn. [Filed May 22, 1875.]

1. The combination of the conical pendulum B with the spring E and screw-spindle C, substantially as described.

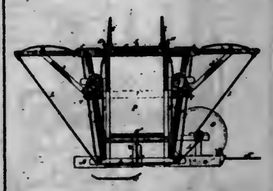
2. The combination of the screw-spindle C passing through the wheel G and the spring E, so attached to the spindle C and the wheel G as to raise and lower the valve by the yielding of the spring E, substantially as described.

3. The combination of the screw-spindle C, wheel G, spring E, and conical pendulum B with a valve, so as to regulate the speed of an engine or other prime mover, by using the inertia of the conical pendulum B to close the valve, and its extra-acquired momentum to open the valve when a change of speed is attempted, the valve movement preceding the action of the pendulum, substantially as and for the purpose described.

164,746. ICE-BREAKING ATTACHMENTS FOR VESSELS. Jos. T. Martin, New York, N. Y. [Filed May 6, 1875.]

The combination, with the revolving shaft B, of the transverse sliding shafts D, provided with heads *d²* and cushions *d³*, placed at right angles with each other and with the shaft B, substantially as herein shown and described, and for the purpose set forth.

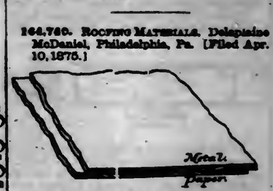
164,747. NUT-LOCKS. Walter F. Matthews, Pittsburg, Pa. [Filed Mar. 20, 1875.]



Brief.—A plate, with an inwardly-projecting pawl to engage with a ratchet formed on the screw-bolt, is pivoted, so that a spring occupying a recess in the upper side of the nut, and attached rigidly by one leg to the under side of the plate, acts to hold the pawl and ratchet engaged or disengaged, as desired.

The combination of the pivoted locking-plate C, having an inner lip, *g*, with the nut B, and the coil-spring arranged in recess A, and having one of its legs secured to the nut and the other to the locking-plate, as shown and described, to operate as specified.

164,748. HAT, COTTON, AND WOOL PRESSES. Maria McBurney, Sacramento, Cal., administratrix of Wm. H. McBurney, deceased. [Filed Apr. 3, 1874.]



Brief.—In a vertical frame. Ends of side levers drawn down by ropes on a working-shaft. Descending bars pivoted to the middle of the levers draw down other ropes passing over pulleys, and attached to protruding ends of the follower to draw it upward.

1. The vibrating hooked levers G', in combination with a hinged door, having a barbed catch, *f*, and a press-frame, having stationary staples H, substantially as specified.

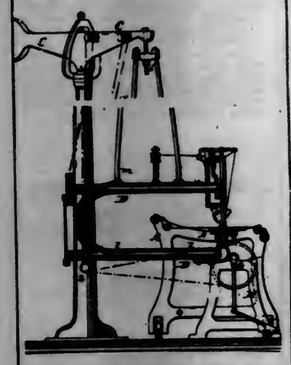
2. The vertically-movable follower H', having a brace, A, cords I I', pulleys J, connecting-rods J', and actuating-levers K, in combination with the windlasses M W, whereby the winding of the rope around one windlass will unwind the rope coiled upon the other, substantially as specified.

164,749. ROOFING MATERIALS. Delapaine McDaniel, Philadelphia, Pa. [Filed Apr. 10, 1875.]

As a new article of manufacture, the roofing material consisting of the metallic sheet and fibrous lining sheet united by suitable adhesive material under compression, substantially as specified.

164,750. SASH-FASTENERS. Peter Meyer, Iowa City, Iowa. [Filed May 22, 1875.]

Brief.—Is fastened through its fastened upper end to the sash, its lower end curving to form a handle for conveniently raising or lowering the sash. The middle part of this spring-latch, bearing on the window-frame, is perforated, so that it may engage over pins at suitable distances on the frame, thus fastening down the sash, or holding it at intermediate heights, in desired position.



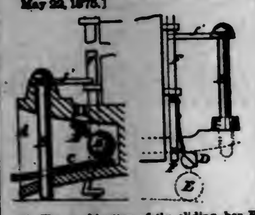
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

A seal-fastener composed of a spring bead or latch, C, attached to the sash, and provided with a perforation, C', at its middle part, and a lower handle part, in combination with the locking-pins D of the window frame, to be operated substantially as shown and described.

164,751. EMBROIDERING-MACHINES. P. Michalet and Pascal Bourget, Lyons, France. [Filed Feb 26, 1875.]

Brief.—A sewing-machine hung in a pivoted frame can be moved in any direction to conform to the pattern to be embroidered on the material, which is carried on a traveling frame, that allows the material to rest on the bed-plate of the machine.

In an embroidering-machine, the combination, with the balanced lever C, adapted to be turned upon the vertical pivots i i, and the U-shaped embroidering-frame D, of the rods m m, vertical pivot O, and nut O*, substantially as herein shown and described.

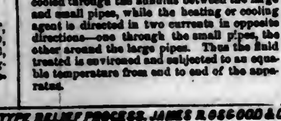


164,752. BAG-LOCKS. Frank W. Mix, Terryville, Conn., assignor to the Eagle Lock Company, same place. [Filed Apr. 20, 1875.]

1. The spring-dog c, pivoted upon the base A, and provided with mechanism for holding it to either side, in combination with the legs b n of the slide D, all operating together within the case, substantially as described.

2. The combination of the case B, slide D, and its legs b n, handle E, spring d, catch C, and swinging dog a b, pivoted upon the base-plate A, all substantially as described.

164,753. CAR-COUPLINGS. Rocco Misco and Bishop J. Warner, Macon, Miss. [Filed May 22, 1875.]



1. The combination of the sliding bar F, provided with an arm, f', the rock-bar D, having its outer end notched, and the bell B, with the bumper-head A and the coupling-pin B, of a car-coupling, substantially as herein shown and described.

2. The coupling-link C, having its end parts filled up, leaving a slot or cavity in its mid dle part, in combination with the bell E, rock shaft D, sliding bar F, arm f', coupling-pin B, and bumper-head A, substantially as herein shown and described.

164,754. FLOORING-CLAMPS. Jno T Moss and G. J. Moss, Ashborough, Ind. [Filed Dec. 28, 1874.]

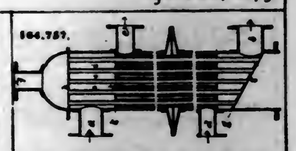
Brief.—The clamp consists of a peculiar shaped clamping lever, provided upon its rear part with a pawl and two extensible gripingplates, adapted for attachment to joists of different sizes.

The combination, with lever G, having pawl H, of plate A, having extension E, and grooved plate F, having lip C, the former adjustable in the latter, as and for the purpose specified.

164,755. WASHING-MACHINES. M. Newton, Kentland, Ind. [Filed May 17 1875.]

The combination of the perforated cylinder A B, T-shaped beckets D D, angular bars E E, and perforated band or roll G, all constructed and arranged substantially as and for the purpose herein set forth

164,756. MEANS FOR PUMPING WELLS. A. E. Nickerson and Levi C. Streeter, Allegheny Township, Venango County, Pa. [Filed May 31, 1875.]



1. The combination of the band-wheel B with crank c, the pitman b, walking-beam A', rope or chain d, pulley e, and walking-beam A', having depending braces C, substantially as and for the purposes herein set forth.

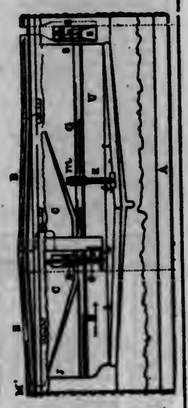
2. The combination, with the band-wheel B and crank c, of the pitman f, T-shaped lever D, rods h A, L-shaped levers E F, rods i i, and walking-beams A' A', substantially as and for the purposes herein set forth.

164,757. COOLERS AND CONDENSERS OR HEATERS. Charles H. North, Somerville, Mass. [Filed May 13, 1875.]

Brief.—Passes the fluid to be heated or cooled through the annulus between the large and small pipes, while the heating or cooling agent is directed in two currents in opposite directions—one through the small pipes, the other around the large pipes. Thus the fluid treated is environed and subjected to an equable temperature from end to end of the apparatus.

164,759.

The apparatus above described, consisting of the inlet a and outlet b for the fluid or gas to be cooled, the plates g h i k, the two sets of pipes, the pair of inlets c and d, and the pair of outlets e and f for the cooling medium, arranged together substantially as described.



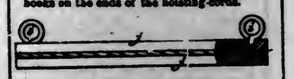
164,758. MANUFACTURE OF ARTIFICIAL STONE. Luke W. Osborn, Morgan, and H. D. Merriam and Peter B. Doty, Conneaut, Ohio [Filed Dec 19. 1874.]

The combination of sand, resin, brimstone, and coal tar, with or without oil and plaster-of-paris, for the manufacture of artificial stone, substantially in the manner herein described.

164,759. RAILWAY-CROSSINGS. Emmet J. Patterson, Chicago, Ill. [Filed Oct. 17, 1874.]

Brief.—A railroad-crossing in which the flange-space is filled while a train crosses a line by a plug, which is elevated into the space by the weight of the approaching train upon an elevated section of the line-rails, acting through appropriate mechanism. When the plug is thus elevated, a stop-block is forced under it, and when the train has passed a spring returns the raised rails, likewise withdrawing the stop-block, and permitting the plug to fall.

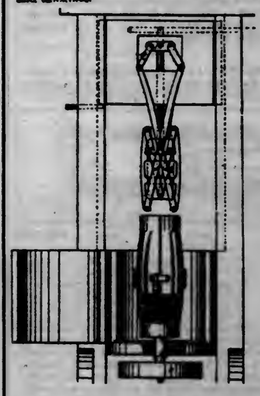
164,759.



1. The panels C C and supporting-rails B B, in combination with arm D, rod and spring F e, cam-levers 3 and 6, shaft G, plug e, and block h, as and for the purpose specified.

2. The combination of shaft G, rod and spring H, arm m, and stripe I I, substantially as set forth

164,760. INVALID-BEDSTEADS. Geo. Pence, Gilman, Iowa. [Filed July 11, 1874.]



Brief.—The ends of the sheet are clamped between the sections of the rod, and the eye-screws, by which the sections are secured together, furnish points of attachment for the hooks on the ends of the hoisting-cords.

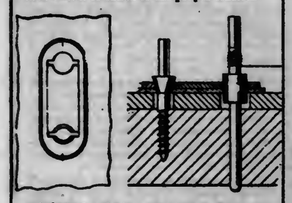
The combination of the eye-screws i i with the sections j j of the rods J, sheet H, and hooks k k upon the ends of the cords K, substantially as specified.

164,761. CENTRIFUGAL MACHINES FOR MAKING PAPER BARRELS. W. G. Pennypacker, Wilmington, Del. [Filed Apr. 24, 1875.]

Brief.—The pulp is placed in the sectional cylinder. The strikes are lowered into it and gradually expanded as the cylinder is made to rotate, thus reducing pulp to the proper shape and thickness

The combination of rotary centrifugal cylinder and circumjacent case, both made in sections that open and close longitudinally, as and for the purpose specified.

164,762. SAW JOINTERS AND GAGES. R. H. Poindexter, Anderson, Ind. [Filed Dec. 11, 1874.]



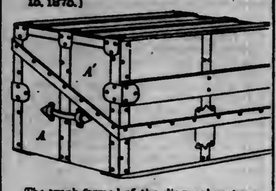
1. A saw jointer and gage provided with a laterally-adjustable plate, e, whereby the tooth is prevented from springing while being filed, substantially as set forth.

2. The metal frame a, having the flanged surfaces g and g', projections f, clamp d, adjustable plate e, and set-gage s, substantially as specified.

164,763. PIANO-TUNING-PIN LOCKS. Geo. P. Reeves, Helena, Mont., assignor to himself and Chas. Bramley, same place. [Filed Mar. 29, 1875.]

Brief.—A link-plate connects the tuning-pin with the setting-pin, the latter having a cone-shaped head, that crowds a slide-plate against the tuning-pin after its string has been drawn or tuned to the proper tension.

A fastening device or "tone-lock," for tuning-pins of pianos and other stringed instruments, consisting of the combination of the insulated tuning-pin with insulated fixed and sliding jaw-plates and an adjustable locking pin or key with conical wedge part, arranged and applied substantially as and for the purpose set forth.



164,764. DIES FOR FORMING SCREW-THREADS. Frank Rhind, Brooklyn, N. Y., assignor to Bristol Brass and Clock Company, Bristol, Conn. [Filed Jan. 13, 1875.]

Brief.—Stamping screw-threads on sheet-metal collars by means of dies, each having a screw-thread thereon.

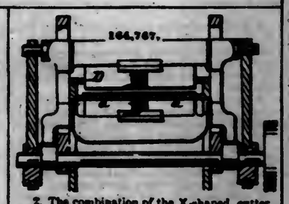
1. The combination of the recessed block A, divided dies B and E, and wedge F, substantially as shown.

2. The die E, formed in four pieces, all of which are pivoted so as to close inward, substantially as described.

164,765. PHOTOGRAPHIC DARK-TRUNKS. Frank Robbins, Oil City, Pa. [Filed May 15, 1875.]

The trunk formed of the diagonal sections A and A', and provided with hood B, frame C, and curtain D, substantially as specified.

164,766. COMBINED LAMPS AND OIL-CANS. William Roberts, Quincy, Ill. [Filed Mar. 20, 1875.]

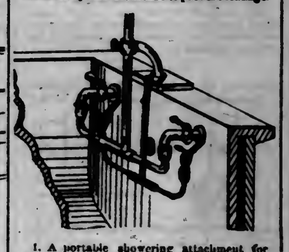


1. The lever M supported at its power end by a spring on the handle of the oil-can, resting with the other end upon and holding down an air-valve, substantially as and for the purpose specified.

164,767. SUGAR-CUTTING MACHINES. F. Rochow, Brooklyn, N. Y. [Filed May 26, 1875.]

Brief.—The knives or clipping-tools operate by cams and eccentrics, from above and below a fixed table, through slots. The sugar-block is carried forward by the intermittently-moving carrier, being firmly clasped by the same, and is thus separated into cakes of desired size.

1. In a sugar-cutting machine, the combination of a reciprocating cutter, D, with the intermittently-moving carrier C, which is provided with apertures that grasp the edges of the slabs of sugar to be cut, and with the stationary table d, substantially as herein shown and described.



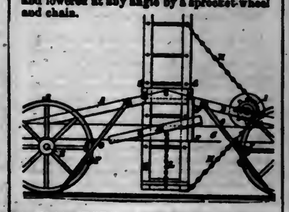
164,767.

2. The combination of the X-shaped cutter D, placed beneath the slotted table e, with the carrier C, and with the upper X-shaped cutter D, all substantially as herein shown and described.

164,768. SHOWERING ATTACHMENTS FOR BATH-TUBS. William H. Rowe, Washington, D. C., assignor of one-half his right to Quinton Corwine, same place. [Filed June 9, 1875.]

Brief.—The stand-pipe having the sprinkler is joined to the cocks of the bath-tub by telescopic-pipe arrangement, thus allowing it to be used in any tub. The pipe is supported by a bracket, as shown, being held by a set-screw, while the connections with the cocks are made by suitable means to prevent leakage.

1. A portable showering attachment for bath-tubs having a rigid stand-pipe, provided with a sprinkler and device for connecting with the faucet, so that it may be readily attached or removed therefrom, substantially as described



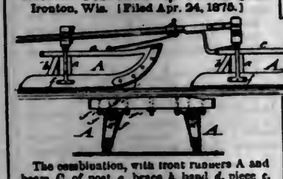
164,768.

2. The combination of the stand-pipe, provided at its upper end with a sprinkler, a branch pipe or pipes for connecting with the faucet or faucets, and a bracket for holding it in position, substantially as described, for the purpose specified.

3. The combination of the stand-pipe, arms for connecting with the faucets, the bracket for holding the pipe in place, and device for jamming the pipes firmly upon the faucets.

164,769. FIRE-ESCAPE LADDERS. David Sanford, Ashton, Ill. [Filed Mar. 6, 1875.]

Brief.—A hollow square ladder pivoted to the timbers of the truck-frame at or near the center thereof, in gimbal-bearings, and raised and lowered at any angle by a sprocket-wheel and chain.



1. The combination of the inclined parts D D of the wheeled frame, and the hollow ladder E, pivoted between the bars, and at the angle thereof, by means of gimbal-coupling F G, as shown and described, for the purpose specified.

2. The combination of the chain H, spur-wheel I, and crank-shaft J, with the ladder E, gimbal F G, and carriage-frame C D, substantially as herein shown and described.

3. The combination of the chains L, levers M, and ratchet-bars N, with the ladder E, the gimbal F G, and the carriage-frame C D, substantially as herein shown and described.

4. The combination of the swiveled braces O, and the chains P, with the carriage A B C D, of the pivoted ladder E, substantially as herein shown and described.

164,770. BOB-SLEDS. John J. Sandgren, Ironton, Wis. [Filed Apr. 24, 1875.]

The combination, with front runners A and beam C, of post a, brace b, band d, piece e, side braces f, and eyebolts f', as and for the purpose specified.

164,771. SCAFFOLDS. John R. Sanders, Indianapolis, Ind. [Filed Apr. 20, 1875.]

1. The combination of the sliding bar F, provided with an arm, f', the rock-bar D, having its outer end notched, and the bell B, with the bumper-head A and the coupling-pin B, of a car-coupling, substantially as herein shown and described.

4. A metallic back-band loop, L, constructed with a raised plane surface, r, around its apertures l, as described, in combination with the tree and back-band, substantially as and for the purpose herein specified.

5. A harness-saddle tree provided with upwardly-inclined pins s s, cast with the frame, and projecting from its lower ends, substantially as and for the purpose herein specified.

164,772. CARPET-CLEANERS. D. B. Scofield, Baker City, Oreg. [Filed Apr. 10, 1875.]

Brief.—A device for extracting grease-spots from carpets by suction.

A device for removing spots from carpets, consisting of tube A, provided with the ring-cap E, the wire cloth F, and sponge G, or their equivalents, the two holes a' a', the valve I, and the piston and piston-rod B C, substantially as herein shown and described.

164,773. SHEET-METAL HINGES. Samuel Scott, Springfield, Ohio, assignor to Wm. A. Dodge, New York, N. Y. [Filed June 29, 1874.]

Brief.—In a sheet-metal hinge that portion of one of the leaves which is ordinarily cut away to make room for the hub of the other leaf is bent out, and utilized to form a rigid arm or auxiliary leaf, standing at or near right angles to the main leaves, preventing wastage, and materially strengthening the hinge.

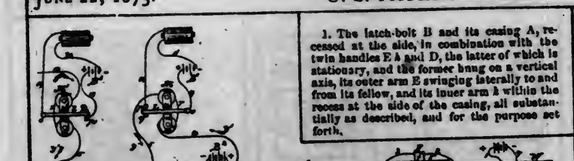
1. In an oil-stove, the combination of the perforated plate E, plate G, having the projections f to guide the air to the flames, the perforated plate H, air-chamber h, and perforated rim I, substantially as shown and described.

2. The combination of the air-reservoir B, hollow plate D, with asbestus packing, the air-space b, vent-tube d, and valve e, all constructed substantially as and for the purposes herein set forth.

164,774. JOINT-SUPPORTS FOR STREET-RAILWAY RAILS. Cevedra B. Sheldon, New York, N. Y. [Filed May 3, 1875.]

164,774.

164,775.



Brief.—A chair for street-railway rails, consisting of a plate conforming to the shape of the under side of the rail, and having upper and lower flanges on its edges, which prevent lateral displacement of rail, and also of the plate or chair upon the stringer or longitudinal timber. A bolt secures the end of each rail to plate.

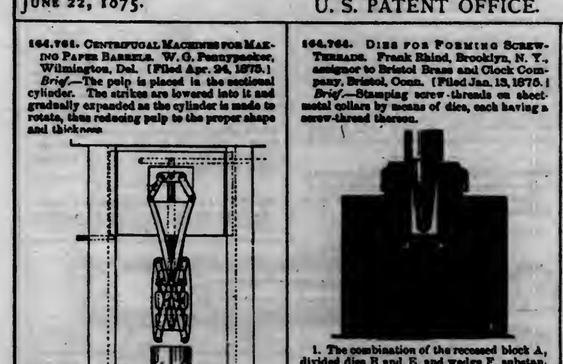
1. A splice-plate for rails laid on stringers, firmly bolted to both rail ends, and having flanges to prevent lateral play on the stringer, also flanges to prevent lateral play of the rails, substantially as specified.

2. The splice-plate for rails laid on stringers having a crowning middle portion of the web corresponding with and fitting in the under side of the rail, in combination with ribs g for preventing lateral movement of the rails, substantially as specified.

164,776. LATCHES. Thomas Bell, Jr., Cincinnati, Ohio. [Filed Apr. 26, 1875.]

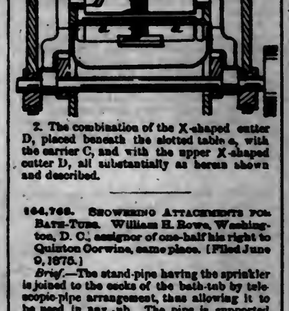
1. The latch-bolt B and its casing A, recessed at the side, in combination with the twin handles E A and D, the latter of which is stationary, and the former hung on a vertical axis, its outer arm E swinging laterally to and from its fellow, and its inner arm h within the recess at the side of the casing, all substantially as described, and for the purpose set forth.

2. The barrel A, having the square end plate d, in combination with the latch-bolt B and fastening-plate C, having the hub e, which fits within the mouth of the barrel, all substantially as described.



164,777. BALING-PRESSES. John C. Stokes, Villanow, Ga., assignor to himself and Jos. W. Cavender, same place. [Filed Mar. 6, 1875.]

Brief.—The pawls have long notches with concave shoulders formed in their forward upper ends, to receive the pins of the driving-wheel. Two sets of notches in their lower ends receive the pins of the operating-lever. The ratchet-wheel is adapted to be turned in either direction by means of the pawls.



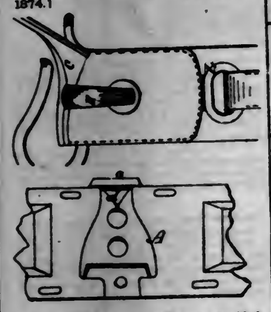
164,778. SEED-DRILLS. Jos. R. Symmes, Hamilton, Ohio. [Filed Sept. 20, 1874.]

Brief.—Scrapers upon the bottom of the drill-tubes sweep away a place upon the surface of the ground for the seed, which is afterward covered by plows following closely in rear, and leaving deep furrows between each ridge.

164,778.

164,779. DEVICES FOR CONVERTING MOTION. George Turner, Kalamazoo, Mich., assignor of one-half his right to Le Grand Whitcomb, same place. [Filed Mar. 27, 1875.]

The spurred rings D D', clamped between two circular plates, E E, each plate having inclined planes c c, which terminate in semi-circular recesses d, and the balls c, in combination with the racked pitman C and operating mechanism.

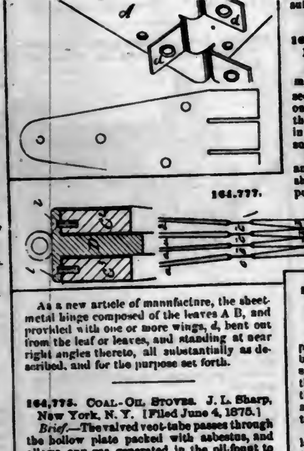


164,780. PLOW-COULTER CLEANERS. Theodore Wallis, Scipio, and Oscar J. Case, Auburn, N. Y. [Filed Mar. 13, 1875.]

The combination, with the sod-cutter D and the wheel H, of the crank-rod I, the loop J, formed of one and the same piece with the

An adjustable bracket formed of one piece of casting, with corel receptacles for the uprights B, cross-ties C, C', and J, constructed and operated substantially as specified.

164,776. HARNESS-SADDLES. Abraham V. Sargeant, Newark, N. J. [Filed Aug. 7, 1874.]



1. A metallic harness-saddle tree provided with a cast projection, *a*, to serve as an immediate support for the upper points *b b* of the jockeys, substantially as herein specified.

2. The wedge-shaped projection *c* on the seat C, in combination with a corresponding cavity, *d*, in the upper surface of the tree, substantially as and for the purpose herein specified.

3. A harness-saddle tree having right-angled pin-projections *h h* cast upon its inner faces, for supporting the saddle-skirts in position, substantially as and for the purpose herein specified.

164,777. LOOM-HARNESS. Joseph Sladdin, Lawrence, Mass. [Filed May 20, 1875.]

164,777.

1. A loom-harness, having its heddle-eyes made from lengths of yarn, and these yarns secured to three rig-bands, of which rig-bands one is at one side and two at the other side of the harness, whereby the eyes are arranged in four series in different vertical planes, all substantially as and for the purpose described.

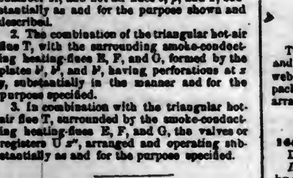
2. The blocks D, provided with an eye, *e*, and applied and secured to the loom-harness shafts C C, substantially as described, for the purpose specified.

As a new article of manufacture, the sheet-metal hinge composed of the leaves A B, and provided with one or more wings, *d*, bent out from the leaf or leaves, and standing at near right angles thereto, all substantially as described, and for the purpose set forth.

164,778. ELECTRIC RAILWAY-SIGNALS. H. W. Spang, Reading, Pa. [Filed Mar. 24, 1874.]

1. The combination of a series of batteries, polarized relays, and means for making or breaking the circuits of the batteries, arranged substantially as set forth, whereby any one of the relays will be operatively affected only by the current from its own designated battery, and not by the current from either of the batteries adjacent to such designated battery.

2. The combination and arrangement of polarized relay M, section of track A A, and battery B with polarized relay M', section of track A^1 A^1, and battery B^1, so that should current of battery B^1 pass over relay M a safety-signal will not be given, as set forth.



3. Circuit-closer and breaker E and wire 6, in combination with rails F^2 F^2, as set forth.

4. Switch-rails E^2 E^2, in combination with rails F^1 F^2 R, wire 2, circuit-closer F, or plate *f*, wire 3, and rails R^1, as and for the purpose set forth.

5. Rails E^1 F^2 F^2 of section A^1 A^1 of branch track or siding, and wire 4, in combination with frog H, or wire 12, and rails E^1 F^2 F^2 of main track A A, as set forth.

164,779. COAL-OIL STOVES. J. L. Sharp, New York, N. Y. [Filed June 4, 1875.]

Brief.—The valved vent-tube passes through the hollow plate packed with asbestos, and allows any gas generated in the oil-fount to escape and be drawn into the wick-flame.

164,780. BELL TOYS. Francis Arnold, Chatham, Conn. [Filed May 4, 1875.]

The combination of the barrel *a*, cylindrical throughout, or at or near its ends only, the bells d d^2, attached to the inside of the cylinder or ends by connections d^3, and the bail *c*, its ends entering the centers of the ends of the cylinder, the whole constructed substantially as shown and described.

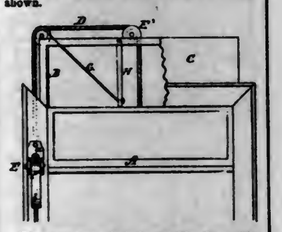
164,781. TOYS. Charles A. Bailey, Cobalt, Conn. [Filed May 31, 1875.]

The herein-described toy ball, consisting of the spherical shell with one or more bells permanently suspended therein, substantially as described.

164,782. PROCESSES OF TANNING HIDES. Edgar A. Baldwin, Phelps County, and C. A. Holcombe, Lincoln, Nebr. [Filed May 21, 1875.]

In tanning hides or skins, the plant *Polygonum fimbriatum*, (Eaton,) treated in the manner herein described.

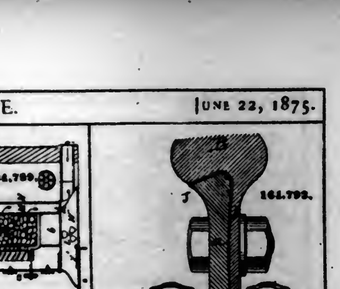
164,783. RAILWAY-TRACKS. R. Sanolas, Madrid, Spain. [Filed May 17, 1875.]



Brief.—An improvement in railroad-tracks, in which a compound rail with detachable head and web, bolted to a permanent base and web, is secured to an I-shaped cross-tie, the intervals between the sections of the rail and the base of rail and the tie being provided with an elastic packing.

164,784.

The combination, with the I-iron ties H and rubber packing J, of the base or foot A, web *a*, cap or head B, web *b*, and interposed packing J, the whole being constructed and arranged as and for the purpose specified.

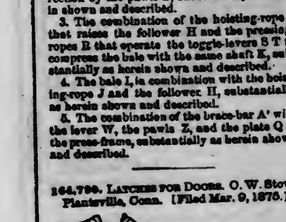


164,784. TRANSOMS FOR DOORS. J. Berndt, Denver, Colo. [Filed May 18, 1875.]

Brief.—The transom is raised and lowered by a rope running on pulleys. It is held down by lock-bar, so that it cannot be opened from the outside. The rope, holding the transom in any desired place, is locked fast by the device shown.

The transom-sash A, in combination with the casing C, the cord D, pulleys E E^1 E^2, fastening F, branch cord G, and the locking-bar H, substantially as and for the purpose described.

164,785. HARVESTER-RIBBLS. Jas. F. Black, Oshkosh, Wis. [Filed Mar. 13, 1875.]



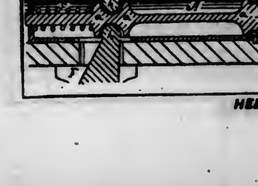
164,785.

The flat reel, consisting of the shafts 13 and 17, drums 15, 15' and 16, 16', swing-beam 18, tighteners 27, and rollers 28, endless chains 24 24', sockets 6, and standards 25, all arranged and operating substantially as and for the purpose set forth.

164,786. CARDING-MACHINES. Thomas Howard Blamires, Henry Blamires, and Harry Marsden, Huddersfield, England. [Filed Mar. 16, 1874.]

Brief.—For delivering the fleece from a carding-engine in folds, and winding it in the form of a lap, which is to be removed and fed into another engine.

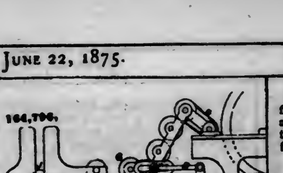
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



164,786.

The creeper B, in combination with the crank C, rod D, pressing-roller G, creeper E, roller J, rollers or drums K K', bevel-wheels L N N', ratchet-wheel D', shaft L', and lever O, all arranged and constructed to operate substantially as described, and for the purposes set forth.

164,787. PRESERVING EFFERVESCENT LIQUIDS. John G. L. Boettcher, Brooklyn, N. Y. [Filed Apr. 29, 1875.]



Brief.—The gas is automatically supplied from a proper receptacle to the liquid to be preserved. It is introduced below the level of the liquid by the means shown.

In an apparatus for supplying carbonic-acid gas to a vessel containing beer or other liquid to be preserved, the combination of a portable closed vessel in which carbonic-acid gas is stored, with a pipe and faucet, said pipe extending from the vessel containing carbonic-acid gas under pressure and connected with the faucet, which is constructed to be secured to the vessel below the level of the liquid, substantially as herein shown and described, whereby the carbonic-acid gas in the portable closed vessel is automatically supplied to the liquid in the vessel through the faucet, as set forth.

164,788. MACHINES FOR MAKING BOXES. John W. Bowers, South Carver, Mass. [Filed Mar. 17, 1875.]

Brief.—The device facilitates the making of boxes by holding the different pieces of which it is composed in their proper position with relation to each other while being nailed together.

1. The combination, in a box gaging and holding frame, of the wings B B', having springs *d d*, whereby they form both clamps and guides on their outside and inside surfaces, respectively, the opening *e* beneath the one wing, the posts or stops C C', and the shoulders or projections *c c*, substantially as and for the purposes herein set forth.

2. The combination, with the plate or connecting-piece D, of the wings B B', forming combined clamps and guides, made adjustable toward or from each other, essentially as described.

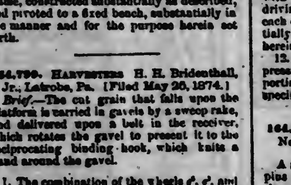
3. The combination of the extension-bart C' C' with the wings B B', substantially as specified.

4. The adjustable blocks, stops, or pieces *f f'*, in combination with the posts C C' and bar C', connected with or forming parts of the wings B B', essentially as described.

5. The extension-bar D', in combination with the plate D and wings B B', substantially as specified.

6. The box gaging and clamping or holding frame, constructed substantially as described, and pivoted to a fixed bench, substantially in the manner and for the purpose herein set forth.

164,789. HARVESTERS. H. H. Bridenthall, Jr., Latrobe, Pa. [Filed May 26, 1874.]



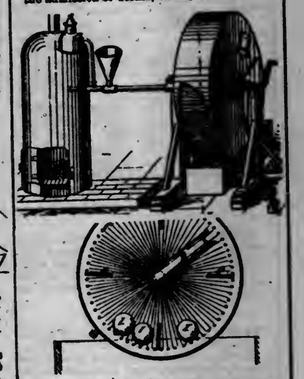
Brief.—The cut grain that falls upon the platform is carried in gavels by a sweep-rake, and delivered upon a belt in the receiver, which rotates the gavel to present it to the reciprocating binding-hook, which knits a band around the gavel.

1. The combination of the wheels c^1, c^2, and c^3, clutch c^4, shipper-lever O, arm o^1, rod P, and the toothed segmental arm J, with each other and with the driving-shaft E and the compressing-belt M, substantially as herein described, and for the purposes set forth.

In a grain-drill, the combination of the surface-sweeping grain-distributers with the ridge-forming covering-plows, substantially as and for the purpose herein specified.

164,790. COMBINED CARRIAGES AND CHAIRS FOR CHILDREN. Chas. F. Tenny and Thos. J. Hobbs, Baldwinsville, Mass., assignors to Thompson, Farley & Waite, same place. [Filed Mar. 17, 1875.]

Brief.—The pivoted legs can be adjusted with relation to the seat of the chair, so that the latter can be used either as a chair or carriage, and the pivoted table or play-shelf can be used as a handle, by which to push the carriage when desired.

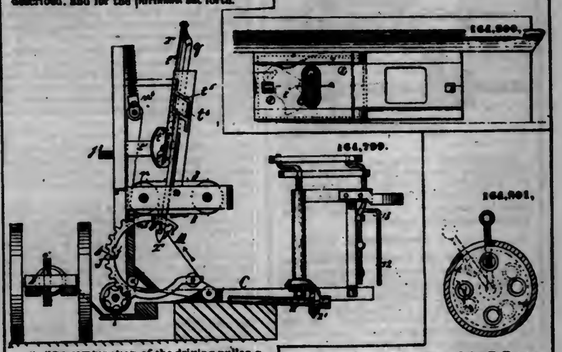


1. A child's carriage, composed of a seat, *a a'*, legs *b* connected with the seat, legs *c* pivoted to legs *b*, and wheels, all combined to operate substantially as described, and to be converted into a high chair, as set forth.

2. The combination, with the seat and its hinged legs *b*, of the legs *c* pivoted to legs *b* and the pivoted guard, connected with legs *c*, as described, whereby downward pressure on the guard throws it back against the seat, substantially as described.

3. The combination, with the carriage, of the table or play-shelf *i*, substantially as described.

164,791. CYLINDER WASHING-MACHINES. Sigismund Wehoy and Agnes F. Wehoy, New York, N. Y. [Filed May 1, 1875.]



Brief.—A closed revolving cylinder with an inclosed cylinder of cane-rods, within which are shelves arranged radially, and loose balls. On one side the cylinder revolves on a hollow axle, which opens into a perforated tube for the admission of steam, water, &c.

1. In a washing-machine, the combination of the closed revolving cylinder A, having an open concentric cylinder C of elastic cane rods, leaving an uninterrupted space between them and balls I, whereby the clothes are washed, rinsed, and moisture expelled therefrom, in the manner described.

164,792. SEAL-ESCUTCHEONS. R. J. Brooks, New York, N. Y. [Filed May 15, 1875.]

A seal-escutcheon, having a tearing pin or pins attached to an automatic fastening for the seal-cover, whereby the seal will be torn in the act of releasing the seal-cover, substantially as set forth.

164,799.

164,800.

164,801.

164,801. SOAP-HOLDERS. John F. Bryan, Canton, Ohio. [Filed Mar. 6, 1875.]

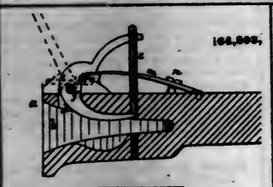
Brief.—A holder for powdered soap, having a sliding valve-bottom, and provided with a bracket to attach it to the wall of a room.

1. A powdered-soap holder, provided with a sliding valve, *d*, and combined with a suitable bracket attached thereto, whereby the device may be secured to the wall, substantially as and for the purpose described.

2. The powdered-soap dish, consisting of holder B, cover A, valve-opening bottom *b*, and bracket C, substantially as and for the purpose described.

164,802. FRICTION-SLIDES FOR DROP-LIGHTS. John T. Bruen, Brooklyn, N. Y. [Filed Mar. 17, 1875.]

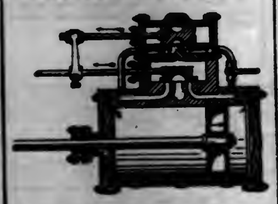
Brief.—Vibrating levers having clamping-jaws on inner end, and male centers resting in lugs upon the adjustable frame.



1. The combination, with the frame A, of the vibrating-levers D, having the clamping-jaws E formed on their inner ends for clamping the pipe or spindle C, and having their outer ends formed with male centers engaging with female centers in the lugs G on the frame, as herein shown and described.

2. The combination, with the frame A and levers D, of the adjustable sliding blocks H, for regulating the pressure of the clamping-jaws, substantially as described.

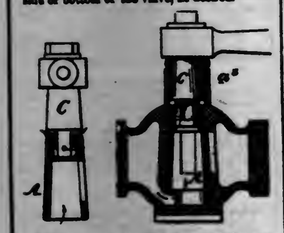
164,803. CAR-COUPLINGS. W. S. Burton, Maryville, Tenn., assignor of one-third his right to John S. Lawrence, same place. [Filed May 27, 1875.]



The combination, with the buffer *a* and pin *c*, of the cam *f*, constructed as described, having the projection *l* on its shaft, and the spring *m*, all arranged and operating substantially as and for the purposes set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

164,803.



164,804. STEAM-ENGINES. Hiram P. Case, Detroit, Mich. [Filed Dec. 30, 1874.]

The combination, with a steam-engine, of an independent valve and valve-chest and pipes, for transferring a portion of the exhaust steam to the steam side of the piston, at or near the completion of each stroke of the piston, substantially as described.

164,805. FAUCETS. Louis Chaine, San Jose, Cal., assignor of one-half his right to H. M. Magee, same place. [Filed Apr. 30, 1875.]

Brief.—Water is admitted to the space between the plugs, to prevent them from becoming jammed in the valve-chest. The supply-pipe may be attached to the inlet on the side or bottom of the valve, as desired.

1. The combination in a faucet of the two plugs A and C, loosely connected together, the plug A being open at its large end to the inlet, and having a passage through it to the space between the two plugs, all substantially as and for the purpose set forth.

2. The combination of the outer casing or chest, and its open plug, A, with the branches a' and a^2, both communicating with the said plug and with a screw-plug, E, adapted to both branches, as set forth for the purpose specified.

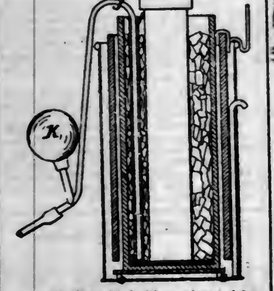
164,806. CASES FOR PRESERVING CIGARS. William B. Chandlee and Edwin H. King, Washington, D. C. [Filed Mar. 12, 1875.]

Brief.—Cigars, intact in their packages, are deposited upon skeleton shelves. Water is kept in shallow vessels beneath. Air is admitted at the base, and ascends through the top under regulations.

1. The process of fruhing and preserving the freshness of cigars, without removing them from their original boxes, by inclosing or enveloping the same in a confined atmosphere, which is supplied with different degrees of moisture or humidity at different heights by contact with water-surfaces, as herein set forth.

2. A close, upright case, having one or more pans or trays adapted to expose large surfaces of water within the case, as means for fruhing and preserving the freshness of cigars and tobacco, in the manner herein set forth.

3. A close, upright case, having one or more horizontal pans or trays exposing water-surfaces, which supply moisture to the air within the case, and impermeable lining to prevent the walls from absorbing moisture, substantially as herein illustrated and set forth, for fruhing and preserving the freshness of cigars and tobacco in the manner specified.

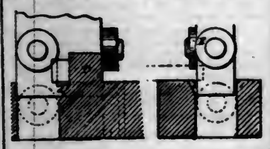


4. The combination, in a close upright case, of the water pans or trays P, (one or more,) operating as described, and two or more open shelves S, for supporting boxes of cigars at different distances from the water surfaces or surfaces, substantially as herein shown and set forth.

5. The combination of walls and doors W D, metallic lining *l*, one or more water pans or trays P, and supporting shelves at different distances from the water pans or trays, substantially as herein shown and described for the purpose specified.

6. The combination, in a case for fruhing and preserving the freshness of cigars and tobacco, of two or more pans P, and waste-pipes *d* for emptying or partially emptying one or all of the pans, as means for regulating the operation of the case by varying the area or extent of exposed water-surface, as herein set forth.

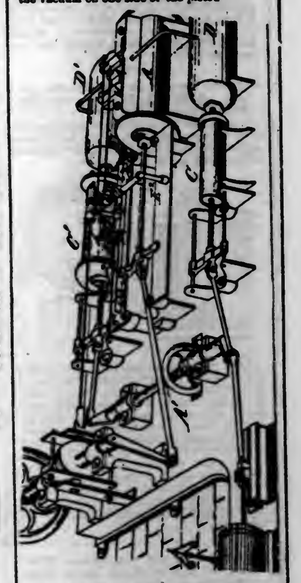
164,807. GALVANIC BATTERIES. Theophile Chatenay, Paris, France. [Filed May 12, 1875.]



Brief.—For withdrawing the spent liquid.

The tube J, provided with an exhaust-globe, K, and extending down into and secured in a tube, *f*, which is secured in and extends to the bottom of the porous cup, and is made of non-conducting material, substantially as and for the purpose set forth.

164,808. DIES FOR FORMING SPURS ON TOE-CALKS FOR HORSESHOES. Thos. M. Clarke and D. B. Chase, Winsted, Conn. [Filed Jan. 22, 1876.]

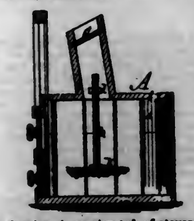


Brief.—Improvement on their Patent No. 157,494, December 8, 1874; and consists in providing the upper dies with rolling-surfaces.

In a die for forming the spurs on toe-calks, the cavities *b d*, one or both, combined with their respective vertically moving and guided rolls E C, substantially as described.

164,809. PNEUMATIC ENGINES. P. M. Connelly, St. Louis, Mo. [Filed Feb. 6, 1875.]

Brief.—A steam-engine exhausts the air from two tanks. Said tanks are alternately put in connection with each end of the atmospheric engine. One of said tanks exhausts the air from the cylinder, and the other maintains the vacuum on one side of the piston

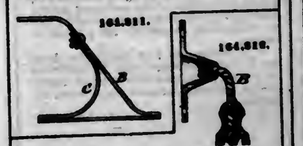


1. An improved pneumatic engine, consisting of the cylinder A, having ports *a a' a² g g'*, valves F H H', operated in the manner herein shown and described.

2. The vacuum-vessel D, exhaust-vessel D', pumps C C', in combination with an auxiliary motor, substantially as and for the purpose set forth.

164,810. INCUBATORS. Adolphe Corbett, Hicksville, N. Y. [Filed July 16, 1874.]

Brief.—The device is composed of staves, with openings left between them, so that manure piled around its sides supplies the necessary heat by fermentation.



The chamber A, constructed of staves attached to the bottom and top pieces, the vertical chimney F, projecting from the top of the chamber, having the slide G, in combination with the artificial mother K, provided with the vertical screw *k*, working in a yoke, *l*, for adjusting the same, all substantially as herein shown and described.

164,811. SPRING-CHAINS. A. W. Coates, Alliance, Ohio. [Filed Jan. 25, 1875.]

Brief.—The main leaf is provided with an auxiliary spring, slotted at the end, and sliding on a pin, thus yielding to ordinary weight without causing the auxiliary leaf to act.

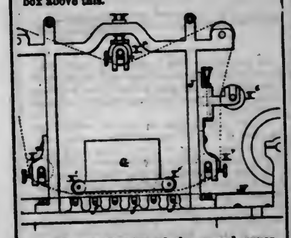
The combination, with the supporting-spring B, of an auxiliary spring, C, loosely connected by means of a slot and pin with the supporting-spring, and operating with the same to reinforce it only when the said supporting-spring is borne down below its usual range of vibration, substantially as described

164,812. COFFIN-HANDLES. M. H. Crane, Cincinnati, Ohio, assignor to Crane, Breed & Co., same place. [Filed May 15, 1875.]

Brief.—The handle is made up of a hollow ear, secured to the coffin to receive a knot in the end of a cord, and a hollow handle, which is held also to the outer end of the cord by a concealed knot, and depends from the ear.

The pendent coffin-handle, composed of a projected hollow conical ear, A, a cord, B, and a tubular handle proper upon the end of said cord.

164,813. GAS VENTS AND STOPPLES. E. M. Crandal, Chicago, Ill. [Filed Feb. 3, 1875.]

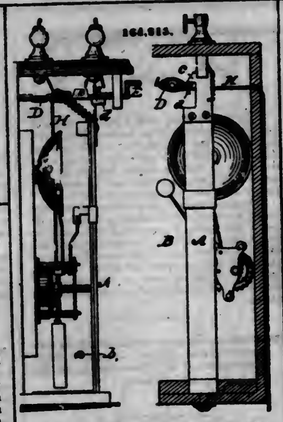


Brief.—The stopple is turned around, and the recess registers with the opening communicating with the interior of the car through the chamber and tube.

The combination of the stopple F, provided with the recess H, and the opening E in the top of the nozzle, chamber C, and the tube B, substantially as and for the purpose described.

164,814. PAPER-MACHINES. Chas. L. Crum, Winchester, Va. [Filed May 19, 1875.]

Brief.—A Fourdrinier machine with an upper wire-cloth above the web, and a suction-box above this.



1. The combination of the second upper wire-cloth H and suction-box G with the Fourdrinier machine, substantially as described.

2. The combination of the second upper wire-cloth H, box G, rolls X^1, X^2, X^4, X^5, X^6, and X^7 with the Fourdrinier, substantially as described.

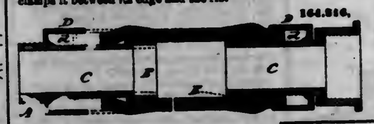
164,815. AUTOMATIC HEAT-REGULATORS AND ALARMS. Selden Allen Day, Bowling Green, Ohio. [Filed May 13, 1875.]

Brief.—The compound bar is bent by the unequal contraction or expansion of its constituents, and this movement of the bar releases the drum, so that the weight operates the register by means of the crank and slotted pitman.

1. The combination of a register or equivalent device for controlling the temperature in an apartment, mechanism, substantially such as herein described, tending constantly to operate said regulating device, and an expansion-bar arranged to detain and release said mechanism as the temperature varies, substantially as shown and described.

2. The combination of the register G, or its described equivalent, the compound bar A, drum D, weighted cord H, crank E, and pitman F.

3. In combination with the laterally-moving catch c, the drum D, provided with the lips *d e*, and connected with the register or its described equivalent, for the purpose of opening and closing the same, substantially as shown and described.



4. The flattened drum, provided with lips *d e*, in combination with the weighted cord H and the catch *c*.

5. In combination with the crank E and register G, the slotted pitman F.

6. In combination with the bar A, constructed and arranged to operate in connection with the heat-controlling devices, substantially as described, one or more alarms to give warning of an extremely high or low temperature.

164,816. HOSE-COUPLINGS. Edwin Dayton, Meriden, Conn. [Filed Mar. 9, 1875.]

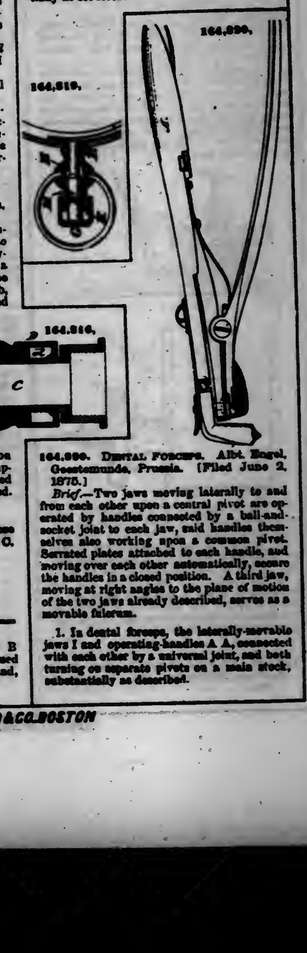
Brief.—Each part of the coupling is constructed with an externally-threaded tube, to enter the hose, and to enter also an internally-threaded rib within the hose end, and with a flange and a plain external ring, all in one piece. Upon screwing the tube into the rib, the external ring envelops the hose end, and clamps it between its edge and the rib.

The hollow-threaded plug C, formed upon or attached to the respective parts of the coupling, and the flange D on said plug combined with the socket E, substantially as described.

164,817. BALE-TIES. Henry K. Du Bose and Edgar W. Charles, Jr., Camden, S. C. [Filed May 22, 1875.]

The combination of tongueless buckle B and fastener D, having two cross-slots, obliqued toward each other, with a flexible bale-band, as and for the purpose specified.

164,818. LIFE-PRESERVING APPARATUS. H. A. Duc, Jr., Charleston, S. C. [Filed May 17, 1875.]



1. A life-preserving apparatus which shall become automatically inflated and buoyant by its immersion in water, substantially as set forth.

2. The combination of an inflatable bag and a receptacle containing chemicals that will generate gas by being dissolved in water, substantially as and for the purposes herein set forth.

3. The combination of an inflatable bag, G, flask A, valves V B, and exterior perforated case F, substantially as and for the purposes herein set forth.

164,819. WATCH-KEYS. John C. Dueber, Cincinnati, Ohio. [Filed Apr. 26, 1875.]

The combination of pendant B E M with exterior screw K, and removable key or pushpin F G H with interior screw J, substantially as set forth.

164,820. DENTAL FORCEPS. Alb. Hanel, Geestemunde, Prussia. [Filed June 2, 1875.]

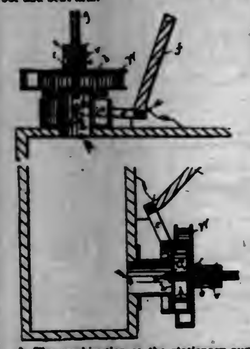
Brief.—Two jaws moving laterally to and from each other upon a central pivot are operated by handles connected by a ball-and-socket joint to each jaw, said handles themselves also working upon a common pivot. Serrated plates attached to each handle, and moving over each other automatically, secure the handles in a closed position. A third jaw, moving at right angles to the plane of motion of the two jaws already described, serves as a movable fulcrum.

1. In dental forceps, the laterally-movable jaws I and operating-handles A A, connected with each other by a universal joint, and both turning on separate pivots on a main stock, substantially as described.

2. The laterally-detachable jaws I I, in combination with the pivot-pin J and retaining-plates D E, as and for the purpose described.

3. The fixed and hinged serrated plates F F' and lever or finger-piece G, in combination with the laterally-movable jaws A A, jaws I I, and main stock H, as and for the purpose described.

164,923. BALE-TIES. Adolph Eichholz, St. Louis, Mo. [Filed May 10, 1875.]

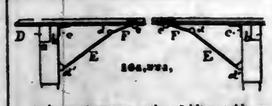


The buckle part formed to have a coupling bar A' with lug a and the V shaped edge d, in combination with the complement buckle part formed to have the opening b, slot b', and edge c, all constructed to form a bale-tie or buckle, as herein shown and set forth.

164,924. PROCESSES FOR THE MANUFACTURE OF ILLUMINATING-GAS. Fredk. H. Eichbaum, Detroit, Mich., assignor of two-thirds his right to Wm. W. Horton, J. T. Salter, J. H. Sheldon, and James Aiken, Chicago, Ill. [Filed Jan. 13, 1875.]

The process of producing, at a single operation, a fixed or permanent illuminating-gas of a required candle-power by the simultaneous destructive distillation of wood and a definite quantity of hydrocarbons at a high temperature common to both distillations, substantially as described.

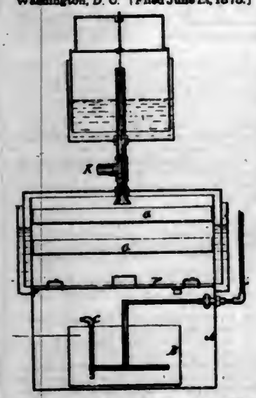
164,925. WATER-WHEELS. John Erikson, Minneapolis, Minn., assignor of one-half his right to Nelson Olsson, same place. [Filed Jan. 14, 1874.]



Brief.—Used with equal efficiency either in a horizontal or vertical position, and by simply adjusting the shaft, either on the pivot and bent arm or in the bar and bent arm, which is easily done by the collars with their set-screws, the shaft is entirely clear of the flume, and the points of friction are the bearings in the bar and bent arm.

1. The combination of the stationary pipe a, skeleton cylinder b, wheel W, and sleeve C with the adjustable shaft p, having the collar f and set-screw r, and all arranged exteriorly to the flume or water-pipe A, substantially as and for the purpose hereinbefore set forth.

2. The sleeve C, in combination with the arms e and e, bar d, and long lever-arm f, when arranged and operating exteriorly to the flume A, substantially as and for the purpose hereinbefore set forth.

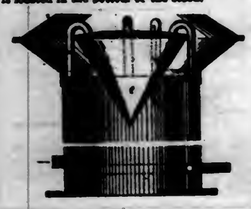


164,926. FOLDING WORK-TABLES. Benj. Fairchild, Washington, D. C. [Filed Feb. 1, 1875.]

1. In combination with a folding table or lap board, a jointed brace having a long arm, E, hinged to the cross plate or rail, and a short arm, F, attached to the table-top, the said arms arranged to fold outwardly and to lie flat against each other and against the under surface of the table, substantially as described

2. In combination with a folding table or lap board, a jointed brace having a long arm, E, and a short arm, F, connected by a hinge, d, having a stop shoulder, c', on the outside of the hinge, the lower end of the brace attached to the rail C and the upper end to the table-top, and the brace adjusted to fold outwardly from the rail, substantially as described and shown.

164,927. APPARATUS FOR CARBURETING AND PURIFYING GAS AND AIR. Leander E. Fish, Washington, D. C. [Filed June 12, 1875.]



1. The combination, with the case A, of the detachable oil-chest B, the inlet oil-pipe C, the gage-pipe D, and the inlet air and gas pipe E, terminating in the bottom of the oil-chest in a perforated section, substantially as and for the purpose described.

2. The combination of the case A, the detachable oil-chest B, the pipes C D E, the detachable cover F, and the purifying-pans G G', as and for the purpose specified.

3. The combination of case A, oil-chest B, pipes C D E, cover F, pans G G', detachable water-sealed cover H, and the pressure-regulator J, as and for the purpose set forth.

164,928. FEED-WATER HEATERS FOR STEAM-BOILERS. S. W. France, Brooklyn, N. Y. [Filed Aug. 27, 1873.]

Brief.—An uptake is formed of an inner and outer wall, forming a water-space, over which and within the hood is suspended a hollow inverted cone, communicating with said water-space and the boiler by proper pipes. The water is heated in the cone by the waste products of combustion passing to the atmosphere. A perforated sediment-discharge pipe is located in the bottom of the stack.

164,929. CAR-FASTENERS. C. B. Gardiner, Westerly, R. I. [Filed Feb. 22, 1875.]

Brief.—A face-plate with inwardly-projecting ears is mortised into the edge of the sash, and carries a pivoted lever, which is connected with and actuates a latch-bolt. This latch-bolt has projecting sides, notched for the connecting-pin, and to enable the bolt to assume an upright position when withdrawn into the face-plate; and there is a suitable spring to force down the long arm of the lever, so that the latch-bolt may automatically engage in a suitable recess of the window-frame.

The combination of the mortise-plate A, provided with projections a, the lever B pivoted to the projections a, the latch-bolt C, provided with projecting sides D, in which notches are cut for the purpose described, and the spring S, all operating together, as described.

164,930. FISHING-RODS. John L. Greves, Springfield, Mass. [Filed May 15, 1875.]

1. The hollow butt A, having a perforation, G or G', through which the cord passes, and the solid wooden plug J, constructed with a base, knob, or cap, K, as and for the purpose described.

2. The combination of hollow sections or reaches A B C, of any suitable number, and the solid tip or upper reach D, grooved at L for the passage of the line F, as described.

3. The method of forming the opening or hollow E through the rod-joints, consisting of slitting a groove from the outside, and then inserting the wedge piece or strip H, as described.

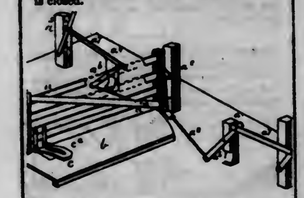
164,931. EXCAVATORS. J. W. Gunoe, Jackson County, Ala. [Filed Mar. 1, 1875.]

Brief.—The plow, endless carrier and discharging-chutes are of the ordinary form. The axle is bent upward to allow room for the carrier. Adjustment for depth of cut is made by a pivoted arm carrying a pinion meshing into a looped rack, and operated by a hand-lever.

1. The combination of the bent axle A, frame C, rock I, arm L, plow-beams E, standards L, and plow E, substantially as and for the purpose specified.

2. The combination of the bent axle A, having the bearings a a', shaft n, crank q, friction-pulley c, and lever N, substantially as and for the purpose specified.

164,932. IRON FENCES. Philip Haffa, Philadelphia, Pa. [Filed Apr. 3, 1875.]



The pale A, having for the reception of each rail a full hole, b, in the middle of its width, and a recess, d, at each edge, so arranged out of line with the hole b as to cause the rail to bind hard upon the bottoms of the recesses and on the opposite side of the hole, substantially in the manner and for the purposes set forth

---

164,933. AUTOMATIC GATES. H. Hammond, Smithfield, Ohio. [Filed Apr. 20, 1875.]

Brief.—In approaching the gate, when closed, the lever a^2 is moved in proper direction, which, acting on the other lever, a^1, and connecting-rods, causes the block b^2 to pass under the end of the weight c^1, and thus raise the catch c and release the latch. At the same time the bar d turns on its pivot, and the pin d^1, acting in the slot c^2, throws the gate open. By a reverse movement of lever a^2 the gate is closed.

1. The combination, with the gate a and the levers a^2 a^1, and their connecting-rods, of the arm c, provided with the slot c^2, and the swinging arm or lever d, provided with pin d^1, substantially as and for the purpose specified.

2. The combination, with the catch c and the levers a^2 a^1, and their connecting-rods, of the bar d, provided with the block b^2, and the weight c^1, substantially as and for the purpose set forth.

164,934. MACHINERY FOR COMPRESSION OR CONSOLIDATION OF BLOCKS OF FUEL OR OTHER MATERIAL. Felix John Hamel, London, England. [Filed May 29, 1873.]

Brief.—A table rotating by a ratchet and pawl, with several series of molds. The first series receives the material from hoppers, which then pass between descending and ascending plungers—the latter attached to a vertically-reciprocating frame over the table, which has also pieces passing through the table, to strike downward, and levers which operate the under plungers. Further rotation brings the molds under other plungers, which expel the contents onto a tilting table beneath, from whence it slides onto an endless belt.

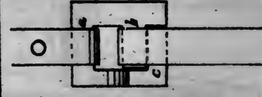
1. The combination of iron L, curved supports M M, socket-plate, F, treadle B, central spring S, and pendant T, having rack t, as and for the purpose set forth.

2. The ironing-board F, having rollers H H, attached contiguously and rigidly to each edge thereof, as and for the purpose set forth.

3. The combination of the carriage D, ironing-board F, supports B G, hinged to said carriage, and forming rigid bearings, substantially as and for the purpose set forth.

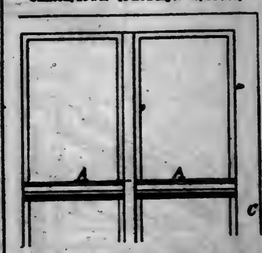
4. The combination of ironing-table F, carriage D, rollers C, rack I, spur-wheel and crank J K, and shield U, substantially as and for the purpose set forth.

164,935. POSTAGE-STAMP HOLDERS. P. W. Hall, St. Louis, Mo. [Filed May 11, 1875.]



Brief.—Is composed of several apartments for stamps of different denominations.

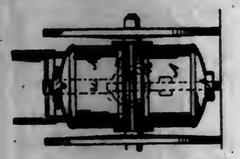
1. In a stamp-holder, the spring D and followers E E, placed one on each side of the spring, in combination with the flanges e e of the side pieces, between which they are placed, and the end pieces B B, with beveled edges d d, substantially as and for the purpose herein set forth.



2. The combination of the side pieces A A, having flanges a a, with cut-out spaces n, the end pieces B B, having beveled edges d, the lids C, springs D, and plates or spreads E, all constructed and arranged to form a holder for several different denominations of stamps, substantially as herein set forth.

164,936. BALE-TIES. John H. Hardman, Allegheny, Pa. [Filed May 6, 1875.]

In a bale-tie buckle having an end bar, a, and a middle bar, b, with the end at side d free, the bar c, having one end attached to the side d and the other end free, substantially as and for the purposes described.



164,937. WINDOW-SASHES. L. P. Haradon, Clinton, Iowa. [Filed Apr. 24, 1875.]

An improved window-sash, having a round muntin, or division-bar, A, inserted in a round hole, and set in from the surface of the sash, and provided with grooves C, to receive and hold the glass, substantially as and for the purposes described and shown.

164,837. CHEMICAL FIRE-EXTINGUISHER. Alex. B. Hughes, New Albany, Ind., assignor to the Great American Fire-Extinguisher Company, Louisville, Ky. [Filed Feb. 10, 1875.]

Brief.—The tank is divided into two by bottoms so inserted that the axle may pass between them. The tank rotates and is held in its several positions by spring-catches, so that one chamber may be recharged while the other is discharging.

1. In a chemical fire-extinguisher, the rotating tank or cylinder, made with two chambers, adapted to be successively charged and discharged without interfering with either operation in the other, substantially as described.

2. In a mounted chemical fire-extinguisher, a double rotating tank, A, in combination with the frame and axle of the main wheels, substantially as and for the purpose described.

3. In a chemical fire-extinguisher, the double rotating tank A, in combination with the retaining-loops *t u*, substantially as shown and described.

4. A mounted chemical fire-extinguisher, composed of the truck, rotating tank, and charge-box, constructed and arranged substantially as shown and described.

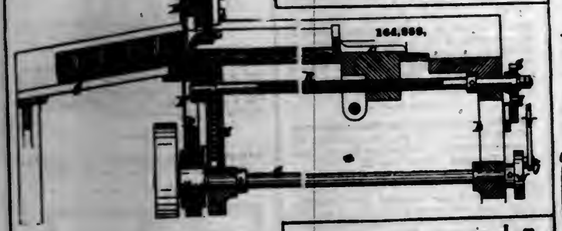
164,838. MACHINES FOR CUTTING FAN-LEAVES. Philip Hubland, Mount Vernon, N. Y. [Filed Apr. 9, 1875.]

Brief.—Fan-leaves of uniform thickness can be cut by means of a reciprocating knife and its carriage, in connection with a spring-clamp capable of a reciprocating motion, and admitting of an intermittent feeding of the material under the knife. Leaves of any desired thickness can be cut by adjusting the intermittent feed mechanism to the extent of its motion.

1. The combination of an adjustable intermittent feed mechanism, a reciprocating knife-carriage, a spring-clamp for holding the work, the whole being constructed for operation, as herein shown and described.

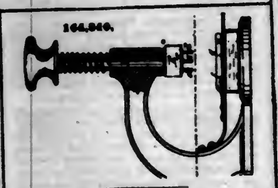
2. The combination, with the reciprocating knife-carriage and spring clamp L, of the feed mechanism, consisting of the feeder Q, screw-shaft K, driving gear S T, ratchet-wheel U, eccentric V, and pawl *e*, substantially as and for the purpose described.

164,839. MANUFACTURE OF FANS. Philip Hubland, Mount Vernon, N. Y. [Filed May 10, 1875.]



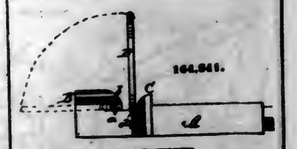
Brief.—The blocks of wood for making fans are first prepared of sufficient length and width for the fan-leaves, and of suitable thickness for two or more complete sets of leaves. They are then split into sheets of the required size, the sheets being left to adhere to each other at one edge. The split blocks are then exposed to the action of a suitable die for producing the shape required, by which a complete set of leaves is cut by one stroke of the die.

The within-described process of manufacturing wooden fans by first preparing blocks of wood of sufficient length, width, and thickness; then splitting these blocks into sheets of the required size, said sheets being left to adhere at one edge; then separating the block into blanks, each for a full set of fan-leaves, and finally exposing these blanks to the action of a suitable die, substantially as set forth.



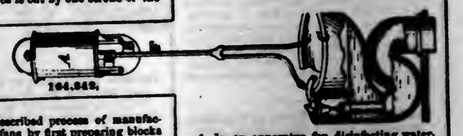
164,840. MACHINES FOR SPOTTING DOMINOS. Isaiah S. Hyatt and John W. Hyatt, Newark, N. J., and Charles M. Hyatt, Albany, N. Y., assignors to the Embossing Company. [Filed Apr. 23, 1875.]

1. A machine for spotting dominos, in which is combined a spotting-die, a reciprocating die-carrier or plunger, a fixed perforated platform for holding and retaining the dominos, and a cistern located beneath the same, the whole being constructed and arranged for operation substantially as described.



2. The guide *f*, and retaining springs *g g*, in combination with the platform B and spotter F, substantially as described.

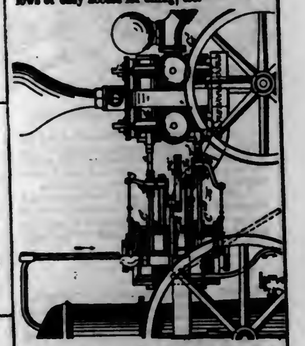
164,841. CAR-COUPLINGS. Jacob Jacobsen St. Joseph, Mich. [Filed Nov. 21, 1874.]



The combination of the draw-bar A, having recess *d*, flag-catcher B, groove *c*, lip *b*, and the shoulder C, with the ring D, all substantially as and for the purposes set forth.

164,842. APPARATUS FOR DISINFECTING WATER-CLOSETS. George Jennings, Stangate, London, Great Britain. [Filed Dec. 17, 1874.]

Brief.—In combination with the reservoir containing the disinfecting liquid, a gaging-vessel, from which the liquid discharges by a siphon connected with the water-service pipe, in such a manner that as the water passes through the service-pipe a suction is created, whereby the disinfecting liquid is caused to discharge through the siphon.

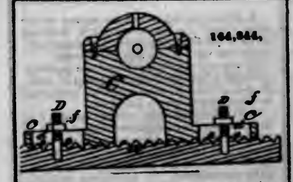


1. In an apparatus for disinfecting water-closets and other conduits, the reservoir A, with which is combined a gaging-vessel, D, provided with a siphon, F, by which the liquid discharges, and which is connected to the water-service pipe, substantially as herein described.

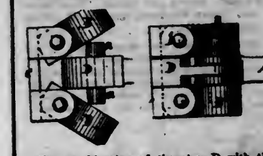
2. The combination, with the gaging-vessel D, of an air-pipe, H, and of a supply-pipe, E, the diameter of which is smaller than that of the siphon, substantially as and for the purpose specified.

164,843. STEAM FIRE-ENGINE. W. Knaust, Vienna, Austria. [Filed June 9, 1875.]

Brief.—The vertical position of the engines and pumps, the fly-wheel being horizontal, allows of easy access for oiling, &c.



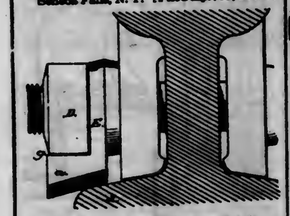
In combination with the steam-cylinders C C, and with the pump-cylinders G G, which are placed in a vertical plane, and with the feed-pump E placed between the steam-cylinders, the vertical crank-shaft I, carrying the horizontal fly-wheel M, substantially as herein shown and described, and for the purpose specified.



164,844. COTTON-GIN. William Koehl, Mentzville, Tex. [Filed Mar. 13, 1875.]

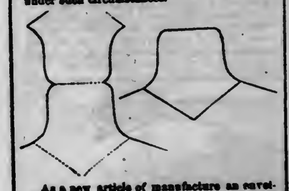
Brief.—The invention is in the means by which the brush-drum is adjustable toward the saws as the brushes become worn.

The brush-drum, journal-bearing C, adjustable in relation to the fixed saw-shaft bearing B by means of the serrations *a a*, slotted flanges *c*, bolts D, and nuts *f*, as and for the purpose specified.



164,845. TRUSS-COUPLINGS. Geo. W. Ladd, New York, N. Y. [Filed Nov. 28, 1874.]

The combination of the stop D with the eyes B, one or both of which are hinged, and with the shaft A, having gudgeons *a* at its inner end, substantially in the manner and for the purpose set forth.

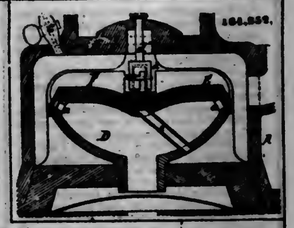


164,846. NUT-LOCKS. Obadiah B. Latham, Seneca Falls, N. Y. [Filed Apr. 12, 1875.]

The washer E, with gravitating extension *a* and recess or seat *g*, in combination with the nut D and bolt C, substantially as and for the purpose herein before described and set forth.

164,847. ENVELOPES. Alexander N. Lewis, Brooklyn, N. Y. [Filed June 10, 1875.]

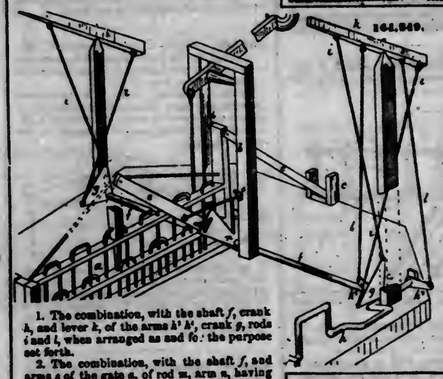
Brief.—Re-enforces the tongue or tack of the closing flap, so as to admit of lighter paper being used in the manufacture of the article, and to facilitate the introduction of the tack under such circumstances.



As a new article of manufacture an envelope having a re-enforced gummed tack or tongue, substantially as described.

164,848. SHAWL-STRAP HANDLES. Lemuel Looser, New York, N. Y., assignor to Chas. Staehlee and Henriette Looser, same place. [Filed May 28, 1875.]

Brief.—Spring-latches are secured to a hollow handle, and operate in such manner that by pulling the binding-strap in one direction they are retained automatically by the spring-latches.



In a strap for shawls and other articles, the combination of the hollow bar A, spring-latches E, guide-loops C C, and straps D D, all constructed and operating substantially in the manner herein shown and described.

164,849. LIFTING-GATES. William Lundy, Atalissa, Iowa. [Filed Apr. 3, 1875.]

Brief.—By a peculiar arrangement of cranks and levers, the gate is raised or lowered upon driving over the proper crank in a crank-rod placed transversely with respect to the road. The latch of the gate is opened by the same mechanism before any pressure is brought to bear upon the gate.

1. The combination, with the shaft *f*, crank A, and lever *k*, of the arms A^1 A^2, crank *g*, rods *i* and *l*, when arranged as and for the purpose set forth.

2. The combination, with the shaft *f*, and arms *s* of the gate *c*, of rod *m*, arm *n*, having the spring *w*, for the purposes set forth.

164,850. COMPOSITIONS FOR BUILDING PURPOSES. Aras T. Lyon, Cincinnati, Ohio, assignor to the Indestructible Building Material Company. [Filed June 17, 1875.]

The composition of matter for building purposes, consisting of asbestos, hydraulic cement, coal-ashes, air-slaked lime, and plaster-of-paris, about in the proportions specified, and thoroughly mixed and incorporated with water, and molded or applied as specified, and saturated with soluble silicate of soda or potash, substantially as described.

164,851. PAINT COMPOUNDS. Aras T. Lyon, Cincinnati, Ohio, assignor to the Indestructible Building Material Company of Ohio. [Filed June 17, 1875.]

A paint or mastic composition consisting of caustic lime, zinc, sulphate of zinc, bisulphide of carbon, chloride of zinc, nitrate of lead, chloride of sodium, whiting, and white lead, compounded and mixed with boiled linseed-oil and a suitable coloring matter, substantially as set forth.

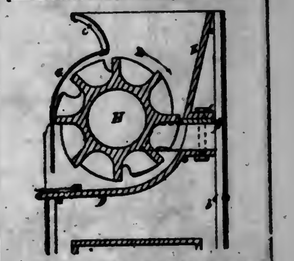
164,852. LIQUID-METERS. Edwd. Marsland, Sing Sing, N. Y. [Filed Sept. 12, 1874.]

Brief.—The case has an air-escape. The rod connecting with the registering apparatus is coupled with the float by means of a cross-bar and sleeve, by means of which the connecting-rod is prevented from being thrown out of place by any sudden change in the pressure. A tube is arranged to carry off all sediment that may collect under the float.

1. A liquid-meter having its case A provided with a vent-tube, G, in combination with the chamber D and revolving disk H, having wings F, substantially as and for the purpose shown and described.

2. A liquid-meter provided with a tube, *c*, to carry off all sediment from under the float H, substantially as shown and described.

3. A liquid-meter having the rod *d* connecting with the registering apparatus, coupled or connected with the float H by means of a crosshead, *e*, and sleeve *d*, in which there are vertical and lateral slits or slots, substantially as shown and described.



164,853. FOUNTAIN-BRUSHES. Francis McDaniel, Philadelphia, Pa. [Filed Oct. 10, 1874.]

Brief.—The T-shaped tube is provided with perforations, and connected to a reservoir by a rubber hose, and is applied to any brush without changing the construction of the latter.

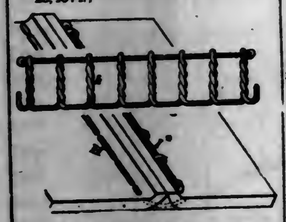
The detachable brush-moistening apparatus, consisting of the T-tube B, having perforated arms, provided with eyes *b* for attachment to the side of the ordinary brush, substantially as shown and described.

164,854. MACHINES FOR CUTTING FATS FOR RENDERING. Philip Lee McDowall, Keokuk, Ohio. [Filed Mar. 22, 1875.]

Brief.—The frame bearing the cutting devices is attached to the heating apparatus in such manner as to form a heating-chamber under the cutter. The flue passes through the revolving cutter to keep it heated. The fats are first cut into strips by the revolving cutter and the cutter bar or plate, and afterward the strips are cut into small pieces by knives which pass into slots in the revolving cutter.

1. In a machine for cutting fats for rendering purposes, the rotary cutting-cylinder H, having a hollow axis and provided with a series of cutters or knives arranged spirally around said axis in such a manner as to form a slot between each two cutters or knives, substantially as described, and for the purposes specified.

2. The combination, with the knives I and blocks i, of the cutter bar or plate K, bed-plate D, and back-plate E, arranged in relation to each other substantially as described, and for the purposes specified.



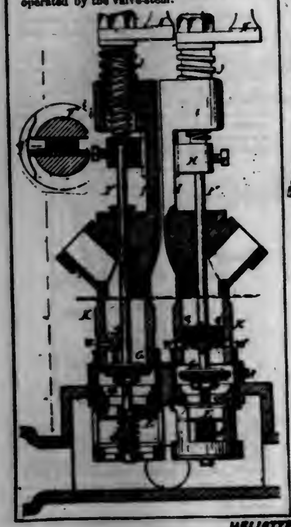
3. The combination of the cutter H with the adjustable cutter bar or plate K, substantially as set forth.

4. The combination of the cutter bar or plate K with the bed plate D, and the set-screws F F, as and for the purposes specified.

5. The combination of the knives I and the cutter-plate E with the cutter H, when constructed and arranged to operate substantially as specified.

6. The combination of the frame of a machine for cutting furs for rendering purfloes with the heating apparatus to form a heating-chamber beneath the cutting devices, as and for the purposes specified.

164,853. BELT-FASTENING. Josiah B. McElroy, Charlestown, W. Va. [Filed July 26, 1874.]



1. A belt fastener or lock-stitch stock, H, formed of wire, with twisted shanks A, and closed eyes, substantially as described.

2. The combination, with a metallic belt-fastener, of the welt O, as and for the purposes set forth.

3. The combination of the lock-stitch or twisted-wire stock H, with the rod I, substantially as described.

164,854. HYDRANTS. William H. McMillan, Philadelphia, Pa. [Filed May 14, 1875.]

Brief.—The chest at the intersection of two or more street-mains is united with hydrant or plug barrels, the barrels being provided with valves, as shown. When the barrels are unscrewed from the chest the water-way is closed by a valve pressed upward by a spring. The wasteway is closed by segmental valves operated by the valve-stem.

1. The chest A at the intersection of two or more street-mains, combined with two or more hydrant or plug barrels, K, communicating with said chest and provided with valves, all as set forth.

2. The combination of the chest A, barrels K, and valves E, arranged to be closed upon the removal of the barrels from the chest.

3. The combination of the valve-spindle with the openings w in the barrel K, and with segmental spring valves g g', for closing or uncloseing the said openings.

4. The combination of the valve-spindle F of a fire-plug or hydrant with the externally and internally threaded tube J, adapted to the threaded projection i, and to the threaded stem M of the guided slide H, attached to the said spindle, all substantially as set forth.

164,857. FRUIT-CANS. Sanford W McOmber, North Manchester, Ind., assignor of one-half his right to J. M. Burdge, same place. [Filed Apr. 17, 1875.]

Brief.—A spring-rod, with transverse grooves near each end to prevent slipping, is placed over a convex cover by means of a detachable key, which is a continuation at one end of the rod.

The spring-rod E, grooved at both extremities, and provided at one end with the reduced portion f, in combination with the detachable lever or key G, the convex cover H and can A, having the eye and hook C D, substantially as described.

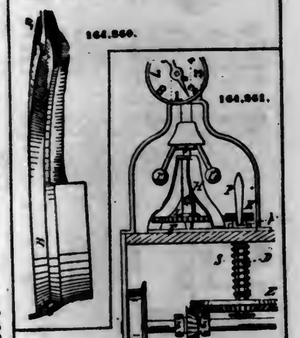
164,858. PROCESSES OF GRAINING WOOD. George F. Mehling, Detroit, Mich. [Filed Mar. 18, 1875.]

The within-described process for enamel ing wood, consisting essentially of coating the wood with boiled oil and a transparent drier, and preparing the same, (which closes the pores with fine dust,) drying the wood, and then coating it with a transparent enamel, applying the different coloring graining materials, and then applying a crumpled cloth saturated with a liquid drier, as described, over the surface, and then passing a haircloth roller over the same, and polishing said surface, all substantially as herein set forth.

164,859. GOVERNORS FOR STEAM-ENGINES. Frank M. Merrill, Marysville, Cal. [Filed Dec. 17, 1874.]

Brief.—The governor controls a small valve, which admits water under pressure to one side or the other of a piston working in a cylinder. Said piston is connected to the valve which admits steam to the engine.

1. The valve J, constructed as shown, in combination with its chamber p, said chamber having the annular passages q r s t and the ports q' r' s' t', for admitting and discharging the fluid to and from the cylinder H, substantially as herein described.



2. The adjusting device, consisting of the head W and the hinged portion X, with the screw a and returning-spring b, substantially as and for the purposes herein described.

3. The supply-chamber K and the pressure-chamber L, together with the pump N, valve J, and cylinder D, when combined to operate substantially as herein described.

4. The longitudinally moving spindle f of the governor, in combination with the arm 1, holding-plate 2, and spring 4, arranged so as to close the valve and stop the engine by the displacement of the governor-belt, substantially as described.

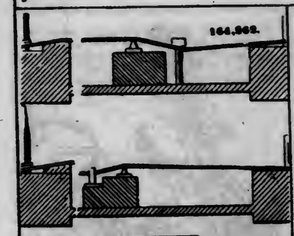
164,860. BOOTS AND SHOES. Wm. Meyer and Henry Freiburg, Quincy, Ill. [Filed Dec. 28, 1874.]

A wooden heel and shank, made in one piece, and provided with a groove, B, to receive and secure the edges of the upper, and having an angular recess, D, to receive the insole, for the purpose of stiffening the connection of the leather with the wood, substantially as described.

164,861. SPEED-MEASURES. Stephen F. Minton, Prairie Plain, assignor of one-half his right to Henry D. Starr, Texana, Tex. [Filed July 18, 1874.]

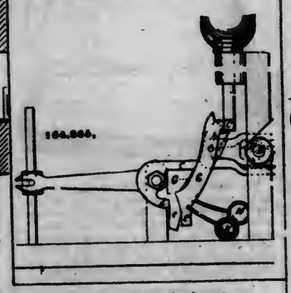
Brief.—The shaft carrying the governor which actuates the dial-indicator is so geared with the axis of a locomotive or car as to be thrown in or out of gear.

1. The combination of the spring S with the vertically-playing shaft D, having cog-wheels E E', substantially as specified.



2. The angular lever P, having a fulcrum, p, hinged to the angle of the weight and power-arms thereof, in combination with the cog-wheels E E' of the actuating-spindle D, and the spring S, substantially as specified.

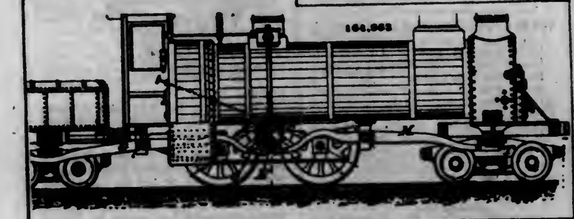
164,862. STRINGING PIANOS. A. Moeller, Hartford, Conn. [Filed Mar. 27, 1875.]



Brief.—A lifting and a pressure strain is exerted upon the sound-board and its bridge, one being arranged to somewhat exceed the other, so as to give a bearing upon or connection with the sound-board.

As an improvement in stringing pianos, the agraffe and the string or wire combined and arranged with the frame and sounding-board, substantially as described, so as to give the downward bend to the wire at the bridge, and a combined lifting and downward strain upon the sounding-board.

164,862.



164,863. VALVE-GEARS. W. L. Newsham Philadelphia, Pa. [Filed May 11 1875.

164,864.

164,863. DEVICES FOR INCREASING TRACTION OF LOCOMOTIVES. John W. Murphy Baltimore, Md. [Filed Dec. 10, 1874.]

Brief.—Throws weight of tender, and also of forward part of locomotive, on driving wheels.
